THE

SCIENTIFIC AND LITERARY TREASURY

BY

SAMUEL MAUNDER

AUTHOR OF

'THE TREASURY OF KNOWLEDGE,' 'BIOGRAPHICAL TREASURY,' ETC. ETC.

EDITED BY

JAMES YATE JOHNSON

Cor. M.Z.S.

LONDON
LONGMANS, GREEN, AND CO.
1885

PREFACE TO THE PRESENT EDITION.

THE SCIENTIFIC AND LITERARY TREASURY was subjected a few years ago to a thorough revision, when not only were all the principal articles rewritten, but upwards of fifteen hundred new articles were supplied. So large, in fact, were the alterations that it might be considered rather a new book than a new edition. An attempt was then made to impress upon the work a more exact and scientific character than preceding editions had pretended to, whilst its utility as a dictionary for popular reference was steadily kept in view.

The present edition has been enlarged by adding a Supplement of fifty-one pages, comprising upwards of six hundred articles. It is hoped that this considerable extension will materially increase the usefulness of the work and help to maintain its popular character.

THE

SCIENTIFIC AND LITERARY TREASURY.

A is the first letter, and the first vowel, of the alphabet in every known language, except the Amaric, a dialect of the Ethiopic, and the Runic; and is used either as a word, an abbreviation, or a sign. If pronounced *open*, as in FATHER, it is the simplest and easiest of all sounds; the first, in fact, uttered by human beings in their most infantile state, serving to express many and even opposite emotions, according to the mode in which it is uttered. A has therefore, perhaps, had the first place in the alphabet assigned to it. In the English language, it has four different sounds:—the long slender English, as in *fate*; the long Italian, as in *far*; the broad German, as in *fall*; and the short Italian, as in *fat*. Most other modern languages want the slender English sound. Among the Greeks and Romans, A was used as an arithmetical sign: by the former for 1; by the latter for 500, or, with a stroke over it, for 5000. The Romans employed it very frequently as an abbreviation also, which practice we still retain: thus A.B. *Artium Baccalaureus*, Bachélor of Arts; A.C. *Ante Christum*, before Christ; A.D. *Anno Domini*, in the year of our Lord; A.H. *Anno Hegiræ*, in the year of the Hegira; A.M. *Anno Mundi*, in the year of the world; *Ante Meridiem*, before noon; *Artium Magister*, Master of Arts; A.U. *Anno Urbis*, in the year of the City; A.U.C. *Anno Urbis Conditæ*, in the year from the building of Rome; &c.——A, *a*, or *aa*, in Medical prescriptions, is put for *ana*, or equal parts of each.——A, in Music, is the sixth note in the diatonic scale; in Algebraic notation it usually denotes, like the other early letters of the alphabet, a known quantity; in Logic, an universal affirmative proposition; in Heraldry, the *dexter chief*, or chief point in an escutcheon; and it is the first of the dominical letters in the calendar.

AARD'VARK (earth-hog: *Dut.*), the *Orycteropus Capensis*, an animal common in Southern Africa, which feeds entirely upon ants, and is remarkable for the facility with which it burrows deep in the earth to avoid its pursuers, and for the instinct it displays in securing its insect prey. It bears a closer relation to the armadillos than the ant-eaters, with which it was formerly associated.

AB, in the Hebrew calendar, the 11th month of the civil year, and the 5th of the ecclesiastical. In the Syriac calendar, it is the last of the summer months.

A'BACA, or Manilla Hemp [see MUSACEÆ, FIBRES].

ABACIS'CUS (*abakiskos*, the *dim.* of *abax*, a slab: *Gr.*), in Ancient Architecture, one of the square compartments of Mosaic pavements.

ABACK', in Nautical language, the position of the sails when they are flattened against the mast by a change of wind or alteration in the ship's course. The sails are sometimes *laid aback*, for the purpose of avoiding a sudden danger.

A'BACUS (*abax*, a slab: *Gr.*), a sort of cupboard or buffet used by the Romans, and which in times of great luxury was plated with gold.——ABACUS, in Architecture, the superior or crowning member of the capital of a column. It is intended to give breadth to the top of the shaft, and afford a larger surface for the reception of the architrave. In the Corinthian order, at least, it was at first intended to represent a square tile laid over a basket; and it still retains its original form in the Tuscan, Doric, and Ionic orders, but in the Corinthian and Composite, its four sides or faces are arched inwards, having a rose or some other ornament in the middle of the curves, and its corners are cut off.——ABACUS, in Arithmetic, an ancient instrument for facilitating operations: still used in teaching. Its form is various: that employed by the Greeks was an oblong frame, having wires stretched across it, and perforated beads or ivory balls were strung on the wires. In that used by the Romans, counters were slid along grooves. But that most generally adopted in Europe, is made by drawing parallel lines or fixing wires, distant from each other at least twice the diameter of a counter or ball. The latter, placed on the lowest line, signifies 1; on the second, 10; on the third, 100; on the fourth, 1000; and so on. The Chinese abacus, termed a *Swan-pan*, has wires like that of the Greeks. The abacus was much used in Europe during the middle ages: but, instead of lines or wires, it had a covering of cloth *chequered*, that is, disposed in squares; and on these the counters were placed. The term *Exchequer* is derived from the use of this chequered square in calculation. The very words employed in Greek and Latin to express calculation indicate the means anciently used in aid of that process. *Psephizo*, I calculate (*Gr.*), is derived from *psephos*, a pebble; and *calculo*, I calculate (*Lat.*), from *calculus*, a pebble. There were also other inventions similarly denominated: thus the ABACUS PYTHAGORICUS, a multiplication table invented by Pythagoras; and the ABACUS LOGISTICUS, a rectangled triangle, whose sides, forming the right angle, contain all the numbers from 1 to 60, and its area the products of each two of the opposite numbers. This is also called a *canon of sexagesimals*. ——ABACUS (*abak*, sand: *Phœn.*), among ancient mathematicians, was a table strewed over with dust or sand, on which they drew their figures.

ABAFT', or AFT, in Nautical language, towards the stern: thus, abaft the main mast means, between the mainmast and the stern.

ABATE'MENT (*abattre*, to pull down: *Fr.*), in Law, a term variously applied. The abatement of a nuisance means its forcible removal.——A plea in abatement in an action at law, is a plea showing matter for quashing the declaration.——A suit in chancery is said to abate when, in consequence of some event subsequent to its institution, such as the death of a party whose interest is not terminated by his death, there is no person before the court by whom or against whom the suit can be prosecuted.——ABATEMENT, in Heraldry, something added to a coat of arms, in order to lessen its true dignity, and point out some imperfection or stain in the character of the person who bears it. The *Baston*, which indicates bastardy, is the only abatement now used. It consists of a line drawn from the left or *sinister* corner of the top of the shield, to the lower part of the opposite side, but not quite down to the circumference; it is therefore part of a Bend-sinister.

A'BATIS (*Fr.*), trees cut down and laid with their branches turned towards the enemy, so as to form a defence for troops stationed behind them.

ABAT'TOIR (*abattre*, to knock down: *Fr.*), the name given by the French to the public slaughter-houses established in Paris by a decree of Napoleon, in order that the cattle should not be driven through the capital, to the annoyance and danger of the inhabitants. These large buildings consist of slaughter-rooms, built of stone, with every arrangement for cleanliness, &c., and of ox and sheep pens.

AB'BE' (an abbot: *Fr.*). Before the French Revolution, the term *abbé* designated a very numerous class, who, from their name, should be superiors of abbeys, but who had little or no connection with the church: they followed a course of theological study, in hopes that the king would confer on them part of the revenues of a monastery. When this was done, it was on condition of their taking orders within a year after their preferment: a clause not always observed. They were engaged in every kind of literary occupation, and exerted an important influence on the character of the country. There was scarcely a family of distinction in France in which an abbé was not found as a familiar friend and spiritual adviser.

AB'BESS, the superior of a nunnery, or other religious community of women. She has the same authority as an abbot, but cannot exercise any spiritual function.

AB'BEY (*abbaie: Fr.*), a religious house governed by a superior, under the title of an abbot or abbess. The term was often applied, also, to the church attached to the establishment. Many of the abbeys of England, after their dissolution under Henry VIII., were changed into cathedrals. Those dissolved by that king had a yearly revenue, which has been estimated at 2,853,000*l.*; an almost incredible sum, considering the value of money in those days.

AB'BOT (*abbas: Lat.*; from *abba*, father: *Heb.*) denotes the head of a monastery of men. From an early period abbots were in the habit of taking holy orders, that they might be qualified to exercise the ministerial office for the monks. Strictly speaking, an abbot should be superior to a prior, the latter being in many cases appointed by the former to take charge of a lesser establishment. But the distinction is not always observed. Abbots, though having supreme power in their monasteries, were originally subject to the bishops of the dioceses in which their convents were situated; but they gradually, to a great extent, threw off this subjection, assuming the authority and insignia of the episcopal office, and taking their seats in councils: hence the mitred and croziered abbots. Anciently the ceremony of creating an abbot consisted in clothing him with the habit called *cuculla*, or cowl, putting the pastoral staff into his hand, and the shoes called *pedales* on his feet; but at present it is only a simple benediction.——It was because certain abbots and priors in England, in right of their monasteries, held lands of the crown, for which they owed military service, that they obtained the title of LORDS, and were summoned, as barons, to parliament. Twenty-six mitred abbots and two priors sat in the House of Lords in the reign of Henry VIII.

ABBREVIA'TION (*abbreviatio*, from *abbrevio*, I shorten: *Lat.*), a contracted manner of writing words so as to retain, in most cases, no more than the initial letters. Such abbreviations were in common use with the Romans, as they are with us, to save time and space. [For the most usual abbreviations, see the different letters.] ——ABBREVIATION, in Music. One dash through the stem of a minim or crotchet, or under a semibreve, converts it into as many quavers as it is equal to in time; two dashes into semiquavers; three into demisemiquavers; and so on. When minims are connected together like quavers, semiquavers, &c., they are to be repeated as many times as if they were reduced to such notes. An oblique dash through the 2nd, 3rd, and 4th lines after an arpeggio, signifies that it is to be repeated; for quavers, a single dash being used; for semiquavers, a double one; and so on.

ABDICA'TION (*abdicatio*, from *abdico*, I abdicate: *Lat.*), strictly speaking, is the resignation of a dignity, particularly a regal one.——The abdication of the emperor Charles V., in 1556, and that of Napoleon at Fontainebleau, in 1814, are the two most remarkable instances of abdication in modern times.

ABDO'MEN (*Lat.*, from *abdo*, I conceal: *Lat.*), that part of the body which is usually called the belly. It contains the viscera more or less immediately connected with digestion, and the kidneys which secrete the urine. By anatomists the abdomen is divided into three anterior regions, viz. the *epigastric*, or upper one; the *umbilical*, or middle one; and the *hypogastric*, or lower one: there is also one posterior region, called the *regio lumbaris*.

ABDOMINA'LES (*abdomen*, the belly: *Lat.*), a sub-order of malacopterygian fishes, so named from having the ventral fins placed on the abdomen at a distance from the pectoral fins. The salmon, trout, herring, pike, carp, and many other freshwater fishes, fall into this sub-order.

ABDUC'TION (*abduco*, I lead away: *Lat.*), the crime of unlawfully taking away, either by force, fraud, or persuasion, the person of another. The abduction of a child under ten years of age is felony; if she is older, but has property, or is presumed to be entitled to it, and is taken away for the purpose of marriage or deflement, it is also felony; if she is under sixteen years of age, taking her from the protection of her parents is a misdemeanour.

ABDUC'TOR (same *deriv.*), in Anatomy, a name given to several muscles, on account of their serving to open or draw backwards the parts into which they are inserted.

ABE'LIANS, or A'BELITES, a Christian sect, who, while they enjoined matrimony, prescribed perfect continence in that state, after the pretended example of Abel, whence the name.

ABELMOS'CHUS, the seed of an Egyptian plant, nat. order *Malvaceæ*, which resembles musk in its perfume, and is used by the Arabians in their coffee.

A'BER, a Celtic term, signifying the mouth of a river: as Aberdeen, the mouth of the Dee.

ABERRA'TION (*aberratio*, from *aberro*, I wander away: *Lat.*), in Astronomy, an apparent motion of the fixed stars occasioned by the progressive motion of light and the motion of the earth in its orbit. If the earth were at rest, or if light travelled instantaneously from a star to the observer, the star would be seen in its true place. But neither is the case; for while the ray of light is passing to the observer, the earth is moving in its orbit. The effect of this is the same as if the ray obeyed two impulses making an angle with each other, one in a direction from the star to the observer, and the other in a direction opposite to the earth's motion on its axis; in which case, according to the ordinary mechanical laws, the result would be the same as that of an impulse in the direction of neither of the original impulses, but compounded of both, and the ray would seem to come from a place different from that really occupied by the star.——ABERRATION, in Optics, a deviation of the rays of light when refracted by a lens or reflected by a speculum, in consequence of which they are prevented from meeting in the same point. Aberrations are of two kinds, one arising from the figure of the reflecting or refracting body, the other from the unequal refrangibility of the different coloured rays which, united together, constitute *white* light, and which, being separated by the lens, give rise to the production of colours.

ABET'TOR (*abedan*, to incite. *Sax.*,, in Law, a person who advises or encourages another to the commission of a crime. If present at its perpetration, he is treated as a principal; if absent, as an *accessory before the fact*. The abettors of almost all felonies, whether present or absent, are considered as guilty as the actual felon. [See ACCESSORY.]

ABE'YANCE (*beyer*, to expect: *Norm. Fr.*), in Law, the expectancy of an estate or possession: thus, if lands be granted to one person for life, with reversion to the heirs of another, the reversion remains in abeyance until the death of that other, since a living person can have no heirs. A peerage descending to co-heiresses is in abeyance. It is a fixed principle of law, that the fee-simple of all lands is in somebody, or else in abeyance.

AB'IB (an ear of corn: *Heb.*), the first month of the Hebrew ecclesiastical year. It contains parts of our March and April. The Chaldee name of *Nisan* is now usually given to this month.

A'BIES (a fir-tree: *Lat.*), in Botany, a genus of coniferous trees, including several species of fir.

ABJURA'TION (*abjuro*, I deny on oath: *Lat.*), a forswearing or renouncing by oath. In old law, it signified a sworn banishment, or an oath taken to forsake the realm for ever: in its modern and now more usual signification, it applies to persons and doctrines only.

ABLACTA'TION (*ablacto*, I wean: *Lat.*), a sort of ingrafting of trees, in which the graft is left on its proper stock until it is fully incorporated with the new stock; when cut off, it is, as it were, *weaned* from the tree.

AB'LUENTS (*abluo*, I wash away: *Lat.*), diluting medicines, or such as dissolve, and carry off impurities from any part of the body.

ABLU'TION (same *deriv.*), a religious washing of the body, still used by the Turks and Mahomedans. It originated in the obvious necessity of practising cleanliness for the prevention of diseases in hot countries, for which purpose it was constituted a sacred rite; and by an easy transition, the purity of the body was made to typify the purity of the soul.

ABNOR'MAL (*ab*, from *norma*, a rule: *Lat.*), that which is irregular, or a deviation from the usual plan.

ABOARD', in Nautical language, within a ship. Also, when a vessel gets entangled in another, it is said to be *aboard of it*.

ABOMA'SUS, the fourth stomach of

ruminating animals, in which the process of digestion is effected.

ABORI'GENES (*ab origine*, from the beginning: *Lat.*), a name given to the original inhabitants of any country, or those occupying it when it first became known, and of whose origin nothing certain has been ascertained.

ABOR'TION (*abortio*, from *aborior*, I perish: *Lat.*), in a *figurative* sense, any production that does not come to maturity, or any design or project which fails before it is properly completed.——In Medicine, the unnatural expulsion of the fœtus after the sixth week and before the sixth month of pregnancy. Before the sixth week it is termed a *miscarriage*, and after the sixth month a *premature labour*.

ABOUT', in Nautical language, the situation of a ship immediately after she has tacked.——ABOUT SHIP, an order to the crew to prepare for tacking.

AB'RACADAB'RA, a term of incantation formerly used as a spell, and worn about the neck as a charm against several diseases, particularly fever.

ABRA'SION (*abrado*, I scrape off: *Lat.*), in Medicine, the corroding or wearing, by sharp and acrimonious humours or medicines.

ABRA'XAS, or ABRASAX', the name of the angelic Prince whom Basilides of Alexandria, the chief of the Egyptian GNOSTICS, supposed to have been set over 365 heavens, each peopled with its own order of angels. The word was probably Egyptian, and employed by Basilides when he found that if written in Greek the letters made up the number 365.——ABRAXAS or ABRASAX STONES are gems, sometimes called *Gemmæ Basilidianæ*, found in Egypt, upon which are represented the human body with the head of a cat and the feet of a reptile. The name of *Abrasax stone* is, in modern times, applied to a variety of gems that exhibit enigmatical compositions.

ABREAST', in Nautical language, a term applied to two or more ships, when ranged side by side. A ship is said to be *abreast of a place* when opposite to it.

ABREU'VOIR (*Fr.*), a watering-place, or any place dug for retaining water, as in camps.

ABRIDG'MENT (*abréger*, to abridge: *Fr.*), a contraction which brings the contents of a book within a short compass. The art of abridging well consists in taking only what is material and substantial, and rejecting all superfluities, whether of sentiment or style. In this light, abridgments are eminently serviceable to all whose occupations prevent them from devoting much time to literary pursuits. To abridge well requires a thorough knowledge of the subject. Montesquieu says, 'Tacitus abridged all, because he knew all.'

AB'SCESS (*abscedo*, I go away from: *Lat.*), in Medicine, an inflammatory tumour containing purulent matter.

ABSCIS'SA (*abscindo*, I cut off: *Lat.*), in Geometry, one of two lines, by which is measured the distance of a point, whose position is required to be ascertained, from two given intersecting lines, the other of the two first mentioned lines being called the *ordinate*. The point and the two given lines, which to facilitate the investigation are usually assumed to be at right angles to each other, must be on the same plane. The abscissa and the ordinate form the *coordinates*, which being known, the position of the point is known. The point of intersection of the two given lines is called the *origin*.

ABSCIS'SION (*abscissio*, from same *deriv.*), in Rhetoric, a figure of speech by which the speaker stops short, leaving his hearers to draw their own inferences from the facts he has stated.——In Astronomy, the cutting off the light of a planet, by another outstripping it and reaching a third planet before it.

ABSENTEE' (*absens*, absent: *Lat.*), a word of modern times applied to landowners and capitalists who expend their incomes in another country.

ABSIN'THINE (*absinthium*, wormwood: *Lat.*), the bitter principle of wormwood.

ABSOLU'TION (*absolutio*, from *absolutus*, freed from: *Lat.*), a religious ceremony of the church of Rome, in which the priest uses the formula 'Ego te absolvo a peccatis tuis.' I absolve thee from thy sins. The Council of Trent asserted that the priest has power of himself to absolve from sin. But this, it is said, is subject to the repentance of the individual and his submission to the requisite penance. The fathers of the Protestant church maintain that God alone can forgive and deliver from sin; and that a judicial power over the souls of Christians is conferred neither on priests nor on teachers.

AB'SOLUTISM, in Theology, a doctrine ascribed to the Calvinists, according to which God is supposed to act from mere pleasure in regard to the salvation of mankind. Absolutism is the grand obstacle to an union between the Lutherans and Calvinists.——In Politics, a power in the supreme head of the state above the control of law, to act according to his own will in the government of the people.

ABSOR'BENTS (*absorbeo*, I swallow up: *Lat.*), in Medicine, calcareous earths, or other substances which remove acids from the stomach.

ABSOR'BENT VESSELS, or ABSORBENTS, in Anatomy, extremely minute and numerous vessels opening on various parts of the body. Those on the undersurface of the smaller intestines are termed *lacteal absorbents*, or *lacteals*, their office being to absorb the digested elements or *chyle*, that it may be mixed with the blood. The *lymphatic absorbents*, or *lymphatics*, take up a transparent substance, *lymph*, and are found in great abundance opening on the skin. Every part of the body has lymphatics, by which waste particles are absorbed and removed.——In Botany, the fibres of the roots of plants, which draw nourishment from the surrounding earth, are sometimes termed *absorbents*.

ABSORP'TION (*absorptio*, from same *deriv.*), in Physiology, the conveyance to the circulating organs of a due supply of materials for the growth and support of the system; and removal, by the same means, of decayed and useless portions.

ABSTER'GENTS (*abstergeo*, I wipe away: *Lat.*), in Medicine, substances used to cleanse the body from those impurities which are not to be removed by simple abluents.

AB'STINENCE (*abstinentia*, from *abstineo*, I abstain: *Lat.*), in the Roman Catholic Church, the refraining from the use of certain kinds of food, such as meat, eggs, milk, &c., which are forbidden to members of that church on particular days. It differs from *fasting*, which is a refraining from all kinds of food during a certain period.

AB'STRACT (*abstractus*, from *abstraho*, I withdraw from: *Lat.*), a concise but general view, or analysis, of some large work; in which sense it differs from an *abridgment* only by its being shorter, and by its entering less minutely into particulars; and from an *extract*, as this last is some part or passage of the work.

ABSTRAC'TION (*abstractio*, from same), in Logic, that operation of the mind by which, in contemplating an object, it attends to some circumstances or qualities belonging to it, to the exclusion of all others. This faculty enables us to generalize, and is directly opposed to *composition*. By the latter, we consider those things together, which, in reality, are not joined in any one existence: by abstraction, we consider those things separately and apart, which, in reality, do not exist apart.——ABSTRACTION, in its passive sense, implies occupation with one's own thoughts, to the exclusion of external objects.

ABSUR'DUM, REDUC'TIO AD (reduction to an absurdity: *Lat.*), a mode of demonstration in which the truth of a proposition is established, not by direct proof, but by showing that the contrary is *absurd*, or *impossible*.

ABUT'MENTS (*aboutir*, to abut: *Fr.*), the extremities of any body adjoining another, as the extremities of a bridge resting on the banks or sides of a river. Also the junctions or meetings of two pieces of timber.

ABYSS' (*abussos*, bottomless: *Gr.*), any very deep place.

ACA'CIA (*akakia: Gr.*), in Botany, a genus of leguminous trees, or shrubby plants, of which several hundred species are known to botanists. They bear white, red, or yellow flowers, and their leaves are frequently elegantly pinnate. Some of them yield *Gum Arabic*, *Gum Senegal* and *Catechu*; and the bark of others affords a large quantity of *tannin*. They abound in Australia and in Africa. Most of the Australian species do not bear true leaves (except when very young), but have in their place flattened leaf-stalks, termed by botanists *phyllodia*, which are green and simulate leaves.——ACACIA, in the Materia Medica, is the inspissated juice of the pods of the *Mimosa Nilotica* of Linnæus.

ACADEM'ICS (*academicus*, relating to the *Academy: Lat.*), certain philosophers who followed the doctrine of Socrates and Plato, as to the uncertainty of knowledge and the incomprehensibility of truth. Socrates is said by some to have declared that 'all he knew was, that he knew nothing;' and it is certain that, in giving instruction, he commenced by professing the limited amount of human knowledge. Those among the ancients who embraced the system of Plato, were called *Academici*, and were divided into a number of sects. Those who have done so since the restoration of learning, have called themselves *Platonists*.

ACAD'EMY (*Akademia*, a public gymnasium at Athens: *Gr.*), in Grecian Antiquity, a place in one of the suburbs of Athens, where there was a school for gymnastic exercises. It took its name from Academus, an Athenian, who is said to have resided there. Cimon, the Athenian general, became its owner about 450 B.C., and adorned the place with fountains and statues. He bequeathed the garden to the public, and it then became the resort of the lovers of philosophy. Socrates was wont to repair thither, but its greatest celebrity arose from its being the place in which Plato taught.——ACADEMY, in the modern acceptation, is a society of persons united for the pursuit of some objects of study and application, as the Royal Academy of Arts of London, the French Academy, the Royal Academy of Sciences of Berlin, &c. The first institution resembling an Academy, of which there is any account, was a society formed at Alexandria by Ptolemy Soter. The first academy of science, in modern times, was established at Naples, by Baptista Porta, in 1560; but it was abolished by papal interdict. From the beginning of the 17th century, academies became very numerous in Italy; and, after some time, they spread into other countries.

ACALE'PHÆ (*akalēphē*, a nettle: *Gr.*), in Zoology, a class in the sub-kingdom *Radiata*, composed of animals which have the power of stinging the skin when applied to it; whence the name. The jelly-fishes, the sea-nettles, and the Portuguese man-of-war belong to this class. Some of the jelly-fishes move by contractions of the disk; others by means of bands of cilia. The tribe to which the Portuguese man-of-war belongs are simply driven about by the wind.

ACANTHA'CEÆ (*akantha*, a thorn: *Gr.*), a natural order of plants growing chiefly within the tropics, and including several beautiful species cultivated in our hothouses. The genera, *Thunbergia*, *Justicia*, *Ruellia*, *Aphelandra*, &c., as well as the European ACANTHUS, belong to the order.

ACAN'THOPHIS (*akantha*, a thorn; and *ophis*, a serpent: *Gr.*), a genus of small venomous serpents, distinguished by a horny spine at the end of the tail. One species is Australian, and considered the most venomous serpent in the country.

ACANTHOPTERY'GII (*akantha*, a thorn; and *pterux*, a wing: *Gr.*), an order of fishes characterized by having spines in some of the fins, and the pharyngeal bones separate. The perch, red mullet, gurnard, mackerel, and other well-known fishes belong to this order.

ACAN'THU'RUS (*akantha*, a thorn; and *oura*, a tail: *Gr.*), a genus of herbivorous fishes found in tropical seas, the species of which have a strong movable spine on each side of the tail.

ACAN'THUS (*akanthos*, the acanthus: *Gr.*), in Architecture, an ornament representing the leaves of the acanthus, or herb bear's foot; principally employed in the Corinthian and Composite capitals.

A'CARUS (*akari*, a mite: *Gr.*), in Zoology, a genus of insects allied to the spiders and included in the order ARACHNIDA. The cheese mite is an Acarus.

ACAT'ALEPSY (*akatalēpsia*, incomprehensibleness: *Gr.*), among ancient Philosophers, the impossibility of comprehending something; uncertainty in science.

ACATHOL'ICI (*a*, not; and *katholikos*, catholic: *Gr.*), the name by which Protestants are distinguished by some Roman Catholic writers.

ACAU'LOSE or **ACAU'LOUS** (*akaulos*: from *a*, not; and *kaulos*, a stem: *Gr.*), among Botanists, a term used for such plants as have no stem.

ACCELERA'TION (*acceleratio*, from *accelero*, I hasten: *Lat.*), in Mechanics, the increase of velocity in a moving body. *Accelerated motion* is that which continually receives fresh accessions of velocity, and is either uniformly or variably accelerated. It is produced by some force which *continues* to act. When it is *uniformly* accelerated, the increments of velocity produced in equal times are equal. Gravity furnishes us with an example of a uniformly accelerating force. If, under the influence of such a force, a body moves through a certain distance in the first second, it will move through three times that distance in the next second, through five times that distance in the third second, and so on; and, during any *number* of seconds, it will move through the distance traversed in the first second, multiplied by the square of that number.——ACCELERATION, in Astronomy, is applied to express the increase of the mean angular velocity of the moon, which causes the time of her mean periodic revolution to be a little shorter than it was many centuries ago; also to the increase of the velocity of a planet in moving from the apogee to the perigee of its orbit: and to the apparent greater diurnal motion of the fixed stars than of the sun, whose apparent motion round the earth each day is retarded by his apparent motion in the opposite direction, due to his apparent annual revolution in the heavens.

AC'CENT (*accentus*: from *ad*, to; and *cantus*, a tone: *Lat.*), a modification of the voice in pronouncing certain words or syllables; also, the marks on the words or syllables. The grammatical accents are the acute, marked thus (´); the grave, marked thus (`); and the circumflex, marked thus ^). Accents are used abundantly in the ancient Greek language; but we totally neglect them, and attend only to *quantity*. The modern Greeks, on the contrary, neglect quantity, and lay great stress on the accented syllables. The French use accents to mark a difference of pronunciation, or to distinguish words which are spelt in the same way, but have a different meaning.——RHETORICAL ACCENT, or *emphasis*, is designed to give distinctness and clearness to language. In a sentence, therefore, the stress is laid on the most important word, and in a word on the most important syllable. When the accent falls on a vowel, that vowel has its long sound, as in *po'rous*; but when it falls on a consonant, the preceding vowel is short, as in *pot'ter*. Accents also not only give a pleasing variety and beauty to the modulation of the voice, but often enable us to ascertain the true meaning of the word.——ACCENT, in Music, is a stress, or forced expression, which is laid on certain parts of a bar or measure, and is intended to indicate the passions, either naturally by the voice, or artificially by instruments. Every bar or measure is divided into the accented and unaccented parts; the former being those on which the spirit of the music depends.——ACCENTS, in Mathematics, are employed to distinguish different quantities, which are expressed by the same letter, used more than once, to avoid the inconvenience of too many letters. Thus, one velocity being represented by V, another may be indicated by V', another by V''. &c.

ACCEP'TANCE (*accipio*, I accept: *Lat.*), in Commerce, is the act by which a person makes himself a debtor for a sum contained in a bill of exchange or other obligation drawn upon or addressed to him, which is done by his writing the word 'Accepted' on it, and signing his name.

ACCEP'TOR (*Lat.*, from same *deriv.*), the person who accepts a bill of exchange in the manner just mentioned.

AC'CESS (*accessus*, from *accedo*, I approach: *Lat.*), in Medicine, the beginning of a paroxysm: or a fit of some periodical disease.

AC'CESSORY (*accedo*, I approach: *Lat.*), in Law, a person who aids in the commission of some felonious action. There are two kinds of accessories, viz. *before* the fact, and *after* it. The first is he who commands or procures another to commit an offence; who, though he be absent when it is committed, is now regarded as much a principal as the actual offender. One who stands by and witnesses the commission of a crime, without attempting to prevent its commission, is also an accessory before the fact. The accessory after the fact is one who receives, comforts, or assists the offender, knowing him to be such.

AC'CIDENS, or **PER ACCIDENS** (happening by chance: *Lat.*), a term formerly used by Philosophers to indicate a something not following from the nature of things, but from some accidental quality. It is opposed to *per se*; thus fire was said to burn *per se*, but a heated iron *per accidens*.

AC'CIDENT (*accido*, I happen: *Lat.*), amongst Logicians signifies that which may be either absent or present, without affecting the essence of the species. Thus, a man may be swimming, or he may be a negro. The former is what is termed a separable accident, because it may be separated from the individual, who would not cease to be the same person when he issued from the water; the other is an inseparable accident, not being separable from the individual, for being once a negro he could never cease to be one.

ACCIDEN'TAL (*accidens*, happening by chance: *Lat.*), in Heraldry, an additional mark in a coat of arms, which may be either omitted or retained without altering its character.——ACCIDENTAL COLOURS, those colours which depend on affections of the eye, and not on light itself. Thus, if we look for a short time steadily at a red wafer placed on a white sheet of paper, on removing the eye from the wafer, a number of spots equal in size to the wafer, and of the complementary colour (green), will appear on the paper as the eye moves over it.——ACCIDENTAL POINT, in Perspective, that point where all the lines parallel among themselves meet the perspective plane.

ACCIP'ITRES (*accipiter*, a hawk: *Lat.*), an order of birds of prey, called also *Raptatores* and *Rapaces*. It includes the eagles, vultures, secretary birds, and owls, and all its members are characterized by having powerful hooked beaks and talons, coupled with great strength of wing.

ACCLAMA'TION (*acclamatio*, from *acclamo*, I cry out: *Lat.*), in Roman Antiquity, a shout raised by the people to testify their approbation or disapprobation of their princes, generals, &c. In the early times of Christianity, the bishops were elected by acclamation. The first German emperors were elected in the same way.

ACCLIMATIZA'TION (*Fr.*), the colonization of one country by the natural productions, whether animal or vegetable, of another, with the view of rendering them subservient to the necessities or pleasures of mankind. There is an Acclimatization Society in London, and another in Paris. Amongst birds, several species of pheasants, the capercailzie, and two geese, have been acclimatized in our island; and amongst quadrupeds, the fallow deer, wapiti, and eland. The common carp is another instance of an acclimatized animal.

ACCOLA'DE (*Fr.*: from *ad*, to; and *collum*, the neck: *Lat.*), the slight blow given to the neck or shoulder of him who is being knighted.

ACCOMMODA'TION (*accommodatio*, an adapting: *Lat.*), a term applied by oculists to the power of adjustment which every normal eye possesses, whereby it is enabled almost imperceptibly and unconsciously so to alter its focus as to receive in rapid succession the correct image of objects situate at different distances.——ACCOMMODATION BILL, in Commerce, a bill of exchange which has been accepted for the accommodation of the drawer without any consideration or value for the acceptance.

ACCOM'PANIMENT (*accompagnare*, to accompany: *Ital.*), an instrumental part added to a musical composition by way of embellishment, and in order to support the principal melody. When the piece may be performed with or without the accompaniment at pleasure, it is said to be *ad libitum*, but when it is indispensable, *obligato*.

ACCOM'PLICE (*ad*, to; and *complexus*, comprised: *Lat.*), in Law, a person who is privy to, or aiding in, the perpetration of some crime.

ACCORDATU'RA, an Italian word signifying *agreement in time*.

ACCOR'DION (*accordo*, harmony: *Ital.*), a musical instrument, of German invention, but now made in this country also. It consists of a double series of vibrating tongues, acted on by a current of air from a sort of bellows.

ACCOUNT'ANT-GEN'ERAL, an officer of the Court of Chancery, whose duty it is to take account of all the moneys paid into that court, and to pay money out under the order of the court.

ACCOU'TREMENTS (*accoutrer*, to equip: *Fr.*), the necessaries of a soldier, as belts, pouches, cartridge-boxes, &c.

ACCRES'CIMENTO (*accrescere*, to increase: *Ital.*), in Music, the increase, by one half its duration, given to a note by a dot.

ACCRE'TION (*accretio*, from *accresco*, I increase: *Lat.*), the increase or growth of a body by an external addition of new parts; shells and various other substances are thus formed.

ACCUBA'TION (*accubatio*, from *accubo*, I recline: *Lat.*), the posture used among the Greeks and Romans at their meals, which was with the body extended on a couch, and the head resting on a pillow, or on the elbow supported by a pillow.

ACEPH'ALA (*akephalos*: from *a*, without; and *kephalē*, a head: *Gr.*), a sub-class of molluscs, comprising those that are destitute of a head such as the snails possess. Those with bivalve shells, the oyster, cockle, &c., belong to this sub-class.

ACEPH'ALI (same *deriv.*), a sect of Christians, so called because they admitted no head or superior, either lay or ecclesiastical.

ACETA'BULUM (originally a vessel for vinegar, hence any small vessel: *Lat.*), in Anatomy, a round cavity in a bone, which receives the convex head of another, and thus forms that species of articulation termed *enarthrosis*. Also, the hip-bone.

ACE'TAL (*acetum*, vinegar: *Lat.*), a colourless inflammable liquid, the result of the slow oxidation of alcohol-vapour. It is composed of carbon, hydrogen, and oxygen. Further oxidation converts it into acetic acid.

ACETA'RIOUS PLANTS (*acetaria*, a salad: *Lat.*), those used in making salads, such as lettuces, cress, &c.

A'CETATES, certain neutral salts formed by the combination of acetic acid with a salifiable base, as the acetate of potash.

ACET'IC ACID (*acetum*, vinegar: *Lat.*), in Chemistry, an acid which is found ready formed only in the organic kingdom It may be produced by the oxidation of organic substances, such as alcohol: or their destructive distillation, in which way it is obtained from wood. It may also be procured from its compounds, which are termed *acetates*. Ordinary vinegar is a weak, and generally an impure, acetic acid. The strong acid is extremely volatile and inflammable, corrodes and cauterises the skin, and, when heated in contact with air, takes fire. The anhydrous acid is a heavy oil, and is composed of carbon, hydrogen, and oxygen. Sugar of lead is an acetate of lead.

ACETOM'ETER (*acetum*, vinegar: *Lat.*; and *metron*, a measure: *Gr.*), an apparatus for determining the strength of vinegar and other forms of acetic acid.

ACE'TONE (*acetum*, vinegar: *Lat.*), a volatile and highly inflammable liquid, obtained by subjecting acetate of lime, baryta, or lead, to dry distillation. It is a colourless limpid fluid, with a peculiar smell. It is one of the numerous combinations of carbon, hydrogen, and oxgen.

ACHÆ'NIUM (*a*, privative, *chaino*, I open: *Gr.*), in Botany, a dry one-seeded fruit, of which the skin or pericarp adheres closely to the seed, but can be separated from it. For instance, the seeds of the ranunculus and the rose are *achænia*. In the strawberry, the part which we eat is a succulent receptacle, bearing achænia upon its surface.

ACHER'NAR (*Arab.*), a star of the first magnitude in the constellation Eridanus; it is the α Eridani of astronomers.

ACHIEVE'MENT (*achever*, to finish: *Fr.*), in Heraldry, a shield of armorial bearings; but, more usually, a funeral shield or *hatchment*, fixed to the dwelling of a person recently deceased.

ACHLAMY'DEOUS (*a*, without; *chlamus*, a garment: *Gr.*), a botanical term for flowers which have neither calyx nor corolla.

ACHROMA'TIC (*a*, without; and *chroma*, colour: *Gr.*), in Optics, colourless.

ACHRO'MATISM (same *deriv.*), freedom from colour. It has been stated [see ABERRATION] that a ray of white light is decomposed into coloured rays, in passing through an ordinary lens, by reason of the unequal refrangibility of those rays. This was a serious objection in optical instruments; but the difficulty has been overcome by employing, instead of simple lenses, compound lenses with the parts made of glass having different dispersive power, which parts correct each other's aberrations. Telescopes and microscopes are thus rendered achromatic.

ACI'CULAR (*acicula*: *Lat.*), needle-shaped.

A'CID (*acidus*, sour: *Lat.*), in a general sense, denotes such things as affect the palate with a sour, sharp, and tart taste; but in Chemistry, it includes all those substances which change vegetable blues to red, and combine with the alkalis, metallic oxides and earths, so as to form the compounds called *salts*. Acids are distinguished, according to the proportion of oxygen which they contain, by the terminations *ic* and *ous*: as nitric acid and nitrous acid, sulphuric acid and sulphurous acid; the former termination denotes the larger dose or portion of oxygen, and the latter the smaller. When the prefix *hypo* is put to either of these, it denotes a degree below it in point of oxidizement; as hyposulphuric acid, an intermediate between the sulphuric and the sulphurous acid. When the prefix *hyper*, or *per*, is used, it indicates a higher degree of oxidation: as hyperchloric or perchloric acid, a compound containing more oxygen than chloric acid. Some of the metals form acids when combined with oxygen, manganese for example. Although oxygen is a constituent of the great majority of acids, this is not invariably the case; for instance, hydrochloric acid is a combination of chlorine and hydrogen, and hydrofluoric acid is a combination of fluorine and hydrogen.

ACIDIFI'ABLE (*acidus*, acid; and *fio*, I become: *Lat.*), capable of being converted into an acid by an acidifying principle, such as oxygen, chlorine, iodine, bromine, sulphur, fluorine, &c.

ACID'ULOUS (*acidulus*, a *dim.* of *acidus*, meaning subacid: *Lat.*), in Chemistry, a term expressing a slight degree of acidity.

ACINE'SIA (*akinēsia*: from *a*, not; and *kineo*, I move: *Gr.*), that interval of rest which takes place between the contraction and dilatation of the pulse.

ACOLLE' (collared, from *col*, the neck: *Fr.*), in Heraldry, a term used sometimes to denote two things joined together; at others, animals with collars or crowns about their necks; and at others, batons, or swords, placed saltier-wise behind the shield.

A'COLYTE (*akolouthos*, a follower: *Gr.*), a cleric belonging to one of the four inferior or *minor orders* of the Roman Catholic church. His office is to attend on those in superior or *holy orders*, to carry a light at mass, and in other solemnities, &c.

ACONI'TA (next), a poisonous alkaloid extracted from aconite, employed as an anodyne in neuralgic affections.

A'CONITE (from *Acone*, in the Crimea, famous for poisonous herbs), the plant wolf's-bane or monkshood (the *Aconitum napellus* of botanists: nat. ord. *Ranunculaceæ*), the flower of which resembles the hood of a monk; it is a violent poison.

ACON'TIAS (*Gr.*, from *akōn*, a dart), in Zoology, a harmless serpent, otherwise called the *Anguis jaculus*, or dart-snake, from its vibrating its body in the manner of a dart.

ACOTYLE'DONS (*a*, without; and *kotulēdōn*, a cavity: *Gr.*), in Botany, a class of plants whose seeds are destitute of cotyledons or seed lobes, such as sea-weeds, mosses, ferns, and lichens.

ACOUSMAT'ICI (*akousmatikoi*, from *akouo*, I hear: *Gr.*), in Grecian Antiquity, such disciples of Pythagoras as had not finished their five years' probation. The *Acousmatici* were instructed by bare positive precepts and rules, without reasons or demonstrations; and these precepts they called *acousmata*.

ACOUS'TICS (*akouo*, I hear: *Gr.*), that branch of science which treats of the laws of sound. It is usually divided into two parts, viz. *diacoustics*, which explains the properties of those sounds that come directly from the sonorous body to the ear; and *catacoustics*, which treats of reflected sounds. Almost all sounds that affect us are conveyed to the ear by means of the air; but water is a good conductor of sound; so also is timber. It must be observed, that a body, while in the act of sounding, is in a state of vibration, which it communicates to the surrounding air, and that the undulations of the air affect the ear, and excite in us the sense of sound.

ACQUIT'TAL (*acquitter*, to discharge: *Fr.*), in Law, a discharge, deliverance, or setting free of a person from a criminal charge. Acquittal is of two kinds; in law, and in fact. When two are indicted and tried for a felony, one as principal, the other as accessory, the principal being discharged, the accessory also is, by consequence, freed: in which case, as the accessory is acquitted by law, so is the principal in fact.

ACQUIT'TANCE (same *deriv.*), a discharge in writing for a sum of money, witnessing that the party is paid the same.

A'CRE, a measure of land, very general in name, but varying in different places as to the extent which it is intended to denote. The English statute acre contains 4 square roods, or 160 square poles of 5½ yards, or 4,840 square yards. 121 Irish acres are equal to 196 English; 48 Scotch to 61 English; and 1,000 English acres to 40·466 French ares.

ACROAMAT'IC (*akroamatikos*, from *akroaomai*, I hear: *Gr.*), in the Aristotelian schools, a denomination given to such lectures as were calculated only for the intimate friends and disciples of that philosopher, being chiefly employed in demonstrating some speculative or abstruse part of philosophy. The acroamatic lectures, called also *esoteric*, stood contradistinguished from the *exoteric*, which were adapted to a common auditory.

ACROCERAU'NIAN (*akron*, a summit; and *keraunos*, a thunderbolt: *Gr.*), an epithet applied to certain mountains of Epirus, which project into the Adriatic, and obtain their name from being often struck with lightning.

ACRO'GENS (*acron*, an extremity; *geno*, I spring from: *Gr.*), a class of flowerless plants, having the stems and leaves distinguishable, forming one division of the Acotyledones of Jussieu, and the Cryptogameæ of others. They grow only at the ends, whence the name. They consist of mosses, lycopodia, and ferns.

ACRON'YCAL (*akronukos*: from *akron*, an extremity; and *nux*, the night: *Gr.*), in Astronomy, an appellation given to the rising of a star above the horizon, at sunset; or to its setting, when the sun rises. *Acronycal* is one of the three terms for the rising of a star, used by the Greek poets to indicate the position of the sun in the ecliptic, or the season of the year; the other two being called *cosmical* and *heliacal*.

ACROP'OLIS (*Gr.*: from *akron*, a summit; and *polis*, a city), the citadel of a Grecian city, and particularly that of Athens.

ACROS'TIC (*akrostichon*: from *akron*, an extremity; and *stichos*, a line: *Gr.*), a poem so contrived that the first or last letter of each line, or word, taken together, will make a proper name, or some other word. Such trifles were formerly much more in fashion than at present. Sir John Davies, who wrote philosophical poems, composed 26 acrostics in honour of Queen Elizabeth, the first letters of the lines making the words *Elisabetha Regina*.

ACROSTO'LIUM (*akrostolion*: from *akron*, an extremity; and *stolos*, equipment: *Gr.*), in the Naval Architecture of the ancients, the extreme part of the ornament fixed on the prows of their ships, and sometimes used for striking the ship of an enemy. It was the custom to tear the *acrostolia* from the prows of the vanquished, as a token of victory.

ACROTE'RIA (*akrotēs*, the end: *Gr.*), in Architecture, small pedestals, upon which globes, vases, or statues stand at the ends or middle of pediments. It also sometimes denotes the figures themselves placed in such situations.

ACT (*actus*, from *ago*, I perform: *Lat.*), in a general sense, denotes the exertion, or effectual application, of some power or faculty. Act is distinguished from power, as the effect from the cause, or as a thing produced from that which produces it.——ACT, among Logicians, more particularly indicates an operation of the human mind in which sense, comprehending, judging, willing, &c., are called acts.——ACT is also used for the final resolution or decree of an assembly, senate, council, &c.——ACTS of parliament are called *statutes*; acts of the Royal Society, *transactions*; those of the French Academy of Sciences, *memoirs*; those of the Academy of Sciences at Petersburg, *commentaries*, and latterly *acts*; those of Leipsic, *acta eruditorum*; the decrees of the Lords of Session, at Edinburgh, *acta sederunt*, &c.——ACT, in a Dramatic sense, is the name given to a division of a drama, at the end of which there is a pause to afford rest to actors and spectators. In the ancient Greek drama, there were certain interruptions of the performance, during which the stage was left to the sole occupation of the chorus. Yet this division of the piece is not noticed, in express terms, by ancient writers; nor do we know on what authority Horace requires that there should be five acts in every dramatic composition. In what is termed the regular drama, the rule laid down by him is still observed, the acts being divided into smaller portions, called *scenes*.

ACT OF FAITH, or **AUTO-DA-FE**, a public solemnity, held in Spain and Portugal, and the countries subject to them, in which the sentences pronounced by the judges on heretics and infidels were read. It is, however, generally considered to include the cruel execution of those who were condemned to be burned. Everything was done to render the processions, &c., appalling: that all might be deterred from resisting the authority of the church, or hesitating to believe whatever had been declared an article of faith.

ACT OF GRACE, an act at the beginning of a new reign, or on other great occasions, by which sometimes a free pardon has been granted to criminals.

ACTS OF THE APOSTLES, a canonical book of the New Testament, which contains great part of the lives of St. Peter and St. Paul; commencing at the Ascension and continued down to St. Paul's arriva at Rome, after his appeal to Cæsar; comprehending in all about thirty years. St. Luke has been generally considered its author.

AC'TA DIUR'NA (daily proceedings: *Lat*), in Roman History, a journal containing the important occurrences of the time. It was first regularly published by direction of Julius Cæsar.

ACTA SENA'TUS (acts of the Senate: *Lat.*), minutes of the proceedings of the Senate; also first regularly published by order of Julius Cæsar.

ACT'IAN GAMES, games celebrated at Actium in honour of Apollo, thence called *Actius*, and revived with increased splendour by Augustus, in commemoration of the victory he obtained over Antony at Actium. They were celebrated every fifth year: consisted of shows of gladiators, wrestling, and other exercises: and were kept generally at Nicopolis, a city built by Augustus, near Actium.

ACTI'NIA (*aktis*, a ray: *Gr.*), a genus of Sea Anemones.

AC'TINISM (same *deriv.*), a name recently given to that property of the sun's rays which effects chemical combinations and decompositions, as shown in all the processes of photography, in contradistinction to their powers of heating and illuminating.

ACTIN'OLITE (*aktis*, a ray; and *lithos*, a stone: *Gr.*), a green mineral which generally occurs in fascicular crystals. It is a variety of hornblende, and occurs in metamorphic rocks.

ACTIN'OMETER (*aktis*, a ray; *metron*, a measure: *Gr.*), an instrument for measuring the force of the solar radiation. Various forms of apparatus have been invented.

AC'TION (*actio*, from *ago*, I act: *Lat.*), in Mechanics and Physics, is the pressure or percussion of one body against another. It is one of the laws of nature, that action and re-action are equal: that is, the resistance of the body moved is always equal to the force communicated to it; or, which is the same thing, the moving body loses as much of its force as it communicates to the body moved.——Action, in the Military art, is an engagement between two armies, or between different bodies of troops belonging to them.——Action, in Rhetoric, may be defined, the accommodation of the orator's voice, but more especially of his gesture, to the subject on which he speaks. Cicero tells us, 'that it does not so much matter what an orator says, as how he says it.' Horace, in his Art of Poetry, is no less explicit in setting forth its vast influence on mankind.——Action, in a Theatrical sense, is nearly the same with action among orators; but the actor adapts his gesture, &c., to an assumed character, whereas the orator is supposed to be in reality what his action expresses.——Action, in Painting and Sculpture, denotes the posture of a statue or picture, serving to express some passion, &c.——Actions, certain proceedings in the courts of common law for the recovery of rights: they are divided into real, personal, and mixed. The only remaining *real* and *mixed actions* are writ of dower and *quare impedit*, and, perhaps, ejectment. Recent legislation has altered the method of bringing these actions, but has not abolished them. They can only be brought in the Court of Common Pleas. *Personal actions* are those in which recovery of a debt is sought, or satisfaction for injury to person or property.

AC'TIONARY, in Commerce, a term used among foreigners for the proprietor of an action or share of a public company's stock.

AC'TIVE (*activus: Lat.*), in a general sense, denotes something that communicates motion or action to another: in which sense it stands opposed to *passive*.——Active, among Grammarians, an appellation given to words expressing some action, as I write, I read, &c.

AC'TOR (*Lat.*), in a Dramatic sense, is a man who enacts some part or character in a play. Actors were treated very differently, at different times, among the ancients. As long as the drama retained in Greece any degree of religious solemnity, they were treated with respect, and persons of rank did not hesitate to appear among them, but when acting became a profession, they were no longer considered to hold a respectable position. In Rome the first actors were buffoons, and during the Republic they continued to be despised; but, under the emperors, they gradually obtained some degree of consideration. In England the first actors were the servants of the great: whence the custom of companies belonging to the principal theatres calling themselves 'His Majesty's servants.'

AC'TRESS (*actrice: Fr.*), a female dramatic performer. Actresses were unknown to the ancients, among whom men always took the parts of women. Nor were they introduced on the English stage till after the Restoration.

AC'TUARY (*actuarius: Lat.*, an official who wrote down the proceedings of a court), the chief clerk, or person, who compiles minutes of the proceedings of a company in business.——Also, the clerk who registers the acts and constitutions of convocations.——One who calculates the value of life interests and annuities.

ACU'LEATE (*aculeatus*, from *aculeus*, a prickle: *Lat.*), an appellation given to anything that has *aculei*, or prickles.

ACU'MINATE (*acumen*, a point: *Lat.*), anything very much tapered to a point; if it is pointed, but without tapering, it is merely *acute*.

ACUPUNCTURA'TION, an oriental practice of puncturing diseased parts of the body with fine needles. In China and Japan, it has long been a part of surgery; and of late years it has obtained some repute in England, as a cure for chronic rheumatism.

ACU'TE (*acutus*, sharp: *Lat.*), an appellation given to such things as terminate in a sharp point or edge; thus we say an acute angle, acute-angled triangle, &c.: it is opposite to *obtuse*.——Acute, in Music, an epithet given to sharp or shrill sounds, in opposition to those called *grave*.——Acute Diseases, in Medicine, are distinguished from *chronic*, by being attended with violent symptoms, and requiring immediate aid chronic diseases are those which usually last long.

AD HOM'INEM, see ARGUMENT.

AD INFINI'TUM (*Lat.*), indefinitely, or to infinity.

AD LIB'ITUM (*Lat.*), at pleasure.

AD PON'DUS OM'NIUM (equal to the weight of all: *Lat.*), among Physicians, denotes, that the last-mentioned ingredient ought to weigh as much as all the before-mentioned ingredients, taken together.

AD VALO'REM (*Lat.*), in Commerce, according to the value.

ADA'GIO (slowly: *Ital.*), in Music, a degree quicker than *grave* time, but with graceful and elegant execution.

• **AD'AMANT** (*adamas*: from *a*, not; and *damao*, I conquer: *Gr.*, on account of its hardness), a name for the diamond.

AD'AMITES, in Church History, an ancient sect, which is said to have professed an exact imitation of the life of Adam and Eve in Paradise. It reappeared in Bohemia in the fifteenth century.

AD'DER, or common viper (*Vipera berus*), a native of England, where it grows about two feet in length. It is of a brownish colour, with a row of black spots along the back. Its bite is venomous, and the remedy for it is to rub the part with olive oil over a chafing dish of coals. It prefers dry places, and during winter lies torpid in a place of concealment. This reptile is viviparous.

ADDI'TION (*additio*, from *addo*, I add: *Lat.*), in a general sense, is the uniting or joining several things together; or it denotes something added to another.——In Arithmetic, the first of the four fundamental rules; that by which we collect several quantities into one total, or sum. When the numbers to be added consist of but one denomination, it is *simple* addition; when they consist of more than one, it is *compound*.——ADDITION, in Algebra, the uniting of two or more quantities, so as to form a more simple expression.——ADDITION, in Law, denotes all kinds of designations given to a man, over and above his proper name and surname, to show his estate, degree, profession, place of abode, &c.

ADDORS'ED (*ad*, to; and *dorsum*, the back: *Lat.*), a term in Heraldry, signifying back to back.

ADENOG'RAPHY, or **ADENOL'OGY** (*adēn*, a gland; and *grapho*, I write; or *logos*, a discourse: *Gr.*), that part of Anatomy which treats of the glands.

AD EUNDEM (to the same degree, understood: *Lat.*), a University phrase, employed when a graduate of one university is, as a matter of favour, admitted to the same degree in another.

ADHE'SION (*adhæreo*, I cling to: *Lat.*), the phenomenon by which the particles of bodies continue together. *Adhesion* denotes union between two bodies of different kinds; cohesion, union between two bodies of the same kind.——ADHESION in Botany, the growing together of parts, a common phenomenon in plants. The adhesion of the margins of petals produces a monopetalous corolla. The adhesion of the filaments of stamens makes them monodelphous, diadelphous, &c.——ADHESION, in Medicine, the junction of parts which ought to be separate.

ADIAN'TUM (*adiantos*, unwetted, hence dry: *Gr.*), in Botany, a genus of thin-leaved ferns, having the fructification at the ends of the lobes of the fronds, covered by the reflexed margin. *Adiantum Capillus Veneris*, *Maiden's Hair*, is an example.

AD'IPOCE'RE (*adeps*, fat; and *cera*, wax: *Lat.*), a substance, in some of its properties, resembling a mixture of fat and wax. It is produced by the decomposition of the flesh of animals in moist situations, or under water.

AD'IPOSE (*adeps*, solid fat: *Lat.*), in a general sense, denotes something belonging to the fat of the body. The term adipose is chiefly used by physicians and anatomists.——ADIPOSE MEMBRANE, the cellular membrane, in which the fat is deposited.——ADIPOSE FIN, the small rudimentary fin on the back of the salmon, trout, and fishes of the same family. It is usually placed over the anal fin, at a distance from the first dorsal.

AD'IT, OF A MINE (*aditus*, from *adeo*, I approach: *Lat.*), the horizontal aperture by which it is entered: it is distinguished from a *shaft*, which is vertical.

AD'JECTIVE (*adjectivus*, from *adjicio*, I place near: *Lat.*), in Grammar, a word expressing some quality, or other accident, of the substantive with which it is joined.

ADJOURN'MENT (*adjournement*: from *a*, to; and *jour*, a day: *Fr.*), the putting off a court or other meeting till another day. In parliament, adjournment differs from *prorogation*: the former is not only for a shorter time, but is also an act of the house itself, whereas the latter is an act of royal authority.

AD'JUNCT (*adjunctus*, from *adjungo*, I join to: *Lat.*), something joined to another.

AD'JUTANT (*adjuto*, I assist: *Lat.*), a military officer, who assists the commanding officer. When detachments are to be made, he gives the number to be furnished by each company or troop, and assigns the hour and place of rendezvous. He also places the guards, receives and distributes ammunition to the companies, &c.

AD'JUTANT-GEN'ERAL, a staff officer, who holds the same position with reference to the army as the adjutant to the regiment. He assists the commander-in-chief, and distributes his orders.

ADMINISTRA'TION (*administratio*, from *administro*, I manage: *Lat.*), the executive government of a country.——ADMINISTRATION, in Law, power granted by the Court of Probate to the person pointed out by the statutes as the manager of the personalty of one who dies intestate, which he is bound to distribute amongst the persons entitled under the statutes of distribution, except in the case of a husband administrator, who is entitled as of right to the administration and enjoyment of his deceased wife's estate. After debts are paid, one-third goes to the widow, and the rest, in equal portions, to the children; or, if they are dead, to their lineal descendants. If there be none of these, the widow receives a half, and the next of kin in an equal degree, and their representatives the remainder, or the whole, if there is no widow. Among collaterals, none more remote than the children of the intestate's brothers and sisters are admitted. Letters of administration are to be granted to the husband or his representatives, to the widow or next of kin; of persons related in an equal degree, the court may take its choice. The order of kindred is, with reference to the distribution of property, children, parents, brothers, grandfathers, uncles or nephews (and the females of each class respectively), cousins. Letters of administration, *de bonis non administratis*, are granted, when a previous administrator dies without completing the business. When a person makes a will without naming an executor, or names executors who refuse to act, the Court of Probate will grant administration *cum testamento annexo*, the duty of the administrator in this case being to carry out the will. The Court of Probate is governed by the same rules as the Ecclesiastical Court, which it superseded.

ADMINISTRA'TOR (*Lat.*, from same *deriv.*), in Law, the person to whom the estate and effects of an intestate are committed, for which he is to be accountable when required.

AD'MIRAL (*amiral: Fr.*), the commander of a fleet of ships of war, having two subordinate commanders, as vice-admiral and rear-admiral. Admirals are distinguished into three classes by the colour of their flags, as red, white, and blue. The *admiral* carries his flag at the main-top-mast head; the *vice-admiral* at the fore-top-mast head; and the *rear-admiral* at the mizen-top-mast head. The admiral has the same power over the maritime forces as the general over land forces.——The LORD HIGH ADMIRAL had the management of all maritime affairs, and the government of the royal navy. He was always a person of high rank. For a short time the office was filled by William IV. when duke of Clarence, after having been in abeyance just a century; during which period, as at present, the office was executed by a certain number of commissioners, called lords of the admiralty.

AD'MIRALTY, COURT OF, is a sovereign court, instituted by Edward III., and held by the judge of the admiralty; from whom there is an appeal to the sovereign in council. His office is to determine all manner of injuries upon the seas, or in parts out of the reach of common law. Murders, robberies, &c., committed at sea, are tried by the ordinary judges. The Court of Admiralty decides regarding prizes, &c.——VICE-ADMIRALTY COURTS, courts established in all the dependencies of Great Britain; they have cognizance of all cases of captured vessels, misdemeanours in merchant ships, &c.

ADMITTEN'DO IN SO'CIUM (admission of an associate: *Lat.*), a writ associating certain persons to the justices of assize already appointed.

ADNA'TA (*adnascor*, I grow upon: *Lat.*), in Anatomy, one of the tunics or coats of the eye, otherwise called *conjunctiva* and *albuginea*: it is the same with the white of the eye.

AD'NATE (same *deriv.*), in Botany, a term applied to an organ which is attached to another.

ADO'NIA, solemn feasts in honour of Venus, instituted in memory of her beloved Adonis, and observed with great solemnity by the Greeks, Phœnicians, Lycians, Syrians, Egyptians, &c. They lasted two days: on the first of these the women laid in the streets the images of Venus and Adonis, as if they were corpses, weeping, tearing their hair, beating their breasts, and using every token of grief; on the second, they sang his praises, and made rejoicings, as if Adonis had been raised to life again.

ADOP'TION (*adoptio: Lat.*), among the Greeks and Romans, the making a person one's heir, and investing him with all the rights and privileges of a son. In Rome, before adoption could take place, the natural father was obliged to renounce all authority over his son, and with great formality consent that he should be translated into the family of the adopter. The adoption of a person already free was called *adrogation*.

ADORA'TION (*adoratio*, from *adoro*, I worship: *Lat.*), a mode of reverence or worship anciently shown to the gods, by raising the right hand to the mouth, and gently applying it to the lips; also, in general, any outward sign of worship, by kissing the hand or feet, walking barefoot, or the like. Among the Jews, adoration consisted in kissing the hands, bowing, kneeling, and even prostration. But the posture of adoration most common in all ages and countries is kneeling.——ADORATION, a mode by which the cardinals, in conclave, sometimes elect the Roman pontiff. In *adoration*, unlike *scrutiny*, the cardinals rush hastily, as if by an internal impulse, to proclaim some one pope.

ADOSSE'E (*adosser*, to put back to back: *Fr.*), in Heraldry, two animals placed back to back. It also denotes any other figures, as axes, keys, &c., placed with their heads facing different ways.

ADULTERA'TION (*adulteratio*, from *adultero*, I corrupt: *Lat.*), in a general sense, denotes the act of debasing, by an improper mixture, something that was pure and genuine. Thus, adulteration of coin is the casting or making it of a metal inferior in goodness to the standard, by using too great a proportion of alloy. Putting inferior ingredients into bread, beer, wine, &c., by bakers, brewers, and other traders, for the purpose of imposing on the public, is also called adulteration, and cannot be too severely reprehended or punished: the consequences often proving fatal to the health, and always greatly abridging the comforts, of those who are the victims of such nefarious practices. An act of parliament authorizes the appointment of official *analysts* whose duty it is to examine articles of food or drink supposed to be adulterated.

ADUL'TERY (*adulterium: Lat.*), a violation of the nuptial bed; an offence which has been regarded by all civilized nations with abhorrence, and in ancient times was punished as a great crime. By the Jewish law the penalty was death, which was inflicted by stoning; though this mode of punishment has not been assigned to it in Deuteronomy. The Romans did not visit it with death until the reign of Constantine. The various countries of Europe have, at different times, punished it in different ways, and sometimes with great severity. In this country it is, at present, subject only to the cognizance of the Court of Probate and Divorce: which may grant a divorce on account of it, if the offending party be the wife. If the offender be the husband, the adultery must be accompanied with desertion for two years, cruelty, bigamy, or some infamous crime, before the wife has a right to a divorce. The court may also award damages, and appropriate all, or a part of them, to maintain the children or the wife.

ADVA'NCED-GUARD, or VAN'GUARD, in the Military art, the first line or division of an army, ranged or marching in order of battle.

ADVEN'TURE, BILL OF (*adventurus*, about to happen: *Lat.*), in Commerce, a writing signed by a merchant, to testify that the goods shipped on board a certain vessel belong to another person, he himself being answerable only for the produce.

AD'VERB (*adverbium*: from *ad*, to; and *verbum*, a verb: *Lat.*), a word so called from its connection with verbs; though it is also frequently joined with adjectives and other parts of speech, to modify their meaning.

AD'VOCATE (*advocatus*, from *advoco*, I summon: *Lat.*), a barrister; a pleader in civil or ecclesiastical causes. Advocates were held in great honour during the first ages of the Roman commonwealth, being patricians who defended their clients gratuitously; whence has arisen the custom among ourselves of regarding fees as honorary, and not recoverable by law. But, even before the subversion of the republic, the class had become a profession, though an honourable one. In the time of Cicero, an *advocate* did not mean the patronus, or him who made the speech; it did, however, in the time of the emperors. In almost every civilized country, men of the first talents are found among its advocates.——LORD ADVOCATE, the chief crown lawyer in Scotland, analogous to the attorney-general in England, and the public prosecutor. He exercises a superintending power over the general administration of criminal justice, and is, in point of fact, the secretary of state for Scotland. His powers are very extensive.

ADVOW'SON (*advocatio*, a calling to: *Lat.*), in Law, a right of presentation to a vacant church or benefice, and capable of being sold, like any other species of property, except during a vacancy. He who possesses this right is called the *patron* of the living. This right was first allowed to such as were founders, benefactors, or maintainers of the church. Advowsons are either *presentative*, as when the patron presents or offers his clerk to the bishop to be instituted; *collative*, as where the benefice is given by the bishop, as the original patron, or by means of the right he has acquired by lapse; or *donative*, as where the king, or other patron, by a simple donation in writing, puts the clerk into possession, without presentation, institution, or induction. If the patron (except in the case of an advowson donative) does not present a clerk within six months after the benefice becomes vacant, the presentation lapses to the bishop. In the case of benefices south of the Trent, the patronage of advowsons belonging to Roman Catholics is vested in the University of Oxford, and the University of Cambridge presents to those on the north of that river.

A'DY, the palm-tree of the island of St. Thomé, on the coast of Malabar; the fruit of which is of the size and shape of a lemon, and contains an aromatic kernel, from which an oil, answering the purpose of butter, is prepared.

AD'YTUM (*adutos*, not to be entered: *Gr.*), the most retired and secret place of the heathen temples, into which none but the priests were allowed to enter.

Æ'DES (a temple: *Lat.*; in the plural, *Ædes* signified a private residence), in Roman Antiquity, an inferior kind of temple, consecrated indeed to some deity, but not by the augurs. There were a number of these in ancient Rome: thus the *Ædes Fortunæ*, *Ædes Pacis*, *Ædes Herculis*, &c. The distinction between ædes and temple was ultimately lost.

ÆDI'LES (*ædes*, a temple: *Lat.*), four Roman magistrates, whose chief business was to superintend buildings of all kinds, but more especially public ones, as temples, aqueducts, bridges, &c.; and to take care of the highways, weights and measures, &c. The ÆDILES were distinguished into the *Ædiles plebeii*, who were chosen from the plebeians, as assistants to the tribunes; and the *Ædiles curules*, who were originally elected only from the patricians, to take charge of certain public games. Julius Cæsar added two plebeian ædiles, termed *cereales*, to inspect public stores of provisions.

Æ'GILOPS (*aigilōps*: from *aix*, a goat; and *ōps*, an eye: *Gr.*), an abscess in the canthus, or corner of the eye near the nose. Goats were supposed to be subject to a similar disease.——In Botany, a genus of grasses, of which several species grow in Europe.

ÆGIN'ETAN MA'RBLES, a collection of ancient sculptures preserved in the Glyptothek at Munich. They were originally placed on the pediments of a temple in the Grecian island Ægina, and represent the heroic actions of Hercules, Ajax, and others against the Trojans. They are anterior to the time of Phidias, and the style is archaic.

Æ'GIS (*aigis*, a shield: *Gr.*), the shield of Jupiter. It had the Medusa's head fixed upon it. The word is sometimes used to express the breastplate of a god. Artists, in representing the ægis, seem to have considered it as a goat's skin, and derived from *aix*, a goat.

ÆNE'ID, the title of Virgil's epic poem, in which he celebrates the adventures of Æneas, one of the bravest among the Trojan heroes, and who was feigned to be the son of Venus by Anchises. The author introduces him as sailing from Troy, after its destruction, in search of the shores of Italy, on which it had been promised by the gods that he should found an empire destined to be immortal. He is shipwrecked upon the coast of Africa, where he is hospitably received by Dido, queen of Carthage, to whom he relates his adventures, beginning with his escape from Troy, when it was taken by the Greeks. Dido falls in love with him, but he is bent on leaving Carthage, and she dies on a funeral pile. A storm drives him to Sicily, but at length he reaches the Italian coast. The Sybil of Cumæ then guides him down to the infernal regions, where he has an interview with his father, who informs him of the destiny reserved for his descendants. Returning to the upper world, Æneas is promised the daughter of king Latinus in marriage, but he has a rival in Turnus, king of the Rutuli, and war is carried on between them. In the end Æneas slays Turnus in single combat, and this terminates the poem. Elegance of language and good taste, not invention or soaring power, are the characteristics of the Æneid, to which Virgil, who died B.C. 19, did not live to put the finishing touches he intended.

ÆO'LIAN HARP (*Æolus*, God of the winds), a stringed instrument which is placed in a window, and played upon by the wind. It produces the effect of a distant choir of music in the air, sweetly mingling all the harmonic notes, and swelling or diminishing its sounds according to the strength or weakness of the blast.

ÆOL'IPILE (*æolipilæ:* from *Æolus*, god of the winds; and *pila*, a ball: *Lat.*), a hollow metal ball, in which is inserted a slender neck or pipe, from whence, after the vessel has been partly filled with water and heated, issues a powerful stream of vapour. It serves to show the convertibility of water into steam, and was known to the ancients.

Æ'RA, or E'RA (*Lat.*), a fixed historical period whence years are reckoned: as the 'building of Rome,' or the 'birth of Christ.' Era and epoch are to be distinguished. An *epoch* is the point of time at which an *era* commences. Different nations have adopted different eras; but Christians always reckon from the birth of Christ, which is generally thought to have taken place in the middle of the 4th year of the 194th Olympiad, and in the 753rd year of the building of Rome. Above are the principal eras.

Era	Commenced	Abbreviation
Year of the World—		
Constantinopolitan account . .	B.C. 5509	A.M. Const.
Alexandrian account	„ 5492	A.M. Alex.
Jewish account .	„ 3760	A.M.
Era of Nabonassar .	„ 747	Era Nab.
Olympiads	„ 776	Olymp.
Year of Rome . .	„ 753	A.U.C.
Julian Era	„ 45	Jul. Era.
Christian Era . . .		A.D.
Era of Sulwanah .	A.D. 78	Saca.
Era of Diocletian .	„ 284	Era Dios.
The Hegira . . .	„ 622	A.H.
Era of Yezdegird .	„ 632	A.Pers.

ÆRA'RIUM (a treasury, from *æs*, money: *Lat.*), in Roman Antiquity, the treasury, or place where the public money was deposited. The *ærarium sanctius*, or more sacred treasury, was intended to provide only for cases of extreme urgency.

AE'RIAL ROOTS. These are roots which some plants are in the habit of emitting above the ground. The processes by which the ivy clings to a wall are aerial roots. The lower part of the trunk of the SCREW PINE sends out a great number of such roots, which enter the ground and prop it all round. In India living bridges are formed across streams by taking advantage of the property possessed by some kinds of fig trees of sending out aerial roots, which are made to grow together and form natural grafts.

AERODYNAM'ICS (*aēr*, the air; and *dunamis*, power: *Gr.*), that branch of aerology which treats of the motion of the air, and its mechanical effects when in motion; also its resistance to bodies moving in it.

AE'ROLITES (*aēr*, the air; and *lithos*, a stone: *Gr.*), meteoric stones, which fall in a state of ignition from the atmosphere. Many different opinions have been held regarding the origin of these remarkable productions. Some have supposed them projected from volcanos in the moon, which is quite possible, since they would require, for this purpose, an initial velocity of only 7770 feet per second, or four times that of a ball when first thrown from a cannon with an ordinary charge of powder. Others have believed them ejected from terrestrial volcanos, with a force sufficient to carry them far above the atmosphere. They are now usually regarded as fragments thrown off from shooting stars and fire balls when, in moving with planetary velocities in space and revolving in conic sections round the sun, they approach the earth in their paths, and enter our atmosphere, becoming luminous therein. They are thrown with such force that they sometimes enter the soil to the depth of 15 or 20 feet. The largest stone that has been measured is 7½ feet long. These stones bear a general resemblance to each other in external form, in the nature of their crust, and in the chemical composition of their principal constituents. In all, 18 elementary substances have been found in them, including metallic iron, a metal which has never been found in this state in our globe. Much interest was attached in ancient times to an aerolite which fell in the 78th Olympiad, about the time of the birth of Socrates at Ægospotamos on the Hellespont. It is mentioned by several Greek and Latin writers.

AEROL'OGY (*aēr*, the air; and *logos*, a discourse: *Gr.*), the doctrine or science of air. [See AIR, ATMOSPHERE, and GAS.]

AEROM'ETRY (*aēr*, the air; and *metreo*, I measure: *Gr.*), the art of measuring the air, so as to ascertain its pressure or weight, its elasticity, rarefaction, &c.

A'ERONAUT (*aēr*, the air; and *nautēs*, a sailor: *Gr.*), one who sails in the air in a balloon.

AERONAU'TICS (last), or AEROSTA'TION (*aēr*, the air; and *istemi*, I stand: *Gr.*), the art of navigating the air, by employing air-balloons, or silken globes, filled with a gas lighter than atmospheric air, usually carburetted hydrogen, from its being easily procurable in large quantity.

ÆRU'GO (rust: *Lat.*), the rust of copper. The Romans considered that ærugo added greatly to the appearance of their bronze statues.

ÆSTHET'ICS (*aistheticos*, fitted to perception: *Gr.*), that branch of philosophy which investigates all questions relating to *the beautiful* in poetry and the fine arts.

ÆSTIVA'TION (*æstivus*, belonging to summer: *Lat.*), in Botany, the manner in which the parts of a flower are arranged before they unfold.

ÆTHER (*aithēr*, pure air: *Gr.*), a hypothetical subtle fluid, supposed by some to fill all space, and to be that substance the vibrations of which constitute light and heat, as the vibrations of the air constitute sound. Some astronomers think that certain irregularities in the motions of the planets are to be accounted for by the retarding property of an æther, and one of the explanations of the phenomena of terrestrial magnetism is founded upon the hypothesis of æther.

ÆTHOGEN (*aithōn*, glittering; and *ginomai*, I become: *Gr.*), a compound of boron and nitrogen, which yields a brilliant phosphorescent light, when heated before the blow-pipe.

ÆTIOL'OGY (*aitia*, a cause; and *logos*, a discourse: *Gr.*), the doctrine of the causes of disease.

AËTI'TES (*aetitēs*, from *aetos*, an eagle: *Gr.*), or EAGLE STONES, a name given to pebbles or stones of any kind, which have a loose nucleus rattling within them. Eagle stones are frequently found in our gravel pits. They obtained their name from being supposed to be used by the eagle in building its nest.

AFFETUO'SO (*affetto*, affection: *Ital.*), in Music, a term prefixed to a movement, to show that it is to be performed in a smooth, tender, and affecting manner, and somewhat slowly.

AFFI'ANCE (*fiancer*, to betroth: *Fr.*) denotes the mutual plighting of troth between a man and woman, to bind themselves to the performance of a marriage contract. It has no other effect in law than that, if a party who was of age at the time of making it violates it, there is a right to an action for damages.

AFFIDA'VIT (*affido*, I confirm by oath: *Lat.*), in Law, a written statement made on oath before one who is legally authorized to receive it. Voluntary affidavits are abolished, *declarations* being substituted, as also in many cases in which affidavits were formerly required.

AFFILIA'TION (*ad*, to; and *filius*, a son: *Lat.*), in Law, proof of paternity in the case of an illegitimate child, with the view of obliging the father to contribute to its support. Application must be made to a justice of peace within a year after the birth of the child, unless the father have already contributed to its support; and a summons will then be issued. The mother's oath must be corroborated by other evidence; and there is a right of appeal given to the reputed father.

AFFIN'ITY (*affinitas*, from *affinis*, related by marriage: *Lat.*), in Civil Law, the relationship in which each of the parties married stands to the kindred of the other. Affinity is distinguished into three kinds: 1. *Direct Affinity*, or that subsisting between the husband and his wife's relations by blood, or between the wife and her husband's relations by blood. 2. *Secondary affinity*, or that which subsists between the husband and his wife's relations by marriage. 3. *Collateral affinity*, or that which subsists between the husband and the relations of his wife's relations. It should, however, be observed, that a person cannot, by legal succession, receive an inheritance from a relation by affinity; neither does it extend to the nearest relations of husband and wife, so as to create a mutual relation between them.——AFFINITY, in Comparative Anatomy, the similarity between animals, arising from a resemblance between their organizations. [See HOMOLOGY.]——AFFINITY, in Chemistry, that attractive force which is assumed to exist when different substances combine, so as to form a compound having qualities very different from those of its elements. To enable substances to unite chemically, they must be placed in favourable circumstances:— two solids rarely unite; and even two fluids sometimes require heat, to overcome the cohesion of their particles. The solar rays frequently aid affinity. Substances unite more readily in their *nascent* state; that is, at the moment they are liberated from some compound. Bodies under the influence of chemical affinity never unite in *all* proportions. Some definite relative quantity of one, or some multiple of it, always combines with some definite relative quantity of any other with which it has an affinity, or some multiple of it; and the least known definite combining proportion of an element is termed its *chemical equivalent*, or *atomic weight*. Thus 6 is the equivalent of carbon, and 8 that of oxygen:—hence 6 grs., for example, of carbon, and 8 grs. of oxygen, form a compound (carbonic oxide); 6 grs. of carbon, and 16 grs. of oxygen, form another compound (carbonic acid); 12 grs. of carbon, and 24 grs. of oxygen, form another compound (oxalic acid). These three compounds, consisting of different quantities of the *same* elements, are extremely unlike in properties:—the first is a combustible; the second is harmless in the stomach; the third is a most violent poison. Again, 8, 16, 24, 32, and 40 lbs., grs., &c., of oxygen, unite with 14 lbs., grs., &c., of nitrogen: forming five totally different compounds. Thus we have enumerated several compounds containing oxygen; but all of them contain it, as some multiple of 8, its atomic weight, or chemical equivalent. And whatever substance we select for examination, we shall always find some multiple of its atomic weight in combination. The exceptions to this rule discovered in the organic kingdom are, undoubtedly, only apparent. The number which expresses how often the atomic weight is found in a compound is generally *small*. This is exemplified by the compounds of nitrogen mentioned above; the weights of the oxygen being, respectively, 1, 2, 3, 4, and 5 times its atomic weight. Lastly, gases combine in volumes; and the volume of the result bears a very simple relation to the volumes of the elements combined to form it.

AFFIRMA'TION (*affirmatio*, from *affirmo*, I assert positively: *Lat.*), a simple asseveration, which, according to a set form of words, is allowed to persons who have conscientious scruples to oaths. Under a special act of parliament declarations have in many cases been substituted for affidavits, without reference to individual opinion. A false affirmation, or a false declaration, is subject to the same penalties as perjury.

AFFIR'MATIVE (*affirmativus: Lat.*, same *deriv.*), an epithet applied by Logicians to propositions in which the copula is affirmative.

AF'FIX (*affixus*, joined to: *Lat.*), in Grammar, a particle added to the close of a word, to alter its signification; when placed at the beginning, it is a *prefix*.

AFFLA'TUS (an inspiration: *Lat.*), among heathen mythologists and poets, the actual inspiration of some divinity. Cicero, however, extends the meaning of the word farther, by attributing all great actions to a divine *afflatus*.

AFFRONTE'E (*affronter*, to face: *Fr.*), in Heraldry, an appellation given to animals facing each other.

AFLOAT', a term used to denote that a ship is in water sufficiently deep to buoy her up.

A FORTIO'RI (for a stronger reason: *Lat.*), a term implying that what follows is a more powerful argument than what has been before adduced.

AF'TERMATH, the grass which springs up after mowing.

A'GA (a commander: *Turk.*), a term applied, in courtesy, to a gentleman or wealthy landholder; or given on account of post or rank. The chief officers under the khan of Tartary are also called *Agas*.

AGALMAT'OLITE (*agalma*, an image; and *lithos*, a stone: *Gr.*), a soft mineral substance chiefly found in China, where it is wrought into various ornaments.

A'GAMOUS (*a*, not; and *gamos*, nuptials: *Gr.*), in Botany, a term sometimes applied to cryptogamic plants, on account of the supposed absence of bodies like stamens and pistils.

AG'APÆ (*agapē*, brotherly love: *Gr.*), love-feasts kept by the ancient Christians as a token of brotherly charity and mutual benevolence. In course of time abuses crept in, and rendered their abolition necessary.

AGAPE'TÆ (*agapētos*, beloved: *Gr.*), a society of unmarried women among the primitive Christians, who attended on and served the clergy. At first there was nothing improper in these societies: but they were afterwards charged with gross immoralities, and were wholly abolished by the council of Lateran, in 1139.

AGAR'ICUS (*agarikon*, a mushroom: *Gr.*), a large genus of fungi, including the common mushroom (*A. campestris*) and other species that are poisonous.

A'GATE (*achates: Gr.*), a stone much used, when cut and polished, for ornamental purposes. It is chiefly found in trap rocks, and consists of silex with a little oxide of iron. Chalcedony, onyx, cornelian, bloodstone, and jasper, are varieties of agate. Also a stone of the agate kind engraven by art, which constitutes, among antiquarians, a species of gem.

A'GAVE AMERICANA, the American Aloe does not belong to the same natural order as the true aloes, but to the *Amaryllidaceæ*. Several species inhabit America, some of which yield the pita fibre, or aloe thread: others a juice which, when fermented, forms a beverage called *pulque* by the Spaniards. The Agave presents a handsome appearance when in flower. A tall stem, like a flag-pole, rises from the middle of the plant, and the flowers are arranged candelabrum-fashion at the upper part. The plant dies after flowering. It is a mere fable that the Agave only flowers once in a hundred years.

AGE (*Fr.*), a certain period or limit of time, marked for the convenience of chronology and history by some remarkable events.—— Among ancient historians, the duration of the world was subdivided into three periods, or ages: the first, reaching from the creation to the deluge which happened in Greece during the reign of Ogyges, is called the obscure or uncertain age; the second, called the fabulous or heroic, terminates at the first Olympiad, the commencement of the third, or historical age. The poets also distinguished the period of the world into four ages; the *golden age*, or that of simplicity and happiness; the *silver age*, which was less pure than the golden age, and in which men began to till the ground for their sustenance; the *brazen age*, when strife and contentions commenced; and the *iron age*, when justice and honour had left the earth.——AGE, in Law, signifies certain periods of life, when persons of both sexes are considered competent to perform certain acts, which, for want of years and discretion, they were incapable of before: thus a man may take the oath of allegiance at twelve; at fourteen he is capable of contracting matrimony, and may be punished capitally for a crime; at twenty-one he can make valid contracts. A woman, at twelve, may contract marriage; and at twenty-one may enter into contracts which may be enforced against her. Both sexes are said to be of age, or to attain their majority, at twenty-one. Infants, under seven years old, are considered incapable of committing felony; between seven and fourteen they are acquitted, unless *malitia supplet ætatem*, that is, unless a propensity to crime makes up for want of age. In England persons are not admitted to deacon's orders until they are twenty-three years of age, nor to priest's orders until they are twenty-four. ——Among ancient Physiologists, the life of man was divided into six ages: *pueritia*, or childhood, extending from birth to five years old; *adolescentia*, or boyhood, to eight; *iuventus*, or youth, to thirty; *virilis ætas*, or manhood, to fifty; *senectus*, or old age, to sixty; and *decrepita ætas*, or decrepitude, to death.—By the Roman law, different ages were required for different purposes. Thus the consular age, or that at which a person might hold the consulship, was forty-three; the judiciary was between thirty and sixty; the military age was seventeen; the prætorian, forty.——AGE, in Literature, some period in which learning flourished to an unusual extent. It generally takes its name from a celebrated monarch, or some other illustrious person. The most remarkable ages are those of Pericles, the Augustan age, the age of Leo X., the age of Louis XIV., &c.——AGE, in Chronology, a century or a generation. The middle ages are generally considered to have begun with the reign of Constantine, and ended about the commencement of the sixteenth century. They ought to be considered as having ended with the invention of printing.

AGEN'DA (things to be done: *Lat.*), among Divines, sometimes signifies things which a man is bound to perform, in opposition to *credenda*, or those which he is bound to believe. It also denotes the service or offices of the church.

A'GENT (*agens*, doing: *Lat.*), in a general sense, denotes anything which acts, or produces an effect.——AGENT, *free* or *voluntary*, in Metaphysics, is he who may equally do anything, or its opposite, as acting not from any predetermination, but from choice.——AGENT is also used to denote a person entrusted with the management of an affair, whether belonging to a society, company, or private person. Thus there are *army agents*, through whom every regimental concern of a pecuniary nature is transacted; and *navy agents*, who are employed by naval officers and seamen to manage their concerns with regard to pay, prize-money, &c. ——AGENT, in Law, he who acts for and in the place of a principal. As long as he keeps within the scope of his authority, and declares that he is acting only as agent, he is not personally bound. A large body of law has grown up with reference to the relations of principal and agent.

AG'GREGATE (*aggrego*, I gather together: *Lat.*), in a general sense, the sum of several things added together, or the collection of them into one whole.

AGGREGA'TION (same *deriv.*), in Physics, a species of union, by which several things, which have no natural dependence or connection with each other, are collected together; thus, a heap of sand, or a mass of ruins, are bodies by aggregation.——In Chemistry, it means the adhesion of parts of the same kind; as pieces of sulphur united by fusion form an aggregate.

A'GIO (conveniency: *Ital.*), in Commerce, a term chiefly used in Holland and at Venice, to signify the difference between the value of standard and current money; also, the premium given when a payment is made in one metal instead of another—thus in gold instead of silver, where gold is scarce.

AGIST', AGIST'MENT, AGIST'AGE, or AGISTA'TION (*agister*, permission to receive cattle on land: *Old Fr.*), in Law, the taking in other people's cattle to graze, at so much per week. The term is applied also to the profits thence arising.

AG'MEN (*Lat.*, from *ago*, I set in motion), in the Roman art of war, an army, or rather a part of it, in march: thus the *Primum agmen*, or van-guard; the *Medium agmen*, or main body; and the *Postremum agmen*, or rear-guard.

AGNA'TION (*agnatio*, relationship on the father's side; from *agnascor*, I am born in addition to: *Lat.*), in Roman Law, the relationship subsisting between the descendants of the same man in the male line; in opposition to relationship through either males or females, termed *cognation*.

AGNOE'TÆ (*agnoeo*, I do not know: *Gr.*), in Church History, a sect of heretics, in the sixth century, who maintained that Christ, with respect to his human nature, was ignorant of many things, and particularly of the day of judgment.

AGNO'MEN (*ad*, to; and *gnomen*, the old form of *nomen*, a name: *Lat.*), in Roman Antiquity, the fourth or honorary name bestowed on account of some extraordinary action, virtue, or accomplishment. Thus the agnomen *Africanus* was given to Publius Cornelius Scipio, on account of his exploits in Africa.

AG'NUS DE'I (Lamb of God: *Lat.*), a prayer of the Roman Catholic liturgy, beginning with those words. Also, the figure of a lamb as symbolical of Christ. It is usually represented as bearing a staff headed with a Greek cross, or carrying a banner. This name is also given to a round piece of wax, on which is impressed the figure of the sacred Lamb, and which is consecrated by the pope with great solemnity. Such pieces of wax are consecrated every seven years, and distributed amongst the people.

AGO'NIA (*agōnia*, a contest: *Gr.*), among Physicians, a struggle between life and death.

AGONIS'TICUM (*agonistikos*, from *agonizomai*, I contend with: *Gr.*), in Medicine, an application of excessively cold water, in cases of fever.

AGOU'TI, the local name of the *Cavia Patagonica*, a rodent animal, which abounds on the wild plains of Patagonia. It weighs from 20 to 25 lbs. It hops like the hare and rabbit, to which it is allied, and like the latter it forms a burrow in the ground.

AGRA'RIAN LAWS (*agrarius*, belonging to land: *Lat.*), in Roman History, several measures regarding the distribution of the lands obtained by conquest, and which were at first leased out to the patricians at a very small rent, the plebeians gaining nothing by them. It is probable, says Michelet, that under the vague title of Agrarian law, two very different propositions have been confounded; first, that of permitting the plebeians to share the sacred territory of primitive Rome, to the possession of which all the rights of the city belonged. Second, that of sharing equally the lands conquered by the people and usurped by the patricians. An agrarian law was first heard of in connection with a half-mythical person, one Spurius Cassius, 484 B.C. The agrarian laws brought forward by Tiberius Gracchus cost him his life in 133 B.C.

AGREE'MENT (*agrément*, agreeableness: *Fr.*), in Law, the consent of two or more persons to anything done or to be done; a *contract*.

AG'RICULTURE (*agri cultura*, tillage of land: *Lat.*), the art of cultivating the ground for the purpose of obtaining vegetable produce therefrom. The system adopted at any given place should have reference to the soil and climate. The former, if of a tenacious nature, will require the application of surface draining for the purpose of withdrawing the water, which, if allowed to remain, might injure the crops; and subsoil draining, which has in view the carrying to the roots of the plants a supply of substances in solution such as are required for their support and growth. For the latter purpose artificial irrigation may be needed. A stiff soil ought to be lightened by the admixture of vegetable matter, road scrapings, &c.; a porous soil should be strengthened with stiffer materials, such as marl. All kinds of soil intended to receive seed require to be prepared by the operations of ploughing, harrowing, &c., and food ought to be supplied to the crops in the shape of some of the different kinds of manure. Some of these are yielded by the farm itself, such as the manure of cattle, and green crops which are ploughed into the soil. Others are prepared from bones, fish, &c.; others are chemical preparations from minerals, such as coprolites, and certain salts; whilst others, such as guano, are imported from foreign parts. The choice of a manure will depend upon the nature of the soil to which it is intended to be applied, and the crops intended to be grown. The mechanical operations of sowing and planting, of cutting, getting in, and storing the crops, are becoming daily more and more performed by machinery actuated on large farms by steam power. The breeding and feeding of cattle with a view to the market, or to the production of milk, butter and cheese, the breeding and feeding of sheep, either for food or for the sake of the wool, are usually but not necessarily, parts of an agriculturist's duties. Of late years agriculture has been much more successful in its results than formerly, because it has been pursued with the assistance of scientific men. Its various operations are rapidly becoming less empirical, and more uniformly conducted under the guidance of the truths of science.

AGROUND', a term applied to a ship, when any part of it rests on the ground, so as to render it immovable.

AGRYP'NIA (*agrupnia*: from *agr*, for *a*, not, and *hupnos*, sleep: *Gr.*), among Physicians, a privation of sleep, a troublesome symptom of nervous and febrile diseases.

A'GUE, a general name for all periodical fevers, which, according to the different times of the return of the feverish paroxysm or fit, are denominated quotidian, tertian, or quartan agues. They occur chiefly in situations where there are shallow, stagnant waters.

AHEAD', in Naval language, signifies farther on than the ship, in opposition to *astern*, or behind it.

A-HULL', a term for a ship when all her sails are furled, and she lies with her helm lashed on the lee-side.

AID (*aide*: *Fr.*), in feudal times, a subsidy paid by vassals to their lords, on certain occasions.

AID'E-DE-CAMP (assistant in camp: *Fr.*), an officer who attends on a general officer in the field, winter quarters, &c. A field-marshal is entitled to four; a lieutenant-general, to two; and a major-general, to one. The king appoints as many as he pleases, and the appointment gives the rank of colonel.

AIGUI'LLE (a needle: *Fr.*), an instrument used by engineers to pierce a rock for the lodgment of powder, as in a mine. The pointed rocks in Alpine mountains are termed Aiguilles.

AIL'ANTHUS, a deciduous tree, with pinnate leaves, introduced into England from China. It grows in the open air with us; and as its leaves afford food to a silkworm, the *Bombyx Cynthia*, it has been proposed to plant it extensively in our island, for the purpose of silk cultivation. It belongs to the natural order *Simarubaceæ*, and is, therefore, allied to the bitter Quassia.

AIR (*aër*: *Gr.*) [see ATMOSPHERE], in Grecian Mythology, was personified under the names of Jupiter and Juno. Jupiter was said to reign in the upper atmosphere, and Juno in the lower.——AIR, in Music, is properly the tune which is adapted to the words of a song, or piece of poetry intended to be sung; and, by the extension of the term, the song itself is called an *air*. In Operas, the name of *air* is given to all measured music, to distinguish it from the recitative; and, generally, to every piece of music, whether vocal or instrumental, which has its beginning and end. *Arietta* signifies a short, less elaborate air, designed to express a more simple and transient emotion.

AIR'-BLADDER, or the SWIM-BLADDER, an organ found in the abdomen of many fishes. It is considered to be homologous with the lungs of higher vertebrata, but its use seems to have relation to the equilibrium of the fish, and to lighten or increase its relative weight by its compression or dilatation. It is said that if the air-bladder is burst, or if it is pierced artificially, the fish remains at the bottom of the water, turning belly upwards. In freshwater fishes the contents of the sac have been found to be chiefly nitrogen.

AIR'-CELLS, in birds, membranous receptacles, communicating with the lungs, occupying the interspaces of the thoracic and abdominal viscera, extending round the principal joints, penetrating the substance of the bones, insinuating themselves between the skin and subjacent muscles, and entering the quills. The whole body being thus permeated by air, its specific gravity is diminished, and the organs of respiration are extended: an arrangement admirably calculated to adapt birds for flight.——**Air-Cells**, in plants, are cavities containing air, which in aquatic plants are large, and serve to float them.

AIR'-ENGINE, a machine somewhat analogous to the steam-engine, in which heated air is the motive power, instead of the vapour of water. Air is pumped into a cylinder, having been previously heated to 450°, by transmission through a series of wire nets, placed parallel and very close, in a vessel called a *regenerator:* when in the cylinder it is raised to 480°; and this increase of temperature doubles its volume. After having moved the piston, it leaves the cylinder, by means of valves; and passing through the regenerator, it gives back to it nearly all the heat it received. It escapes from the regenerator by that extremity at which the cold air is pumped in, and which therefore is cold, the other extremity being hot. The power of such an engine would be, the difference between that produced by increasing the elasticity of the air with heat, and that expended in working the pump which forces the air through. Its advantages would be, freedom from the danger of explosion, absence of a boiler and the necessity for water, and—theoretically at least—a more economical expenditure of heat. But, in practice, it is complicated, and has not been found to answer, particularly on a large scale.

AIR'-GUN, a gun constructed so as to propel bullets solely by means of condensed air, some of which is liberated at each discharge of the trigger.

AIR'-JACKET, a sort of jacket made of leather, in which are several bags or bladders, containing air. By the help of these bladders, which are placed near the breast, a person is supported in the water, without making the efforts used in swimming.

AIR'-PLANTS, or Epiphytes, are plants which are able to grow without attachment to the ground, deriving all the materials required for their growth from the atmosphere; the orchids of warm climates are examples.

AIR'-PUMP, a machine for exhausting the air out of vessels, in the same manner as water is drawn away by a pump. The operation of this machine depends on the elasticity of the air: for, by working the pump, the air in the receiver will expand itself; by which means part of it will be forced into the barrel of the pump, and be carried off. By thus continuing to work the pump, the air in the receiver will be gradually exhausted; but can never be wholly drawn out, so as to leave a perfect vacuum within the vessel; for it must be considered, that the air which is exhausted, is only pushed out by the spring of that which remains behind. In practice the machine will cease to act, when the air is so rarefied as to be unable by its elasticity to open the valves; though they are of extreme lightness, being generally formed of oiled silk.——**Air-Pump**, in steam-engines, is a pump worked by the engine for removing the air disengaged from the cold water in the condenser, and the water that collects at the bottom of that vessel.

AIR'-SHAFTS, in Mining, holes or shafts let down from the open air, to discharge the foul air or gases.

AIR'-THREADS, in Natural history, the long filaments seen floating in the air at the autumnal season of the year. [See Gossamer.]

AIR'-VESSELS; in insects, air-vessels, or *tracheæ*, scattered through all parts of their bodies, convey the air wherever it is required for renovating the fluids. They are frequently mounted as objects for the microscope.

AISLE (*ala*, a wing: *Lat.*), in Architecture, the side subdivisions of a church, generally separated from the nave by pillars or piers.

A'JUTAGE, or AD'JUTAGE (*adjuto*, I help: *Lat.*), in Hydraulics, a short pipe placed in a vessel to assist the discharge of a fluid.

AL, an Arabian particle, answering to the English *the*, as 'Alcoran,' *the* book.

A'LA, or A'LÆ (*Lat.*), in Ancient Military affairs, the wings of an army, or the horse on each side flanking the foot.——In Grecian Architecture, the colonnade surrounding the cella of a temple.——In Modern Architecture, the lateral buildings, subordinate to the centre or principal one.——**Ala**, in Ornithology, the wing of a bird.

AL'ABASTER (*alabastros: Gr.*), a well-known mineral composed of sulphate of lime, forming a soft, granular, imperfectly transparent marble; used for ornaments in houses, and by statuaries. It is found in Germany, France, Italy, &c.

ALA'BASTRUS (rose-bud: *Lat.*), a name occasionally given by botanists to the flower bud.

ALA'RAF (*arafa*, to distinguish: *Arab.*), according to the Mahometan creed, the party-wall which separates heaven from hell.

ALA'RES (belonging to a wing, from *ala*, a wing: *Lat.*), in Roman Antiquity, an epithet given to the cavalry, on account of their being placed in the two wings, or alæ, of the army.

ALAR'UM (*alarme*, fear: *Fr.*), any contrivance for the purpose of calling assistance in cases of sudden danger, generally a bell.

ALB, or ALBE (*albus*, white: *Lat.*), in the Roman Catholic Church, a vestment of white linen, hanging down to the feet. In the ancient church, it was usual with those newly baptized, to wear an alb, or white vestment; and hence the Sunday after Easter was called *dominica in albis*, on account of the albs worn by those baptized on Easter-day.

AL'BANIAN, a language of the Indo-European family, supposed to be the last surviving representative of the tongues which were spoken by the barbarous races living near and coexistent with the ancient Greeks.

AL'BATROSS, or Man-of-War Bird. This

belongs to the genus DIOMEDEA of naturalists, of which there are several species, all possessing a strong hard and thick beak with a curve at the end, webbed feet, and very long wings. The common albatross (*D. exulans*) is the largest known sea-bird, and is often met with in the neighbourhood of South Africa. Its plumage is white with black bands. It feeds on fish and is very voracious.

ALBIGEN'SES (from *Albigesium*, in the twelfth century the name of a place in France, now called *Albi*), a designation common to several sects who agreed in opposing the dominion of the Romish hierarchy, and endeavouring to restore the simplicity of primitive Christianity. They endured the severest persecutions, and after the middle of the thirteenth century, the name of Albigenses altogether disappeared; but fugitives of their party formed, in the mountains of Piedmont and in Lombardy, what is called the *French Church*, which not only existed till the era of the Reformation, but continues still to flourish.

ALBI'NO (*albus*, white: *Lat.*), or LEUCÆTHIOPS (*leukos*, white; and *Aithiops*, an Ethiopian; *Gr.*), a variety of the human species that frequently occurs in Africa. The Portuguese first gave the name of Albino to the white negro, whom they formerly described as belonging to a distinct race: but modern naturalists have discovered Albinos in various countries of Europe, viz. in Switzerland, among the Savoyards in the valley of Chamouni; in France, in the tract of the Rhine; in Tyrol, &c. Their characteristics are now said to be owing to a morbid state of the *rete mucosum*, which may attack men in every climate, and to which even certain animals are subject. Their skin has a dull white or cadaverous appearance; the iris of the eye is of a bright red; and the hair is either white and silky, or of a very flaxen colour. When this variety is found among the negroes, the woolly covering of their heads is white.

ALBU'GO (*albus*, white: *Lat.*), a disease of the eye, which consists of a white speck; and is called the *pearl*, &c.

AL'BUM (same *deriv.*), a white table or register, on which the Roman prætors had their decrees written. There were many others in use, and they received their appellations from the various magistrates whose names were entered in them; as the *album judicum*, the *album decurionum*, &c.——The ALBUMS of the present day are derived from the practice adopted in many foreign countries of having a white paper book, in which strangers of distinction or literary eminence were invited to insert their names, or any observation in prose or verse, as a memorial of their visit.

ALBU'MEN (the white of an egg: *Lat.*), a white or transparent viscous fluid, without taste or smell, which is a constituent of the nerves, the serous part of the blood, the white of eggs, milk, &c. The essential part is *albumin*, which is chiefly composed of carbon, oxygen, and nitrogen, with which a little hydrogen, sulphur, and phosphorus are combined. It is the sulphur which blackens a silver spoon when put into a boiled egg. Albumin coagulates with heat, and thus changed is insoluble in water, and frequently consisting of starch.——Also, a substance found in many seeds; it constitutes the flour of corn, &c. However poisonous a plant may be, its albumen is never deleterious.

ALBUR'NUM (sap-wood: *Lat.*), the soft white substance between the inner bark and the wood of exogenous trees.

ALCA'ICS, a term given to certain kinds of verse, from their inventor, the poet Alcæus. Of these verses Horace has given several examples of two:—1. Consisting of an iambus or spondee, an iambus, a long syllable, and two dactyls; 2. Two dactyls, and two trochees.

AL'CAIDE, or AL'CALDE, a Spanish or Portuguese magistrate, or officer of justice, answering nearly to the British justice of peace. Both the name and office are of Moorish origin.

AL'CHEMY, or AL'CHYMY (*al*, the: *Arab.*; and *chemia*, which is remotely derived from *cheo*, I pour: *Gr.*), that obsolete branch of Chemistry which had for its object the transmutation of metals into gold; and the finding of the *elixir vitæ*, or universal remedy. Though designing men have often used alchymy as a means of defrauding the credulous of their money, many have laboured in the fruitless search with indefatigable patience and purity of heart; and various discoveries of real value to science have been the accidental results of their labours.

AL'COHOL, a term of Arabic origin, signifying a spirit or essence, and originally applied to several chemical preparations. The word, at present, is used for a highly rectified spirit, the product of vinous fermentation. This is extremely light and inflammable: it is colourless and transparent, appearing to the eye like pure water. To the palate it is exceedingly hot and burning, but without any peculiar taste. When perfectly pure and free from water it is termed absolute alcohol, and it is then composed of carbon, hydrogen, and oxygen. The proof spirit of commerce has a specific gravity of 0·9198 at 60°F., and contains 49¼ per cent. of real alcohol. Under various forms it is largely employed in the arts, in the preparation of varnishes, &c. Its antiseptic power makes it also useful in preserving anatomical preparations. It has never been frozen.

AL'CORAN, or the KORAN (*al*, the; and *Koran*, a book: *Arab.*), the name of the volume containing the pretended revelations, doctrines, and precepts of Mahomet, in which his followers place implicit confidence. The general aim of the Alcoran was to unite the professors of the three different religions then followed in Arabia, Idolaters, Jews, and Christians, in the knowledge and worship of one God, under the sanction of certain laws, and by the use of ceremonies, partly of ancient, and partly of novel institution, enforced by the consideration of rewards and punishments, both temporal and eternal, and to bring all to the obedience of Mahomet, as the prophet and ambassador of God, who was to establish the true religion on earth. It was not until after Mahomet's death, which took place in 632 of our era, that his revelations were collected into a volume. They had been originally written on palm leaves and scraps of parchment. [See MAHOMETANISM].

ALCO'VE (*alcoba: Span.*; from *elcaut*, a sleeping chamber: *Arab.*), in Architecture, a recess intended for a bed, and often separated from the chamber by a balustrade. It was used sometimes by the Romans, at least as early as the Emperor Adrian.

ALCYO'NIUM, the scientific name of a genus of marine polypes to which the one popularly-known as 'Cow paps' or 'Dead man's fingers' belongs.

ALDEBA'RAN, a star of the first magnitude, vulgarly called the Bull's Eye, as making the eye of the constellation Taurus. It is the *α* Tauri of astronomers.

ALDE'HYDE (*alcohol dehydratus*, alcohol deprived of water: *Lat.*), a limpid colourless liquid, with a suffocating odour, obtained by passing the vapour of ether or alcohol through a red-hot tube, and by other methods. It is a compound of carbon, hydrogen, and oxygen.

AL'DER (*ellarn*, in *Ang.-Sax.*), a tree growing in damp places, the *Alnus glutinosa* of botanists, nat. order, *Betulaceæ*. The wood is of little value, except for charcoal.

AL'DERMAN (*ealderman*, older man: *Sax.*), a municipal officer, in a city or borough (see BOROUGH). In London their number is twenty-five, not including the lord mayor; each being elected by the freemen of a ward of the city, and having that ward committed to his more peculiar care, but serving by rotation as sitting magistrate for the whole. —— ALDERMAN, among our Saxon ancestors, was a name of dignity, at first unconnected with any office. It was afterwards the designation of him who was subsequently termed Eorl or *Earl*, and hence counties were sometimes called *Aldermanshires*.

AL'DINE EDITIONS, those editions of the Greek and Roman classics which were printed by the family of Aldus Manutius, first established at Venice about 1490.

ALE (*ælaw*, to inflame: *Sax.*), a fermented liquor, obtained from an infusion of malt and hops. *Pale ale* is brewed from slightly dried malt, and *brown* from malt highly dried.

A'LEA (a die: *Lat.*), in Antiquity, all kinds of games of chance; but used particularly for a game played with dice.

A-LEE', a sea-term, used when the wind, crossing or flanking the line of a ship's course, presses upon the masts and sails so as to make her incline to one side, which is called the lee-side: hence, when the helm is moved over to this side, it is said to be *a-lee*.

ALEM'BIC (*al*, the; and *ambecq*, corrupted from the Greek *ambix*, a cup: *Arab.*), a vessel formerly used for distilling, in the place of which retorts and stills are now most generally employed.

ALEXAN'DRIAN, or ALEXAN'DRINE, in Poetry, a kind of verse, consisting of twelve syllables, or six iambic feet. It is so called from a poem on the life of Alexander, written in this way, by some French poet, and is exemplified by Pope in the following lines:—

> 'A needless Alexandrine ends the song,
> Which, like a wounded snake, drags its
> slow length along.'

ALEXAN'DRIAN LIBRARY. This celebrated library was founded by Ptolemy Soter, for the use of an academy that he instituted in Alexandria; and, by continual additions under his successors, became at last the finest library in the world, containing no fewer than 700,000 volumes. To collect books for this library, all those which were brought into Egypt by Greeks or other foreigners were seized, and transcribed by persons appointed for that purpose: the copies were then delivered to the proprietors, and the originals laid up in the library. It was eventually burnt by order of the caliph Omar, A.D. 640. Omar argued thus: if these books agree with the Koran they are superfluous, and need not be preserved; if they disagree, they are pernicious, and ought to be destroyed.

ALEXAN'DRIAN MANUSCRIPT, or CODEX ALEXANDRINUS, a famous copy of the Scriptures, consisting of four volumes, in a large quarto size; which contains the whole Bible in Greek, including the Old and New Testaments, with the Apocrypha, and some smaller pieces, but not quite complete. This manuscript is now preserved in the British Museum. It was sent as a present to king Charles I., by Cyrillus Lucaris, patriarch of Constantinople, through Sir Thomas Rowe, ambassador from England to the grand seignior, about the year 1628. Its age and value have been the subject of much controversy. It was evidently not all written by the same hand.

ALEXI'PHARMICS (*alexo*, I repel; *pharmakon*, poison: *Gr.*), antidotes to poisons.

AL'GÆ (seaweed: *Lat.*), in Botany, a class of cellular flowerless plants with leaves and stems undistinguishable from each other, without proper roots and living entirely in water. They imbibe nutriment by their whole surface from the medium by which they are surrounded. SEAWEEDS, DIATOMS, and CONFERVÆ, belong to this class. A very curious fact connected with algæ is that some species produce particles which appear to have a voluntary motion as if they were minute animals. These are called spermatozoids. The motion is believed to be effected by means of vibratile cilia. As to the economical uses of the class, some gelatinous species contain a substance identical in its chemical formula with starch, and are employed as food (see NOSTOC). Iodine is obtained from seaweed, but soda is now otherwise procured. Some algæ have their tissues so stiffened with carbonate of lime that it was supposed they were corals, and one of the genera still bears the name of *Corallina*. Algæ are frequently of microscopic minuteness, occasionally they are of great size. Captain Cook says he met with seaweed that was quite 360 feet long. Beds of seaweed swarm with animal life to an extraordinary degree. [*See* SARGASSO SEA.]

AL'GAROTH (from Algarodi, an Italian, its discoverer), POWDER OF, a precipitate obtained by pouring water into the acidulous chloride of antimony.

AL'GEBRA (*al*, the; and *gebr*, resolution: *Arab.*), is a science the object of which is to abridge and generalize the resolution of all questions relating to quantities. Letters of the alphabet are employed to represent the quantities under investigation, and several of the signs of common operations are borrowed from arithmetic. Algebra, arithmetical and symbolical (says Mr. Cockle), is capable of division into three parts. The subject of identity might be made to constitute the first of these divisions; that of equality the second; and that of incongruity or absurdity the third. These divisions are of a purely theoretical character; practically speaking the subjects of them are treated indiscriminately as occasion requires. The assertion that *one is equal to one* is an identity; that x *is equal to one* is an equation; that *two is equal to one* an absurdity or contradiction. Whether they indicate identity, equality, or contradiction, these three species of proposition are all exhibited in algebra under the form of equations: thus

$$1 = 1; \quad x = 1; \quad 2 = 1;$$

but it is often a very difficult matter to determine whether what purports to be an equation, in the strict sense of the term, be really so, or whether it be not an identity or a contradiction. In one point of view, then, the whole of algebraic science may be said to be contained in the theory of equations. We may also regard the vast and illimitable field comprehended under this phrase as consisting of two great parts: the theory of *algebraic* equations, and the theory of *numerical* equations. In the former, accurate results are exclusively aimed at; and the algebraic theory may be defined as that which treats of the rigorous solution and transformation of equations, and the number and properties of their roots symbolically considered. The aim of the numerical theory is to ascertain the nature and limits of the roots of equations, and to arrive at values which shall enable us to satisfy equations either accurately or to any required degree of approximation. A literal equation (that is, one in which letters are made use of) may be treated either as an algebraic or a numerical one. In the latter case the letters stand for generalized numbers, and the processes applied to them are but universal types or examples of those which are to be employed when concrete are substituted for abstract numbers. It is only in their possible application to particular numerical instances that such processes are of any value whatever. On the other hand, a numerical equation (as we may call an equation with numerical coefficients) may be treated as an algebraical one, that is to say, by the algebraical theory. We may obtain rigorous expressions for its roots, ascertain their number, discuss their relations to the coefficients, or transform the equation itself by rigorous processes, and under exact forms as well when the coefficients are numbers as when they are symbols. [See MATHEMATICS.]

AL'GOL, a star in the constellation Perseus, the β Persei of astronomers, which, during a period of 2d. 20h. and 48m., changes from the second to the fourth magnitude, and then back to the second.

AL'GORITHM (an Arabic term), the art of computation, with reference to some particular subject, or in some peculiar way. Thus we say, 'the algorithm of numbers,' 'the algorithm of the differential calculus.'

AL'GUAZIL, the title of one of the lower orders of Spanish officers of justice, whose business is to execute the commands of the magistrate.

A'LIAS (otherwise: *Lat.*), in Law, a word often used in describing the accused, who has assumed other names besides his real one.

AL'IBI (elsewhere: *Lat.*), an expression employed when an accused person attempts to prove his innocence by showing that he was in another place when the act was committed.

A'LIEN (*alienus: Lat.*), in Law, a person born in a foreign country, unless his father, or grandfather on the father's side, were a natural born subject; in which case, though born abroad, he is considered a denizen; the term is used in opposition to natural subject. An alien is incapable of inheriting, or purchasing, or holding lands in England. But a child born out of the British dominions of a mother being a natural born subject, may inherit, purchase, or hold land; and all aliens subject of a friendly state may take a lease of houses or land for the purpose of residence or trade for a term not exceeding twenty-one years. No alien can become a member of parliament, of the privy council, or of any municipal corporation. An alien, guilty of a felony or misdemeanour, may elect to be tried by a jury composed of an equal number of denizens and aliens. [See NATURALIZATION].

ALIENA'TION (*alienatio*, from *alieno*, I make over to another: *Lat.*), in Law, the act of transferring the property and possession of lands, tenements, or other things, from one man to another: it is termed also *conveyance*. To alienate in fee, is to sell the fee simple of any land, or other incorporeal right.

ALI'GNMENT (*Fr.:* from *ad*, to; and *linea*, a line: *Lat.*), in Warfare, the state of being formed into a line, and the line so formed.

AL'IMENT (*alimentum, from alo,* I nourish: *Lat.*), whatever serves as nutriment to animal life.

ALIMEN'TARY (*alimentarius*, from same *deriv.*), in a general sense, is a term applied to whatever belongs to aliment or food.
——ALIMENTARY DUCT, or CANAL, a name given to the stomach and intestines, on account of the food passing through them. Sometimes it is a simple cavity, with but one opening; sometimes a canal with a vent distinct from the mouth; sometimes it is divided into four bags, as in the ruminants, or into seven, as in the bottle-nosed

whale.——ALIMENTARY LAW, among the Romans, that law by which children were obliged to maintain their aged parents.

AL'IMONY (*alimonia*, from same *deriv.*), in Law, an allowance which the English Court of Divorce and Matrimonial Causes directs to be paid to a wife when cohabitation has ceased. Alimony may be awarded either during the progress of a suit for divorce or judicial separation (alimony *pendente lite*), or it may be given after a decree for judicial separation has been pronounced.

AL'IQUANT PARTS (*aliquanto*, in some degree: *Lat.*), such parts of a number as will not divide or measure it exactly: as 7, the aliquant part of 16.

AL'IQUOT PARTS (*aliquot*, a certain number of: *Lat.*), such parts of a number as will divide or measure it exactly: as 2, the aliquot part of 4, 3 of 9, and 4 of 16. *Prime* aliquot parts are those which are prime numbers: *composite* aliquot parts, those formed by multiplying the prime together.

AL'KAHEST (*Arab.*), a universal menstruum possessing, according to the Alchemists, the virtue of pervading every substance, and capable of resolving all bodies into their *ens primum*, or first matter.

AL'KALI (*al*, the; and *kali*, the name of a plant: *Arab.*), in Chemistry, a term originally applied to the ashes of plants, but now used to designate potash, soda, and ammonia. The alkalis neutralize and form salts with acids, redden some vegetable yellows, and change some vegetable blues to green.

ALKALIM'ETER (*alkali*; and *metron*, a measure: *Gr.*), in Chemistry, an instrument for measuring the quantity of alkali, or alkaline carbonates, contained in the potash or soda of commerce.

AL'KALOIDS (*alkali*; and *eidos*, form: *Gr.*), substances analogous to alkaline bases, of vegetable origin, and possessed of great medicinal activity. Their ultimate elements are carbon, oxygen, hydrogen, and nitrogen. Quinine, obtained from various species of cinchona, conine from hemlock, and morphia from opium, are examples.

AL'KANET, the *Anchusa tinctoria* of botanists (nat. order, *Boraginaceæ*), a plant of which the root affords a reddish brown substance used by dyers. It is chiefly imported from the Levant.

AL'LAH, the Arabian name of God, as opposed to the deities of the idolators.

ALLE'GIANCE (*alligo*, I bind to: *Lat.*), in Law, the faithful obedience which every subject owes to his prince; being the tie or bond of fidelity which binds the governed to the governor. Every official person is required to take an oath of allegiance before he enters on his duties.

AL'LEGORY (*allēgoria*: from *allo*, another thing; and *agoreuo*, I declare: *Gr.*), in Literature, a figurative representation, which signifies something beyond the ordinary or apparent meaning. It may be addressed to either the eye or the ear. An *allegorical tale*, or *allegory*, is one in which abstract ideas are personified: thus, in many fables. A whole poem may be an allegory, as Spenser's 'Faery Queen;' or an entire narrative, as Bunyan's 'Pilgrim's Progress.' A parable is a short allegory. Allegorical interpretation becomes necessary when there is some difficulty or absurdity in the literal and obvious sense.

ALLE'GRO (merry: *Ital.*), in Music, denotes that the part is to be played in a brisk and sprightly manner. The usual distinctions succeed each other in the following order: *grave*, *adagio*, *largo*, *vivace*, *allegro*, *presto*. Allegro time may be heightened, as *allegro assai* and *allegrissimo*, very lively; or lessened, as *allegretto* or *poco allegro*, a little lively. *Più allegro* is a direction to play or sing a little quicker.

ALL-HAL'LOWS, an old English name for *All-Saints*, a festival in commemoration of the saints in general. It is kept on the 1st of November, Boniface IV. having in 835 appointed that day for its celebration: the saints having become so numerous that a day could not be allotted to each.

ALLI'ANCE (*allier*, to unite with: *Fr.*), in the Civil and Canon law, the relation contracted between two persons or two families by marriage.——ALLIANCE is also used for a treaty entered into by sovereign princes and states, for their mutual safety and defence.

ALLIGA'TION (*alligatio*, from *alligo*, I bind to: *Lat.*), a rule in Arithmetic, teaching how to compound several ingredients for any design proposed. It is either *medial* or *alternate*. The former shows the rate or price of any mixture, when its several quantities and their rates are known; the latter is the method of finding the quantities of ingredients necessary to form a compound of a given rate.

AL'LIGATOR (from a North American Indian word), a crocodilian genus inhabiting America. Their feet are not webbed like those of the true crocodiles. The *alligator lucius* haunts the Mississippi, and sometimes grows to the length of eighteen feet: it is protected by a dense covering of horny scales, impenetrable, in most parts, to a musket-ball.

ALLITERA'TION (*ad*, to; and *litera*, a letter: *Lat.*), a figure or embellishment of speech, which consists in the repetition of the same consonants, or syllables of the same sound, in one sentence. The Greek and Roman literature afford many instances of this; and in English poetry there are also many beautiful specimens of alliteration; though it must be confessed that it is too often used without the requisite skill, and carried too far. In burlesque poetry it is frequently used with excellent effect.

ALLOCU'TION (*allocutio*: *Lat.*), in Roman Antiquity, an harangue made by generals to their armies, in order to rouse their courage before a battle.——Also, in the Roman Catholic Church, an address made by the pope, on important occasions, to the cardinals and others.

ALLO'DIAL LANDS are those which, under the feudal system, were free. Their owners owed no service to a superior lord. 'Allodial lands,' says Hallam, 'are commonly opposed to beneficiary or feudal; the former being strictly proprietary, while the latter depended upon a superior. In this sense the word is of continual recurrence in ancient histories, laws, and instruments. It sometimes, however, bears the sense of inheritance.'

ALLO'PATHY (*allopatheia*: from *allos*, another; and *pathos*, suffering: *Gr.*), a term recently introduced to describe the ordinary course of medical practice in contradistinction to *Homœopathy*. The difference consists in the allopathists prescribing substances which, of their own nature, are calculated to *remove* symptoms like those of the disease to be cured; while the homœopathists employ medicines which, in the normal state of the patient, are calculated to *produce* these symptoms.

ALLO'PHANE (*allophanes*, appearing otherwise: *Gr.*), a luminous earth, of a blue, and sometimes of a green or brown colour, which occurs massive, or crystalline.

ALLO'TROPIC (*allos*, another; *tropos*, mode or position: *Gr.*), a term applied by chemists to bodies when possessing a form, different from their ordinary one, with the same essential chemical qualities. Thus, ordinary white phosphorus may, by the application of heat, be converted into a hard red amorphous substance, which is its allotropic form. It is theoretically assumed that the particles of the body are in different states of molecular equilibrium in the two forms.

ALLOY' (*alloyer*, to mix one metal with another: *Fr.*), a compound of any two or more metals (mercury not being one): thus, bronze is an alloy of copper and tin; brass, an alloy of copper and zinc, &c. The alloys are not mere mixtures, but true chemical compounds.

ALL'SPICE, so called from its compound flavour, is the dried immature berry of several species of *Eugenia* (nat. ord. *Myrtaceæ*), particularly *E. acris* and *E. pimento*, or Jamaica pepper.

ALLU'VION (*alluvius*, from *alluo*, I wash against: *Lat.*), in Law, a gradual increase of land along the sea-shore, or on the banks of rivers. This, when slow and imperceptible, is deemed a lawful means of acquisition; but when a considerable portion of land is torn away at once, by the violence of the current, and joined to a neighbouring estate, it may be claimed again by the former owner.

ALLU'VIUM (same *deriv.*), in Geology, deposits of gravel, sand, and mud, resembling those of a river's bed, or those left upon low lands by a flood, which are frequently found upon the surface of the earth under the vegetable mould. Alluvium is to be met with in all latitudes, from the equator to the polar regions. The greater part of it consists of transported materials. Rivers, or the sea, have been the means of removal. That form of it which has been called *diluvium*, or drift, or the boulder formation, is thought to have been transported by glaciers or floating ice.

ALMACAN'TAR (*almocantharat*: *Arab.*), a term used by the old astronomers, to indicate a small circle of the sphere parallel to the horizon.——ALMACANTAR'S STAFF is an instrument for observing, at sea, the sun's amplitude rising and setting.

AL'MAGEST (the greatest work: *Arab.*), the name of a celebrated book, composed by Ptolemy; being a collection of many of the observations and problems of the ancients, relating both to Geometry and Astronomy.

AL'MA MA'TER (kind mother: *Lat.*), a title given to a university by those who are, or have been, members thereof.

AL'MANAC (*Arab.*), a calendar or table, containing a list of the months, weeks, and days of the year, with an account of the rising and setting of the sun, the moon's age, the solar and lunar eclipses, the ecclesiastical feasts and fasts, the most remarkable phenomena of the heavenly bodies, and other incidental matters. The first printed almanac appeared in 1474; it was drawn up by Regiomontanus, in nearly the form now used.——The NAUTICAL ALMANAC, a most valuable work for mariners, is published in England two or three years in advance. It was commenced in 1767, by Dr. Maskelyne, the astronomer-royal, and has been regularly continued ever since.

AL'MONER (*aumonier*: *Fr.*), a functionary, usually an ecclesiastic, appointed by the crown, with the title of Lord High Almoner, for the distribution of the royal alms twice a year to as many poor men and women as the sovereign's age amounts to in years. Silver pennies are specially coined for distribution on Maunday Thursday, each person receiving a number equal to the years of the sovereign's age.

ALMS (*aumone*: *Fr.*), a general term for what is given out of charity to the poor. In the early ages of Christianity the alms of the charitable were divided into four parts, one of which was allotted to the bishop, another to the priests, and a third to the deacons and sub-deacons, which made their whole subsistence; the fourth part was employed in relieving the poor, and in repairing the churches.

AL'OE (*aloë*: *Gr.*; *alloch*: *Arab.*), a genus of liliaceous plants, several species of which yield the well-known drug so useful as a purgative. The aloes have fleshy leaves, with a juice of intense bitterness. Specimens are to be seen in every hothouse. The plants called *Yucca*, or Adam's Needle, and *Phormium tenax*, or New Zealand Flax, belong to allied genera.—The American aloe is an AGAVE, and falls into another order.

AL'OES-WOOD, or Eagle-Wood, is the produce of trees belonging to the genus *Aquilaria* (nat. ord. *Aquilariaceæ*), growing in the tropical parts of Asia. A fragrant oily or resinous substance, called in India uggur oil, is extracted from the wood which is sometimes used in medicine.

ALOE'TICS, a general term for all medicines, the basis or principal ingredient of which is aloes. The latter stimulates the larger intestines.

ALOGOTROPH'IA (*alogos*, out of proportion; and *trophē*, nourishment: *Gr.*), in Medicine, unequal growth or nutrition in different parts of the body.

ALOPE'CIA (*alōpekia*, a shedding of the hair—literally, the mange in foxes: *Gr.*), in Medicine, a falling off of the hair, occasioned either by a defect of nourishment, or by a bad state of the body.

AL'PACA, the *Auchenia alpaca* of naturalists, is a ruminant animal of the camel tribe, but distinguished from the true camels by having disjoined movable toes. It inhabits the mountain districts of Peru and Bolivia. Its long silky hair wool has been of late years extensively imported for manufacturing purposes. The Llama, the Guanaco, and the Vicuna are three other species of the same genus, natives of South America. The wool of the two former is coarse, that of the last downy.

AL'PHABET (*alpha*, *beta*, the two first Greek letters), the natural or customary series of the several letters of a language. The earliest kind of writing was, undoubtedly, the representation of what was to be told, by a kind of painting; the Greek word *graphein* means either to *paint* or to *write*. This mode of writing was used very early in Egypt, and gave rise, no doubt, to the invention of hieroglyphics: being probably adopted by other ancient nations also. It was employed by the Mexicans to convey to Montezuma information of the landing of the Spaniards. Syllabic writing must next have been devised, in which the different sounds, or syllables, were expressed; a word by this method would have as many characters as syllables. Such writing, though a great improvement, was still very inconvenient. At length, syllables were decomposed into their elements, a few simple sounds; and the representation of these constituted an alphabet. It is now supposed that the hieroglyphics of the Egyptians, which originally denoted objects, were ultimately employed to express sounds; and, from being *ideographic*, became not merely syllabic, but *alphabetical*. The Greeks believed that the Phœnicians were the inventors of letters; but there is reason to suppose that the Hebrew characters are older than the Phœnician, and were known in the time of Moses. The most ancient Greek, like the oriental languages, was written from left to right: it was afterwards written in alternate lines, from left to right and from right to left. It has been proposed to adopt a universal alphabet, which might contain a smaller number of elementary sounds than any used at present.

ALPHON'SINE TABLES, astronomical tables made in the reign of Alphonsus X., king of Arragon, who was a great lover of science, and a prince of rare attainments; but though these tables bear his name, they were chiefly drawn up by Isaac Hazan, a learned Jewish rabbi.

ALT (*altus*, high: *Lat.*), in Music, the high notes of the scale.

AL'TAIR, a star of the first magnitude in the constellation of the Eagle; it is the α Aquilæ of astronomers.

AL'TAR (according to some, from *alta ara*, high altar: *Lat.*;—according to others, from *Al*, God; and *tar*, appointed: *Heb.*), a place upon which sacrifices were anciently offered to the deity. There was probably a difference between the *ara* and *altare*, the latter being raised on a substruction; and they may have been employed in different circumstances. Before temples were in use, altars were erected sometimes in groves, sometimes in the highways, and sometimes on the tops of mountains; and it was a custom to engrave upon them the name, proper ensign, or character of the deity to whom they were consecrated. In the great temples of ancient Rome, there were ordinarily three altars; the first was placed in the sanctuary, at the foot of the statue of the divinity, upon which incense was burnt and libations offered; the second was before the gate of the temple, and upon it they sacrificed the victims; and the third was a portable altar, upon which were placed the offerings and the sacred vessels. These altars were of various heights, sizes, and materials; some yet remaining are beautifully decorated with *bassi relievi*. The principal altars of the Jews were those of *incense*, of *burnt-offerings*, and the *altar*, or *table*, for the *shew-bread*.

AL'TERATIVES (*alter*, the other: *Lat.*), such medicines as induce a favourable change in the system, without any manifest operation or evacuation.

AL'TERNATION OF GENERATION, a mode of reproduction amongst some of the lower animals, in which the perfect animal produces a different form, which may be termed larval, and this will for some generations produce similar or again different forms, the last of them producing the perfect form. Thus a Medusa will produce a larva which grows into the form of a sea-anemone, and this will go on for some time, throwing off similar animals by budding, until at length one of them will produce a Medusa of the original form.

ALTHÆ'A (*althaia*, marsh mallow: *Gr.*), marsh mallow, the *Althæa officinalis* of botanists, nat. order *Malvaceæ*, a plant, the root of which abounds with a mild mucilage, and is of great efficacy in medicine as an emollient. The hollyhock belongs to the same genus.

ALTIM'ETRY (*altus*, high: *Lat.*; and *metreo*, I measure: *Gr.*), the art of taking heights by means of instruments: and founded on the principle that the corresponding sides of triangles, having equal angles, are in exact proportion to one another.

AL'TITUDE (*altitudo*, height: *Lat.*), the height of an object, or its elevation above that plane to which the base is referred; thus, in Mathematics, the altitude of a figure is the perpendicular or nearest distance of its vertex from the base. The altitude of an object is the elevation of an object above the plane of the horizon; or the length of a perpendicular let fall to that plane.——ACCESSIBLE ALTITUDE of an object is that to whose base there is access, to measure the nearest distance to it on the ground from any place.——INACCESSIBLE ALTITUDE of an object is that to whose base there is not free access, by which a distance may be measured to it, on account of some impediment, such as water, wood, or the like. The instruments most generally used in measuring altitudes are the quadrant, sextant, theodolite, &c.——ALTITUDE OF THE EYE, in Perspective, the perpendicular height of the eye above the geometrical plane.——ALTITUDE OF A STAR, &c., in Astronomy, the height of any star, &c., above the horizon, or an arc of a vertical circle, intercepted between the star and the horizon. This altitude is either true or apparent, according as it is reckoned from the rational or sensible horizon: and the difference between these two is termed by astronomers the *Parallax of Altitude.*——ALTITUDES OF MOUNTAINS. [See HYPSOMETRY.]

AL'TO (*Ital.*), in Music, the *counter-tenor* part, or that immediately below the *treble.* It also indicates the tenor violin.

AL'TO RELIE'VO (high relief: *Ital.*), in Sculpture, a representation of figures and other objects against a flat surface; it differs from *mezzo relievo,* and *basso relievo,* only by the greater projection, or higher relief, of the figures.

AL'UM (*alumen: Lat.*), a salt consisting of alumina, potash, and sulphuric acid, with, in its ordinary form, water of crystallization. Its solution has a sweet and astringent taste. It is consumed largely in the arts, being employed by the dyer as a *mordant,* also by the tanner. Sulphate of alumina also combines with the sulphates of soda and ammonia, and these are also termed alums. There are several processes for the manufacture of alums. The old process of roasting alum shale is employed at Whitby and in Scotland. The shale of the coal measures is used at other places. Sulphate of alumina, obtained by boiling clay in sulphuric acid; and aluminate of soda, have also been employed for several of the purposes for which common alum is used.——ALUM STONE, a mineral, of a greyish or yellowish-white colour. It is found at Tolfa, in Italy, and in Bohemia; and yields a very pure alum, by simply subjecting it to roasting and lixiviation.

ALU'MINA (same *deriv.*), the oxide of aluminium, an earth which is the basis of alum, clay, basalt, slate, &c. It is of the greatest importance to mankind, for it enters largely into the composition of the best arable land, and is the chief constituent of all earthenware and porcelain.

ALU'MINITE (same *deriv.*), a mineral of a snow-white colour, dull, and opaque; the native sulphate of alumina.

ALU'MINIUM (same *deriv.*), a metal of which the earth alumina, the chief constituent of clay, is an oxide. It is only of late years that chemists have succeeded in inventing a process for extracting it in sufficient quantities and sufficiently cheap to enable it to be used for manufacturing purposes. It has a white colour somewhat resembling tin; its specific gravity is only 2·6 (about that of common glass), and hence it is frequently used in the construction of articles where lightness is an object. The melting point is much below that of silver. When heated in oxygen it burns with brilliancy and produces alumina. It is not affected by sulphuretted hydrogen like silver. From its sonorousness it will probably be employed in the construction of musical instruments. With from 92½ to 95 per cent. of copper it forms an alloy named aluminium-bronze, which is scarcely distinguishable by the eye from gold, whilst it is nearly as hard as iron. This alloy is coming into use in the manufacture of ornamental articles.

ALVEA'RIUM (*alveus,* a hollow place: *Lat.*), among Anatomists, the hollow of the auricle, or outer ear.

AL'VEOLATE (*alveolatus,* hollowed: *Lat.*), in Botany, an epithet applied to the *receptacle* of composite plants (the disk upon which the florets are placed), when it is divided into cells like a honeycomb.

ALVE'OLUS (a *diminutive* of *alveus,* a small cavity), in Natural History, properly denotes one of those waxen cells of which the combs in beehives consist.——ALVEOLUS, in Anatomy, the socket-like cavity in the jaws, in which each of the teeth is fixed.

AMA'DIS DE GAUL, the most celebrated of the romances of chivalry, written in Spanish by a Portuguese named Vasco Lobeira, who died in 1325. It relates the fabulous adventures of Amadis and other knights; the fairy mythology of the east is introduced, with monsters and marvels of every kind.

A'MADOU, or GERMAN TINDER, a fungus (a species of *Polyporus*) found chiefly on old oaks and ash trees. It is boiled in water, dried, beaten, soaked in a solution of nitre, and again dried for use.

AMAL'GAM, the combination of mercury with some other metal. Amalgams are used either to render a metal fit to be spread out, as in gilding, or else to reduce it to powder. Two methods are generally employed in making amalgams. The first is merely trituration in a mortar, and without heat: the second is fusing the metal which is to be amalgamated, and adding to it, when fused, the intended quantity of mercury. An amalgam of tin and mercury is used for looking-glasses. Medallists consider any soft alloy as an amalgam. The extraction of particles of gold from sand or stamped rock is usually effected by means of mercury. The mercury is afterwards vaporised by heat, and then condensed for future use.

A'MARANTH (*amarantos:* from *a,* not; and *maraino,* I wither: *Gr.*), a plant of fable and poetry, feigned to have flowers that never withered, and therefore made into garlands by the blessed. Botanists have given the name of *Amaranthus* to a genus of plants, nat. ord. *Amaranthaceæ,* which includes the well-known prince's feather, cock's-comb, and love-lies-bleeding.

AMARYL'LIS (*amarusso,* I sparkle: *Gr.*), a genus of bulbous rooted plants, with handsome flowers, belonging to the nat. ord. *Amaryllidaceæ.* They are natives of America, the West Indies, and the Cape of Good Hope, but most of our hothouse plants are hybrids. *Snowdrops* belong to the same order.

A'MATEUR (*amator,* a lover: *Lat.*), a person having a taste for a particular art, yet not professing nor being dependent on it.

AMAURO'SIS (*amauros,* dark: *Gr.*), among Physicians, a disease of the eye, called also the *gutta serena.* It arises, not from any external injury, but from a defective action of the nerve.

A'MAZONS (usually derived from *a*, without: and *mazos*, a breast: *Gr.*), a nation of female warriors, who are said to have founded an empire in Asia Minor. According to tradition, they permitted no males to reside among them, but had intercourse with the men of the neighbouring nations merely for the sake of preserving their community. Their male children they either killed or sent back to their fathers, but they brought up the females to war. They are said to have destroyed the right breast, that this part of the body might not impede them in the use of the bow: and it was from this supposed practice that they obtained the name of Amazons. The last account we have of them dates about 330 years before Christ, when it is related that their queen, Thalestris, made a visit to Alexander of Macedon, at the head of 300 of her Amazons.——The old geographers gave the name of **AMAZONIA** to a large tract of country in the interior of South America, because Orellana, the first discoverer of the country, asserts, that as he sailed up the stupendous river Maranon, or Amazon, he found on its banks a nation of armed women, who made war on the neighbouring people.

AMBAS'SADOR (*ambasciare*, to solicit: *Ital.*,—perhaps because originally sent to ask favours), the representative of one sovereign power to another, to which he is sent properly accredited. Ambassadors are the highest order of foreign ministers, and are either ordinary or extraordinary. An *ordinary* ambassador resides permanently at the foreign court to which he is accredited, and his duties consist in acting as the medium of intercourse between his own court and that to which he is accredited, and in transmitting such intelligence as is likely to interest his own court. *Ambassadors extraordinary* are sent on some important occasion, and are generally surrounded with great pomp and splendour; but they leave the country as soon as the affair is despatched. The persons of ambassadors are sacred, both in peace and war; so that, according to the law of nations, if hostilities break out between two nations, the respective ambassadors are permitted to depart without molestation. By the laws of England, an ambassador is amenable only for crimes which are contrary to the laws of all nations: when guilty of these, he is punishable as an alien. He is protected from arrest, and his goods cannot be seized in distress. Prussia is the only great European power that does not send this class of ministers. Envoys, or ministers, form the second class of diplomatists, resident ministers the third class, and chargés d'affaires the fourth.

AM'BER (*ambre: Fr.*), a hard brittle tasteless substance, generally semitransparent, or opaque, of a glossy surface and conchoidal fracture. It is susceptible of a good polish, and is worked up into ornaments. It is inflammable, and, when heated, yields a strong and bituminous odour. After it has been exposed to a slight friction, it attracts straws and other light bodies, and produces sparks, visible in the dark. The Greeks called it *electron*, from its resemblance in point of colour to an alloy of gold and silver of the same name. Whence comes our word electricity. The Romans, supposing it to be a vegetable juice, named it *succinum*, by the Arabs it is denominated *ambra*, whence the French write it *ambre*, and the English *amber*. It is believed to be of vegetable origin: the leaves and stalks of vegetables are found in it; and wasps, flies, gnats, &c., which it contains, have evidently been entangled in it while it was in the soft state. It occurs as a fossil, which is procured in large quantities on the Prussian coast of the Baltic.

AM'BERGRIS (*ambre*, amber; and *gris*, grey: *Fr.*), a solid opaque ash-coloured inflammable substance, variegated like marble, remarkably light, and, when heated, emitting a fragrant odour. It is found floating in the sea near the coast of various tropical countries, and is a morbid secretion from the liver of the spermaceti whale. It is very much prized in Asia and Africa, where it is made use of to flavour luxurious dishes: in Europe, it is highly valued as an article of perfumery.

AM'BIDEXTER (*ambo*, both; and *dexter*, a right hand: *Lat.*), a person who can use both hands with equal facility, and for the same purposes that the generality of people do their right hands.

AM'BIENT (*ambio*, I encompass: *Lat.*), a term used for such bodies, especially fluids, as encompass others on all sides: thus, the air is frequently called an ambient fluid, in consequence of being diffused round all terrestrial bodies.

AM'BIT OF A FIGURE (same *deriv.*), in Mathematics, the *Perimeter*, or the sum of the lines by which a figure is bounded.

AMBLYO'PIA (*ambluōpia*, from *amblus*, dull; and *ōps*, the sight: *Gr.*), in Medicine, a term for dimness of sight.

AMBRO'SIA (*Gr.*, from *ambrosios*, immortal), in heathen Antiquity, the food of the gods. Hence, whatever is very gratifying to the taste or smell has been termed *ambrosial.*

AM'BRY, in Ecclesiastical Architecture, a place in which were deposited charters, &c., and, when it was inside the church, the vessels of the altar. In ancient abbeys and priories, there was an office under this denomination, in which were laid up all the charities for the poor.

AMBUR'BIUM (*amb*, about; and *urbs*, a city: *Lat.*), in Roman Antiquity, a solemn procession round the city, made annually, or to avert some calamity which suddenly threatened: the victim accompanied it, and was afterwards sacrificed.

AMBUSCA'DE, or **AM'BUSH** (*embûche*, ambush: *Fr.*), in the Military art, a place where soldiers may lie concealed, till they find an opportunity to surprise the enemy.

AMEN' (truly: *Heb.*), in Scripture language, a solemn conclusion to prayer, employed by the Hebrews, signifying *verily*, or *so be it.*

AMEND'E HONORA'BLE (*amende*, a penalty: *Fr.*), in French Law, an infamous kind of punishment formerly inflicted in France on traitors, parricides, or sacrilegious persons. It was of two kinds: one consisted in the mere acknowledgment of the offence, in open court, bareheaded, and kneeling: which was called the *simple* or *dry amende*. In the other, the offender was obliged to kneel in his shirt, with a torch in his hand, and a rope about his neck, being conducted by the executioner: which was called the *amende honorable in figuris*. It was, and still is sometimes, joined with capital punishment.——The common acceptation of the term indicates that an open apology is made for an offence or injury done.

AMENTA'CEÆ (*amentum*, a thong: *Lat.*), a natural order of trees and shrubs, distinguished by their unisexual flowers, the staminiferous ones being in catkins. The order includes the birch, alder, willow, poplar, plane, hasel, beech, spanish chestnut, and oak.

AMERC'EMENT (*à merci*, at the mercy: *Fr.*), a pecuniary punishment imposed on offenders, at the mercy of the court. Amercements differ from fines, inasmuch as the latter are defined, and the former are proportioned to the fault, or more properly at the discretion of the court. The statute of Magna Charta ordains, that a freeman is not to be amerced for a small fault, but in proportion to the offence, by his peers and equals.

AMER'ICANISM, any word or phrase in general use among the inhabitants of the United States, which deviates from the English standard. Of these, a great proportion are words of local character, originally taken from different counties in England, by the first emigrants. Others are words formerly used by English writers, but which have become obsolete.

A'METHYST (*amethustos*, a remedy against drunkenness: *Gr.*), the *oriental* amethyst is a variety of CORUNDUM, and is composed almost entirely of alumina. The *common* amethyst is a variety of quartz, consisting chiefly of silica, coloured in various shades of violet, by the oxides of iron and manganese. It is usually found crystallised in six-sided prisms, with a six-sided pyramid at the end. It occurs in Europe and India. The Persians believed that wine drunk out of an amethystine cup would not intoxicate: hence the name.

AMIAN'THUS, or ASBES'TOS (*amiantos*, undefiled; *asbestos*, inextinguishable: *Gr.*), names applied to different minerals which agree in the possession of a fibrous structure, arising from the parallel position of long capillary crystals. They are varieties of amphibole. In that form called amianthus, the threads are easily separated, are very flexible, and have a silky lustre. They may be made to serve as the wick of a lamp, and can even be woven into a fire-proof cloth. It occurs in Corsica, Savoy, Cornwall, and elsewhere. Common asbestos is of a dull green colour, and has little flexibility.

AMIO'TUS (*Lat.*), in Roman Antiquity, any upper garment worn over the tunic. ——A part of the dress worn by a Roman Catholic priest, &c., under all the ecclesiastical costume, at mass, &c. It is a square piece of linen drawn over the shoulders.

AMID'-SHIPS, a Naval term, signifying in the middle of the ship, applied either to length or breadth.

AM'MON (*Amun*: *Egypt.*), the name of an Egyptian deity, whom the Romans termed Jupiter Ammon. He was usually represented with a ram's head. There was a magnificent temple erected to him in a sacred grove of trees in the oasis now called the Oasis of Siwah, with an oracle famous through many ages. It was so renowned, that Alexander the Great crossed the desert to consult it, and the priests telling him that he was the son of the god, he ever afterwards claimed divine origin. Cambyses sent an army of 50,000 men to destroy the temple, but the tradition runs that they never reached it, and never returned. Some ruins of the temple still exist.

AMMO'NIA, a colourless gas, with a strongly pungent odour, exhibiting an alkaline reaction with test paper. By pressure it may be condensed into a liquid. It is soluble in water to the extent of 700 times its volume. It is a combination of three volumes of hydrogen and one of nitrogen, but it cannot be formed directly from these gases. It must be obtained from some of its compounds; it is found in large quantities during the manufacture of coal-gas, and is a product of the decomposition of animal matters containing nitrogen. When a solution of ammonia is treated with acids, a series of salts is obtained, resembling completely the corresponding salts of potash and soda. If sal-ammoniac, which is a hydrochlorate of ammonia, is properly brought into connection with mercury, an amalgam is formed, similar to the amalgams formed by mercury, potassium, and sodium. Hence it is supposed there is a metal which has received the name of ammonium, but all attempts to obtain it as a separate substance have hitherto failed. Ammonia received its name from having been found in old times in the ordure of camels, near the temple of Ammon.

AMMO'NIAC, or GUM AMMO'NIAC, a resinous substance brought from the East Indies in drops or granules. The best kind is of a yellowish colour without, and white within. It is the produce of some umbelliferous plant not yet accurately determined.

AMMONI'TES. [See CORNU AMMONIS.]

AMMUNI'TION (*munitio*: *Lat.*), all warlike stores, and especially powder, ball, bombs, guns, and other weapons necessary for warfare.

AM'NESTY (*amnēstia*: from *a*, not; and *mnaomai*, I remember: *Gr.*), an act by which two parties at variance promise to pardon and bury in oblivion all that is past. It is more especially used for a pardon granted by a prince to his rebellious subjects.

AMO'MUM (*khamāma*: *Arab.*; *amōmon*: *Gr.*), one of the aromatic herbs formerly used for the preservation of dead bodies;

whence is derived the word *mummy*. Its aromatic seeds are much used, under the name of *cardamoms*, *grains of paradise*, &c. It belongs to the same nat. ord. as the ginger and turmeric, and is allied to the arrow-root (*Maranta*).

AMOR'PHOUS (*a*, without; *morphe*, form: *Gr.*), destitute of regular figure. Thus felspar is found both crystallised and amorphous.

AMORTIZA'TION (*mors*, death: *Lat.*), in Law, an alienation of lands or tenements in mortmain, which see.

AMPHIARTHRO'SIS (*amphi*, roundabout; and *arthroo*, I fasten by joints: *Gr.*), in Anatomy, a term for such junctures of bones as have motion similar to that of the articulation of the ribs with the vertebræ.

AMPHIB'IA (*amphibios*, living a double life: from *amphi*, on both sides; and *bia*, bodily strength: *Gr.*), a class of vertebrate animals, in which the *Batrachia* (frogs, toads, salamanders, and tritons), the *Siren* and *Proteus* are placed. In strictness it is only those animals which are equally adapted by the possession both of lungs and branchiæ for living in air and water that can be called amphibious, and this is only the case with five genera, viz. Siren, Lepidosiren, Proteus, Axolotl, and Menobranchus.

AMPHI'BOLE (*amphibolos*, equivocal: *Gr.*), in Mineralogy, one of the forms of hornblende, taking its name from its resemblance to augite.

AMPHIBO'LIA, or AMPHIBOL'OGY (*amphibolos*, equivocal; and *logos*, a discourse: *Gr.*), in Rhetoric, ambiguity of expression, when a sentence conveys a double meaning. It is distinguished from an equivocation, which lies in a single word.

AMPHIC'TYONS (according to the ancients, from *Amphictyon*, near whose temple the council was held; but probably from *amphictiones*, dwellers around: *Gr.*), in Grecian Antiquity, assemblies composed of deputies from different states of Greece. That which obtained the name, by pre-eminence, met twice a year, in the spring at Delphi, and in the autumn at Thermopylæ; and decided all differences, especially in matters of religion, between any of the Grecian states: their determinations being held sacred and inviolable.

AMPHISBÆ'NA (*amphisbaina*: from *amphi*, on both sides; and *baino*, I go: *Gr.*), a genus of harmless serpents, which are supposed capable of moving backwards or forwards, with equal facility. This belief has arisen from the two extremities being equally obtuse, and the scales of the head being the same as those on the back. They are natives of South America, and live upon ants.

AMPHITHE'ATRE (*amphitheatron*: from *amphi*, on both sides; and *theatron*, a theatre: *Gr.*), in Antiquity, a spacious edifice, built either round or oval, like a double theatre, with a number of rising seats, upon which the people used to sit and behold the combats of gladiators, or of wild beasts, and other sports. Some of them, as the Colliseum at Rome, were capable of containing from 50,000 to 80,000 spectators. The principal parts of the amphitheatre were the *arena*, or place were the gladiators fought; the *cavea*, or hollow place where the beasts were kept; the *podium*, or projection at the top of the wall which surrounded the arena, and assigned to the senators; the *gradus*, or benches, rising all round above the podium; the *aditus*, or entrances; and the *vomitoria*, or gates which terminated the aditus.

AM'PHITRITE (*Amphitrite*, a goddess of the sea), in Zoology, a genus of marine worms, living in tubes composed of grains of sand. They have short golden-coloured bristles, arranged in one or two rows, on the anterior part of the head.

AM'PHORA (*amphoreus*, having two handles: *Gr.*), in Antiquity, a liquid measure in use among the Greeks and Romans. It had two handles, and was sometimes used as an architectural ornament.

AMPLIFICA'TION (*amplificatio*, a magnifying: *Lat.*), in Rhetoric, part of a discourse or speech, in which a crime is aggravated, a praise or commendation heightened, or a narration enlarged, by such an *enumeration* of circumstances as will excite strong emotions in the minds of the auditors. It differs from *exaggeration* in which circumstances and facts are heightened in *colouring*, so as to exceed the reality.

AM'PLITUDE (*amplitudo*, size: *Lat.*), in Astronomy, an arc of the horizon, intercepted between the east or west point and the centre of the sun, or of a planet, at its rising or setting.——The word is sometimes used to express the horizontal distance to which a projectile is thrown, or the *range*. ——AMPLITUDE, MAGNETICAL, is an arc of the horizon, contained between the centre of the celestial body, when rising or setting, and the east or west point of the compass.

AMPUL'LA (*Lat.*), an ancient drinking cup; but among ecclesiastical writers, one of the sacred vessels used at the altar. The ampulla still holds a distinguished place in the coronation of the kings of England and France. That which is used in England is of the purest chased gold, and represents an eagle with expanded wings standing on a pedestal near seven inches in height, and weighing about ten ounces. It was deposited in the Tower by the Black Prince, and is still preserved there with the other regalia.

AM'ULET (*amuletum*; *Lat.*: from *hamalet*: *Arab.*), a superstitious charm or preservative against mischief, witchcraft, or diseases. Amulets were made of stone, metal, animals, and, in fact, of everything which fancy or caprice suggested. Sometimes they consisted of words, characters, and sentences, ranged in a particular order, and engraved upon wood, &c., and were worn about the neck or some other part of the body. At other times they were neither written nor engraved, but prepared with many superstitious ceremonies, great regard being usually paid to the influence of the stars.

AMUSETT'E (a toy: *Fr.*), a small one-pound cannon, formerly employed in war in mountainous regions: and which, for lightness and facility of movement, was found to possess great advantages.

AMYG'DALOID (*amygdalē*, an almond; and *eidos*, form: *Gr.*), a term applied to rocks in which minerals are imbedded, like almonds in a cake.

A'MYL (*amulon*, starch: *Gr.*), in Chemistry a hypothetical compound radical, consisting of ten atoms of carbon, and eleven of hydrogen. It forms with other substances a series of ethers and compounds, which correspond to those formed by ordinary alcohol. Potato oil and fusel oil, matters obtained on the distillation of potatoes and grain, are examples of these compounds.

A'NA, the Latin *neuter plural* termination, given to the names of amusing miscellanies, consisting of anecdotes, traits of character, and incidents relating to any person or subject. It is used in English, French, and Latin works, and was first adopted in the 'Valesiana,' which were detached observations on passages of classical antiquity by the celebrated Valois, and published at Paris in 1695.——ANA (*ana*, each: *Gr.*), among Physicians, denotes an equal quantity of the ingredients which immediately precede it in prescriptions: as syrup and water, *ana*, *aa*, or *a* ʒii.; that is, of syrup and water each two ounces.

ANABAP'TISTS (*ana*, signifying repetition; and *baptizo*, I dip under: *Gr.*), a name given to a Christian sect because they objected to infant baptism, and baptized again those who joined them. They were known in the early ages of Christianity as Cataphrygians and Novatians, &c. But they are to be distinguished from the sects which appeared in Germany in 1521, immediately after the rise of Lutheranism. These latter at first preached up an entire freedom from all subjection to the civil as well as ecclesiastical power, and committed frightful excesses; but the tenet from whence they took their name, was their rebaptizing all new converts to their sect. They were put down with some difficulty and great slaughter, their leader, Muncer, being killed. The struggle they made was a political as well as a religious one: it was a contest between the lower and upper classes. The Baptists of England form a distinct sect, without any connection with the Anabaptists here spoken of.

ANA'BASIS (a going up: *Gr.*), the title of Xenophon's description of the younger Cyrus's expedition against his brother Artaxerxes, King of Persia, B.C. 401. A body of Greek mercenaries formed part of Cyrus' army, and Xenophon accompanied them, ultimately obtaining military command. When Cyrus lost his life on the plains of Cunaxa, the retreat of the 'Ten Thousand' commenced.——Arrian also gave the name of *Anabasis* to a work in which he described the campaigns of Alexander the Great.——ANABASIS, among Physicians, denotes either the increase or augmentation of a fever in general, or of any particular paroxysm.

ANABRO'SIS (*Gr.*: from *ana*, through; and *brōsis*, an eating out), in Medicine, a corrosion of the solid parts by acrid humours.

ANACAR'DIUM (*a*, without; and *kardia*, a heart: *Gr.*, because the seeds are not within the fruit), the botanical name of the genus of the tree producing the CASHEW NUT, which see.

ANACATHAR'SIS (*Gr.*, from *anakathairo*, I cleanse thoroughly), in Medicine, a cleansing of the lungs, by expectoration.——This term is likewise applied by divines to the clearing up of obscure passages of Scripture, by a spiritual interpretation.

ANACH'RONISM (*ana*, backwards; and *chronos*, time: *Gr.*), in Literature, an error with respect to chronology, by which an event is placed *earlier* than it really happened; in which sense it stands opposite to *parachronism*.

ANACOLU'THON (*anakolouthon*, wanting sequence: *Gr.*), in Grammar or Rhetoric, a want of coherency, generally arising from inattention on the part of the writer or orator.

ANACREON'TIC VERSE, a term applied to lyrical pieces with a convivial or amatory turn, such as the Greek poet Anacreon composed. The verses of that poet have an elegant simplicity which has never been equalled by his numerous imitators.

ANADIPLO'SIS (*Gr.*, from *anadiploo*, I make double), a figure in Rhetoric and Poetry, in which the last word or words of a sentence are repeated at the beginning of the next.

ANÆSTHET'ICS (*a*, priv.; and *aistheticos*, fitted for perception: *Gr.*), substances which produce insensibility, apparently by suspending certain of the functions of the nervous system: among these, the vapour of ether and of chloroform are the most manageable, and have lately attracted much notice in reference to the performing of surgical operations under their influence.

AN'AGRAM (*anagramma*, a transposition of letters: from *ana*, up and down; and *gramma*, a letter: *Gr.*), the change of one word or phrase into another, by reading the letters backwards, or by transposing them. Anagrams were very common among the ancients, and occasionally contained some happy allusion; but perhaps none were more appropriate than the anagram made by Dr. Burney on the name of the hero of the Nile, just after that important victory took place: HORATIO NELSON, '*Honor est a Nilo.*'

ANALEC'TA (*analego*, I pick up: *Gr.*), a collection of extracts from different works.

ANALEM'MA (*analambano*, I take up: *Gr.*), in Geometry, an orthographic projection of the sphere, on the plane of the meridian.

ANALEP'TICS (same word, in the sense of *I recover*), in Medicine, restoratives which serve to repair the strength, and to raise the depressed spirits.

AN'ALOGUE (*analogos*, according to due proportion: *Gr.*), in Comparative Anatomy, an organ which resembles another in its functional relations; thus, the wing of a bird is analogous to the wing of the flying lizard, and to the wing of an insect, though it be not in its structural relations the cor responding organ of the body. [See HOMOLOGY.]

ANAL'OGY (same *deriv.*), originally signified resemblance of relations; but it is now usually understood to mean any sort of resemblance affording a ground for arguments which do not amount to a complete induction. If A and B resemble each other in certain respects, and if a proposition is true of A, it is argued that it is also true of B. The force of this argument will depend on the degree of relationship that exists between A and B.——In Geometry, it is the same as *proportion*.——In Grammar, it is a conformity to the principles of organization of the different words or collections of words.——As to its meaning in Natural History, see HOMOLOGY.

ANAL'YSIS (*analusis*, from *analuo*, I unloose: *Gr.*), in Chemistry, the separation of any substance into its constituent parts. It is either qualitative or quantitative. *Qualitative* analysis ascertains the *nature* of the elements: *quantitative*, their *relative amounts*.——VOLUMETRICAL ANALYSIS, or the quantitative estimation of chemical substances by measure, is an easy method of ascertaining the quantity of a given substance which a certain solution or compound contains. Chemists are continually needing to determine such a question, for many purposes, especially for ascertaining the commercial value of alkalis, manganese, chlorides of lime, indigo, and many other substances. Suppose, for example, we wish to know how much potash a certain solution contains. We measure off a given quantity, and ascertain how much acid of a known strength is required to saturate it. This being done, a simple calculation completes the operation, and this calculation may be spared by the inspection of a previously-prepared table.——ANALYSIS, among Grammarians, is the explaining the etymology, construction, and other properties of words.——ANALYSIS is frequently employed to signify the algebraical branches of pure mathematics.——ANALYSIS is likewise used for a brief, but methodical, illustration of the principles of a science; in which sense it is nearly synonymous with what is termed a *Synopsis*.

ANAMORPHO'SIS (*anamorphōsis*, from *anamorphoo*, I renovate: *Gr.*), in Perspective and Painting, the representation of some image, either on a plane or curved surface, deformed, or distorted; which in a certain point of view appears regular and in just proportion.

ANA'PÆST, a foot in Greek and Latin metre, consisting of two short syllables and a long one. The French language is much more abundant in anapæsts than the English, which is richer in dactyls. We have, however, several poems in an anapæstic measure, composed of couplets, each line having four anapæsts: thus,

> They are true to the last of their blood
> and their breath,
> And like reapers descend to the harvest of death.

ANAPH'ORA (a raising up: *Gr.*), the repetition of the same word or phrase at the beginning of several successive sentences.——ANAPHORA, in Astronomy, an ascension or rising of the twelve signs of the zodiac, from the east to the west, by the daily course of the heavens.

ANAPLEROT'ICS (*anaplēroo*, I fill up: *Gr.*), medicines which promote the growth of flesh in wounds and ulcers.

A'NARCHY (*anarchia*, want of government: *Gr.*), a disorderly society without a government.

ANASAR'CA (*ana*, throughout; and *sarx*, the flesh: *Gr.*), a diffusion of water through the cellular membrane of the limbs, as in *dropsy*.

ANASTAL'TICS (*anastaltikos*, fit for putting back: *Gr.*), in Pharmacy, astringent or styptic medicines.

ANASTAT'IC PRINTING (*anastasis*, a setting up again: *Gr.*), a process by which the productions of typography, lithography, or engraving, may be transferred from the originals without injury to them, and afterwards fixed on metal or wood, so as to be printed from again.

ANASTOMO'SIS (*Gr.*, from *anastomoo*, I furnish with a mouth), *Inosculation:* applied to the opening of one vessel into another. It occurs with arteries, veins, and lymphatics, in the animal body.

ANAS'TROPHE (*Gr.*, from *anastrepho*, I turn upside down), in Rhetoric, the inversion of words in a sentence, or the placing them out of their natural order.

ANATH'EMA (a person exposed to public reprobation: *Gr.*), among Ecclesiastical writers, the word is usually intended to express the cutting off a person from the privileges of society, and from communion with the faithful. The anathema differs from simple excommunication, inasmuch as the former is attended with curses and execrations.

ANA'TOMY (*anatomē*, from *anatemno*, I cut up: *Gr.*), in its widest sense, signifies the dissection of organized bodies, with a view to discover their structure, and the connection of the parts. Anatomy is the basis of Physiology, the object of which is the discovery of function; and both form the indispensable basis of Medicine. The object of *Comparative Anatomy* is the discovery of the differences in structure and organization which obtain throughout the animal kingdom, from the simplest forms to the most complex, and from the earliest dawn of life on the planet to the present epoch. *Descriptive Anatomy* is concerned with healthy structure, and is the necessary basis of *Pathological Anatomy*, which is concerned with diseased structures.

AN'CESTORS (*ancêtres: Fr.*), those from whom a person is descended in a direct line, the father and mother not included. Both law and custom make a difference between ancestors and predecessors, the first being applied to a natural person, as a man and his ancestors, and the latter to a body politic, as a bishop and his predecessors.

AN'CHOR (*ankura: Gr.*), a heavy, strong, crooked instrument of iron, cast or dropped from a ship into the water, to retain her in a convenient station in a harbour, road, or river. Anchors were at first mere weights: afterwards, as at present, they were intended to fasten in the ground. They are so contrived as to sink into the earth the moment they reach it, and to bear a great strain before they can be loosened or dislodged. Every ship has, or ought to have, three principal anchors, with a cable to each, viz. the *sheet*, the *best bower*, and the *small bower*, so called from their usual situation on the ship's bows. There are besides small anchors for moving a ship from place to place in a harbour or river, where there may not be room or wind for sailing; these are the *stream*-anchor, the *kedge*, and the *grapnel*. The last, however, is chiefly designed for boats.

AN'CHORAGE (same *deriv.*), ground fit for holding the anchor; also the duty paid by ships for the use of the haven where they cast anchor.

AN'CHORET, AN'CHORITE, or ANACH'ORET (*anachōrētēs*, from *anachōreo*, I withdraw: *Gr.*), in a general sense, means a hermit, or one who voluntarily lives apart from the world. Retirement from all society has, by vast numbers, been considered as facilitating the attainment of a virtuous life. In Egypt and Syria, where Christianity became strongly tinged with the peculiar notions of the East, the anchorets were most numerous; and from those who lived in cells in the vicinity of a church, sprang the convents of a later period, which were filled with inmates anxious to escape from the tumult and bloodshed that marked the beginning of the middle ages.

ANCHO'VY (*ancioe: Ital.*), a small sea-fish belonging to the genus *Engraulis* of Naturalists. It is allied to the herring, and is taken in large quantities in the Mediterranean by night-fishing. It is also taken on the British coasts.

ANCHYLO'SIS (*ankulōsis*, from *ankuloo*, I crook: *Gr.*), in Medicine, a stiffness or immobility of the joints, arising from various causes, and often connected with deformities of the limbs. For the most part it is the result of inflammation in the membrane lining the joints.

ANCO'NES (*ankōn*, the bent arm: *Gr.*), in Architecture, the consoles, or ornaments on the key stones of arches or sides of doors.

ANCY'LE or ANCI'LE (*Lat.*), in Antiquity, a small brazen shield belonging to Mars, which fell, as was pretended, from heaven in the reign of Numa Pompilius: when a voice was heard, declaring that Rome should be mistress of the world as long as she should preserve this holy buckler.

ANCYLOBLEPH'ARON (*Gr.*: from *ankulos*, crooked; and *blepharon*, the eyelid: *Gr.*), in Medicine, a disease of the eye which closes the eyelids.

ANCY'LOGLOS'SUM (*ankulos*, crooked; and *glōssa*, the tongue: *Gr.*), in Medicine, a contraction of the ligaments of the tongue, so as to hinder speech.

ANDAN'TE (going: *Ital.*), in Music, an indication that the notes are to be distinct from each other.——ANDANTE LARGO signifies that the music must be slow, the time exactly observed, and each note distinct.

ANDANTI'NO (*Ital.*), in Music, gentle, tender; somewhat slower than *andante*.

ANDROG'YNOUS (*andro-gunos*, hermaphrodite: *Gr.*), in Botany, an epithet for plants bearing separate male and female flowers on the same root, without any mixture of hermaphrodites.——In Physiology, the possession of organs, of both sexes, in each individual, as in the snail.

ANDROI'DES (*andros*, of a man; and *eidos*, the form: *Gr.*), in Mechanics, a term used to denote an automaton in the figure of a man, which, by means of certain springs and other mechanical contrivances, is enabled to walk, and perform other actions of a man.

ANEMOM'ETER (*anemos*, the wind; and *metron*, a measure: *Gr.*), apparatus for indicating, measuring, and recording, the direction, force, and velocity, of the wind. Various contrivances have been invented for these purposes, and some one of them is to be found in every meteorological observatory. Various contrivances have been invented for this purpose; the first of which is attributed to Wolfius, who described it in 1709; but considerable improvements have been since made in its construction. During the experiments made by Dr. Lind with his anemometer, he found, in one instance, that the force of the wind was such as to be equal to upwards of 34 lbs. on a square foot, answering to a velocity of 93 miles per hour!

ANEM'ONE (*anemos*, the wind: *Gr.*), a beautiful flower, originally brought from the East, but now much cultivated in our gardens, nat. order, *ranunculaceæ*. Some species are wild in Britain. The word signifies properly wind-flower, because it was supposed that it opened only when the wind blew.

ANEM'OSCOPE (*anemos*, the wind; and *scopeo*, I examine: *Gr.*), any contrivance for showing from what point of the compass the wind blows.

ANE'PIGRAPHOUS (*a*, without, *epigraphe*, an inscription: *Gr.*), in Numismatics, an epithet applied to coins which bear no inscription.

A'NEROID BAROM'ETER (*a*, without; *neros*, humid; and *eidos*, form: *Gr.*, on account of no fluid being used), an instrument for indicating the variations of atmospheric pressure, and differing from the ordinary barometer in this, that while, in the latter, the pressure of the atmosphere is measured by the height of the column of mercury which it supports; in the former, the differences of pressure are measured by the effect produced on a partially exhausted metallic vessel, the opposite sides of which are more or less brought together, according as the pressure of the atmosphere is greater or less. A spiral spring resists the compression of the sides: the motion is magnified by levers, and is communicated to an index which moves round a dial-plate.

AN'EURISM (*aneuruno*, I widen: *Gr.*),

in Surgery, a diseased swelling of an artery, attended with a continued pulsation.

AN'GEL (*angelos*, a messenger: *Gr.*), the name given to those spiritual, intelligent beings, who are supposed to execute the will of God, in the government of the world.——ANGEL, the name of an ancient gold coin in England, so called from having the figure of an angel upon one side. It was introduced from France in the time of Edward IV., and was used till the reign of Charles I.; varying in value from 6s. 8*d.* to 10*s.*

ANGEL'ICA, in Botany, a genus of plants of the natural order *Umbelliferæ*. All the parts of angelica, especially the root, have a fragrant aromatic smell, and a pleasant bitterish taste. It is useful in medicine.

AN'GELUS DOMI'NI (angel of the Lord: *Lat.*), a prayer of the Roman Catholic Church, embodying a passage in scripture beginning with these words. It was ordered by pope John XXII., in 1326, to be repeated three times a day, morning, noon, and night, when the church bell gives the people warning. This prayer is also termed *Ave Maria* (Hail Mary), from this invocation being repeatedly employed in it.

ANGI'NA (*ancho*, I strangle: *Gr.*), the *Quinsy*, an inflammatory disease of the throat. Also, a consequence of organic disease of the heart, which causes difficulty of respiration, and is hence called *angina pectoris*. Angina is accompanied by anxiety, and a sense of suffocation.

ANGIOSPER'MOUS (*aygeion*, a vessel; and *sperma*, seed: *Gr.*), a term applied by botanists to such plants as have their seeds enclosed in a seed-vessel. [See SEED.]

AN'GLE (*angulus*, a corner: *Lat.*), the opening, or mutual inclination, of two lines, or of two or more planes, meeting in a point called the *vertex*, or angular point. ——ANGLE OF DIRECTION, that comprehended between the lines of direction of two conspiring forces.——ANGLE OF ELEVATION, in Astronomy, the angular height of a celestial object above the horizon.——FACIAL ANGLE, the angle made by the intersection of two lines, the one drawn from the most prominent part of the frontal bone over the anterior margin of the upper jaw, the other from the external orifice of the ear-passage along the floor of the nasal cavity.——ANGLE, in Fortification, that formed by the lines used in fortifying, or making a place defensible.——ANGLE, in Geometry. When the lines forming it meet perpendicularly, it is called a *right* angle, and is of 90 degrees; when it is less than a right angle, it is called an *acute* angle; and when larger than a right angle, an *obtuse* angle. When two circles cross each other, their planes form what is called a *spherical* angle. The angles made by solids are called *solid* angles.——ANGLE OF INCIDENCE, in Optics, the angle which a ray of light, falling upon a reflecting surface, makes with a perpendicular erected on that surface from the point where the ray impinges. The angle of incidence is invariably equal to the angle of reflection. ——ANGLE OF LONGITUDE, in Astronomy, the angle which is made at the pole of the ecliptic by two circles, one passing through the celestial object, the other through the vernal equinox.——ANGLE OF PARALLAX, the angle made by two lines, the one supposed to be drawn from a celestial object to the observer as he actually stands, and the other to the centre to which its motion is referred—the centre of the earth, or the centre of the earth's orbit.——VISUAL ANGLE, that formed by two rays of light, drawn from the extreme points of an object to the centre of the eye.

AN'GLER, or FISHING FROG, a marine fish of singular form, called by Ichthyologists *Lophius piscatorius*. It has a large broad head, a very wide mouth, and three long detached bony rays projecting from its head. It is very voracious, and has been taken from Norway to Madeira.

AN'GLICISM (*anglus*, English: *Lat.*), an idiom of speech, or manner, peculiar to the English.

AN'GLING, the art of ensnaring fish with a hook, which has been previously baited with a small fish, a worm, or a fly, &c. The best season for angling is from April to October: the cooler the weather, in the hottest months, the better; but in winter, on the contrary, the warmest day is the most promising. A cloudy day, after a moonlight night, is in all cases favourable; as the fish avoid feeding by moonlight, and are therefore hungry. Warm, lowering days are always coveted by anglers.

ANGLO-SAX'ON, the name of the English people, when the Saxons and some other German tribes had settled in England, after it was abandoned by the Romans in the fifth century, and had introduced their language, government, and customs.——ANGLO-SAXON LANGUAGE, that which was used after the conquest of England by the Saxons, and Saxon had become the prevalent tongue of that country. It is the basis of our present English.

ANGUI'NEAL (next) denotes something belonging to or resembling a snake. Hence we say, anguineal curve, hyperbola, verse, &c.

AN'GUIS (*Lat.*), in Zoology, a genus of harmless reptiles, to which our blind-worm belongs.

ANGUSTU'RA CORTEX, a bark which comes from the Spanish main, and is a powerful bitter. A poisonous bark is sometimes found in commerce under the name of Spurious Angustura.

ANHY'DROUS (*a*, without, *udor*, water: *Gr.*), in Chemistry, a term applied to acids, salts, &c., when they are entirely free from water. A salt, for example, may appear perfectly dry to the eye and to the touch, at the very time that water is present. It is not until this is driven off that the salt is rendered anhydrous. Some acids have so strong an affinity for water that it is with the utmost difficulty they can be procured anhydrous.

ANIL'INE (*anil*, indigo: Portuguese), a pale, brownish, oily liquid, obtained in proportionally minute quantity from coal tar, but now manufactured on a large scale for dyeing purposes. It is a compound of carbon, hydrogen, and nitrogen; its specific gravity is slightly heavier than water. When aniline or its salts are treated with suitable oxidizing agents a number of brilliant dyes are produced, which have come into extensive use. The first of these made commercially available was Perkins's mauve-purple, obtained by treating sulphate of aniline with bichromate of potassium. By the use of this and other salts every shade of purple may be obtained from it, from the deepest royal to faint lilac; every variety of blue from a pale sky tint to the deepest ultramarine; all the gradations of scarlet and crimson, including roseine, magenta, &c.; besides many shades of yellow and green. The dyes thus produced are very intense, a few pounds weight of the dye being capable of colouring some miles of fabric. A pound of it will impart a perceptible tint to a large pond of water.

AN'IMA (the soul: *Lat.*), the soul, or principle of life in animals.——ANIMA MUNDI, a phrase formerly used to denote a certain pure ethereal substance or spirit, supposed to be diffused through the mass of the world, organizing and actuating the whole and the different parts.

AN'IMAL (a living creature: *Lat.*), a living body endued with sensation and spontaneous motion. The difficulty of drawing the line of demarcation between the animal and vegetable kingdoms is acknowledged by all naturalists. The lowest forms of each are well-nigh undistinguishable, and have been attributed by turns, first to one and then to the other domain of organized existence. It is, however, said that the best distinction hitherto ascertained is drawn from the fact that the food of plants consists of inorganic compounds, whilst animals require organized matter for their support, coupled with the facts that the alimentary matter of plants is absorbed through their external surface, no solid particles being taken in, whilst that of animals goes direct into their substance. As to the arrangement of animals, see ANIMAL KINGDOM.

AN'IMAL FUNC'TIONS are those by which the materials that constitute and support the bodies of animals are prepared and supplied. The principal of these functions are the following: circulation, digestion, nutrition or assimilation, respiration, and secretion: which are employed in producing animal matter from the substances that compose it, repairing waste, and getting rid of what is superfluous. But, besides these, there are others, which, though they do not act like the foregoing, are, in many animals, subservient to various important purposes.

AN'IMAL HEAT is that property of all animals by which they preserve a certain temperature, quite independent of that of the medium by which they are surrounded, and is essentially necessary to life. That of a man in health is from about 94° to 100° Fahrenheit. Birds maintain a temperature of about 108° F. This heat appears to depend upon the absorption of oxygen in the lungs, and throughout the body: carbonic acid being formed in the lungs by the union of oxygen with carbon, and water throughout the body by the union of oxygen with hydrogen—heat and vital energy being in both cases the result. Hence this general slow combustion, which is constantly going on in the body, is most intimately connected with the state of the nervous system. The heat of the human body remains nearly the same, when exposed to extreme degrees of temperature. Fishes, reptiles, and most invertebrate animals, are cold-blooded. They have not the power of maintaining a uniform temperature, and their heat depends upon that of the surrounding medium.

AN'IMAL KING'DOM, THE, is divided by naturalists into five provinces or sub-kingdoms: viz. 1. VERTEBRATA (animals with a jointed back-bone). 2. MOLLUSCA (shell-fish and their allies). 3. ARTICULATA (crabs, spiders, insects, worms). 4. RADIATA (sea-urchins and star-fishes). 5. PROTOZOA (sponges, foraminifera, &c.).

ANIMAL'CULA (plur. of *animalculum*, a *dim.* of *animal*: *Lat.*), a term popularly applied to very small organisms requiring the aid of lenses for their detection. [See INFUSORIA.]

ANIMA'TION (*animatio*, a bestowal of life: *Lat.*), in Painting, the expression given to a figure when representing activity. A figure well executed is said to be animated. ——SUSPENDED ANIMATION. Life may suffer considerable diminution of its powers, and even a total suspension, without being absolutely destroyed. The action of the lungs, and consequently all the functions of the body, depend upon the free use of air. The want of this great principle of life causes faintings in crowded assemblies; and it is from the same privation of air that drowning and suffocation produce suspended animation and then death.

AN'IME', or GUM ANIME', a resinous substance, imported from New Spain and the Brazils, which is obtained from a leguminous tree, the *Hymenæa Courbaril* of Botanists. It is now known to be inert, and therefore of little value as a remedy. ——ANIME', in Heraldry, a term used when the eyes of any rapacious creature are borne of a different tincture from the creature itself.

AN'IMUS (the mind: *Lat.*), in Metaphysics, the mind or reasoning faculty, in distinction from *anima*, the being in which the faculty exists.——ANIMUS, in Law, signifies intention, for example, he went *animo revertendi*, with the intention of returning.

AN'ISE-SEED (*anison*, the anise or dill: *Gr.*), the product of an umbelliferous plant (*Pimpinella Anisum*) which grows wild in Egypt, Syria, and other countries of the East. Anise-seeds are imported from Spain and Italy, where they are cultivated to a considerable extent. They are chiefly used in the manufacture of liqueurs, and as a remedy against flatulency.

AN'NALS (*annales*, chronicles of things done year by year: *Lat.*), a species of history in which events are related in the exact order of chronology. They differ from perfect history in this, that *annals* are a bare relation of what passes every year, as a journal is of what passes every day; whereas *history* relates not only the transactions themselves, but also their causes, motives, and springs.

ANNA'TES (*Fr.*, from *annus*, a year: *Lat.*), in Ecclesiastical Law, first-fruits paid out of spiritual benefices to the pope, being the value of one year's profit.——Also a fine paid to the king, as head of the church, by one promoted to an ecclesiastical benefice. It is supposed to amount to one year's value of it: but it is less, as it is founded on a valuation made in 1535.

ANNEA'LING (*anhelan*, to anneal: *Sax.*), the process of heating steel and other bodies, and then suffering them to cool again gradually. Without this, many substances are extremely brittle, and liable even to break simply under slight changes of temperature—for instance, glass.

ANNE'LIDA (*annulus*, a little ring: *Lat.*), in Zoology, the class of worms, forming an extensive section of invertebrate animals with bodies marked off into rings. This class has hitherto received little attention from naturalists, and many thousands remain to be described and classified. They abound far more in the sea than on land. They have been divided into those with and those without bristles. The former section has been again divided into *Memertini*, worms without a sucker, and *Hirudinei*, such as leeches, which possess a sucker. The worms possessing bristles may be divided into three sections. 1. *Lumbricini*, the earth-worms. 2. *Capiti branchiati*, those having the blood-aerating organs attached to the head, such as the Serpulæ; many of these live in tubes constructed by themselves. 3. *Dorsi branchiati*, those having the blood-aerating organs attached to the rings of the body, such as the lob-worms.

AN'NO DOM'INI (in the year of our Lord: *Lat.*), abbreviated A.D., a term employed in the computation of time. The era commencing with the birth of Christ is used in dating all public deeds and writings, in Christian countries, on which account it is called the 'Vulgar Era.'

ANNO'NÆ PRÆFEC'TUS (overseer of the annona: *Lat.*), in Antiquity, an extraordinary magistrate, whose business was to prevent a scarcity of provisions, and to regulate the weight and fineness of bread.

ANNOTA'TION (*annotatio*, from *annoto*, I write down: *Lat.*), a brief commentary, or remark upon a book or writing, in order to clear up some passage, or draw some conclusion from it.——ANNOTATION, in Medicine, the beginning of a febrile paroxysm, when the patient grows chilly, yawns, shudders, or the like.

ANNOT'TO, an orange-red substance obtained from the waxen pulp or pellicle surrounding the seeds of *Bixa orellana*, a South American tree. It is used in dyeing, for varnishes and for colouring cheese.

ANNU'ITY (*annus*, a year: *Lat.*), a periodical payment of money for a lengthened period. If it is to begin on the occurrence of some uncertain event, it is a *contingent annuity*. If it is not to be enjoyed immediately, it is a *deferred annuity;* if not until the death of some one now living, it is a *reversionary annuity*. As the probability of the duration of life at every age is known, annuities may be purchased for fixed sums during a life or lives in being.

AN'NULAR (*annularis*, from *annulus*, a ring: *Lat.*), anything in the form of, or resembling, a ring. Hence, ANNULAR, in Anatomy, is an appellation given to several parts of the body: thus, the *annular cartilage* is the second cartilage of the larynx; the *annular ligament* is a strong ligament encompassing the wrist, after the manner of a bracelet; and *annular process* is that which surrounds the medulla oblongata. ——In Astronomy, an eclipse is said to be annular when a ring of light is left on the body eclipsed.

AN'NULATA (same *deriv.*), a large class of soft-bodied animals marked with rings, including the leeches, the earth-worms, and many marine worms, some of which live in tubes. This class is sometimes styled ANNELIDA, which see.

AN'NULET (*annulus*, a ring: *Lat.*), in Architecture, a small square moulding, which crowns or accompanies a larger. Also, though improperly, the fillet which separates the flutings of a column. Also, in Heraldry, a small ring.

ANNUNCIA'TION (*annunciatio*, from *annuncio*, I make known: *Lat.*), the delivery of a message, particularly the angel's message to the Virgin Mary, concerning the birth of our Saviour. The festival in commemoration of that event is called Lady-day, and falls on the 25th of March.

AN'ODE (*ana*, up; and *odos*, a way: *Gr.*), the way by which electricity *enters* a body through which it passes. It is opposed to *Cathode*.

AN'ODYNES (*anodunos*, free from pain: *Gr.*), medicines so called because they relieve pain and procure sleep, such as the preparations of the poppy. They are divided into three classes: *Paregorics*, or such as assuage pain; *Soporifics*, or such as procure sleep; and *Narcotics*, or such as ease the patient by stupefying him.

ANOMALIS'TICAL YEAR (*anōmalos*, irregular: *Gr.*), in Astronomy, the time that the earth takes to pass from any point in the ecliptic round to the same point.

ANO'MALY (*anōmalia*: *Gr.*, from same *deriv.*), any irregularity or exception to a rule.——ANOMALY, in Astronomy, the angular distance of a planet from its perihelion, as seen from the sun. It is of three kinds, the *true*, the *mean*, and the *excentric*. ——In Grammar, an exception from the general rule.

ANO'MIA (*anomios*, unequal: *Gr.*), a genus of bivalve shell-fish allied to the oyster. The valves are unequal, and one is perforated near the hinge. A plug passes through the hole and attaches the animal to a submerged rock.

ANO'PLURA (*anoplos*, unarmed; *oura*, a tail: *Gr.*), an order of insects with suctorial mouths, including the louse and its allies, which live parasitically on other animals. Almost every species of bird and quadruped has a peculiar species of this order attached to it. They do not undergo any metamorphosis.

ANOREX'IA (*Gr.*: from *a*, without; and *orexis*, a desire for a thing), in Medicine the loathing of food. It is either original, or symptomatic of some disorder.

ANOS'MIA (*a*, without; and *osmē*, smell: *Gr.*), in Medicine, a disease attended with a diminution or loss of smell.

AN'SER (*anser*, a goose: *Lat.*), a genus of swimming birds with webbed feet, of which the common goose may be taken as an example.

ANT, in Entomology, well-known insects, much celebrated for industry and economy. They belong to the *Hymenoptera*, an order of insects with membranaceous wings, and distinguished by not being armed with a sting, or any instrument for piercing the bodies of animals, or plants, for the purpose of depositing their eggs. Ants are social insects, and are divided, like the bees and wasps, into males, females, and neuters, which last constitute the great mass of this tribe, and appear to conduct the business of the nest. The neuters are unproductive females, their ovaria being undeveloped. Their heads are very large, and the mouth is armed with strong mandibles. The males die, or are killed by the neuters, before the eggs they have impregnated are excluded. The productive females die soon after the eggs are matured and excluded. They, like the males, have four well developed wings, by means of which they can fly. The eggs which the queen ant deposits and the larvæ when hatched, are tended with the most careful solicitude by the workers. The pupæ are as well looked after, and when the time has arrived for the perfect insect to emerge from its cocoon, the workers are at hand to aid in its release. At a particular period some of the pupæ produce perfect males and females, which after a while take flight and pair. The impregnated females denude themselves of their wings, and in many cases are seized by a colony of workers, carried into a nest, and tended on until they have deposited their eggs. Naturalists have divided the ants they have examined into many genera. Several of our British forms fall into the genus *Formica*. They feed on both animal and vegetable substances. White ants belong to a different order of insects. [See TERMITES.]

ANTANACLA'SIS (*Gr.*, from *antanaclao*, I reflect sound), in Rhetoric, a figure which repeats the same word, but in a different sense; as 'dum vivimus, vivamus.'

ANTARC'TIC (*antarktikos*: from *anti*, against; and *Arktos*, the Bear: *Gr.*), in a general sense, denotes something opposite to the Arctic, or northern pole. The *Antarctic circle*, in Geography and Astronomy, is one of the lesser circles of the sphere, and is distant only 23½° from the Antarctic, or south pole. The stars near the Antarctic pole never appear above our horizon.

ANTARES, a star of the first magnitude in the Scorpion; it is the α Scorpii of Astronomers.

ANT'-EATERS, a genus (*Myrmecophagæ*) of toothless quadrupeds, allied to the sloths, inhabiting South America. There are several species: one as small as a squirrel, another as large as a calf. One is terrestrial, the others arboreal. Again, some are diurnal, others nocturnal in their habits. They feed on termites, or white ants, which they lick up with their long flexible tongues. The great ant-eater, remarkable for its long slender muzzle, is a harmless animal, but it has been known to kill a dog with its claws when attacked. Its flesh is eaten in some parts of South America.

ANTECE'DENCE (*antecedo*, I go before: *Lat.*), in Astronomy, an apparent motion of a planet towards the west, or contrary to the order of the signs, viz. from Taurus towards Aries, &c.

ANTECE'DENT (*antecedens*, going before: *Lat.*), in Grammar, the word to which a relative refers: thus, in 'God whom we adore,' the word *God* is the antecedent to the relative *whom*.——ANTECEDENT, in Logic, the first of the two propositions in an enthymeme.——ANTECEDENT, in Mathematics, the first of two terms of a ratio, or that which is compared with the other: thus, in the ratio of 2 to 3, or *a* to *b*, 2 and *a* are each antecedents.——ANTECEDENT SIGNS, in Medicine, such as are observed before a distemper is so formed as to be reducible to any particular class, or proper denomination.

AN'TELOPES (*anthos*, an ornament; and *ōps*, the eye: *Gr.*, from the beautiful eye of the gazelle), are ruminating animals, forming a division of the family of *Bovidæ*. In form they resemble the deer, but have unbranched hollow horns, frequently very large. In shape they are elegant animals, timid in disposition, and rapid in flight. The gazelle is an antelope, and in South Africa there are several other species, including the springbok and the harte-beeste.

ANTEM'BASIS (*Gr.*, from *antembaino*, I enter instead), in Anatomy, a mutual insertion of the bones.

AN'TE MERI'DIEM (before noon: *Lat.*), abbreviated A.M., in Astronomy, the time before noon.

ANTENCLE'MA (*Gr.*: from *anti*, in return for; and *enclema*, an accusation), in Oratory, a defence in which the accused replies to the charge by criminating the accuser.

ANTEN'NÆ (*antenna*, a sail-yard: *Lat.*), in Zoology, jointed processes with which the heads of some animals, such as crustaceans and insects, are furnished. They are of various shapes; they are commonly called horns or feelers.

ANTEPENUL'TIMATE (*ante*, before; *pene*, almost; and *ultima*, the last: *Lat.*), the last but two.

ANTEPOSI'TION (*antepono*, I place before: *Lat.*), a Grammatical figure, by which a word, that by the ordinary rules of syntax ought to follow another, comes before it.

ANTHELMIN'TICS (*anti*, against; and *helmins*, a worm: *Gr.*), medicines proper to destroy worms.

AN'THER (*anthēros*, blooming: *Gr.*), that part of the stamen of a flower which is at the top of the filament; it is usually divided into two cavities, which are filled with pollen, minute grains that are discharged when ripe, and these falling upon the pistil impregnate the ovary. Anthers are generally yellow, that being the usual colour of the pollen.

AN'THESIS (bloom, from *anthos*, a flower

Gr.), in Botany, the period at which the flower-bud opens.

ANTHO'LOGY (*anthologia*, a gathering of flowers: *Gr.*), a name given to a collection of short pieces of poetry, which are frequently called *epigrams*. The first collection of this kind was made by Meleager, a Syrian Greek poet, who lived about a century before the birth of Christ.

AN'THRACITE (*anthrax*, a coal: *Gr.*), a species of coal containing more carbon and less bituminous matter than the ordinary kind. Inferior anthracite and the smaller kinds of good coal constitute *culm*. Some are of opinion that anthracite was originally bituminous coal, and that the alteration has been caused by subterranean heat. In North Wales, the two kinds are sometimes found as portions of the same bed. There is a coal, known as steam coal, which is intermediate between the two. Anthracite is inflammable with some difficulty, and burns without smell or smoke, leaving a more or less earthy residue. It has no special value of its own, and is only used when it can be obtained cheaper than other kinds. It is scarce in Europe, and consequently but little used; but in the United States of America, where it abounds, it has lately acquired a high degree of importance.

ANTHRO'POID (*anthropos*, a man; *eidos*, shape: *Gr.*), a term applied to certain apes, such as the gorilla, orang-outang, chimpanzee, and gibbon, on account of a certain amount of resemblance to the human species which they possess.

ANTHROPO'LOGY (*anthrōpos*, a man; *logos*, a discourse: *Gr.*), the science which has man for its object. It undertakes to describe and classify the races of men, to point out their similarities and differences, to study their manners and capabilities, and to determine their relationship. Since the races of men, notwithstanding their differences, form an entire group, anthropologists examine that group as a whole, and endeavour to ascertain its position in the scale of organic nature, its relations to other groups, and its common characters, whether under an anatomical, a physiological, or an intellectual point of view. The laws which govern the maintenance or change of these characters, the influence of external conditions, the phenomena of hereditary transmission, and the effect on the offspring of intermarriage of nearly related persons, or of persons of different races, are studied, as well as the grand subject of the history of humanity through the stages of its development. There are Anthropological Societies in London and Paris.

ANTHROPOMOR'PHITE (*anthropos*, a man; *morphē*, shape: *Gr.*), one who ascribes a human figure and a bodily form to God.

ANTHROPO'PHAGI (*anthropophagoi*: from *anthrōpos*, a man; and *phago*, I eat: *Gr.*), or CANNIBALS, persons who eat the flesh of men.

AN'TI, a Greek particle which enters into the composition of several words, in Latin, French, English, &c., and signifies opposite or contrary to; as in *antiscorbutics*.

ANTICAR'DIUM (*antikardion*: from *anti*, opposite to; and *kardia*, the heart: *Gr.*), in Anatomy, that hollow opposite the heart called the pit of the stomach.

ANTI-CLI'MAX (*anti*, opposite to; and *klimax*, a gradation: *Gr.*), in Literary Composition and Oratory, a descent from the great to the little.

ANTI'CLINAL (*anti*, against; and *clino*, I incline: *Gr.*), in Geology, a term applied to an axis, the strata of which slope in opposite directions; in opposition to *synclinal* (*sun*, together: *Gr.*), where the strata dip towards each other.

AN'TIDOTE (*antidotos*: from *anti*, against; and *didōmi*, I give: *Gr.*), a counter-poison, or any medicine generally that counteracts the effects of what has been swallowed.

ANTIL'OGY (*antilogia*, a contradiction: from *anti*, opposite to; and *logos*, a discourse: *Gr.*), an inconsistency between two or more passages of the same book.

ANTIMETA'BOLE (*Gr.*: a transformation: from *nati*, against; and *metaballo*, I change), in Rhetoric, a setting of two things in opposition to each other.

ANTIMETA'THESIS (*anti*, against; and *metatithēmi*, I transpose: *Gr.*), in Rhetoric, an inversion of the parts or members of an antithesis.

AN'TIMONY, a metal of a bluish white colour. It is so brittle that it is easily reduced to powder. Its spec. grav. is 6·7; and it fuses, at 810°, just below redness. Its principal ore is the sulphuret, known in commerce as *crude antimony*, and the metal is obtained by fusing the sulphuret with scrap iron, when the iron unites with the sulphur and turns out the antimony. *Glass of antimony* is an impure oxide. *Tartar-emetic* is a tartrate of antimony and potash. *Type metal* is an alloy of antimony and lead; on account of its expanding at the moment of solidifying (a property possessed by neither metal separately) it takes a very sharp impression of the mould.

ANTINO'MIANS (*anti*, against; and *nomos*, a law: *Gr.*), in Church History, a sect who reject the moral law as a rule of conduct to believers. They consider good works as unnecessary, and faith alone as sufficient for salvation; and hence are sometimes called *Solifidians* (*sola fides*, faith alone: *Lat.*).

ANTIPA'THES (*anti*, against; *pathe*, suffering or misfortune: *Gr.*), a genus of flexible corals, of a dark brown colour, which are usually branched into delicate twigs, the whole looking like a small leafless shrub. The substance is horny and very similar to that composing the axis of the Gorgonias, but it is destitute of a calcareous bark. When fresh from the sea they are covered with gelatinous matter, formed of dead polypes. The stems are sometimes thick, and so hard that they will take a polish. They are frequently called Black Coral.

ANTI'PATHY (*antipatheia*: from *anti*, against; and *pathos*, a violent feeling: *Gr.*), in Physiology, a natural aversion of one body to another, in contradistinction to *sympathy*. In a more restricted sense, it is an involuntary aversion which is felt towards some object perceived either in reality or by the imagination, although the person who feels this abhorrence is entirely ignorant of its cause, and can by no means account for it.

ANT'IPHON (*antiphoneo*, I sing against: *Gr.*), in Church Music, the short verse sung before the Psalms and other portions of the Roman Catholic service.

ANTI'PHRASIS (*Gr.; from anti*, opposite to; and *phrasis*, a phrase: *Gr.*), in Rhetoric, a kind of irony, in which we use words in a sense opposite to that which belongs to them: as when we say, 'you are very clever,' when we mean, 'you are very stupid.'

ANTI'PODES (*Gr.:* from *anti*, against; and *pous*, a foot), the name given to those inhabitants of the earth who are diametrically opposite to each other, as it were feet to feet. They have the same or equal latitudes—the one north, and the other south; but opposite longitudes. Consequently, when it is day to the one, it is night to the other.

AN'TIQUARY (*antiquarius*, from *antiquus*, ancient: *Lat.*), a person who searches after and studies the monuments and remains of antiquity.——The monks who were employed in making new copies of old books were formerly called *antiquarii*.

ANTI'QUITIES (*antiquitas*, antiquity: *Lat.*), the remains of ancient historical times; genealogies, inscriptions, monuments, coins, names, archives, mechanical instruments, fragments of history, &c. Antiquities form a very extensive branch of learning, referring to ancient edifices, magistrates, habiliments, manners, customs, ceremonies, religious worship, and other objects worthy of curiosity, of all the principal nations of the earth. There is a Society of Antiquaries in London, which received its charter of incorporation in 1751.

ANTISABBATA'RIANS (*anti*, against; and *sabbaton*, the Sabbath: *Gr.*), those who deny the necessity of observing the Sabbath.

ANTIS'CII, or ANTIS'CIANS (*anti*, opposite to; and *skia*, shadow: *Gr.*), an old term in Geography, signifying the people who live on different sides of the equator, and whose shadows at noon fall in opposite directions.

ANTISEP'TICS (*anti*, against; and *sēpo*, I make rotten: *Gr.*), things which prevent putrefaction, such as creosote, alcohol, and ice.

ANTISPASMO'DICS (*anti*, opposite to; and *spasmos*, a spasm: *Gr.*), medicines proper for the prevention or cure of spasms or cramps.

ANTIS'TROPHE (*antistrophē*, from *antistrepho*, I turn about: *Gr.*), the alternate verse in ancient poetry, which was divided into the *strophe* and *antistrophe*. In reciting odes the chorus turned from the left to the right at the *strophe*, and from the right to the left at the *antistrophe*.

ANTI'THESIS (*Gr.*, from *antitithēmi*, I set one thing against another), in Rhetoric, a figure of speech, by which two things are made more striking by being set in opposition to each other. 'Antitheses, well managed,' says Bohours, 'give infinite pleasure in the perusal of works of genius; they have nearly the same effect in language as lights and shadows in painting, which a good artist distributes with propriety: or the flats and sharps in music, which are mingled by a skilful master.' The beautiful antithesis of Cicero, in his second oration against Catiline, may serve as an example: 'On the one side stands modesty, on the other impudence; on the one fidelity, on the other deceit; here piety, there sacrilege,' &c. It is imputed as a fault to some writers that they have carried the use of antithesis to excess, frequently employing an antithetical form of words, when there is no antithesis in the thought.

ANTITRINITA'RIANS (*anti*, against: *Gr.;* and *Trinitas*, the Trinity: *Lat.*), all those who deny the doctrine of the Trinity.

AN'TITYPE (*anti-tupos*, a copy: *Gr.*), among Ecclesiastical writers, that which was foreshadowed by the type or figure. In the Greek church it is also an appellation given to the symbols of bread and wine in the sacrament.

ANTŒ'CI (*antoikoi:* from *anti*, opposite to; and *oikos*, a house: *Gr.*), in Geography, those inhabitants of the earth who live under the same meridian, but on different sides of the equator, and at equal distances from it.

ANTONOMA'SIA (*Gr.*: from *anti*, instead of; and *onoma*, a name), a mode of speaking in which a proper name is put for an appellative, as when a patron of learned men is called a Mæcenas, or when a person is addressed or described by some appropriate or official designation, but not by his surname; as, in the House of Lords, 'the noble lord.'

A'NUS, in Anatomy, the excrementary orifice of the alimentary canal, or termination of the *intestinum rectum*. In oviparous vertebrates, it opens into a cavity common to it and the urinary organs, called the *cloaca*. In many of the lower classes of invertebrate animals, one orifice performs the functions of a mouth and anus.

AORIS'TIA (*Gr.:* from *aoristos*, indefinite), in the Sceptic philosophy, that state of the mind in which we neither assert nor deny anything positively, but only speak of things as seeming or appearing to us in such a manner.

AOR'TA (usually derived from *aēr*, the air; and *tēreo*, I keep: *Gr.*; being found empty after death, it was supposed by the older anatomists to be intended to convey air), in Anatomy, the great artery issuing from the left ventricle of the heart. All the other arteries proceed mediately or immediately from the aorta. It is distinguished into the *descending* and *ascending* aorta, according to the direction it takes.

AP'ATHY (*apatheia*, insensibility: *Gr.*), a term expressive of an utter privation of passion, and an insensibility to pain. Thus, the Stoics affected an entire apathy, so as to be unconscious of pleasure or pain, and incapable of being moved by anything.

AP'ATITE, a mineral found in Canada, Norway, and Spain; composed chiefly of phosphate of lime, and hence useful as a manure. It has the advantage over coprolites in containing less siliceous matter and carbonate of lime.

APAU'ME' (*paume*, the palm of the hand: *Fr.*), in Heraldry, a hand opened, so that the full palm appears, with the thumb and fingers extended, as may be seen in the arms of a baronet.

APEAK, perpendicular. A ship is said to be *apeak*, when the cable is drawn so tight as to bring her directly over the anchor.

APEP'SIA (*a*, without; and *pepsis*, digestion: *Gr.*), in Medicine, a bad digestion; the more usual term for which is *Dyspepsia*.

APES, quadrumanous mammalian animals, which have their teeth of the same number and form as in man, and have neither tails nor cheek pouches. Apes approach nearer to man in organization than do any other animals. All of them have the power of walking in an erect position [See CHIMPANZEE, GIBBON, GORILLA, ORANG-OUTANG.]

APET'ALOUS (*apetalos:* from *a*, without; and *petalon*, a leaf: *Gr.*), in Botany, a term for plants whose flowers have no corolla.

A'PEX (*Lat.*), in its general sense, the top, summit, or highest degree of anything. ——In Antiquity, a little woollen tuft on the cap of the flamen, or high-priest.—— In Mathematics, the point of a cone.

APHÆ'RESIS (*aphairĕsis*, from *aphaireo*, I take away: *Gr.*), in Grammar, the removal of a letter or syllable from the beginning of a word. —— In Surgery, an operation by which something that is superfluous is taken away.

APHE'LION (*apo*, from; and *hēlios*, the sun: *Gr.*), in Astronomy, that point of its orbit at which the earth, or any planet, is at the greatest distance from the sun.

A'PHIDES, in Entomology, the plural of *Aphis*, the genus to which *Plant Lice* belong. These are homopterous insects, which are sometimes wingless and sometimes furnished with four wings, feeding upon the juices of plants, especially those of young shoots. Some species are remarkable for secreting on the leaves of trees a sweet fluid, known as honey-dew, which is eagerly sought for by ants. The *Aphis Humuli*, or Hop Fly, is in some years very destructive to the crop; and it is to this cause that the variations of the hop crop from year to year are mainly due. Not long ago an aphis made its appearance all at once on the grain fields of New England, and in the State of New York, in such astonishing numbers, that in old time it would have been looked upon as a miraculous occurrence. In many fields the insect swarmed to an extent that the crop seemed smothered. It was found that the insect commenced bearing when it was only three days old, and produced four young ones daily. Thus the descendants of a single aphis will in twenty days amount to more than two millions. The Aphides are also very remarkable in regard to the phenomena attending their reproduction. The eggs produce females which will for many generations (as many as eleven have been counted) produce living young ones without the presence of a male insect amongst them. This is a striking instance of what has been called PARTHENO-GENESIS.

APHLOGIS'TIC (*aphlogistos:* from *a*, not; and *phlogistos*, burnt: *Gr.*), not inflammable. An *aphlogistic lamp* is one in which a coil of platinum wire is kept in a state of ignition by vapour of alcohol or ether, without flame.

APHO'NIA (*Gr.:* from *a*, without: and *phōnē*, a voice), in Medicine, a deprivation of voice, arising from palsy of the tongue.

APH'ORISM (*aphorismos*, from *aphorizo*, I define: *Gr.*), a maxim or principle of a science; or a sentence which comprehends a weighty truth in a few words.

APHRI'TE (*aphros*, foam: *Gr.*), a mineral substance, so called from its frothy appearance. It is a soft friable carbonate of lime.

APH'THÆ (*aphthai: Gr.*), in Medicine, the thrush; small, round, and superficial ulcers arising in the mouth. The principal seat of this disease is the extremity of excretory vessels. salivary glands, &c.

APHYL'LOUS (*aphullos:* from *a*, without; and *phullon*, a leaf: *Gr.*), in Botany, an epithet applied to plants which have no leaves, their place being taken by scales. Many species of cactus are aphyllous.

A'PIARY (from next), a place where bees are kept. It should be selected with great care; should be sheltered from the wet as well as from the extremes of heat and cold; should face the south, be defended from high winds, and not be within the sphere of offensive smells, or liable to the attacks of any hostile vermin.

A'PIS (*Lat.*), in Entomology, a genus of bees, including the hive-bee, *Apis mellifica*. [See BEE.]——In Mythology, APIS was the name of a bull to which divine honours were paid by the Egyptians, chiefly at Memphis.

APLANA'TIC (*aplanētos*, not gone astray: *Gr.*), in Optics, a term applied to that kind of refraction which causes rays to converge exactly to the true focus, and without the production of colour. It differs therefore from *achromatic*, in which colour has been corrected.

APO'CALYPSE (*apokalupto*, I disclose: *Gr.*), the Greek name of the last book of the New Testament, termed in English the Revelations. It was at one time generally attributed to the Apostle John, and supposed to have been written in the isle of Patmos, whither he had been banished by the emperor Domitian. Other authors have been named, and some wholly reject it as spurious. On account of its metaphorical language, the Apocalypse has been explained differently by almost every writer who has ventured to interpret it; and for the same reason it is one of those parts of the Bible which have furnished all sects with quotations to support their creeds or opinions. Bishop South's opinion of it was that it either found a man mad or left him so.

APO'COPE (*Gr.*, from *apokopto*, I cut off), in Grammar, a figure by which the last letter or syllable of a word is cut off.

APO'CRYPHA (*apokruptos*, hidden: *Gr.*), in Theology, certain books of doubtful authority which are not received into the canon of Holy Writ by the Reformed Churches, being considered as either spurious or not acknowledged as of divine origin; but nearly all of them are received by the Roman Catholic church, as of equal authority with the books of Scripture. They were never, however, on the canon of the Jews; they are not quoted by the authors of the New Testament; they contain manifest inconsistencies; and some of them even countenance tenets at variance with orthodox religion.

APO'CYNACEÆ, a nat. order of plants, of which many have a poisonous juice. They have monopetalous flowers, and a remarkable stigma, forming at the base a sort of ring. To this order belong our common periwinkle, the oleander, and some tropical plants with showy flowers, some of which are cultivated in our hothouses, such as the *Allamanda*, *Dipladenia*, *Plumieria*, and *Echites*.

A'PODAL (*a*, without; and *pous*, a foot: *Gr.*), a term applied by naturalists to fishes which have no ventral fins, like many eels.

APODIC'TICA (*apodeiktikos*, demonstrative: *Gr.*), in Rhetoric, an epithet for arguments which are fitted for proving the truth of any point.

APODIOX'IS (*Gr.*, from *apodiōko*, I drive away), in Rhetoric, a figure by which we either pass over a thing slightly, or reject it as unworthy of notice.

APODIX'IS (*Gr.*, from *apodeiknumi*, I point out), in Rhetoric, an evident demonstration.

APOD'OSIS (*Gr.*, from *apodidomi*, I explain), in Rhetoric, the latter part of a complete exordium, or the application of a simile.

AP'OGEE (*apo*, from; and *gē*, the earth: *Gr.*), in Astronomy, when the earth is at its greatest distance from the sun, the latter is said to be in *apogee*, and the earth in its *aphelion*; when at its least distance from the sun, that body is said to be in *perigee*, and the earth in its *perihelion*. Apogee and perigee are terms derived from that exploded system which considered the earth to be the centre round which the sun and planetary bodies circulated.

AP'OGRAPH (*apo*, from; and *grapho*, I write: *Gr.*), a copy or transcript of some book or writing.

APOLLINA'RIANS (from *Apollinarius*, Bishop of Laodicea, their founder), in Church History, a sect who maintained that Jesus Christ had a sensitive, but not a rational human soul, the divine nature supplying its place.

APOL'LO BEL'VIDERE, a famous marble statue of Apollo, which was found amongst the ruins of Antium, twelve leagues from Rome. It was purchased by pope Julius II. when a cardinal, and removed by him when pope to the Belvidere at the Vatican, whence its name. The left hand and the right fore-arm are modern restorations. The name of the sculptor is unknown, but it is thought to have been carved in the time of the emperor Nero.

AP'OLOGUE (*apologos*: *Gr.*), a poetical fiction, the purpose of which is the improvement of morals. Some writers are of opinion that this term ought to be confined to that species of fable in which brutes or inanimate things—as beasts or flowers—are made to speak.

APONEURO'SIS (*apo*, from; and *neuron*, a nerve: *Gr.*), in Anatomy, a tendinous membrane, expanded over the muscles of the limbs. The older anatomists gave it this name, because they believed tendons to be derived from nerves.

APOPH'ASIS (a denial: *Gr.*), a figure of speech, in which the orator briefly alludes to, or seems to decline stating, that which he wishes to insinuate.

AP'OPHTHEGM, or AP'OTHEGM (*apophthegma*: *Gr.*), a short sententious and instructive remark, especially if pronounced by a person of distinguished character.

APOPH'YGE (*apophugē*, a flight: *Gr.*), in Architecture, the part of a column where it springs out of its base.

APOPH'YLLITE (*apo*, from; and *phullon*, a leaf: *Gr.*), a mineral belonging to the *Zeolite* family, of foliated structure and a peculiar pearly lustre. When a fragment is forcibly rubbed against a hard body, it separates into thin laminæ.

APO'PHYSIS (a sprout: *Gr.*), in Anatomy, a projecting part or process of a bone. The various processes of the joints of the vertebræ are thus named, with the addition of prefixes to distinguish them. [See VERTEBRÆ.]

AP'OPLEXY (*apoplexia*, from *apoplēsso*, I strike down: *Gr.*), a disorder in which, while the patient is suddenly deprived of the exercise of all the senses, and of voluntary motion, a strong pulse remains with a deep respiration, attended with a stertor, and the appearance of a profound sleep. Complete apoplexy is produced by the pressure of blood (whether extravasated or not) upon the brain; and it is most usually found to accompany persons of a full habit of body, who have a short neck and a system disposed to a too copious sanguification.

APOS'TASY (*apostasia*, from *aphistamai*, I stand apart: *Gr.*), the quitting any system of thinking or acting, good or bad; but the word is generally used in a reproachful sense of one who has changed his religious opinions.

APOSTAX'IS (a trickling down: *Gr.*), in Medicine, any defluxion, but particularly of blood from the nose.

A POSTERIO'RI (from the latter: *Lat.*) [See A PRIORI.]

APOS'TLE (*apostolos*, one sent: *Gr.*), properly a person delegated or sent by another upon some business; and hence, by way of eminence, one of the twelve disciples commissioned by Jesus Christ to preach the gospel.

APOS'TROPHE (*Gr.*, from *apostrepho*, I turn aside), a figure of speech by which the orator turns from his subject to address a person either absent or dead, as if he were present.——APOSTROPHE, in Grammar, a mark of contraction in a word; thus, *lov'd* for *loved*.

APOTHEO'SIS (*Gr.*, from *apotheŏo*, I deify), deification, or the ceremony of placing men among the gods. The ancients deified all those who had invented things useful to mankind, or who had done any important service to the commonwealth. This honour was also conferred on several of the Roman emperors at their decease.

APOTH'ESIS (*Gr.*, from *apotithemi*, I put away), in Surgery, the placing of a fractured limb in the position in which it ought to remain.

AP'OTOME (*Gr.*, from *apotemno*, I cut off), in Music, the difference between the greater and the less semitone; also, the difference between the whole tone and the major semitone.——In Geometry, the difference between two lines or quantities, commensurable only in power. Thus, the diagonal of a square minus, one of the sides is the apotome, and is equal to $\sqrt{2} - 1$.

AP'PANAGE (*Fr.*), lands appropriated by the sovereign to the younger sons of the family as their patrimony; the reversion being reserved to the crown, on failure of male heirs.

APPARA'TUS (*Lat.*), the component parts of machinery; or a set of instruments or utensils necessary for practising any art.

APPA'RENT (*appareo*, I appear: *Lat.*), in a general sense, something that is visible to the eyes, or obvious to the understanding.——APPARENT, among Mathematicians and Astronomers, denotes things as they appear to us, in contradistinction from what they really are: thus we say, the apparent diameter, distance, magnitude, place, figure, &c., of bodies. In Astronomy, the apparent altitude of a star is the angle made by the line of vision with the horizon, while the real altitude requires the effect of parallax, &c., to be taken into account. The apparent diameter of a planet is measured by the angle made by two lines from the eye to opposite points of its disk: the real is a line joining these points. The apparent or sensible horizon is a plane tangential to the earth's surface at the place of the observer; the true horizon is a plane parallel to this, passing through the centre of the earth, &c.——APPARENT, in Law, is an epithet for an heir whose right of inheritance is indefeasible, as the heir *apparent;* or the immediate heir to the crown, in distinction from the heir *presumptive*.

APPARI'TION (*apparitio*, from same *deriv.*), in Astronomy, signifies a star or other luminary becoming visible, which before was hid: it is opposed to *occultation*. The *circle of apparition* is an imaginary line, within which the stars are always visible in any given latitude.

APPA'RITOR (*Lat.*), among the Romans, a general term to comprehend all attendants of judges and magistrates, appointed to receive and execute their orders.——APPARITOR, in English Law, a messenger that serves the process of a spiritual court.

APPEAL' (*appello*, I call upon: *Lat.*), in Law, the removal of a cause from an inferior to a superior court or judge, when a person thinks himself aggrieved by the sentence of the inferior judge. Appeals from the English and Irish Courts of Chancery and Common Law, from the Scotch Court of Session, and from the Probate and Divorce Courts, lie to the House of Lords. Appeals from the Indian and Colonial Courts, the Ecclesiastical Courts, and the Court of Admiralty, lie to the Sovereign in Council, and are heard by the Judicial Committee of the Privy Council.

APPEAR'ANCE (*appareo*, I appear: *Lat.*), in Perspective, the projection of a figure or body on the perspective plane.——In Astronomy, the same as *phenomenon* or *phasis*.——In Law, it signifies, in strictness, a party presenting himself in a court of law personally; but in some cases it may be effected through another.

APPEL'LANT, or APPEL'LOR (*appello*, I call upon: *Lat.*), in Law, he who makes or brings an appeal.

APPEL'LATIVE (same *deriv.*), in Grammar, a noun or name applicable to a whole species or kind, as, a man, a horse.

APPEN'DANT (*appendo*, I hang to: *Lat.*), in Law, anything that is inheritable, belonging to some more worthy inheritance; thus, an advowson, common, or court, may be appendant to a manor, land to an office, &c.

APPENDIC'ULATE (same *deriv.*), in Botany, having appendages.

APPEN'DIX (*Lat.*), in Literature, a treatise or supplement added at the end of a work, to render it more complete.

APPLICA'TION (*applicatio*, from *applico*, I put one thing to another: *Lat.*), in Geometry, is either the applying one quantity to another, or the transferring a given line into a circle or other figure, so that its end shall be in the perimeter of the figure, &c.——The *application* of one science to another is the use made of the principles of the one in perfecting the other: as in the application of algebra and geometry to mechanics; of mechanics to geometry; of geometry and astronomy to geography; of geometry and algebra to natural philosophy, &c.——APPLICATION, in Medicine, anything administered, externally or internally, by way of a remedy.

APPOGIATU'RA (*appogiare*, to lean upon: *Ital.*), in Music, a small note placed before another, from which it borrows half or a quarter of its value.

APPOSI'TION (*appositio*, from *appono*, I put to: *Lat.*), in Grammar, the placing two or more substantives together, referring to the same person or thing, without any copulative between them, as, 'Wellington, the conqueror.'

APPRAIS'ING (*apprecier*, to set a price upon: *Fr.*), the valuation of goods by competent persons. They are in some cases sworn to make a true return.

APPREHEN'SION (*apprehensio*, from *apprehendo*, I lay hold of: *Lat.*), in Logic, the first or most simple act of the mind, by which it perceives or is conscious of some idea: it is more usually called *perception*.

APPREN'TICE (*apprendre*, to learn: *Fr.*) a young person bound by indentures or

articles of agreement to a tradesman or artificer, to learn his trade.

APPROACH'ES (*approcher*, to approach: *Fr.*), in Fortification, the works thrown up by the besiegers, in order to get nearer a fortress without being exposed to the enemy's fire.

APPROPRIA'TION (*Fr.*, from *proprius*, peculiar: *Lat.*), in Ecclesiastical Law, the annexing a benefice to the proper and perpetual use of a religious house, bishopric, college, &c.; in the same way as *impropriation* is the grant of a benefice to a lay person or corporation; that which is an appropriation in the hands of religious persons, being usually called an impropriation in the hands of the laity.

APPRO'VER (*approbo*, I prove: *Lat.*), in Law, one who, confessing that he has committed a felony, is admitted to give evidence against his accomplices.

APPROXIMA'TION (*approximo*, I approach: *Lat.*), in a general sense, the getting near to an object.——In Mathematics, a continual approach to a root or quantity sought, but not expected to be found.

APPUI' (a support: *Fr.*), in the Manège, the sense of the action of the bridle in the horseman's hand. Thus, a horse has *no appui* when he cannot suffer the bit to bear even slightly upon the parts of the mouth; or *too much appui* when he throws himself too much upon the bit, &c.—— POINT D'APPUI, in the Military art, is a term for any particular given point or body upon which troops are formed, or by which they are marched into line or column.

AP'PULSE (*appulsus*, an arrival: *Lat.*), in Astronomy, the approach of a planet towards a conjunction with the sun or any of the fixed stars.

A'PRIL (probably contracted from *aperilis*, from *aperio*, I open: *Lat.*; because the earth, in this month, begins to open for the growth of plants), the fourth month of the year, according to European computation.

A PRIO'RI, A POSTERIO'RI (from something before, from something after: *Lat.*), logical terms, which are loosely employed to distinguish two lines of reasoning. An *a priori* argument is one derived from axioms, or admitted data, or previous facts, rendering the examination of the case before us unnecessary, in order to arrive at a conclusion respecting it: an *a posteriori* argument is one derived from the facts of the case itself. To show how vaguely the terms are applied, this instance may be given. From certain facts ascertained by astronomers, it was argued that there must be another planet attached to our system, which had not then been discovered. Now, as this conclusion was arrived at *previous to* the actual discovery of the planet Neptune, the reasoning might be called *a priori*. But it may also be styled *a posteriori* reasoning, since the existence of an unknown planet was inferred from the disturbances of the motions of the known planets, by the unknown planet itself.

APSE (*apsis*, a curved form: *Gr.*), in Ancient Architecture, the arched roof of a room, the canopy of a throne, &c.——In Ecclesiastical Architecture, the curved end of a church where the altar was placed.

AP'SIDES, or AP'SES (*apsis*, a wheel, or any curved form: *Gr.*), in Astronomy, the two points of a planet's orbit in which it is at its greatest and least distance from the sun. The line which joins them is called the *line of apsides*.

AP'TEROUS (*apteros*, wingless: from *a*, without; and *pteron*, a wing: *Gr.*), a term applied by naturalists to insects destitute of wings.

AP'TERYX (*a*, without; *pterux*, a wing: *Gr.*), the scientific name of the bird KIWI-KIWI, which see.

APYREX'IA (*apurexia*: from *a*, without; and *puretos*, a fever: *Gr.*), in Medicine, the abatement of a fever.

A'QUA (*Lat.*), water.

AQUAFOR'TIS (strong water: *Lat.*), the common name of nitric acid.

AQUA RE'GIA (royal water: *Lat.*), a combination of nitric and hydrochloric acids: so called because it dissolves gold, the king of metals. It is the chlorine of the latter acid which chiefly attacks the metal, and a chloride of gold is the product.

AQUARI'UM (*aqua*, water: *Lat.*), or AQUAVIV'ARIUM (*vivarium*, a preserve: *Lat.*), a small tank, usually of glass, for the maintenance of water-plants and animals in a living state. Both marine and fresh-water objects may be thus preserved for the study of their habits, mode of growth, &c.

AQUA'RIUS (the water-bearer: *Lat.*), in Astronomy, a constellation which makes the eleventh sign in the zodiac. It is said to have been called Aquarius, or the water-bearer, because the sun moves through it in parts of January and February, when the weather is usually rainy.

AQUATIN'TA (*aqua*, water; and *tincta*, dyed: *Lat.*), a style of engraving, or rather etching, by which an effect is produced similar to that of a drawing in Indian ink.

AQUA VI'TÆ (water of life: *Lat.*), a name applied to ardent spirits, answering to the *eau de vie*, or brandy of the French, and the *usquebaugh* of the Irish.

AQ'UEDUCT (*aquæ-ductus*, a channel for conveying water: *Lat.*), a construction of stone, &c., built to preserve the level of water, and convey it, by a canal, from one place to another. There are aqueducts under the ground, and others above it, supported by arches. The Roman aqueducts were noble works: remains of them are found not only in Italy, but in other parts of Europe. In the time of the emperor Nerva nine aqueducts supplied Rome, and delivered 27,743,100 cubic feet daily. At a later period there were twenty, which are estimated to have afforded 50,000,000 cubic feet. Near Nismes in the south of France there is an aqueduct 873 feet long and 188 feet high, built by the Romans, to convey water to the town from springs which are 14 miles distant. Aqueducts have been erected in modern times: that constructed by Louis XIV. for conveying the waters of the Eure to Versailles is about 4,400 feet long, and upwards of 200 high. It contains 242 arcades, forming 726 arches of 50 feet span. A supply of water is brought to Lisbon by an aqueduct which has a length of 56,380 feet. The work at the valley of Alcantara is 2,873 feet long, with a height at the middle of 226 feet.

A'QUILA (an eagle: *Lat.*), the eagle. It was reckoned by the ancients not only the king of birds, but the minister of Jupiter, who is said to have carried Ganymede up into heaven in the form of an eagle. It was also chosen as the symbol of empire, first by the Persians, and afterwards by the Romans; in consequence of which the eagle is seen on coins in a variety of forms. But the most frequent use of the eagle was on the Roman standards, upon which it was represented in gold or silver, with expanded wings.

AQUILA'RIA, see ALOES WOOD.

AQUILE'GIA (same *deriv.*), *columbine*, nat. order, *Ranunculaceæ*, a plant so called because of the resemblance its nectaries are supposed to bear to the eagle's claws.

ARABES'QUE, or MORESQUE, a style of decoration, in which flowers, fruits, curved lines, &c., were whimsically painted or sculptured in combination. The Moors and Arabians rejected the representations of human and animal forms, but in modern arabesques, these are usually introduced. Raffaelle painted some beautiful arabesques in the Vatican.

AR'ABIC FI'GURES, the numeral characters now used in Arithmetic. They were borrowed from the Arabians, and introduced into England about the eleventh century.

ARABO-TEDES'CO (*arabo*, Arabic; and *tedesco*, German: *Ital.*), a style of Architecture, in which are combined the Moorish, Roman, and German Gothic.

ARACHNI'DA (*arachnē*, a spider: *Gr.*), in Zoology, a class of articulate animals considered distinct from the true Insecta. They are wingless, have a head which is not usually distinct from the thorax, possess four pairs of legs, and the antennæ are modified into a prehensile or mandibuliform apparatus. To this class belong the SCORPIONS, which have an articulated abdomen, the SPIDERS, the Mites and their allies, and some minute parasites, such as the Mange-mite and the Itch-mite.

ARACHNOI'DES (*arachnē*, a spider; and *eidos*, form: *Gr.*), in Anatomy, an appellation given to several different membranes, as the tunic of the crystalline humour of the eye, the external lamina of the pia mater, and one of the coverings of the spinal marrow.

AR'ACHNOLO'GY (*arachnē*, a spider; *logos*, a discourse: *Gr.*), that branch of science which is concerned with SPIDERS and their allies.

ARÆOM'ETER (*araios*, thin; and *metron*, a measure; *Gr.*), an instrument for measuring the density or gravity of fluids, and usually made of glass. It consists of a round hollow ball, which terminates above in a long slender stem hermetically sealed, and below in a shorter stem ending with a smaller ball, in which is placed as much mercury as will keep the instrument floating in an erect position. The longer stem is divided into degrees or parts, which are numbered, to show the depth of its descent into any liquor; for that fluid is heaviest in which it sinks least, and lightest in which it sinks deepest. [See HYDROMETER.]

ARÆ'OSTYLE (*ariostulos*: from *arios*, thin; and *stulos*, a column: *Gr.*), in Architecture, a sort of intercolumniation in which the columns are at a considerable distance from each other.

AR'BITER (*Lat.*), in Civil Law, a person appointed by the magistrate, or chosen by the parties, to decide any point of difference; an umpire.

ARBITRA'TION, or **ARBIT'REMENT** (*arbitratio*, from *arbitror*, I award: *Lat.*), a power given by two or more contending parties to some person or persons to determine the dispute between them. Their decision is called an *award*.

AR'BOR (a tree: *Lat.*), in Mechanics, the principal spindle or axis, which communicates motion to the rest of the machine.

AR'BOR DIA'NÆ (the tree of Diana: *Lat.*), the figure of a tree formed by an amalgam of silver and mercury, which appears to vegetate in a very beautiful manner. The experiment is thus performed. One part of silver being dissolved in a sufficient quantity of nitric acid, the solution is diluted with 20 parts of clean water, and poured upon 2 parts of mercury. After a short time a crystallization will take place in the shape of a tree, with its branches, &c. It obtained its name from silver having been called Diana by the old chemists.

AR'BOR SCIEN'TIÆ (the tree of knowledge: *Lat.*), a general distribution or scheme of science or knowledge.

AR'BOR VI'TÆ (the tree of life: *Lat.*), evergreen shrubs belonging to the genus *Thuja*, nat. ord., *Coniferæ*.

ARBORES'CENT (*arboresco*, I become like a tree: *Lat.*), a term applied to all such things as resemble trees; thus we say arborescent shrubs.

ARBU'TUS (*Lat.*), the strawberry-tree; a beautiful evergreen shrub, bearing a fruit not unlike the strawberry. It belongs to the nat. ord. *Ericaceæ*, an order in which the heaths are placed.

ARC (*arcus*, a bow: *Lat.*), any part of a regular curve, such as a circle and ellipse.

ARCA'NUM (a secret: *Lat.*), among the old philosophers, any remedy, the preparation of which was industriously concealed, in order to enhance its value.

ARCH (*arcus*: *Lat.*), a building in form of a curve. Arches are either circular, elliptical, or straight.—*Pointed arches* are usually described by two segments on the sides of a supposed triangle. When this triangle is equilateral, it is an *equilateral arch*; when *acute*, a *lancet arch*; and when *obtuse*, a *drop arch*. *Elliptical arches* consist of a semi-ellipsis, and have commonly a key-stone and imposts; they are usually described by workmen on three centres. *Straight arches* (as they are improperly called) are used over doors and windows. They have, both above and below, plain straight edges, which are parallel: but the ends and joints point towards a centre. The term arch is peculiarly used for the space between the two piers of a bridge, for the passage of water, vessels, &c. It is not known in what country the arch was first invented: it is not found in any certainly ancient Egyptian building; nor was it used in the early Greek temples, &c. Its value was soon perceived by the Romans; for we find it in the *Cloaca Maxima*, the great common sewer of ancient Rome, constructed, most probably, in the time of the Tarquins. The pointed arch was introduced in the Middle Ages.——DIURNAL ARCH, in Astronomy, that part of a circle described by the heavenly body between its rising and setting. The *nocturnal arch* is that which is described between its setting and rising. ——TRIUMPHAL ARCH, in Ancient Architecture, a stately gate adorned with sculpture, inscriptions, &c., generally consisting of three arches, that in the centre being higher than the others; and erected in honour of those who had deserved a triumph.——ARCH (*archos*, chief: *Gr.*), as a syllable prefixed to another word, denotes the highest degree of its kind, whether good or bad; as *archangel, archduke, archbishop, archfiend*, &c. Many of the highest offices in different empires have this syllable prefixed to them.

ARCHÆOLO'GY (*archaios*, ancient; and *logos*, a discourse: *Gr.*), the study of Antiquities.

AR'CHAISM (*archaios*, ancient: *Gr.*), any antiquated word or phrase. The use of archaisms, though generally objectionable, occasionally adds to the beauty and force of a sentence.

ARCHBISH'OP, a metropolitan prelate, having several suffragan bishops under him. In England there are two archbishops—the archbishop of Canterbury, who is primate of *all* England; and the archbishop of York, who is styled primate of England. The first establishment of archbishops in England, according to Bede, was in the time of Lucius, said to be the first Christian king in Britain; but the first archbishop of Canterbury was Augustine, appointed A.D. 598, after the conversion of Ethelbert.

ARCHDEA'CON (*archos*, chief; and *diakonos*, minister: *Gr.*), an ecclesiastical officer next below a bishop in rank. Every diocese has one, and the majority more. Archdeacons are usually appointed by their diocesans; but their authority is independent. They visit the clergy, and have courts for the punishment of offenders by spiritual censures, and for hearing some other causes that fall within ecclesiastical cognizance.

ARCH'DUKE (*erz*, chief: *Germ.*), a title borne by the sons of the emperors of Russia and Austria.

ARCH'ERY (*arc-tirrerie*, the drawing of the bow: *Fr.*), the art of shooting with the bow and arrow. Since the introduction of gunpowder, the arrow has ceased to be employed as an offensive weapon; but in former times it was reckoned of the utmost importance to the military strength of this kingdom. The practice of archery was followed both as a recreation and a duty, and Edward III. prohibited all useless games that interfered with it on holidays and other intervals of leisure. By an act of Edward IV. every man was to have a bow of his own height, to be made of yew, hazel, or ash, &c.; and mounds of earth were to be raised in every township for the use of the inhabitants. Indeed, it appears from the use made of the bow by the English at the battles of Cressy, Agincourt, and Poictiers, that their claim to be considered the best of modern archers can scarcely be disputed. Artillery was originally a French term, signifying archery; and the London Artillery Company was a fraternity of bowmen.

ARCH'ES, or COURT OF ARCHES, the supreme court belonging to the archbishop of Canterbury, to which appeals lie from all the inferior courts within his province. *The Dean of the Arches*, who sits as the Archbishop's deputy, is the judge of this court. The name originated from the court having been held in the church of St. Mary-le-Bow (Bow Church), London, which was built on arches.

AR'CHETYPE (*archetupos*: from *archē*, an origin; and *tupos*, a type: *Gr.*), the first model of a work, which is copied when the work is executed.——In Comparative Anatomy, the plan or scheme of structure to which, in the opinion of some, organic beings existing and extinct variously approximate. Thus an archetype vertebrate skeleton has been described, which the skeletons of all known vertebrata shadow forth without being completely possessed by any. The *archetypal world*, among Platonists, means the world as it existed in the idea of God before the visible creation.

AR'CHIL, a violet-red paste used in dyeing: prepared, by the aid of air, moisture, and an ammoniacal liquor, from several species of lichen, but principally from those belonging to the genus *Roccella*.

AR'CHITECT (*architektōn*: from *archos*, the chief; and *tectōn*, a builder; *Gr.*), one who is skilled in architecture. The architect forms plans and designs for edifices, conducts the work, and directs the artificers employed in it.

AR'CHITECTURE (*architectura*: *Lat.*), the art of inventing and drawing designs for buildings, or the science which teaches the method of constructing any edifice for use or ornament. It is divided into *civil, military*, and *naval*, according as the erections are for civil, military, or naval purposes; and, for the sake of convenience, other divisions are sometimes introduced. Civil Architecture appears to have been among the earliest inventions, and its works have been commonly regulated by some principle of hereditary imitation. Whatever rude structure the climate and materials of any country have obliged its early inhabitants to adopt for their temporary shelter, the same structure, with all its prominent features, has been afterwards in some measure kept in view by their refined and opulent posterity. To Greece we are indebted for the three principal orders of architecture, the *Doric*, the *Ionic*, and the *Corinthian*; Rome added the *Tuscan* and the *Composite*, both formed out of the former. Each of these orders has a particular expression; so that a building may be rude, solid, neat, delicate, or gay, according as the Tuscan, the Doric, the Ionic, the Corinthian, or the Composite is employed. The columns of the several orders are easily distinguishable by the ornaments that are peculiar to their capitals; but the scientific difference consists in their proportions. The Tuscan order is characterized by its simplicity and strength. It is devoid of all ornament. The Doric is enlivened with ornaments in the frieze and capital, and the shaft is often fluted. The Ionic is ornamented with the volute scroll, or spiral: its ornaments are in a style between the plainness of the Doric and the richness of the Corinthian. The Corinthian is known by its capital being adorned with two sorts of leaves, between which rise little stalks, of which the volutes that support the highest part of the capital are formed. The Composite is nearly the same as the Corinthian, with an addition of the Ionic volute. In their private buildings the Roman architects followed the Greeks; but in their public edifices they far surpassed them in gorgeous magnificence. During the dark ages which followed the destruction of the Roman empire, the classic architecture of Greece and Rome was lost sight of, or most unskilfully copied; but was again revived by the Italians at the time of the restoration of letters. All the debased styles, which sprang from vain attempts to imitate the ancients, and which flourished from the destruction of the Roman power till the introduction of the Gothic, have been united under one term, the *Romanesque*. The origin of the *Gothic* style is a matter of great uncertainty. At first it was rude; but it ultimately exhibited grandeur and splendour, with the most accurate execution. The *Saxon* and *Norman styles* were so called because they were respectively used by the Saxons, in this country, before the Conquest, and by the Normans after it in the building of churches. The *Saxon* employed the semicircular arch, which seems to have been borrowed from the Romans. It was generally plain, but sometimes ornamented with rude and massive mouldings. The heads of small openings were often formed of two straight stones laid against each other. The quoins were usually of hewn stones, placed alternately flat and on end, a mode commonly termed 'long and short.' The walls were often decorated externally with flat vertical strips of stone, slightly projecting, and somewhat resembling pilasters. There is scarcely any one example containing all the peculiarities of this style; nor, indeed, is there a certainty that any building now remaining decidedly belongs to it. The *Norman* was at first very rude and heavy; its walls were very thick and generally without buttresses. The arches, both within and without, were semicircular, and supported by very plain and massive columns. The windows had no mullions, but were generally arranged in pairs, sometimes under a larger arch. Buttresses, when used, were broad, of small projection, often without breaks; and terminated under the cornice; neither spires nor pinnacles were employed. The imposts of the doors, &c., were massive and rudely carved: and external walls were frequently ornamented with interlaced arches. The Chapel of the White Tower, in London, is a fine specimen of this style. The Saxon and Norman, particularly the latter, continued to be the prevailing modes of building in England until the reign of Henry II., when a new mode was introduced, which was called *Modern Gothic*, or the *Pointed Style*. Whether this was purely a deviation from the other two modes, or was derived from any foreign source, is not known. It is, however, supposed by some to be of Saracenic origin, and to have been introduced by the Crusaders. This style may be divided into: 1. *Early Complete Gothic*, with its subdivisions of Lancet, and Geometrical Decorated; and 2. *Late Complete Gothic*, with its subdivisions, the Flowing, Flamboyant or Curvilinear Style, and the Perpendicular Continuous Style. The employment of the ogive in place of circular forms in the windows first marks the transition from one of these subdivisions to the other. The perpendicular style is confined to Great Britain; on the continent, 'the Flamboyant Style' was contemporaneous. During the latter part of the sixteenth century, the pointed style assumed the form termed 'the Elizabethan,' or 'Tudor;' in the latter examples of which the Italian is much mingled. The pointed style is distinguished by its numerous buttresses, lofty spires and pinnacles, large and ramified windows with a profusion of ornaments throughout. In the fifteenth and sixteenth centuries the taste for Greek and Roman architecture revived, and brought the five orders again into use: although for sacred edifices the Saxon and Gothic styles still maintain the pre-eminence. Besides those we have mentioned, other styles have been used: thus the Chinese, remarkable for its lightness; the Egyptian, for its vastness. This, as well as the Indian, was most probably derived from the excavations provided by nature as a protection against the sultry heat. Mexican architecture, notwithstanding the enthusiastic praises bestowed by some writers upon it, seems to have been of the rudest character; its temples were little more than vast mounds of earth, sometimes partially faced with stone.

AR'CHITRAVE (*archos*, the chief; and *trapĕx*, a beam: *Gr.*), in Architecture, that part of an order which lies immediately upon the capital of the column, being the lowest member of the entablature. It is sometimes called the *epistylium* (*epi*, upon; and *stulos*, a column: *Gr.*).

AR'CHIVES (probably from *archeia: Gr.*, used by Josephus to signify public registers), ancient records, or charters which contain the titles, pretensions, privileges, and prerogatives of a community, family, city, or kingdom.

AR'CHIVOLT (*arcus volutus*, a turned arch: *Lat.*), in Architecture, the inner contour of an arch, or a frame set off with mouldings, running over the faces of the arch stones, and bearing upon the imposts.

AR'CHON (*archōn*, a ruler: *Gr.*), one of the chief magistrates of the city and commonwealth of Athens. At first the archons succeeded to the kings, and had regal power. Their authority was then divided among nine, and was made annual. In the time of the Romans, the archonship was merely titular and honorary.

ARC'TIC (*arktikos*, near the Bear, northern: *Gr.*), lying under the polar Bear. In Astronomy, the *Arctic* or *North Pole* is that which is raised above our horizon, and is nearly pointed out by the stars in the tail of *Ursa Minor*. The *Arctic circle* is a lesser circle of the sphere, parallel to the equator, and distant 23½° from the north pole. This and the *Antarctic* are often called polar circles.

ARC'TOS, or **ARC'TUS** (*arktos*, the Bear: *Gr.*), in Astronomy, the Greek name for the *Ursa major* and *minor*, or the great and little Bear.

ARCTU'RUS (*arktos*, the Bear; and *ouros*, a guard: *Gr.*), a fixed star of the first magnitude, the α Boötis of astronomers.

ARCUA'TION (*arcuatus*, bent like a bow; *Lat.*), in Horticulture, the raising of trees by layers.——ARCUATION, in Surgery, a distortion or incurvation of the bones.

ARCUBALIS'TA (*arcus*, a bow: *Lat.*; and *ballo*, I hurl: *Gr.*), a cross-bow; a term which has been contracted both into *Balista* and *Arbalist*.

ARDAS'SINES, a very fine sort of Persian silk, the finest used in the looms of France.

A'REA (*Lat.*), in Geometry, the superficial contents of any triangle, quadrangle, or other figure.——AREA, in Mineralogy, the mass dug from the mines, or the place where it is dug.

ARE'CA (*arec: Malab.*), an Indian palm, bearing a nut, of which slices are rolled up in a betel leaf with a little lime, and chewed by the natives. [See BETEL.]

ARE'NA (*Lat.*), in Roman Antiquity, that part of the amphitheatre where the gladiators fought: so called from its being always strewn with sand, to conceal from the view of the people the blood spilt in the combat.

ARENA'TIO (*arena*, sand: *Lat.*), a kind of dry bath, in which the patient sat with his bare feet on hot sand.

ARE'OLA (a *dim.* of *area*; a little space: *Lat.*), one of the small divisions into which a space may be marked out by lines.

AREOP'AGUS (*Areiopagos*: from *Arēs*, Mars; and *pagos*, a hill: *Gr.*), a rocky eminence at Athens, near the Acropolis, upon which a sovereign criminal court held its sittings. The judges were called Areopagites, and through a long period they were greatly respected.

AR'GAND LAMP, so called from the inventor, a Frenchman, is a lamp with a hollow cylindrical wick, supplied with air both inside and outside.

AR'GENT (silver: *Fr.*), in Heraldry, the white colour in the coats of arms of baronets, knights, and gentlemen.

AR'GIL (*argilla*, potter's earth: *Lat.*), in Mineralogy, white clay: an unctuous kind of earth, of which earthenware is made.

ARGILLA'CEOUS EARTH, any earth consisting wholly or in great part of clay.

AR'GOL, a crystalline stony substance, deposited during the fermentation of grape juice. It consists of tartrate of potash and a little tartrate of lime with colouring matter. The tartaric acid of commerce is prepared from it.

AR'GONAUTA AR'GO, the scientific name of the Paper Nautilus, a marine mollusc belonging to the class of Cephalopods, and inhabiting a thin white shell of elegant form. [See NAUTILUS.]

AR'GONAUTS (*Argo*; and *nautēs*, a sailor: *Gr.*), in Grecian Antiquity, a company of illustrious Greeks, who are said to have embarked along with Jason in the ship Argo, on an expedition to Colchis with a design to obtain the golden fleece, a fable to which perpetual allusion is made by Greek and Latin writers. Whether there was any nucleus of fact in the tradition it is impossible to tell.

AR'GO NA'VIS (the ship Argo: *Lat.*), in Astronomy, a constellation, called after the ship of Jason and his companions.

AR'GUMENT (*argumentum*: *Lat.*), in Logic a line of reasoning employed to convince an opponent or one ignorant of the subject. Locke observes that, in reasoning, men ordinarily use four sorts of argument. The first is to allege the opinions of those whose parts and learning, eminence, power, or some other cause, have gained them a name, and settled their reputation in the common esteem, with some kind of authority; this may be called *argumentum ad verecundiam*. A second way is to require the adversaries to admit what they allege as a proof, or to assign a better; this he calls *argumentum ad ignorantiam*. A third way is, to press a man with consequences drawn from his own principles or acts: this is known by the name of *argumentum ad hominem*. A fourth way is the using proofs drawn from any of the foundations of knowledge or probability; this he calls *argumentum ad judicium*, and observes that it is the only one of all the four that brings true instruction with it, and advances us in our way to knowledge.——ARGUMENT, in Literature, the abridgment, or heads of a book, history, chapter, &c.——ARGUMENT, in Astronomy, the angle or quantity on which a series of numbers in a table depends. Thus, in a table showing the amount of horizontal refraction at every degree, &c., of altitude, the altitude would be the argument of the refraction.

ARGUMENTA'TION (*argumentatio*, a reasoning: *Lat.*), in Logic, an operation of the intellect, by which any proposition is proved with the help of other propositions.

A'RIANS, the followers of Arius, a presbyter of Alexandria, who, about A.D. 319, denied the three persons in the Holy Trinity to be of the same essence: affirmed that Christ was a creature inferior to the

Father as to his deity, and neither co-eternal nor co-equal with him; and asserted that the Holy Ghost was formed of the Son. These opinions were revived by Servetus in 1531, and have become prevalent among the disciples of the church founded by Calvin. They were propagated in England in the beginning of the eighteenth century.

A'RIES (the Ram: *Lat.*), in Astronomy, a constellation of fixed stars, drawn on the celestial globe in the figure of a *ram*. It is also the first of the twelve signs of the zodiac, from which a twelfth part of the ecliptic takes its denomination; and the *first point* of Aries coincides with the point at which the ecliptic intersects the equator. Anciently, the signs and constellations coincided; but as, on account of the precession of the equinoxes, the twelve signs go backward among the constellations at the rate of 50′ annually, the first point of Aries is now in the constellation Pisces.—— ARIES was also the original name for the battering ram of the ancients, the striking end of it being frequently made in the shape of a ram's head.

ARIO'SO (graceful: *Ital.*), in Musical Composition, like an air, in contradistinction to recitation. When applied to instruments, it means a sustained vocal style.

ARIS'TA (*arista*, a beard of corn: *Lat.*), in Botany, a long needle-like beard, which stands out from the husk of barley, grass, &c., commonly called the awn.

ARISTOC'RACY (*aristokratia*: from *aristos*, the best; and *krateo*, I govern: *Gr.*), an hereditary government, composed of the nobles or superior citizens of a country: such was the government of Venice. The word aristocracy is also often used to express the nobility of a country, under a monarchy, or any form of government.

ARISTOLO'CHIA (*Gr.*: from *aristos*, best; and *locheia*, childbirth—from its supposed virtues), *Birthwort*, nat. ord. *Aristolochiaceæ*. The species of this genus are for the most part climbers, with curious flowers, inhabiting tropical countries. One species, *A. clematitis*, is indigenous in Britain.

ARISTOTE'LIAN, something relating to Aristotle: thus the Aristotelian philosophy, school, &c. The Aristotelians were also designated Peripatetics, and their philosophy long prevailed throughout Europe, until men perceived that facts could not be discovered by words.

ARITH'METIC (*arithmos*, number: *Gr.*), is the art of computation by numbers. Books of arithmetic contain a body of rules, by which the processes of addition, subtraction, multiplication and division are facilitated, and by which certain other computations desirable for the purposes of business are effected. The method of notation we now use is said to have been obtained from the Arabians: and the characters by which all the operations of common arithmetic are performed are 1, 2, 3, 4, 5, 6, 7, 8, 9, 0. The first nine are called significant figures, or *digits*, which when placed singly denote the simple values belonging to them; but when several digits are placed together, the first or right-hand only is to be taken for its simple value, the second signifies so many tens, the third so many hundreds, and so on. Although this notation consists of only nine digits, with the cipher 0, yet, by giving a local power to these figures, namely, that of units, tens, hundreds, thousands, &c., they may be made to express numbers to an indefinite extent. The Greeks, and other ancient nations, made use of the letters of their alphabets to represent numbers. The Romans followed the same method, but in a simpler form, using I, for One; V, for Five; X, for Ten; L, for Fifty; C, for One Hundred: D, for Five Hundred; and M, for a thousand. Now it is evident that with these seven letters any number may be represented, by repetition and combination: thus XXX stands for three tens, or thirty, CCX for two hundred and ten, and so on. The general rule with regard to the addition and subtraction of these letters is this: when a character of smaller is placed *after*, or on the right hand of, one of a greater value, their values are to be added: thus XVI stands for sixteen. But when it is placed *before*, or on the left hand of, one of greater value, the value of the less is to be taken from that of the greater: thus IV stands for five less one, or four; IX for ten less one, or nine; XC one hundred less ten, or ninety, &c. MDCCCLXIV expresses the year 1864. Arithmetic deals not only with whole numbers, but with broken parts called fractions, of which there are two kinds, Vulgar Fractions, and Decimal Fractions. [See FRACTIONS.]

ARK OF THE COV'ENANT, the chest in which the stone tables of the ten commandments, written by the divine hand, were laid up. The lid of the ark was called the mercy-seat, before which the high-priest appeared once every year on the great day of expiation; and the Jews, wherever they worshipped, turned their faces towards the place where the ark stood.

ARMA'DA, a Spanish term, signifying a fleet of men-of-war. The armada to which the Spaniards, in the confidence of success, gave the name of *invincible*, consisted of 150 large ships, carrying 2,650 guns, 20,000 soldiers, besides volunteers, and 8,000 seamen; it was furnished with an immense quantity of military stores, and was intended to destroy the liberties of this country during the reign of the illustrious Elizabeth; but it was scattered by the elements and almost annihilated by the English fleet, on the 30th of July, 1588. On this occasion, a medal was struck with the motto, 'Afflavit Deus, et dissipantur.' 'God breathed upon them, and they are scattered'

ARMADIL'LA (the *dim.* of *armada*), or GUARDA COSTA, a squadron of men-of-war, formerly maintained on the coasts of Spanish America, to prevent foreigners from trading with the colonists and natives.

ARMADIL'LO (*Dasypus*), a mammalian animal, belonging to Cuvier's family of *Edentata*, of which there are several species, all inhabiting South America. They are covered with a bony case, and most of the species have long tails similarly protected

They are burrowing animals, with nocturnal habits, feeding chiefly on vegetables. Their flesh affords excellent food.

ARME'NIANS, a sect or division amongst the Eastern Christians; thus called from Armenia, the country anciently inhabited by them. There were two kinds of Armenians, one which adhered to the Roman Catholic church, and another which rejected episcopacy. They are generally accused of being Monophysites, allowing only one nature in Jesus Christ.

AR'MIGER (*arma*, arms; and *gero*, I bear: *Lat.*), an esquire, or armour-bearer. Also, one entitled to bear coat-armour. Justice Shallow wrote himself '*armigero*, in any bill, warrant, quittance or obligation.'

ARMIL'LA (a bracelet: *Lat.*), in Antiquity, an ornament for the wrist, presented to soldiers as a badge of distinction.——**ARMILLA MEMBROSA** (a membranous bracelet: *Lat.*), in Anatomy, the circular ligament which surrounds all the tendons of the hand, retaining them as it were in a circle.

ARMIL'LARY SPHERE (last), in Astronomy, an apparatus composed of the principal celestial circles, the equator ecliptic, &c., arranged so as to assist a student to comprehend the facts of astronomy. It revolves on its axis, has a silvered horizon which is divided into degrees, and is movable every way upon a brass supporter.——**ARMILLARY TRIGONOMETER**, an instrument consisting of five semicircles, divided and graduated so as to solve many problems in astronomy.

ARMI'NIANS, followers of Arminius, known as Remonstrants on the continent; a sect of Christians which arose in Holland about the beginning of the 17th century, and separated itself from the Calvinists. Arminius taught against Calvin that men are not predestined by the decrees of God to happiness or perdition in a future state. The Church of England, the Wesleyan Methodists, and other sects, entertain Arminian opinions.

AR'MOUR (*armatura*: *Lat.*), a name for all such contrivances as serve to defend the body from wounds, or to annoy the enemy. Hence it is divided into two kinds, defensive and offensive. A complete suit of *defensive armour* anciently consisted of a casque or helm, a gorget, cuirass, gauntlets, tasses, brassets, cuishes, and covers for the legs, to which the spurs were fastened. This was called armour *cap-a-pie*, and was worn by cavaliers and men-at-arms. The infantry had only part of it, viz. a pot or head piece, a cuirass and tasses; all of them made light. The horses had armour, which covered the head and neck. Of all this furniture of war, scarcely anything is now retained except, in a few cases, the cuirass. *Offensive armour*, or arms, consists of a sword, lance, darts, musket, &c.

AR'MOUR-BEARER, the person who was formerly employed to carry the armour of another.

ARMS (*arma*: *Lat.*), in Military phraseology, all kinds of weapons, whether used for offence or defence.——**ARMS**, in a Legal sense, anything that a person wears for his own defence, or takes into his hand, and uses, in anger, to strike or throw at another.——**COATS OF ARMS**, family insignia or distinctions, which had their rise from the painting of shields practised even in the most ancient times; from the banner borne in war and the tournament; and from the embroidered tunics worn over the armour. Without such contrivances, men cased in armour could not be recognized. In modern times they are placed on carriages, plate &c.

AR'MY (*armée*: *Fr.*), in a general sense, the whole armed force raised for the defence of a country by land. In a limited sense, it denotes a large body of soldiers consisting of horse and foot, completely armed and provided with artillery, ammunition, provisions, &c., under a commander-in-chief, having lieutenant-generals, major-generals, brigadiers, and other officers under him. An army is generally divided into a certain number of corps, each consisting of brigades, regiments, battalions, and squadrons. When in the field it is formed into lines; the first line is called the vanguard, the second the main body, the third the rear guard, or body of reserve. The middle of each line is occupied by the foot; the cavalry forms the right and left wing of each line, and sometimes squadrons of horse are placed in the intervals between the battalions.——The *matériel* of an army, as the French term it, consists of the horses, stores, provisions, and everything necessary for service.

ARO'MA (any spice: *Gr.*), the odoriferous principle peculiar to plants and flowers.

AROMAT'IC (last), an appellation given to such plants and other bodies as yield a brisk fragrant smell, and a warm spicy taste, as cloves, cardamom-seeds, cinnamon, nutmegs, &c. The peculiar qualities of aromatic plants reside in a volatile oil, usually called essential oil, and in a grosser resinous substance, capable of being extracted by spirit of wine. *Aromatics*, considered as medicines, warm the stomach, and by degrees the whole habit, raise the pulse, and quicken the circulation: hence, in cold languid cases, they increase strength and promote the natural secretions.

ARPEG'GIO (*arpeggiare*, to play the harp: *Ital.*), in Music, a term implying that the tones should be sounded distinctly, as they are heard on the harp.——**ARPEGGIO ACCOMPANIMENT**, one that consists chiefly of the notes of the several chords, taken in returning successions.

AR'PENT, an old French measure of 100 perches.

AR'QUEBUS (*Fr.*), an ancient hand-gun, larger than a musket. He who used it was called an *Arquebusier*.

ARQUEBUSA'DE (last), an aromatic spirituous lotion, used with sprains and bruises, but originally intended for wounds inflicted with an arquebus.

ARRA'CHE' (*arracher*, to snatch: *Fr.*), in Heraldry, the representation of a plant torn up by the roots.

ARRA'CK, an East Indian name for an ardent spirit distilled from rice, palm-juice, and other matters.

ARRAIGN'MENT, in Law, the bringing a prisoner forth, reading the indictment to him, and putting the question of guilty or not guilty.

AR'RAS HANG'INGS, tapestry made at Arras, in France, or tapestry of similar design.

ARRAY' (order: *Old Fr.*), the drawing up of soldiers in order of battle.——In Law, *to challenge an array* is to make exceptions against all the persons arrayed or empanneled as a jury.

ARREST' (*arrêter*, to stop: *Fr.*), the apprehending and restraining a person which in all cases, except treason, felony, or breach of the peace, must be done by virtue of a warrant from some court, or some person authorized to grant it. Ambassadors, peers of the realm, and members of parliament are privileged from an arrest in civil cases, as also barristers and attorneys when attending the courts. When a defendant is already in one of the prisons of the superior courts, a writ of *detainer* will continue such imprisonment at the suit of a new plaintiff.——ARREST OF JUDGMENT, is the assigning just reasons why judgment should not pass; as, want of notice of the trial; a material defect in the pleading; when the record differs from the deed pleaded; where more is given by the verdict than is laid in the declaration, &c. This may be done either in criminal or civil cases.——ARREST, in the Veterinary art, a disease seated between the ham and the pastern.

ARRIE'RE BAN (*arrière*, rear; and *ban*, a convening of those who held immediately from the king: *Fr.*), the phrase for a general proclamation of the French kings, by which not only their immediate feudatories, but their vassals, were summoned to take the field, in war.——An *arrière vassal* was the vassal of a vassal.

AR'RIS (*arisan*, to arise: *Sax.*), in Architecture, the intersection or line formed by the meeting of the exterior surfaces of two bodies, answering to what is called the edge.——ARRIS FILLET, a small piece of timber, of a triangular section, used in raising the slates against a wall that cuts obliquely across the roof.

ARRON'DE'E (*arrondir*, to round: *Fr.*), in Heraldry, a cross, consisting of segments of a circle, the whole of the curves being in the same direction, so that its arms are not of different widths at different parts.

AR'ROW (*arwe: Sax.*), a light shaft, or rod, pointed at one end, and feathered at the other, intended as a weapon of offence. Arrow-makers were called *fletchers* (from *flèche*, the French word for *arrow*). When the arrow is borne in coats of arms, it is said to be barbed and feathered.

AR'ROW-GRASS, marsh plants belonging to the genus *Triglochin*, nat. order, *Juncaginaceæ*, so called because their leaves resemble the head of an arrow. There are two species in Britain.

AR'ROW-ROOT, a nutritive fecula, obtained from the tuberous roots of several exotic plants. The West Indian arrowroot is obtained from species of *Maranta*, chiefly *M. arundinacea*; East Indian from *Curcuma leucorhiza*. The root is simply grated, and the starch freed from impurities by repeated washing.

AR'ROW-STICK, a rod employed in surveying.

ARSE'NIATE, a salt formed by the combination of arsenic acid with a base; as the arseniate of ammonia, &c.

AR'SENIC (*arsenikon*, yellow orpiment: *Gr.*), a brittle metal, of an iron-grey colour; its specific gravity is 5·7. It volatilizes at 365° Fahr., with the odour of garlic. Like its compounds it is highly poisonous. It is found associated with many other substances; but it is usually obtained as *realgar*, or *orpiment*, which are both sulphurets, and, when prepared artificially, are used as red and yellow paints. White oxide of arsenic or arsenious acid is the arsenic of which we hear in poisoning cases. The best antidote for arsenic is expelling it as quickly as possible by emetics or the stomach-pump, and administering the hydrated peroxide of iron in plentiful doses.

AR'SON (*arsum*, to burn: *Lat.*), the act of wilfully setting houses on fire, which is felony at common law, and likewise by statute.

ART (*ars: Lat.*), a system of rules, serving to facilitate the performance of certain actions; in which sense it is opposed to *science*, or a system of principles.——Such words as are used in any particular art, profession, or science, are called *terms of art*, or *technical terms*.

ART AND PART, a phrase used in Scotland. When anyone is charged with a crime, they say he is *art and part* in committing it: that is, he was concerned both in the contrivance and execution of it.

ARTEMI'SIA (*Gr.*: from *Artemis*, Diana), in Antiquity, a festival celebrated in honour of Diana.——In Botany, a genus of composite plants, in which southernwood, wormwood, and tarragon, are contained.

AR'TERY (*aër*, the air; and *têreo*, I keep: *Gr.*—see AORTA), a blood-vessel which proceeds from the heart, and gradually becomes less in diameter the farther it goes; but it gives out numberless ramifications in its course. Arteries carry the blood from the heart to every part of the body. The action of the arteries, called the pulse, corresponds to that of the heart.

ARTE'SIAN WELL, a well bored to a considerable depth, until it reaches a subterranean basin. The water then rises up the bore in consequence of the hydrostatic pressure, and in some cases will spring into the air from the mouth of the well. It is said that Artesian wells derive their name from the ancient French province of Artois where for many centuries they have been used, although their adoption in this country is very recent. In London and its vicinity there are now a great many of these wells, which have been perforated through the immensely thick bed of London clay, and even through some portions of the subjacent chalk. The fountains in Trafalgar Square are supplied by an Artesian well 400 feet deep, and from another one of the same depth is drawn the water required for the Horticultural Gardens at South Kensington. The Artesian well at Grenelle, near Paris, is 1,798 feet deep: it affords 881,884 gallons of pure water in the twenty-four hours. The water rises to a considerable height above the surface of the ground. The temperature of the water as it escapes is 81°. A well at Passy, near Paris, is 1,925 feet deep, and affords upwards of four millions of gallons per diem, sufficient for the wants of a population of 500,000. The cost was about 39,000*l.*

ARTHRI'TIS (*Gr.*), the *gout*, which see.

ARTHRO'DIA (*arthron*, a joint: *Gr.*), in Anatomy, a species of articulation, in which the flat head of one bone is received into the shallow socket of another.

ARTHUR, the chief hero of British chivalrous romance. He was said to be the son of Pendragon, the last British king who defended England against the Anglo-Saxons. His wife was named Genevra, or Guinevere. He, and his twelve knights, called peers, sate at the Round Table which he instituted. Of these knights the most famous were Sir Tristan of the Lyonnese, Lancelot of the Lake, Galaar his son, Percival of Wales, and Gawin the king's nephew. Merlin the enchanter was a leading personage at the king's court.

AR'TICHOKE (*kharciof: Arab.*), a composite plant, the *Cynara Scolymus* of botanists. The fleshy bases of the scales of the involucre are eaten. The Jerusalem Artichoke, called *Helianthus tuberosus* by botanists, is a member of the same order. It is the root of this plant that is eaten. Its common name is a corruption of the Italian word Girasole, a name given to it because it was supposed that it, or some of its congeners, turned with the sun.

AR'TICLE (*articulus*, literally a small joint: *Lat.*), in Grammar, a particle in most modern languages, that serves to mark the several cases and genders of nouns, when the languages have not different terminations to denote their different states and circumstances.——ARTICLE, in Law, a clause or condition in a covenant. ——ARTICLE, in Zoology and Botany, a joint.

AR'TICULATA (same *deriv.*), a sub-kingdom or province of the Animal Kingdom, which is divided into five classes: 1. CRUSTACEA (Crabs, lobsters &c.) 2. ARACHNIDA (SPIDERS and their allies) 3. INSECTA (Flies, bees, beetles, butterflies, moths, &c.) 4. ANNELIDA, or ANNULATA (Worms). 5. ENTOZOA (Intestinal worms).

ARTICULA'TION (*articulatio*, from *articulo*, I divide into joints: *Lat.*), in Anatomy, the junction of two bones intended for motion. There are two kinds of articulation; the *diarthrosis*, which has a manifest, and *synarthrosis*, which has only an obscure motion.——Also, the distinct utterance of every letter, syllable, or word, so as to make oneself intelligible.

ARTIF'ICER (*artifex*: from *ars*, an art; and *facio*, I make: *Lat.*), one who works with the hands, and manufactures any kind of commodity in metal, wood, &c.; a mechanic.

ARTIFI'CIAL DAY, in Astronomy, that space of time which intervenes between the rising and setting of the sun.

ARTIFI'CIAL LINES, in Geometry, lines so marked on a sector as to represent logarithmic lines and tangents.

ARTIL'LERY (*artillerie: Fr.*), a collective name denoting all kinds of missiles used in war, with the machines for propelling them, but particularly cannon, mortars, and other large pieces for the discharge of shot and shell. The science of artillery teaches whatever relates to the construction of all engines of war, the arrangement, movement, and management of cannon and all sorts of ordnance, used either in the field, or the camp, or at sieges, &c. The same name is also given to the troops by whom these arms are served, the men being, in fact, subsidiary to the instruments.——*Park of artillery*, a place set apart in a camp for the artillery and large firearms.——*Train of artillery*, a set or number of pieces of ordnance mounted on carriages. ——*Flying artillery*, a sort of artillery, so called from the celerity with which it can be moved. Seats are contrived for the men who work it, and a sufficient force of horses is applied to enable them to proceed at a gallop.

AR'TIST (*artiste: Fr.; from ars*, an art: *Lat.*), a proficient in the liberal arts, in distinction from *artisan*, or one who follows one of the mechanic arts.

ARTS (*ars*, an art: *Lat.*), are usually divided into the *fine* and the *useful*: the former comprising all those of which the direct object is not absolute utility, as painting, sculpture, music, poetry, &c.; and the latter such as are essential to trade and commerce. The ancients divided them into the *liberal* and the *servile*: the former being considered as belonging to freemen, and the latter to slaves.

ARUM, a common English herbaceous plant, the root of which yields a starch known as Portland sago. It belongs to the nat. ord. *Araceæ*, or *Aroideæ*, characterized by having the male and female flowers growing upon a central shaft or spadix, and surrounded by a sheath called a spathe. The beautiful Lily of the Nile belongs to this order. The roots of some species belonging to the genera *Caladium* and *Colocasia* are common articles of food in hot countries, and form the *taro* (*kalo* according to Seemann) of the South Sea Islanders. In tropical Brazil there are groves of arborescent *Caladia*, from 12 to 15 feet high, and having woody stems from 8 to 10 inches in diameter.

ARUNDE'LIAN MAR'BLES, a collection of ancient statues, busts, altars, and inscribed stones, found, in the early part of the 17th century, by Thomas Howard, Earl of Arundel, a great lover of the arts, who died in 1646. The collection when complete consisted of 37 statues, 128 busts, and 250 inscribed marbles, besides altars, sarcophagi, and some fine gems (the Marlborough gems of the present day), and these were placed in Lord Arundel's house in the Strand. After his death the collection was dispersed: part was purchased by Lord Pembroke, and is now at Wilton; another part went into the possession of the present Lord Pomfret's family, and ultimately found their way to Oxford. The inscribed marbles which had descended to a grandson of Lord Arundel, were by him presented to the University of Oxford. After Selden's collection had been added to them, the inscriptions were published with annotations. The most interesting of the inscribed stones is that called the Parian Chronicle, from its being supposed that it was made in the island of Paros, B.C. 263.

ARUS'PICES, or HARUS'PICES (*haruspex*, a soothsayer: *Lat.;* probably from *hira*, the empty gut, or jejunum; and *spicio*, I behold: *Lat.*), an order of priests among the Romans, who pretended to foretell events by inspecting the entrails of victims killed in sacrifice. They derived their name from looking on the entrails, being called also, for the same reason, *exti spices* (ab extis inspiciendis). The tradition ran that they had been instituted by Romulus.

AR'VIL, or AR'VAL, in English Archæology, funeral rites.——ARVIL BREAD, bread given to the poor at a funeral.

ARYAN (*Sanskrit*), a term applied in Philology to a family of languages, otherwise termed Indo-European, embracing Sanskrit, Greek, Latin, Gothic, Celtic, and Slavonic. It is conjectured that there was an ancient people, the Aryans, of whose tongue these various languages are corruptions.

AS (*Lat.*), a weight used by the ancients, consisting of 12 ounces, and very nearly equal to our pound.——Also, a brass coin, which originally weighed an *as*, but was ultimately reduced to half an ounce: its value was about three farthings English money.——Also, an integer divided into twelve parts. 'Ex asse hæres,' the heir to the whole estate.

ASBES'TOS (inextinguishable: *Gr.*), a mineral which has a fibrous structure [see AMIANTHUS]. The ancients made an incombustible cloth from asbestos, for the purpose, it is said, of wrapping up the bodies of the dead when placed on the funeral pile, that their ashes might be collected free from mixture with those of the combustibles employed. A rock has been found in Western Australia, of which asbestos forms a principle ingredient, and this renders it so soft that it may be cut into any shape with an axe.

ASCAR'IDES (*Gr.*), the plural of *Ascaris*, the name of a genus of entozoa, of which some species infest the human body.

ASCEN'DANT (*ascendo*, I ascend: *Lat.*), in Law, such relations as are nearer the root of the family; as the father, grandfather, great-uncle, &c. Marriage is always forbidden between the ascendants and descendants in a right line.——ASCENDANT, in Astrology, that degree of the ecliptic that rises at a person's nativity; or the planet supposed by astrologers to preside over the fate of an individual at his birth.——ASCENDANT, in Architecture, an ornament in masonry or joiner's work, which borders the three sides of doors, windows, and chimneys.

ASCEND'ING (same *deriv.*), in Astronomy, an epithet applied to any star, degree, or point in the heavens, which is rising above the horizon.——ASCENDING LATITUDE, the latitude of a planet when going towards the north pole.——ASCENDING NODE, that point of a planet's orbit, at which it passes the ecliptic to proceed northward.——ASCENDING SIGNS, those eastward from the meridian, that is, approaching the meridian on account of the diurnal rotation.

ASCEN'SION (*ascensio*, from same *deriv.*), an astronomical term. The *right ascension* of a star is the arc of the equinoctial included between a certain point called the vernal equinox and the point cut by the circle of declination of that star. The right ascension (R.A.) and declination (N.P.D.) of a star correspond to the longitude and latitude of a place on our globe. The right ascension of a star is determined by observing the moment of its passage across the meridian by a clock regulated to exact sidereal time.

ASCEN'SION-DAY (same *deriv.*), a festival observed in the Christian church, on a Thursday, ten days before Whitsuntide, in commemoration of Christ's ascent into heaven.

ASCET'ICS (*asketikos*, industrious; from *askeo*, I exercise: *Gr.*), in Ecclesiastical History, such Christians as inured themselves to great degrees of abstinence and fasting, in order to subdue their passions; following the system of the Essenes and Therapeutæ among the Jews. They had their origin in Egypt and Syria. They seem to have supposed that mortification of the body, even though equivalent to slow suicide, is the perfection of religion.

ASCID'IANS (*askidion*, the *dim.* of *askos*, a wine-skin: *Gr.*), in Zoology, a tribe of marine molluscs, belonging to the class of TUNICATA. In place of a shell they have an elastic bag, like a coat or tunic, by the base of which they are attached to rocks. Into this sac there are two openings, one branchial, the other anal. These animals sometimes grow to the length of several inches.

AS'CII (*askioi;* from *a*, without; and *skia*, shadow: *Gr.*), in Geography, inhabitants of the globe who, at certain times, have no shadow: such as those in the torrid zone, who twice a year have the sun vertical at noon.

ASCI'TES (*askites*, from *askos*, a wine-skin: *Gr.*), in Medicine, dropsy in the region of the abdomen.

ASCLEPIADA'CEÆ (from *Asclepias*, the name of one of the genera), an order of plants with monopetalous flowers growing chiefly in Africa. They are remarkable for abounding in milky juice, and for the curious structure of the anthers and stigma, which are consolidated into a column. A kind of silky cotton is attached to the seed.

The plants of this order are not possessed of many useful properties; but some of the genera (Hoya, Stapelia, Stephanotis, &c.) are conspicuous in our hot-houses for their beautiful or curious flowers.

ASH (*ac*, a point: *Celt.*), a well-known English tree, whose wood is much used by wheelwrights, turners, &c. It is the *Fraxinus excelsior* of botanists: nat. ord. *Oleaceæ*. The mountain-ash is a small tree, bearing bunches of red pomes, which are very ornamental in autumn. It is called *Pyrus aucuparia* by botanists, and is allied to the apple and pear: nat. ord. *Rosaceæ*.

ASH-WED'NESDAY, the first day in Lent, so called from the ancient custom of fasting in sackcloth and ashes.

ASH'LAR MAS'ONRY (*asciare*, to chip: *Ital.*), in Architecture, consists of blocks of stone cut to rectangular or other regular figures, and laid in courses of uniform depth.

ASHO'RE, a term for 'on the shore or land,' as opposed to *aboard;* but a ship is said to be *ashore* when she has run aground.

ASI'DE, a term in plays for what is supposed to be said on the stage without being heard by the other performers.

ASI'LUS (the horse-fly: *Lat.*), in Entomology, a genus of dipterous insects which prey on other insects. Several of the species are natives of Britain.

ASP (*aspis*, a shield: *Gr.*, because it coils itself up so as to resemble a circular shield), a venomous serpent, the *Naja haje* of naturalists, a native of Lybia and Egypt, where it was formerly considered sacred, and the emblem of divinity. Its bite is very deadly, and yet the serpent charmers make use of it in their performances. It is supposed to have been the instrument of Cleopatra's death. The fatal cobra de capello belongs to the same genus.

ASPAR'AGUS (*asparagos: Gr.*), a well-known plant, the young shoots of which are eaten. It belongs to the order of *Liliaceæ*.

AS'PEN-TREE, a species of poplar, the *Populus tremula* of botanists. The shaking of its leaves with the slightest motion of the air is well-known.

ASPHAL'TUM (*asphaltos: Gr.*, from its use as a cement), a bituminous substance, found in abundance in different countries, especially near the Dead Sea, and in Albania; but nowhere in such quantities as in the island of Trinidad, where there is a large plain of it, called the Tar Lake, which is three miles in circumference, and of an unknown depth. It is also found in France, Switzerland, and in some other parts of Europe. This substance, which is also called mineral pitch and compact bitumen, has no regular structure, and breaks easily in any direction. It is a little heavier than water, melts easily, is highly inflammable, and burns with a red smoky flame. It is a compound of carbon, hydrogen and oxygen. The ancients employed asphaltum in the construction of their buildings.

AS'PHODEL (*asphodelos*, the daffodil: *Gr.*), a plant celebrated by the ancient poets, belonging to the lily order. There are several species, most of which are natives of Europe.

ASPHYX'IA (*asphuxia:* from *a*, without; and *sphuxis*, pulsation: *Gr.*), in Medicine, a stoppage of the power of respiration. If a person's throat were accidentally stopped up by the introduction of some foreign substance, and he were to die in consequence, it would be a case of death by asphyxia.

AS'PIRATE (*aspiratio*, from *aspiro*, I breathe on: *Lat.*), in Grammar, a character in the Greek marked thus (ʽ), denoting that *h* is to be sounded before the letter to which it is prefixed. In English, the letter *h* is called aspirate, when it is sounded, in distinction from *h* mute.

ASS (*asinus: Lat.*), a well-known animal, remarkable for its hardihood and length of life. It is said to be a descendant of the wild ass, inhabiting the mountainous deserts of Tartary, &c., celebrated in history for the fiery activity of its disposition, and the fleetness of its course. Its characteristics are a long head, long ears, a round body covered with a short and coarse fur, of a pale dun colour, with a streak of black running down its back and across the shoulders, and a tail not hairy all the way, as in a horse, but only at the end. The best breed of asses is that originally derived from the hot and dry regions of Asia; but the best to be met with in Europe are the Spanish.

ASSAFŒ'TIDA (*fetidus*, stinking: *Lat.*), a resinous gum of a very fetid smell, obtained from the *Ferula Assafœtida*, a perennial umbelliferous plant, a native of Persia. It comes into this country in small grains of different colours, hard and brittle, and is employed medicinally as a stimulant and antispasmodic.

ASSA'I (enough: *Ital.*), a Musical term, which indicates that the time must be reasonably accelerated or retarded; as *allegro*, quick; *allegro assai*, still quicker; *adagio assai*, still slower.

ASSAS'SIN (*haschischa*, henbane: *Arab.*), which was used by such persons to produce excitement), one who kills another, not in open combat, but privately or suddenly.

ASSAULT' (*assaut: Fr.;* from *assilio*, I spring upon: *Lat.*), in Law, an attempt or offer, with force and violence, to do a bodily injury to another, as by striking at him either with or without a weapon.——ASSAULT, in the Military art, a furious effort made to carry a fortified post, camp, or fortress, in which the assailants do not screen themselves by any works.

ASSAY' (*essayer*, to try: *Fr.*), in Metallurgy, is used to express those chemical operations which are made in small to ascertain the quantity of metal contained in ores, or to discover the value or purity of any mass of gold, silver, or other metal. This mode of examination differs from *analysis*, in being principally concerned about only one of the ingredients in the ore or alloy, whereas the object of the latter is to ascertain the quantity and proportion of every substance in the mass to which it is applied.

ASSAY'-MASTER, an officer of the Mint,

whose duty it is to make *assay* of the gold and silver.

ASSENT' (*assentio*, I agree with: *Lat.*), (THE ROYAL), is the approbation given by the sovereign in parliament to a bill which has passed both houses; after which it becomes a law. The formal words by which this assent is expressed are in Norman-French. If it is a bill of supply, the words are 'Le Roi (or la Reine) remercie ses loyaux sujets accepte leur benevolence et ainsi le veut.' If it is a public bill, not being a bill of supply, 'Le Roi le veut,' and if a private bill, 'Soit fait comme il est desiré.'

AS'SETS (*assez*, enough: *Fr.*), in Law, signifies goods or property in the hands of the heir, devisee, executor, or administrator, of a deceased person, chargeable with the payment of debts and legacies. It has been extended to all property which can be made available to satisfy a man's liabilities.

AS'SIDENT SIGNS (*assideo*, I attend: *Lat.*), in Medicine, symptoms which occasionally attend any disease incident to the human frame.

ASSIGN'ABLE MAG'NITUDE (*assigno*, I assign: *Lat.*), in Mathematics, any finite magnitude that can be expressed or specified.

ASSI'GNAT (*Fr.*), the name of the national paper currency in France during the Revolution. Four hundred millions of this paper money were first struck off by the constituent assembly, with the approbation of the king, April 19, 1790, to be redeemed with the proceeds of the sale of the confiscated goods of the church, &c. They at length increased, by degrees, to forty thousand millions, and after a while they became of no value whatever.

ASSIGNEE' (*assigno*, I assign to: *Lat.*), in Law, a person to whom something is made over. One to whom is committed the management of a bankrupt's estate.

ASSI'GNMENT (same *deriv.*), in Law, the act of assigning or transferring the interest or property a man has in a thing, or of appointing and making over a right to another, and the formal instrument by which the act is made evident.

ASSIMILA'TION (*assimilatio*, from *assimilo*, I make like to: *Lat.*), that process in the animal economy by which the different ingredients of the blood are made parts of the various organs of the body.

ASSI'ZES (sessions: *Nor. Fr.*), a meeting of the king's judges, the sheriff, and juries, for the purpose of making gaol deliveries, and trying causes between individuals; in some places held eight times a year. The assizes are *general* when the justices go their circuits, with commission to take all assizes, that is, to hear all causes; and they are *special* when special commissions are granted to hear particular causes.

ASSOCIA'TION OF IDE'AS (*associo*, I unite with: *Lat.*). By this phrase is understood that connection between certain ideas which causes them to succeed each other involuntarily in the mind. To the wrong association of ideas made in our minds by custom, Locke attributes most of the sympathies and antipathies observable in men, which work as strongly, and produce as regular effects, as if they were natural, though they at first had no other origin than the accidental connection of two ideas, which, either by the strength of the first impression, or by subsequent indulgence, are so united, that they ever after keep company together in the mind, as if they were but one idea.

ASSO'DES (loathsome: *Gr.*), in Medicine, a fever with excessive inward heat, though not so great externally.

ASSOI'LE (*absoudre*, I absolve: *Fr.*), in our ancient Law-books, to absolve, free, or deliver one from excommunication.

AS'SONANCE (*assono*, I answer by sound: *Lat.*), in Poetry, is where the terminating words of the verses have the same vocalic sounds, but different consonants, so that there is no proper rhyme. Spanish poetry abounds with assonant verses.

ASSUMP'SIT (*assumo*, I take up: *Lat.*), in Law, an implied promise to pay for work or goods, such as will sustain an action.

ASSUMP'TION (*assumptio*, *from same deriv.*), a festival in the Roman Catholic Church, kept on the 15th of August, in honour of the alleged miraculous ascent of the Virgin Mary into heaven.——ASSUMPTION, in Logic, is the minor or second proposition in a categorical syllogism. Also, the consequence drawn from the propositions of which an argument is composed.

ASSUMP'TIVE ARMS (same *deriv.*), in Heraldry, such arms as a person has a right to assume to himself by virtue of some action, provided his right be confirmed by the approbation of his sovereign and the heralds. Also, armorial bearings improperly assumed.

ASSU'RANCE. [See INSURANCE.]

AS'TER (*astēr*, a star: *Gr.*), a genus of ornamental plants belonging to the *Compositæ*.

AS'TERISK (*asteriskos*, from same: *Gr.*), a little star (*) used in Printing as a mark of reference.

AS'TERISM (*astēr*, a star: *Gr.*), in Astronomy, a constellation of fixed stars.

A'STEROI'DS (*astēr*, a star; and *eidos*, form: *Gr.*), the small planets that circulate between the orbits of Mars and Jupiter. The first discovery took place in 1801. About eighty are now known, and new discoveries are being continually made. They are conjectured to be the ruins of a large planet, shattered by some explosion. They are so small that their magnitudes cannot be ascertained with certainty; but it is thought that their total mass is quite insignificant. In only two can disks be perceived by careful examination with very powerful telescopes. 'A man placed on one of them (says Sir John Herschel) would spring with ease sixty feet high, and sustain no greater shock in his descent than he does on the earth from leaping a yard. On such planets giants might exist, and those enormous animals which on earth require the buoyant power of water to counteract their weight might there be denizens of the land.'

AS'THMA (*Gr.*), a disease of the lungs, causing paroxysms of laborious breathing.

AS'TRAGAL (*astragalos*, the ankle-bone: *Gr.*), in Architecture, a little round moulding in form of a ring, serving as an ornament at the top and bottom of columns.——ASTRAGAL, in Gunnery, the corner ring of a piece of ordnance.

ASTRA'GALUS (same *deriv.*), in Anatomy, the ankle-bone.——ASTRAGALUS, in Botany, *Liquorice-Vetch*, the seed of which resembles in shape the ankle-bone. It belongs to the *Leguminosæ*.

ASTRIC'TION (*astringo*, I bind: *Lat.*), the operation of astringent medicines.

ASTRIN'GENTS (same *deriv.*), medicines which cause the fibres of the muscles and blood-vessels to contract. Hence they diminish the flow of the fluids, and are employed to give tone, lessen glandular secretions, stop the flow of blood from a ruptured vessel, &c. Mineral acids, metallic salts, tannin, and gallic acid, are amongst the astringents commonly employed.

AS'TROLABE (*astron*, a star; and *lambano*, I take: *Gr.*), an instrument formerly used for observing the stars. It consisted of two or more graduated circles, having a common centre, but so inclined to each other, that the astronomer might observe in the planes of different circles of the sphere. Its place is now supplied by the equatorial, theodolite, &c. Ptolemy reduced its form to a plane surface, which he called a *planetarium*.

ASTROL'OGY (*astron*, a star; and *logos*, a discourse: *Gr.*), originally meant the same thing as astronomy: but for a long time, under the name of *judicial* astrology, it has been used to designate an art which may truly be said to be among the oldest superstitions of the world, and which consisted in judging or predicting human events from the situation and different aspects of the heavenly bodies. It is mentioned in the Mosaic history; and we know that those who professed the astrological art, gave so much trouble at Rome, that they were at length banished by Tiberius. During the middle ages, astrology and astronomy were cultivated in connection by the Arabs, and their works on the subject are still extant. Nay, even so late as the 17th century, astrology had its defenders among the learned men of Europe; but the Copernican system shook the foundations of this ancient science, and, at the present day, there are none but artful plunderers and ignorant dupes who give it the slightest countenance.

ASTRON'OMY (*astronomia;* from *astron*, a star; and *nomos*, a law: *Gr.*) that science which treats of the heavenly bodies, explaining the motions, times and causes of the motions, distances, magnitudes, gravities, light, &c., of the sun, moon, and stars; the nature and causes of the eclipses of the sun and moon, the conjunction and opposition of the planets, and any other of their mutual aspects, with the times when they did or will happen. Since the heavens may be considered either as they appear to the naked eye, or as they are discovered by the understanding, Astronomy may be divided into Practical, Rational, and Physical. *Practical* Astronomy enables us, by means of instruments, to determine the apparent positions and motions of the heavenly bodies. *Rational* Astronomy teaches us the modes of ascertaining their real orbits and motions, and gives us the means of calculating their positions in advance. Various hypotheses have at different periods been invented to explain their apparent motions, and seemed sufficient to account for the phenomena known at the time of their adoption. But they were exploded in succession, by more accurate observations. *Physical* Astronomy is the application of mathematical science to the investigation of the laws which regulate the motions of celestial bodies, the nature of the forces which maintain them, and the effects produced by the action of one on another. This sublime science is founded on observation, but it receives its last perfection from calculation. Outrunning the cautious advances of observation, it descends from causes to phenomena, and on philosophical principles explains all the motions, magnitudes, and periods of revolution of the heavenly bodies. It is not within the scope of this work, however, to enter into the details of this science: but we shall briefly notice the most striking portions of its history. The generality of writers agree in assigning the origin of Astronomy to the Chaldeans soon after the deluge. For the purpose of making their astrological predictions, to which they were much addicted, as also for that of advancing the science of Astronomy, they devoted themselves to the study of the heavenly bodies. They discovered their motions and peculiar characters, and, from their supposed influence on human affairs, pretended to predict what was to come. The Egyptians also cultivated the science of Astronomy about the same time, and there are some who ascribe to them the honour of being its real authors. The most ancient astronomical observations known to us are Chinese: one, mentioned by Montucla, viz. a conjunction of Saturn, Jupiter, Mars, Mercury, and the Moon, was made almost 2,500 years before the Christian era! That the Indian Brahmins also made considerable advances in the science of Astronomy, among the earliest people of antiquity, appears no less certain. But, in the obscurity of ancient history, it is no easy task to determine to what nation the merit is actually due. Descending, however, to classic times, we find that Astronomy made great progress in Greece, and that Thales calculated a solar eclipse about 600 years B.C. Pythagoras also seems to have been possessed of very considerable astronomical knowledge. He taught that the earth was not placed as the centre of the system, but revolved about the sun. After him, the Athenian Meton (B.C. 432) introduced the famous lunar cycle of 19 years, at the end of which time the new moon appears on the same day of the year as at the beginning of it, since 19 solar years constitute very nearly 235 lunations, a discovery which was then regarded as so important that the calculation was engraved in letters of gold, whence the number which marks the year of the cycle is still called *golden*. Eratosthenes, a Cyrenian, who was born 276 B.C., measured the circumference of the earth; and, being invited to the court of Ptolemy Euergetes at Alexandria, he was made keeper of the royal library, and set up there the armillary spheres which Hipparchus and Ptolemy afterwards used so effectually. He also determined the distance between the tropics to be $\frac{11}{166}$ of the whole meridian circle, which makes the obliquity of the ecliptic in his time to be 23 degrees, 51 minutes and one-third. Archimedes is said to have constructed a planetarium to represent the phenomena and motions of the heavenly bodies; and many others added to the stock of astronomical knowledge; but none so much as Hipparchus, who flourished about 140 years B.C., and surpassed all who had gone before him in the extent of his researches. He showed that the orbits of the planets are eccentric, and that the moon moves more slowly in her apogee than in her perigee. He constructed tables of the motions of the sun and moon; collected accounts of eclipses that had been computed by the Chaldeans and Egyptians, and calculated such as would happen for six hundred years to come; besides correcting the errors of Eratosthenes in his measurement of the earth's circumference, aad computing the sun's distance more accurately. He is, however, most distinguished by his catalogue of the fixed stars to the number of a thousand and eighty, with their latitudes and longitudes and apparent magnitudes. These and most other of his observations have been preserved by his illustrious successor Ptolemy. From the time of Hipparchus, a chasm exists in the history of Astronomy, till the commencement of the 2nd century after Christ, when Ptolemy compiled a complete system of Astronomy, in 13 books, which is known under the name of *Almagest*, an appellation given it by the Arabians, who translated it into their language in 827, and which, as the Ptolemæan system, notwithstanding its many errors, has maintained its value down to the latest times. The Arabians continued for many ages to direct their attention to astronomical science; and though they confounded it with the dreams of astrologers, they, nevertheless, deserve the regard of all who came after them, by their valuable observations. Among the Christian nations at this period a profound ignorance generally prevailed; but in the 13th century Astronomy, as well as other arts and sciences, began to revive in Europe, particularly under the auspices of the emperor Frederic II., who, besides restoring some decayed universities, founded a new one, and in 1230 caused the works of Aristotle and the Almagest of Ptolemy to be translated into Latin. King Alphonso of Castile, about the same time, invited to his court several astronomers, and commissioned them to prepare a set of new astronomical tables, which, under the name of *Alphonsine Tables*, have acquired much celebrity, but which in the 17th century differed a whole degree from the true situations of the celestial bodies. We now approach the era of reviving science. Many astronomers of inferior note paved the way, by various insulated observations, for the great restorer of Astronomy, Copernicus, who, at the beginning of the 16th century, gave the science an entirely different aspect, exploded the Ptolemæan hypothesis, and in its stead substituted the Copernican system of the world, which, with a few modifications, is now universally acknowledged to be correct. He it was who gave the sun its place in the centre of the planetary system, and who first conceived the bold idea that the earth is a planet, like Mercury, Venus, and the rest, and moves, in common with them, in an orbit round the sun. His system did not, however, immediately meet with a general reception; and among its opponents was Tycho Brahe, a Dane, who asserted that the earth is immovable, in the centre of the universe, and that the whole heavens turn round it in 24 hours: an opinion which he supported principally by the literal sense of various passages in the Bible, where a total absence of motion is ascribed to the earth. His pupil and assistant, Kepler, however, found that all the planets revolve in elliptical orbits, in one of the foci of which the sun is placed; and he moreover demonstrated that, in each elliptical revolution of the planets round the sun, an imaginary straight line, drawn from the latter to the former, called the *radius vector*, always describes equal areas in equal times, and, lastly, that in the revolutions of the planets and satellites, the squares of the times of revolution are as the cubes of the mean distances from the larger body. These great discoveries paved the way for views still more comprehensive. Kepler had been indulged with a faint glimpse of the mutual tendency of all bodies to one another; and Dr. Hook went so far as to show that the motions of the planets are produced by the attractive agency of the sun, combined with the force which had originally projected them. But it was reserved for Newton to establish the law of universal gravitation in its entire generality, and to apply it with demonstrative evidence to all the movements within the solar system. His doctrine was, that all material bodies attract each other with a force directly proportional to the number of their particles, and inversely proportional to the squares of their distances. Descartes had sought the cause of the motion of the planets around the sun, and of the satellites around the planets, in the rotatory motion of a subtle matter. But Newton and Kepler have rescued the laws of the material universe from the thraldom of a false philosophy, and left to later times merely the development of the truths which they established. By the application of their principles, as well as by new discoveries, several succeeding astronomers have gained a high reputation; thus, Halley by his theory of comets; Bouguer and Maupertuis, by their exertions to determine the form of the earth; Meyer, by his lunar tables; and Bradley, by the discovery of the aberration of light. The progress recently made in Astronomy has been very great. The existence of the planet Neptune was ascertained, not, as usual in such cases, by chance, but by the most profound calculations; and its approximate position was fixed before it was seen. These results were attained, not by one, but by two astronomers—one in England, the other in France; and neither knew of the investigations of the other. Forty years elapsed, after the discovery of the fourth asteroid, before a fifth was found: ten more were soon discovered, and their number has been gradually increased until about eighty have been found. An eighth satellite has been added to those of Saturn: and it was discovered on the very same day by an English and an American astronomer. The improvement of telescopes, &c., have led to the best results; and better methods of calculation and observation have enabled astronomers to derive the greatest advantages from the more perfect means placed at their disposal.

AS'TROSCOPE (*astron*, a star; and *skopeo*, I examine: *Gr.*), an old astronomical instrument, composed of two cones, on whose surface the constellations were delineated, and by means of which the situation of a star might easily be known.

ASY'LUM (*asulon*: from *a*, not; and *sulao*, I rob: *Gr.*), in Antiquity, a place of refuge for offenders, where they were screened from the hands of justice. The use of altars and temples for such a purpose was very ancient. The Jews had their asyla; the most remarkable of which were, the temple, the altar of burnt offerings, and the six cities of refuge. Among the Greeks and Romans, temples, altars, and statues were places of refuge for criminals of every description. They had an idea that he who fled to the temple or altar submitted his crime to the punishment of the gods, and that it would be impiety in man to take vengeance out of their hands. In former times the like immunities were granted by the pope to churches, convents, &c. At present, an *asylum* is a place of refuge for blind, deaf, or other afflicted or unfortunate people.

ASYM'PTOTE (*a*, not; and *sumpipto*, I fall together with: *Gr.*); two lines which continually approach each other, and yet never meet, are termed asymptotic or asymptotes by mathematicians. At least one of such lines must be a curve. However improbable the existence of such lines may be, it can be easily proved.

ASYN'DETON (*a*, without; and *sundeton*, a bond: *Gr.*), in Rhetoric or Composition, the omission of conjunctions, or other connecting particles of speech, in order to render the sentence more lively and impressive, as 'I came, I saw, I conquered.'

AT'ABAL, a kind of tabour used among the Moors.

AT'ABEK, the title given to the rulers of the small states into which the empire of the Seljuk Turks was divided during the eleventh, twelfth, and thirteenth centuries. According to one interpretation, the word signifies 'the Father of the Prince;' according to another, 'a faithful parent.'

ATARAX'IA, or **AT'ARAXY** (*ataraxia*, freedom from passion: *from a*, without; and *taraxis*, confusion: *Gr.*), a term used to denote that calmness of mind which secures us from all emotions arising from vanity or self-conceit. *In this consisted the summum bonum, or sovereign good, of* the Stoics.

A'TAXY (*ataxia*: from *a*, without; and *taxis*, order: *Gr.*), *in a general sense, the want of order; with Physicians it signifies* the irregularity of crises and paroxysms of fevers.

A TEM'PO (in time: *Ital.*), in Music, is a term employed, when the regular measure has been interrupted, to show that the usual time is to be again observed.

ATHANA'SIAN CREED, a formula of faith ascribed to St. Athanasius, which has been adopted into the liturgy of the Church of England. In consequence of its comminating character several attempts have been made to remove it from the Prayer Book.

A'THEIST (*atheos*: from *a*, without; and *Theos*, God: *Gr.*), one who denies the existence of God or Providence.

ATH'ELING (*athel*, noble: *Sax.*), the title given to the king's eldest son among the Saxons, as that of Prince of Wales is in our time.

ATHENÆ'UM (*Athenaion*, a temple dedicated to Minerva: *Gr.*), in Antiquity, a public school in which the professors of the liberal arts held their assemblies, the rhetoricians declaimed, and the poets rehearsed their performances. That at Rome, built by the emperor Adrian, was situated on the Capitoline hill, and had a staff of professors like a university. Besides the instructions given in it, there were recitations by orators, poets, &c. The most celebrated Athenæa were those at Athens, at Rome, and at Lyons.

ATHLE'TÆ (*athlētēs*, a prize-fighter: *Gr.*), in Antiquity, men of remarkable strength and agility, disciplined to perform in the public games. Under this general term were comprehended wrestlers, boxers, runners, leapers, throwers of the disk, and those who practised exercises exhibited in the Olympic, Pythian, and other solemn sports, in which there were prizes allotted to the conquerors.

ATHWART', a sea term, signifying across the line of a ship's course.

ATHYM'IA (*Gr.*: from *a*, without; and *thumos*, courage), in Medicine, the dejection of spirits attendant upon some diseases.

AT'IBAR, in Commerce, gold-dust obtained on the coast of Africa.

ATLAN'TES (from *Atlas*), in Architecture, images of men, used as pillars, supporting buildings like Caryatides.

ATLAN'TITES (supposed to be the daughters of *Atlas*), in Astronomy, another name for the Pleiades.

AT'LAS (probably from *a*, euphon.; and *tlao*, I bear: *Gr.*), in Geography, a collection of maps, more properly a book containing maps of the whole world; so called from Atlas, who was fabled to have borne the world on his shoulders.——It is also the name of a chain of high mountains in Africa, extending from the coast of the Atlantic to the border of Egypt.——ATLAS, a rich kind of satin, made in the East Indies: it is either plain, striped, or flowered, and interworked with gold: its manufacture is beyond the reach of European art. Though formerly in great repute, it is but little used at present.

ATMOSPHERE (*atmos*, vapour: *sphaira*, a sphere: *Gr.*). The ring of subtle, invisible, elastic fluid, surrounding our globe, and reaching about 45 miles above the earth's surface, is termed the atmosphere. The air of which it is composed is 816 lighter than water. Four-fifths of it, by bulk, are nitrogen, the remaining fifth oxygen; it has also a little carbonic acid, and some vapour of water, which varies very considerably at the same place at different times. [See HYGROMETRY.] Though invisible, except in large masses, and without smell or taste, yet it is a substance possessing all the principal attributes of matter; it is impenetrable, ponderable, compressible, dilatable, and its particles are operated on, like those of other bodies, by chemical action. It is indispensable to the life of all organic beings; it is the agent of combustion, and the principal medium of sound. Although the atmosphere is one of the most transparent bodies in nature, yet its transparency is not perfect. Its particles absorb one portion of the light they receive, transmit a second, and reflect a third. Hence it is that light becomes diffused over terrestrial objects and enables us to see those upon which the rays of the sun do not directly fall, and hence the phenomenon of twilight, by which we see things after the sun has set. The greater the extent of atmosphere traversed by rays from a luminous body the fewer do those rays become. The light of the sun in the zenith is much more powerful than when it is near the horizon. The blueness of the heavens is owing to the reflection of light by the particles of air, and not to the colour being proper to them. The air has the property of reflecting the blue rays of the spectrum more than the other rays. As the blue rays disappear with the increasing depth of atmosphere, the red rays become predominant, and this is the reason that when the sun is at the horizon it is of an orange or red colour. The refracting power of the atmosphere increases from the zenith to the horizon, and causes us to see objects, except when they are in the zenith, at places where they really are not. Hence the sun's disk becomes enlarged the lower it sinks, and we are able to see a portion of it when, in fact, the whole is below the horizon. The atmosphere has also a polarizing effect, and maps of its polarizing power have been constructed, from which we perceive that the curves of equal polarisation are related to three principal neutral points or poles of non-polarisation. Professor Wheatstone constructed an ingenious apparatus, which he called a polar clock or dial, for determining the apparent solar time as long as the sun's rays illuminate the atmosphere. His method consisted in determining the diurnal changes of the plane of polarisation at the north pole of the sky. Instruments have been invented for ascertaining the electrical condition of the atmosphere at any given moment at the place of observation. It appears that the atmosphere is nearly always positively electric, and that fluctuations in atmospheric electricity produce two maxima and two minima in the twenty-four hours. As to the temperature of the air, as the sun is the only source of heat which need be taken into account, it is manifest that there must be a considerable variation of temperature in every twenty-four hours. The minimum of this variation takes place about half an hour before sunrise, and the maximum in our climate about 2 P.M. The extent of the daily range varies considerably at different places. It is least at sea, and greatest on the middle of a large continent. Small islands surrounded by a large expanse of ocean enjoy an equable climate. The less elevated the sun above the horizon, the more feeble is its heating power, because its rays cross a greater thickness of atmosphere, and many of them glance along the surface of the ground without resting upon it. Hence the coldness of the polar regions throughout the year, and of our climate in winter. Hence, also, the greater warmth of the atmosphere in the neighbourhood of the equator. The higher we go into the atmosphere the colder becomes the temperature, because we move farther and farther out of the range of the earth's reflected heat. As to other phenomena of the atmosphere, see BAROMETER, HYGROMETRY, WINDS, AURORA BOREALIS.

ATOLL (*Ind.*) or *Lagoon Island*, a ring formed by coral-zoophytes in the ocean, enclosing a tract of smooth water. Atolls abound in the Pacific and Indian Oceans. The ring is usually elevated into land formed of sand, on which palms sometimes grow. It is often more or less incomplete, and sometimes it consists of a great number of separate little atolls. The water usually breaks furiously upon the outer side of atolls. They vary in size, some being less than a mile in diameter, whilst the Suadiva atoll is 44 geographical miles in one direction and 34 in another, and Rimsky atoll is 54 miles by 20. [See CORAL ISLANDS.]

A'TOM (*atomos: from a*, not; and *tomē*, a cut: *Gr.*), in Philosophy, an ultimate particle of matter. Two opinions, directly opposed to each other, have long had currency with regard to the constituent particles of material things; the one, that matter is composed of an assemblage of minute particles, or atoms, incapable of further division; the other, that there is no limit to its divisibility, the smallest conceivable portion still consisting of an infinity of parts. The first of these theories, which is commonly distinguished by the name of the ATOMIC PHILOSOPHY, was originated in Greece by Leucippus; it was supported by Democritus, and subsequently improved by

Epicurus and his disciples. The Epicureans professed to account for the origin and formation of all things by supposing that these atoms were endued with gravity and motion, and thus came together into the different organized bodies we now see.

ATOM'IC THE'ORY. [See AFFINITY.]

A'TONY (*atonia*, languidness: from *a*, without; and *tonos*, a brace: *Gr.*), a defect of tone or tension, or a relaxation of the solids of the body.

A'TRA BI'LIS (black choler: *Lat.*), a disposition to a dark biliary secretion, usually visible throughout the whole frame.

ATRIP', in Nautical language, is applied either to the anchor or sails. The *anchor* is atrip when it is just drawn out of the ground in a perpendicular direction. The *topsails* are atrip when they are just started from the cap.

A'TROPA (*Atropos*, one of the Fates: on account of its deadly effects), in Botany, a genus of plants, of the nat. order *Solanaceæ*, one species of which, the *Atropa Belladonna*, or *Deadly Nightshade*, is remarkable for bearing berries of a fine black colour, which are highly poisonous. The flowers are bell-shaped, dusky on the outside and purplish within. The fruit has a nauseous sweet taste, and is full of small kidney-shaped seeds. From it is extracted the medicine called Belladonna, which is a narcotic and diaphoretic. It is also employed by oculists to produce dilatation of the pupil, which it does on being dropped into the eye. It is said that the juice of this plant was mixed with the food with which the Scotch were bound to supply the Danes during a truce, and that they were so intoxicated thereby, that Sweno's army was in great part killed when asleep.

A'TROPHY (*a*, not; and *trepho*, I nourish: *Gr.*), a disease in which the body, or some of its parts, not receiving necessary nutriment, insensibly wastes away.

ATTACH'MENT (*attacher*, to stick to: *Fr.*), in Law, a process issuing, in a summary way, from a court of record, against a person guilty of contempt of its rules.——FOREIGN ATTACHMENT. Under the custom of the City of London, whenever process for debt, from the mayor or sheriff's court, is returned *nil*, the plaintiff may attach the debt due by a third person to the defendant, to satisfy his claim.

ATTACK' (*attaque*: *Fr.*), in the Military art, a general assault, or onset, made to gain a post, or any particular point. Every combat consists of attack and defence: the first is generally the most advantageous; and an experienced general chooses it, if possible, even in a defensive war. Those attacks are considered the best where all the forces can be directed in concert towards that point of the enemy which is the key of his position.

ATTAIN'DER (*teindre*, to stain: *Fr.*), the penalty by which the estate and life of a traitor or other convicted person are forfeited. It is the immediate inseparable consequence of sentence of death. When that sentence is passed, the person is said to be attaint (*attinctus*, *Lat.*), and in law he is considered as already dead (*civiliter mortuus*). A *bill of attainder* is a bill brought into parliament for attainting persons convicted of high treason. A person attainted of high treason forfeits all his lands, tenements, and hereditaments; his blood is corrupted, and he and his posterity are rendered base; and this corruption of blood cannot be taken off but by act of parliament. Attainders may be reversed or falsified (i. e. proven to be false) by writ of error, or by plea.

ATTAINT' (*atteinte*, a damage: *Fr.*), in the Veterinary art, is a diseased limb, proceeding from a blow.

ATTEN'TION (*attentio*, from *attendo*, I take heed: *Lat.*), the word of command given in the British army, preparatory to any particular exercise or direction.

ATTEN'UANTS (*attenuo*, I make thin: *Lat.*), medicines which dilute the blood.

AT'TIC (*Attikos*, Athenian: *Gr.*), in Architecture, a sort of building in which there is no roof or covering to be seen, as was usual in the houses of the Athenians.——The ATTIC, or ATTIC STORY, is the upper story of a house.——The ATTIC BASE is a peculiar kind of base employed chiefly in the Doric and Ionic orders.

AT'TICISM (*attikismos*: *Gr.*), a concise and elegant form of expression, such as a polished Athenian might be expected to use. The brilliant style of the Attic writers was greatly admired by the Romans.

ATTI'RE (*attirail*, apparatus: *Fr.*), in Heraldry, a term designating the horns of stags and similar animals in blazoning coats of arms.

ATTOL'LENS (*attollo*, I raise up: *Lat.*), in Anatomy, an epithet applied to certain muscles, otherwise called *levatores* and *elevatores*.

ATTOR'NEY (*attornatus*, a person set in place of another: *Mod. Lat.*), one who is appointed by another to do a thing in his absence. An attorney-at-law is one who acts in the courts of law. No attorney can practise in any court, unless he has been admitted and sworn an attorney of that particular court. He must have served under articles of clerkship, in the office of another attorney, and must pass a public examination. As an officer of the court in which he is admitted, an attorney enjoys several privileges, and is liable, on the other hand, to the censure and correction of the judges.——A *private* attorney acts upon particular occasions, and is authorized by a *letter of attorney*, which gives him full power to act.

ATTOR'NEY-GEN'ERAL, the chief law officer of the crown, appointed by letters patent. The office is a very important one, and the duties numerous and onerous. The holder conducts all suits and prosecutions in respect to the public revenue, exhibits informations against persons who disturb or endanger the state, appears on behalf of the crown in all legal proceedings where the interests of the crown come into question, and, in conjunction with the solicitor general, advises the government upon legal points. The chief lawyer of the day is usually selected for the post, and he is almost invariably knighted on receiving the appointment. Upon a vacancy occurring in the chancellorship, or any of the chief judgeships, it is the custom to make him an offer of the place. Upon a change of ministry he resigns office. His income from official and general business transacted by him usually exceeds 20,000*l.* a year.

ATTRAC'TION (*attrachio*, from *attratio*, I draw to: *Lat.*), that property of bodies by which they mutually tend towards each other; it varies according to the nature of the bodies attracted, and the circumstances under which this attraction takes place. All bodies are supposed to consist of very small undecomposable particles named atoms, which form groups termed molecules. The immanent forces of atoms, leading to the formation of molecules, are named atomic forces; molecules though chemically decomposable are incapable of decomposition by any mechanical force whatever; and, therefore, in a mechanical point of view, the molecule may be regarded as the fundamental element of bodies. Molecules are kept at certain distances apart, by a force called molecular force, which exhibits itself in the form of attraction (frequently called the attraction of cohesion) when the space between the molecules is increased, but in the form of repulsion when such space is lessened. [See GRAVITATION].

AT'TRIBUTES (*attribuo*, I assign to: *Lat.*), in Logic, are the predicates of any subject, or what may be affirmed or denied of anything.——ATTRIBUTES, in Painting and Sculpture, are symbols added to a figure or group, which are characteristic of the principal subject. Thus the eagle is an attribute of Jupiter; a peacock of Juno; a caduceus of Mercury; a club of Hercules, &c.

ATTRI'TION (*attritus*, a rubbing against: *Lat.*), the rubbing or striking of bodies one against another, so as to throw off some of their superficial particles.——ATTRITION, in Roman Catholic Theology, an imperfect kind of sorrow, which, with confession to a priest, is considered to be a sufficient means of obtaining pardon for sin.

AUC'TION (*auctio*, an increase: *Lat.*), a public sale of goods to the highest bidder. A bidder at an auction, under the usual conditions, may retract his bidding any time before the hammer is down, but the fall of the hammer indicates the acceptance of his offer by the auctioneer on the part of the seller, and both parties are then bound.

AU'CUBA JAPON'ICA, an evergreen shrub, nat. ord. *Cornaceæ*, much cultivated in England, where we have hitherto had only the variety with spotted leaves, and only female plants. Mr. Fortune has lately sent male plants from Japan, so that we shall now have the shrubs adorned during winter and spring with bunches of red berries.

AUCUPA'TION (*aucupatio: Lat.*), fowling, or the art of bird-catching.

AU'DIENCE (*audientia*, from *audio*, I hear: *Lat.*), the ceremonious admission of ambassadors or other public ministers to the presence of the sovereign, for the purpose of presenting his credentials, taking leave, &c. In England audience is given to ambassadors in the presence-chamber, and to envoys and residents in a gallery, closet, or any place where the sovereign happens to be.——AUDIENCE is also the name of an ecclesiastical court, held by the archbishop of Canterbury. It originated in the extrajudicial hearing of causes by the archbishop at his own palace.

AU'DIT (*audio*, I hear: *Lat.*), a regular examination of accounts by officers appointed for that purpose.

AU'DITOR (a hearer: *Lat.*), an officer appointed to examine accounts.

AUDITO'RIUS MEA'TUS (the auditory passage: *Lat.*), the passage or entrance into the ear, conveying the air to the auditory nerve.

AU'DITORY NERVES, the seventh pair of nerves arising from the *Medulla oblongata*, and distributed to the ear, tongue, &c.

AUGETT'E (a *dim.* of *auge*, a trough: *Fr.*), in Fortification, the wooden pipe which contains the powder by which a mine is fired.

AU'GITE (*augē*, radiance: *Gr.*), a mineral of which there are many varieties, differing both in form and colour. It is supposed to be essentially the same as HORNBLENDE, and that the difference of its external appearance arises from its having cooled more rapidly. Different names have been applied to some of its most remarkable varieties; it is *Diopside* when in greenish-white transparent crystals; *Sahlite*, when it is in imperfectly prismatic and foliated masses; and *Coccolite*, when in small, slightly-cohering grains. It is one of those few mineral substances, the composition of which may be imitated by the artificial mixture of its constituents, and subjecting them to fusion. More than half of it consists of silica; its other component parts are lime, magnesia, alumina, and oxide of iron. It is common in basaltic and volcanic rocks.

AUGMENTA'TION (*augmen*, an increase: *Lat.*), in Heraldry, a particular mark of honour generally borne either on the escutcheon or a canton; as *argent*, a hand *gules*, borne by every baronet who cannot claim higher honour.

AU'GUR (*Lat.*), an officer among the Romans, appointed to ascertain the will of the gods by the interpretation of signs and omens, for the guidance of the state or individuals. The augurs bore a staff or wand as the ensign of their authority, and their dignity was so much respected, that they were never deposed, nor were any substituted in their places when they were convicted of the most enormous crimes. There was a college of augurs, which, from B.C. 300 to Sylla's time, consisted of nine. In his dictatorship they were increased to fifteen. Julius Cæsar added another one.

AU'GURY (*augurium: Lat.*), a species of divination, or the art of foretelling events, practised by the ancients. *Auguries* originally differed from *auspices*, inasmuch as the latter were limited to the omens afforded by birds, but in process of time they were extended to all *omens*.

AU'GUST, the eighth month of our year, containing thirty-one days. It was dedicated to the honour of Augustus Cæsar, because, being in the same month (before called Sextilis, or the sixth from March) created consul, he thrice triumphed in Rome, subjugated Egypt to the Roman sway, and put an end to the civil wars.

AUGUS'TAN denotes something relating to the emperor Augustus; as, *Augustan age*, *Augustan era*, &c.

AUGUS'TINES, a religious order, established in the 11th century, and called after the communities which had been established by St. Augustine, but which had long ceased to exist. They were commonly called *Austin friars*, and, before the Reformation, had thirty-two houses in England. There are nuns of this order, who, at Paris, are known by the name of the *religious women of St. Genevieve*, and their abbess is the chief of the order. They are clothed in black.

AUK, the popular name of some sea birds, placed by naturalists in different genera. All have strong bills and webbed feet. The little auk (*Mergulus melanoleucos*) is only a winter visitor to Britain, and chiefly frequents the Orkneys and Shetlands. The great auk (*Alca impennis*) has become extremely rare, and perhaps it may be extinct. The wings are so short that the bird cannot fly, but they are of great service in diving for fish. The razor-bill is also an *alca*.

AU'LIC (because it followed the emperor's *aula*, or court), an epithet given to certain officers in the old German empire, who composed a court which decided, in most cases, without appeal. This court, which was proverbial for the slow administration of justice, had not only concurrent jurisdiction with the court of the imperial chamber, but, in many cases, exclusive jurisdiction. The right of appeal, possessed by the estates, existed also in regard to the judicial decisions of the aulic court.

AURE'LIA, or *Chrysalis*, the name given to the form which lepidopterous insects assume between the caterpillar and the winged condition.

AURE'OLA (*aureolus*, a *dim.* of *aureus*, golden: *Lat.*), in its original signification, denoted a jewel which was proposed as a reward of victory in some public dispute. Hence the Roman schoolmen applied it to the reward bestowed on martyrs, virgins, &c., on account of their works of supererogation. Painters use it to signify the glory which in old pictures is represented as surrounding the whole body, the *nimbus* being that placed round the head. The aureole was only given to the Father, Son, and Virgin.

AU'REUS (golden: *Lat.*), a Roman gold coin, worth 25 denarii, or 100 sestertii; and from 17*s.* 8½*d.* to 21*s.* 1½*d.*, according to the relative values of gold and silver.

AU'RICLE (*auricula*, a *dim.* of *auris*, the ear: *Lat.*), in Anatomy, that part of the ear which is prominent from the head, called by many authors *Auris externa.*—Auricles of the heart, two cavities in the mammalian heart, placed above the two cavities called ventricles. The auricles are in communication with the ventricles, but not with each other. The right auricle receives the blood after it has been distributed through the body and been collected by the veins. Thence it passes into the right ventricle, which propels it by the pulmonary arteries to the lungs, where it is oxygenated. Collected by the pulmonary veins, it is conveyed to the left ventricle, by the contraction of which it is sent along the main arterial trunk, called the AORTA, and by its branches is distributed through the veins, and thus the circuit is completed. The auricles dilate and contract together; the ventricles also dilate and contract together, but these operations are performed alternately with those of the auricles. These successive contractions and dilatations make the pulsations of the heart, the contraction being called *systole*, and the dilatation *diastole*.

AURIC'ULA (same *deriv.*), a garden flower of which there are many cultivated varieties, all derived from the yellow *Primula Auricula* of the Swiss Alps.

AURIC'ULAR CONFES'SION (same *deriv.*), a mode of confession among Roman Catholics. In fulfilment of the duty of confessing our sins 'to one another,' enjoined by Christ, it became the custom in the early church to make *public* confession of sins. Certain inconveniences, however, at length arose from the practice, which induced Leo the Great, in the fifth century, to recommend private confession to a priest in certain cases. But the obligation of auricular confession was not imposed until the fourth council of Lateran, in 1215.

AURI'GA (a charioteer: *Lat.*), or the WAGONER, in Astronomy, a constellation of the northern hemisphere, containing about 261 stars.

AURISCAL'PIUM (*Lat.:* from *auris*, the ear; and *scalpo*, I scrape), a surgical instrument employed to operate on the ear.

AURO'RA (the goddess of the morning; *Lat.*), the morning twilight, or that faint light which appears in the morning when the sun is within 18° of the horizon.

AURO'RA BOREA'LIS, in Meteorology, the *northern lights*, a kind of meteor appearing in the northern part of the heavens, most frequent and most brilliant during the winter solstice. We often see in the north, near the horizon, usually a short time after sunset, a dark segment of a circle, surrounded by a brilliant arch of white or fiery light; and this arch is often separated into several concentric arches, leaving the dark segment visible between them. From these arches, and from the dark segment itself, in high latitudes, columns of light, of the most variegated and beautiful colours, shoot up towards the zenith, and sometimes masses like sheaves of light are scattered in all directions. In the Shetland Islands, the *merry dancers*, as they are there called, are the constant attendants of clear evenings, and cheerers of the long winter nights. In still more northern countries, as Norway, Lapland, and Siberia, they greatly enliven the snowy landscapes. They commonly appear at twilight, near the horizon, of a dun colour, approaching to yellow; sometimes continuing in that state for several hours, without any sensible motion; after which they break out into streams of stronger light, spreading into columns, and altering slowly into a thousand different shapes, varying their colours from all the tints of yellow to the obscurest russet. They often cover the whole hemisphere, and then make the most splendid appearance. Their motions, at all these times, are amazingly quick; and they astonish the spectator with the rapid change of their form. They break out in places where none were seen before, skimming briskly along the heavens, and are suddenly extinguished, leaving behind them a uniform dusky track. This is again illumined in the same manner, and as suddenly left a dull blank. In certain nights, they assume the appearance of vast columns, on one side of the deepest yellow, on the other declining away till they become undistinguished from the sky. They have generally a strong tremulous motion, which continues till the whole vanishes. During the winters of 1837 and 1838, the Aurora Borealis was several times witnessed in England; but we, who only see the extremities of this northern phenomenon, have but a faint idea of its grandeur or its motions. Various theories have existed respecting its cause: but little doubt is now entertained of its being occasioned by the passage of electricity through the upper regions of the atmosphere, where it is highly rarefied; its appearance, in fact, exactly resembling the effects of ordinary electricity when passing through rarefied air. There is the same variety of colour and intensity; the same undulating motion and coruscations; the streams exhibit the same diversity of character, being at one moment minutely divided in ramifications, and at another beaming forth in one body of light, or passing in distinct broad flashes; and when the rarefaction is considerable, various parts of the stream assume that peculiar glowing colour which occasionally appears in the atmosphere, and is regarded by the uninformed observer with astonishment and fear.

AU'RUM FUL'MINANS (fulminating gold: *Lat.*), a precipitate of gold, so called because of the explosion which it causes when it is gently rubbed. [See FULMINATING POWDER.]

AU'RUM MUSI'VUM (mosaic gold: *Lat.*), an obsolete name for bisulphuret of tin, used by statuaries and painters for giving a gold colour to their figures.

AU'RUM POTA'BILE (drinkable gold: *Lat.*), a preparation of gold not now used.

AUS'PICES (*Lat.*: from *avis*, a bird; and the obs. *specio*, I behold), a kind of soothsaying among the Romans, originally depending on the flight or singing of birds. [See AUGURY.]

AUS'TRAL (*Auster*, the south wind: *Lat.*), relating to the south: thus the six signs on the south side of the equinoctial are called austral signs.

AUTO-DA-FE' (act of faith: *Span.*), the public infliction of the punishment of death, with many circumstances of solemnity and horror, upon those found guilty of heresy, in Spain and Portugal, at the instance of the Inquisition. Those who professed penitence were strangled before their bodies were burned; the impenitent were burned alive. The last Spanish *Auto-da-fé* was celebrated in 1680, at the wish of Charles II., who thought that a religious rite of this sort would draw down the favour of heaven upon him and his kingdom. Upwards of 340,000 persons have suffered punishments of various kinds at *Autos-da-fé*, in Spain, from the first celebrated at Seville in 1481

AU'TOGRAPH (*autos*, self; and *grapho*, I write: *Gr.*), an epithet applied to whatever is in a person's own handwriting, as an autograph letter.

AUTOM'ATON (*automatos*, self-moving: from *autos*, self; and *mao*, I attempt: *Gr.*), Every mechanical construction, which, by virtue of a latent intrinsic force not obvious to the sight, can carry on for a certain length of time such movements as resemble those of an animal, is an automaton. But the term is generally applied to the figure of an animal, to which motion is given by wheels, springs, and weights, internally placed, and causing apparent animation; as the mechanical chess-player and flute-player. The practice of making these automata is much less frequent at present than formerly; ingenious mechanicians now find themselves better rewarded by directing their talents to the self-acting machinery of modern manufactures. As Dr. Ure observes, 'it is in our modern cotton and flax-mills that automatic operations are displayed to most advantage; for there the elemental powers have been made to animate millions of complex organs, infusing into forms of wood, iron, and brass, an intelligent agency.' Many of the needs of a steam engine are automatically supplied. Thus, the boiler is furnished with a self-feeding apparatus, and with a safety-valve, which corrects over pressure; the heat of the fire can be regulated by a valve in the chimney acting automatically; the engine itself removes the condensed water, &c.

AU'TUMN (*auctumnus*, from *auctus*, an increase: *Lat.*, being the season of plenty), the third season in the year, which begins, in the northern hemisphere, on the day on which the sun enters Libra, that is, about the 22nd of September, and continues while he is passing through the three signs, Libra, Scorpio, and Sagittarius. The elliptic form of the earth's orbit prevents the four seasons from being equal in length; and the precession of the equinoxes causes them to vary a little from age to age. At present the length of autumn is 89 days, 16 hours, and 47 minutes. It is the time which the sun takes to pass from the autumnal equinox to the winter solstice.

AUTUM'NAL SIGNS, the three signs, Libra, Scorpio, and Sagittarius, through which the sun passes during the season of autumn.

AUXIL'IARY VERBS (*auxilium*, assistance: *Lat.*), in Grammar, are such verbs as help to form or conjugate others: as, in English, the verbs 'to have' and 'to be.'

AVA'TAR (descending: *Sans.*), a term used by the Hindoos to express an incarnation or descent of Vishnu, their deity, of which nine are believed to be past, and the tenth is yet to come.

A'VE MARI'A (hail, Mary: *Lat.*), the Latin form of the angel Gabriel's salutation of the Virgin Mary. [See ANGELUS DOMINI.]

A'VENUE (*Fr.*; from *advenio*, I arrive at: *Lat.*), in ornamental Gardening, a walk planted on each side with trees, leading to a house, garden-gate, wood, &c., and generally terminated by some distant object. ——AVENUE, in Fortification, an opening or inlet into a fort, bastion, &c.——In Architecture, an approach to a palace or mansion, by a long line of columns, arcades, statues, &c.

A'VERAGE, the result from division of several sums added together by the number expressing how many of them have been added. Thus, if I buy a pound of anything for 5*s.*, another pound of it for 4*s.* and a third pound for 3*s.*, I have paid, *on an average*, 4*s.* per pound: that is, if each pound had cost 4*s.* the whole would have come to the same sum; and the average is formed by adding 5*s.*, 4*s.*, and 3*s.*, which make 12*s.*, and dividing by 3, the number of pounds, which gives 4*s.* The *method of averages* is a potent instrument of research which has come into use only of late years. It has been applied to physical phenomena as well as to the social and moral conditions of man, and has contributed greatly to the extension and accuracy of our knowledge. GENERAL AVERAGE, a term used among merchants and ship-owners, to denote the quota or proportion which each merchant or proprietor in the ship or lading is adjudged, upon a reasonable estimate, to contribute for any damage, loss, or necessary expense which has been incurred by any one for the good of all.

A'VIARY (*aviarium* from *avis*, a bird: *Lat.*), a place set apart for feeding and propagating birds.

A'VOIRDUPOI'S (*avoir du poids*, to have weight: *Fr.*, because employed in weighing heavy goods), a weight used in England, the pound being sixteen ounces.

AWARD', in Law, the judgment of an arbitrator, or of one who is not appointed by the law, but is chosen by the parties themselves for terminating their difference.

AWEIGH', a sea term, denoting that the anchor is just drawn up, and hangs perpendicularly.

AWL'WORT, the popular name of the *Subularia aquatica*; a British plant belonging to the order *Cruciferæ*, so called from its awl-shaped leaves, which grow in clusters round the root. It expands its white flowers under water.

AWN, a slender sharp process issuing from the glume or chaff in corn and grasses: the beard.

AX'E-STONE, a mineral: a sub-species of nephrite, of an olive or grass-green colour. It is a tough silico-magnesian stone, found chiefly in New Zealand and the South Sea Isles, where it is used by the natives for axes and other instruments.

AXIL'LA (*Lat.*), in Anatomy, the arm-pit, or the cavity under the upper part of the arm.—— AXILLA, in Botany, the apex of the angle formed by a branch with the stem, or by a leaf with a branch.

AX'INITE (*axinē*, an axe: *Gr.*), a mineral which sometimes occurs in lamellar masses, but commonly in axe-shaped crystals. Its edges are thin and sharp, like an axe, whence its name. Its principal constituents are silica, alumina, and lime. It has been found in Cornwall and Saxony.

AX'IOM (*axiōma*, from *axioo*, I demand: *Gr.*), in Philosophy, is such a plain, self-evident proposition, that it cannot be made more plain and evident by demonstration; because it is itself better known than anything that can be brought to prove it. By axioms, called also maxims, are understood all common notions of the mind, whose evidence is so clear and forcible that a man cannot deny them without renouncing common sense and natural reason.

AX'IS (*Lat.*), in Anatomy, the second vertebra of the neck, so called from the head's turning on it like an axis.——AXIS, in Astronomy, an imaginary right line supposed to pass through the earth, sun, planets, satellites, &c., and about which they perform their respective diurnal rotations. The axis of the earth is inclined to the ecliptic at an angle of nearly sixty-six degrees and a half. ——AXIS, in Geometry, a right line conceived to be drawn from the vertex of a figure to the middle of the base. It is so called because the figure, by revolving round this line, is conceived to generate a solid. The axis of a circle is the same as the diameter.——AXIS, in Mechanics, a certain line about which a body may move, as the axis of a balance, &c.——AXIS, in Optics, is that ray, among all others that are sent to a lens which passes through its centre. ——AXIS IN PERITROCHIO, or *wheel and axle*, one of the five mechanical powers or simple machines. It consists of a wheel (*Peritrochius*) fixed on an axis. The power is applied at the circumference of the wheel, and the weight is raised by a rope that is wound up on the axis while the wheel turns round.——AXIS OF OSCILLATION is a line parallel to the horizon, passing through the centre about which a pendulum vibrates, and perpendicular to the plane in which it oscillates.——AXIS of a vessel is an imaginary line passing through the middle of it, perpendicular to its base, and equally distant from its sides.

AX'OLOTL (*Mex.*), a fish-like animal living in the lake which is adjacent to the city of Mexico. It is furnished with both lungs and gills, and is therefore truly amphibious. It is esteemed as an article of food. Naturalists place it in the family of *Sirenidæ*.

AYE-AYE (*Chiromys Madagascariensis*), the name of a Madagascar quadrumanous animal, allied to the lemurs, remarkable for the position of the mammæ at the lowest part of the abdomen, and for having the middle finger of each hand very long and slender, and terminated by a hooked claw. The large front teeth enable it to gnaw wood easily, and it is supposed that, in its native woods, it eats into trees, for the purpose of devouring the larvæ of insects, which it extracts with its long finger. But in captivity, in this country, it rejects all the insect larvæ offered to it. Its habits are nocturnal. Its curious structure has excited much interest and some controversy amongst zoologists.

AZA'LEA (*azaleos*, dry: *Gr.*), in Botany, a genus of plants with beautiful monopetalous flowers, the chief species of which are flowering shrubs, inhabiting North America and China. They belong to the nat. ord. *Ericaceæ*, and are allied to the rhododendron.

AZ'IMUTH (*assamt*, a path: *Arab.*), in Astronomy, an arc of the horizon intercepted between the meridian of the place and the vertical circle passing through the centre of a celestial object.——MAGNETICAL AZIMUTH is an arc of the horizon contained between the sun's azimuth circle and the magnetic meridian.——AZIMUTH CIRCLES, or *vertical circles*, imaginary great circles passing through the zenith and nadir, and cutting the horizon at right angles. The altitudes of the heavenly bodies are measured on these circles.——AZIMUTH COMPASS, an instrument for finding, in a more accurate manner than by the common sea compass, the magnetical amplitude of the sun or stars.

AZO'TE (*a*, not; and *zōe*, life: *Gr.*), one of the constituents of atmospheric air, otherwise NITROGEN, which see.

A'ZURE (*azzurro*: *Ital.*), the blue colour of the sky. Among Painters, this word originally signified *lapis lazuli*, and the blue colour prepared from it. At present the latter is called *ultramarine*; and the blue glass made from the earth of cobalt and other vitrifiable matters, which, when in masses, is called *smalt*, is, in the state of fine powder, known by the name of *azure*. Azure, being employed to colour starch, is also called *starch-blue*.——AZURE, in Heraldry, the blue colour in the arms of any person below the rank of a baron. In the escutcheon of a nobleman it is called *sapphire*; and in that of a sovereign prince, *Jupiter*. In engraving, this colour is expressed by lines or strokes drawn horizontally.

A'ZYMA (*azumos*: from *a*, not; and *zumē*, leaven: *Gr.*), the feast of unleavened bread among the Jews.

A'ZYMITES (same *deriv.*), in Church History, Christians who administer the eucharist with unleavened bread. This appellation was given to the Latin by the Greek church, and also to the Armenians and Maronites

B

B, the second letter and first consonant in all European and most other alphabets, is formed by a quick emission of the breath, and a sudden opening of the lips; it is therefore called a *labial*, and its pronunciation differs but slightly from *p* and *v*. Among the Romans, it was used as an abbreviation, in inscriptions, for *Baccho*, &c.; B.B. for *bene bene*, that is *optime* (best); B.F. *benefactum* (done under favourable auspices), affixed to decrees, &c. We use it for *Bachelor*, as B.A. Bachelor of Arts, B.D. Bachelor of Divinity; for *before*, as B.C. Before Christ; for *Bath*, as C.B. Companion of the Bath; G.C.B. Grand Cross of the Bath; for *bene*, as N.B. *nota bene* (mark well), &c. B, as a numeral among the Romans, stood for 300, and, with a dash over it, for 3000. B, in the ecclesiastical calendar, is one of the dominical letters, and in Music is the seventh note in the gamut.

BA'AL, an idol among the ancient Phœnicians and Carthaginians, worshipped chiefly at Tyre; supposed to represent the sun, and to be the same as the Bel or Belus of the Greeks. The word signifies lord or commander; the character of the idol was varied by different nations and at different times. Of the manner in which Baal was worshipped we have only imperfect and contradictory statements; but we are informed in the Bible that human victims were among the sacrifices offered to him.

BABOO'N (*babouin*: *Fr.*), the popular name of the members of the genera *Cynocephalus*, and *Papio*, apes with projecting ridges above the eyes, long and truncate muzzle, cheek pouches, ischiatic callosities, and generally no tail. They are the ugliest of the tribe, and have fierce and brutal dispositions, which render them tameable with great difficulty. They are vegetable feeders. They herd together in troops, and when they are living near cultivated ground, they make predatory incursions at night upon it. Their limbs are strong, the face dog-like, and the teeth of the same number and form as in man. The common baboon (*C. papio*) is an inhabitant of the Guinea coast. The Derrias (*C. hamadryas*) lives in the mountains of Arabia and Abyssinia, and its figure in a sitting posture frequently appears upon the temples and tombs of Egypt. It was dedicated to Thoth and the moon, and appears as the second amongst the four gods of death. The chacma (*C. porcarius*) is a native of South Africa, and is well known to the people of Cape Town. The Mandrill (*Papio mormon*) is the largest species.

BABYLON'ICA, in Antiquity, a species of rich weaving, so called from the city of Babylon, where the art of weaving hangings with a variety of colours was first invented.

BABYLON'ICS, in Literary History, a fragment of the ancient history of the world, ending at 267 years before Christ; and composed by Berosus, a priest of Babylon, about the time of Alexander.

BABYROUS'SA, the Indian hog. This quadruped, the *Babirussa Alfurus* of naturalists, belongs to the boar tribe. It is a native of the Indian Archipelago, and is remarkable for the great development of the upper canine teeth, which curl upwards, bending like horns, and almost touching the forehead.

BACCA (*Lat.*), in Botany, the berry, a succulent fruit, such as that of the currant and gooseberry, in which the calyx adheres to the ovary, and the parietal placentas when the fruit is ripe form a pulpy mass, in which the seeds lie.

BACCALAU'REAT (probably from *baccis laureis* donatus, presented with laurel berries: *Lat.*, on account of the custom among the ancient Greeks and Romans, and the modern Italians, of crowning distinguished persons with laurel), the first and lowest degree in continental universities, equivalent to the degree of bachelor of arts with us.

BACCHANA'LIA (from Bacchus), feasts celebrated in honour of Bacchus by the ancient Greeks and Romans. Their times of celebration were spring and autumn, the former in the city, and the latter in the fields. The celebrants personified Silenus, Pan, fauns, satyrs, &c.; and in this manner appeared in public, acting frantically, and crying out *Evoe Bacche!* or *Io Bacche!*

BACCIF'EROUS (*bacca*, a berry; and *fero*, I bear: *Lat.*), a term applied to berry-bearing plants. [See BACCA.]

BACH'ELOR [see BACCALAUREAT]. Connected with knighthood, it has been derived from the *baculus*, or staff with which knights were usually invested; or from *bas chevaliers*, an inferior kind of knights. In old French, the word signifies a young man, as *bachalette*, a young woman; in its primitive sense, meaning one who has not been married.——BACHELOR, in the Universities, one who has attained the first degree in the liberal arts and sciences in the particular study to which he devotes himself. At Oxford a student must have resided twelve terms, at Cambridge nine, before he can take the degree of Bachelor of Arts. ——BACHELOR, an ancient denomination of knighthood, given to such as had not a sufficient number of vassals to carry their banners, to such knights-bannerets as were not of age to display their own banner, to young cavaliers little more than initiated to arms, and, in a very honourable sense, to him who had overcome his antagonist in the tournament.——KNIGHTS BACHELORS the lowest rank of knights, whose titles are not hereditary. These are the *knights* of modern days.

BACK, a word used in various nautical phrases; as to 'back an anchor,' to 'back the sails,' to 'back astern,' &c.; meaning to carry out a small anchor to support the larger one—to arrange the sails for the ship to move back, in consequence of the tide favouring her—to manage the oars in a way contrary to the usual one, to move a boat stern foremost, &c. The word *back* has also various figurative as well as technical applications.

BACKGAM'MON (*bach*, little; and *cammon*, a battle: *Welsh*), an ingenious game played by two persons with the help of dice, on a board or table divided into parts, on which are twenty-four black and white spaces called points.

BACK'PAINTING, the method of painting mezzotinto prints pasted on glass with oil colours.

BACK'STAFF, an instrument used before the invention of the *quadrant* and *sextant*, for taking the sun's altitude at sea; it had this name because the back of the observer was turned towards the sun.

BACK'STAYS, the ropes or stays which extend from the topmast heads to both sides of a ship, to assist the shrouds in supporting the masts, when strained by a weight of sail, and to prevent them from giving way and falling overboard.

BAC'ULITES (*baculum*, a stick: *Lat.*), a genus of fossil shells of a straight form, allied to the ammonites. It is so abundant in the chalk of Normandy, that the name of *baculite limestone* has been given to it.

BADGE, an exterior ornament of a coat of arms, originally worn by the retainers or attendants of the nobility. It fell into disuse in the reign of Queen Elizabeth.——In Naval Architecture, an ornament placed on the outside of ships near the stern, containing either a window or the representation of one.

BAD'GER, the *Meles taxus* of naturalists, an animal which inhabits the north of Europe and Asia, and is found in many parts of England. It is of a clumsy make, with short thick legs, and long claws on the fore-feet; is very indolent and sleepy; feeds on insects, roots, earth-nuts, or berries; burrows during winter, hunts by night, and lies concealed by day.

BAG'GAGE (*Fr.*), in Military affairs, the clothes, tents, utensils of different sorts, provisions, and other necessaries belonging to an army.

BAG'NIO (*bagno*, a bath: *Ital.*), a house with conveniences for bathing and otherwise cleansing the body.——In Turkey, it is the name of prisons where slaves are kept.

BAG'PIPE, a musical wind instrument used chiefly in Scotland and Ireland. It is of high antiquity, and consists of two parts, namely, a leathern bag and three pipes. The bag of the Irish pipes is filled with wind by a bellows, that of the Scotch pipes by the mouth: and each is compressed with the arm, so as to sound the pipes. There are three of the latter; two of them, called the great and little *drones*, have but one sound each; the third is something like an oboe, and has eight finger-holes. Sometimes there are other pipes.

BAIL (*bailler*, to deliver up: *Old Fr.*), in Law, sureties given for the appearance, when required, of a person on his being set free from custody. In civil cases, bail is of two kinds, *above* and *below*: bail below, or common bail, is bail to the sheriff; and bail above, or special bail, is bail to the action. When a person is arrested on affidavit that he is indebted to the plaintiff 20*l.* or upwards, and that there is probable cause for believing he intends to leave the kingdom unless discharged by a judge's order, he cannot regain his liberty if he do not execute a bail-bond to the sheriff, that he will, at a period mentioned in the bond, put in special bail. At this period he must either put in special bail, consisting of two or more persons, who undertake that if he lose the verdict he shall pay the amount awarded against him, or render himself to custody, or that they will do it for him; or he must return himself into custody. In cases of felony, bail is taken by the magistrates where there is a presumption, from the nature of the case and the character of the person, that he will not abscond from the kingdom.——*To admit to bail* is to release upon security given by bondsmen.——*To justify bail*, is to prove by the oath of the person that he is worth the sum for which he is surety beyond his debts.

BAILEE' (same *deriv.*), in Law, the person to whom the goods of another (the bailor) are delivered for some purpose on the express or implied contract that they shall be delivered to some third person or redelivered to the bailor. The case of a carrier to whom goods are entrusted to be conveyed to some third party is a case of bailment. The sender of the goods is the bailor and the carrier is the bailee.

BAI'LIFF (same *deriv.*), a subordinate magistrate or officer appointed within a particular province or district: as the bailiff of hundred, liberty, &c. Sheriffs' bailiffs are officers appointed by the sheriff to execute writs. These, being bound in bond to the sheriff for the due execution of their office, are called bound bailiffs, vulgarly bum-bailiffs.——WATER BAILIFF, an officer who searches ships, gathers toll for anchorage, and arrests persons for debt upon the water.

BAI'LIWICK (*bailli*, a bailiff: *Fr.;* and *vicus*, a village: *Lat.*), a liberty exempt from the power of the sheriff, in which district the lord exercises the office of sheriff, and appoints his own bailiff. A bailiwick is also the hundred, or district, through which the authority of a bailiff extends.

BAIO'CO (*Ital.*), a small coin in the Papal States, one hundred of which make a Roman ducat.

BAI'RAM, a festival among the Turks, in imitation of the Christian Easter, celebrated after the fast of Ramazan, when it is customary to send presents from one to another, and otherwise to express the joy felt on the occasion.

BAIZE, a coarse woollen stuff, with a long nap, sometimes frized on one side: it is without wale, being manufactured on a loom with two treadles, like flannel.

BALÆ'NA (*phalaina*, a whale: *Gr.*), a genus of Whales, which includes the right-whale of sailors.

BA'LANCE (perhaps from *bilanx: bi*, two; and *lanx*, the basin of a balance: *Lat.*), an instrument for weighing commodities, consisting of a beam or lever suspended exactly in the middle, with a scale hung to each extremity, both scales being of precisely equal weight. Hence the term balance, in Mechanics, is understood to mean a peculiar application of that simple mechanical power called the lever, by which it is rendered useful in determining the difference or equality of weights in heavy bodies, and consequently their masses or quantities of matter. The difference between the common *scales* and the *steelyard* consists in this, that in the former a larger power or more weight is used to estimate the weight of a heavier body; in the latter the same power is employed, but applied at a varying distance from the fulcrum or fixed point. [See LEVER.]——The *hydrostatic balance* is an instrument to determine the specific gravity of fluid and solid bodies.——The *assay balance* is used to ascertain the exact weight of the different metallic bodies of which an ore, &c., is composed.——In accounts, *balance* is the *difference of two sums:* hence, to pay a balance is to pay the difference, and make the two accounts equal. ——BALANCE, or *Libra*, in Astronomy, a sign in the zodiac which the sun enters at the autumnal equinox.——BALANCE, in Horology, that part of a watch which, by its inertia, regulates the beat, and produces equable motion.

BALANCE OF POWER, the equipoise of nation and nation, an object of much solicitude amongst politicians, with a view to prevent any one nation becoming greatly stronger than, and domineering over, the others.

BALANCE OF TRADE, in Commerce, the equality between the value of the commodities bought of foreigners, and the value of the native productions exported. An opinion was long entertained that, when a nation imports to a greater extent than it exports, the balance of trade is against it—that is, that it loses by its trade; and *vice versâ*. But this opinion is now proved to be utterly groundless. So far from an excess of exports over imports being any criterion of an advantageous commerce, it is directly the reverse; for, were the value of the exports greater than the value of the imports, merchants would lose in every transaction with foreigners, and the trade with them would be speedily abandoned.

BA'LAS RU'BY, in Mineralogy, a ruby of the bright red spinel kind. It is much less valuable than the oriental ruby, or red sapphire.

BAL'CONY (*balcone*, a canopy: *Ital.*), in Architecture, a projection from the front of a house, surrounded by a balustrade or open gallery. In large buildings balconies are susceptible of considerable elegance of decoration, and may be made highly ornamental to the edifices to which they are attached.

BALDACHI'NO (a canopy: *Ital.*), in Architecture, a kind of canopy erected over an altar.

BALIS'TES (from *ballista: Lat.*) [See FILE FISH.]

BALL (*Germ.*), in Military affairs, comprehends all sorts of bullets for fire-arms, from the cannon to the pistol. Balls for pistols and small arms are made of lead, but cannon-balls are formed of cast iron.

BAL'LAD (*ballata: Ital.*), a short lyric composition, or tale in verse, of a simple and popular character.

BAL'LAST (*ballo*, I cast: *Gr.*), in Navigation, stones or other weighty articles placed in the hold of a vessel when she has no cargo on board, with the view of sinking her to the proper depth in the water In

Railway Engineering, ballast signifies that part of the road which forms a firm foundation for the rails and their sleepers. The best material for the purpose is broken stone.

BALL'-COCK, a hollow globe of metal attached to the end of a lever, which turns the stop-cock of a cistern pipe by floating on the surface of the water, and thus regulates the supply.

BAL'LET (*Fr.*), a dramatic entertainment, consisting of action and dancing only, invented by the Italians.

BALLIS'TA, or BALLIS'TÆ (*Lat.*, from *ballo*, I throw : *Gr.*), a military engine used by the ancients, in battle, to throw stones, darts, and javelins.

BALLIS'TICS (same *deriv.*), the art of using projectiles.——The BALLISTIC PENDULUM is an apparatus for measuring the velocity of military projectiles, and the impulse of the explosion of powder. In the former case, it is a box full of clay, or a heavy block of wood, into which the cannon-ball is fired; and the rate at which it vibrates gives, with easy calculations, the velocity at which the ball was moving. In the latter case, the gun to be experimented on is fixed to and forms part of the pendulum. When the ball is fired, the pressure produced by the gas generated by the explosion causes the pendulum to swing through a certain angle, and this being registered forms the basis of the calculation.

BALLOO'N (*ballone*, a large ball : *Ital.*), in a general sense, means any spherical hollow body; but it more particularly designates a globe made of silk, or other material, rendered air-tight, so that when filled with hydrogen gas, coal gas, or some other elastic fluid lighter than ordinary air, it will ascend into the atmosphere, and convey heavy bodies suspended to it. A car, supported by a network which extends over the balloon, sustains the aeronaut. A valve at the top allows the gas to escape when he wishes to descend; and throwing out a ballast, consisting of sand, makes him ascend. There are two kinds of balloon: the *fire-balloon*, in which ordinary air, made lighter than the surrounding atmosphere by rarefaction produced with heat, is employed: and the *gas-balloon*, in which an air naturally lighter than that of the atmosphere is used. The principle on which a balloon rises in the air is that which makes a cork ascend in the water. The lightness of hydrogen gas very soon suggested its employment in the construction of a body specifically lighter than the atmosphere, and therefore calculated to ascend in it. Many aerial voyages have been effected, but aerostation has made little progress, and probably will never be very successful. Of late, balloons have been made use of for scientific investigations in the upper regions of the atmosphere, and an ascent to the height of five miles above the earth's surface has been effected. The largest balloon built in this country was constructed for Mr. Glaisher's ascents. It had a height of 69 feet and a diameter of 54, and it was capable of holding 95,000 cubic feet of gas.—A fire-balloon is inflated with rarefied air, by burning in the car a quantity of chopped straw, the heated air from which fills it.

BAL'LOT (*ballotte*, from *balle*, a ball : *Fr.*), the method of determining an election by means of small balls, black or white, &c., put privately into a box.

BALLOTA'DE (*ballöter*, to toss : *Fr.*), in Horsemanship, the leap of a horse between two pillars, or upon a straight line, so that, when his fore feet are in the air, he shows nothing but the shoes of his hind feet, without jerking out; differing in that respect from the *capriole*.

BALM (a contraction of *balsam*), in Botany, the name of several aromatic plants. ——BALM OF GILEAD, or Balsam of Mecca, the dried juice of a small tree or shrub growing in Syria, called *Balsamodendron opobalsamum* by botanists: nat. ord. *Amyridaceæ*. It has a warm aromatic taste, and an exquisitely fragrant smell. It is highly esteemed by the Turks as an odoriferous unguent and cosmetic; but its scarcity is such that the genuine balsam is seldom exported as an article of commerce. The American Balm of Gilead is the produce of a tree belonging to the same order.——The Balm of Gilead Fir is a coniferous tree, growing in Canada, the *Abies balsamea* of botanists.

BAL'SAM (*balsamon : Gr.*), an oily aromatic, resinous, or liquid substance, flowing, either spontaneously or by means of incisions, from certain plants, and used in the cure of several kinds of wounds, diseases, &c. The Balsam of Tolu is the produce of the *Myrospermum toluiferum*; the Balsam of Peru, of *Myrospermum peruiferum*; the Balsam of Copaiva, of various species of *Copaifera*, all leguminous trees. ——FACTITIOUS, or ARTIFICIAL BALSAMS, are certain compositions, chiefly of balsamic and healing ingredients, made by apothecaries in imitation of the native balsams.

BA'LUSTER (*balustre : Fr.*), often improperly written *banister*, in Architecture, a small turned column, usually introduced between piers, on the upper parts of large buildings, under windows, and on balconies, &c.

BALUSTRA'DE (same *deriv.*), a series or row of balusters, joined by a rail; serving as well for rest to the elbows as for a fence or enclosure to balconies, altars, staircases, &c.

BAMBOO'. All the species of bamboo, and they are numerous, belong to the family of grasses. Some of them grow to the height of sixty feet, and most of them are very useful to the inhabitants of tropical countries, on account of the number of purposes to which they can be applied. The stems are hollow, more or less flexible, and extremely tough. A group of bamboos waving in the breeze is one of the most graceful objects in nature.

BANA'NA, the fruit of the *Musa sapientum*, a tall herbaceous plant, with broad sail-like leaves, growing in tropical countries. Dampier compares it, when stripped of its integuments, to a large sausage, in size and shape; and to fresh butter in winter, as to substance and colour. Its taste is luscious, and perhaps more resembles that of a pear than any other fruit. [See MUSACEÆ.]

BAND (*bande: Fr.*), in Architecture, any flat, low member or moulding which is broad but not deep.——The BAND OF PENSIONERS, now the band of GENTLEMEN-AT-ARMS, which see.

BAN'DAGE (same *deriv.*), in Surgery, a fillet, roller, or swathe, used in dressing and binding up wounds, restraining dangerous hæmorrhages, and in joining fractured or dislocated bones.

BANDAN'NA, a kind of calico-printing practised in India from time immemorial, by which white or bright-coloured spots are produced on a red or dark ground. By the joint resources of mechanical and chemical science, the European imitations have now far surpassed, in beauty and precision, the Oriental patterns.

BANDIT'TI (outlaws: *Ital.*), a term peculiarly denoting companies of armed robbers, formerly common in Italy and France; but sometimes also used, in a more general sense, for robbers, pirates, outlaws, or others, united for nefarious purposes.

BANDOLEE'R (*bandoulier: Fr.*), a large leathern belt, thrown over the right shoulder, and hanging under the left arm, worn by ancient musketeers, for sustaining their fire-arms and musket-charges.

BANG, the name of a narcotic used in the East, made from the leaf of wild hemp.

BA'NIANS (*banik*, a merchant: *Sans.*), a caste of the Hindoos, whose profession is trade and merchandise; and, in India and Asia, they are the great factors and bankers, as the Jews often are in the West. They believe in the transmigration of souls, and not only abstain from eating the flesh of animals, but endeavour to release even the most noxious from the cruelty of others. They are mild in temper and honest in their dealings, and are so cautious of having communication with any but their own caste, that if one belonging to another nation or tribe has drunk out of or touched their cup, they break it.

BA'NIAN-DAYS, a proverbial expression, imported from the Asiatic colonies, and used for a short or indifferent dinner, or days on which no animal food is eaten: in allusion to the Banians above described.

BA'NIAN-TREE, one of the greatest wonders of the vegetable kingdom, the *Ficus indica* of botanists, a tree growing in India. Every branch shoots downward, and, striking into the ground, takes root, and is then capable of becoming a distinct tree. One of them, the Cubbeer Burr, has 350 stems, equal to large oaks, and more than 3,000 smaller ones, covering space sufficient to shelter 7,000 persons. Its branches are crowded with families of monkeys, and with birds of every description, and also with enormous bats, all of which find luxurious subsistence upon the rich scarlet figs that grow upon it.

BANK (*banco*, a bench: *Ital.*), in Commerce, an establishment for the receiving of moneys and letting them out at interest. It may likewise be defined, a place used as a common repository of the money of individuals or of companies. The basis of all banking is the profitable use to which the banker or company can apply the capital which is deposited. The first bank was established at Venice, about 1157, and the name was given to it, in Italian, from the bench upon which the money-changers or bankers used to sit in their burses or exchanges.

BANK'-NOTE, or BANK'-BILL, a promissory note, issued by a banking company, properly signed and countersigned, payable to the *bearer* in the current coin of the realm, on demand.

BANK OF ENGLAND. In the fifth and sixth years of William and Mary, 1694 and 1695, in consideration of a loan to government of 1,200,000*l.* at an interest of almost eight *per cent.*, a company was incorporated by the name of the 'Governor and Company of the Bank of England,' with a restriction by which it was prevented from dealing in any other than money concerns. The loans to government ultimately amounted to 14,686,800*l.*; but one-fourth of this has since been paid off. The profits of the company arise from the interest received from government on the permanent debt, and on their annual advances on exchequer bills, &c.; from their allowance for receiving the contributions to loans, and for paying the dividends on the public funds; from dealing in bullion, and from their large discounts with a mere paper currency. The Bank receives about 200,000*l.* a year from government for managing the public debt, receiving taxes, &c. To this revenue must be added the profit derived from the use of a floating balance due to the public, and never less in amount than four millions sterling. The affairs of this company are in the hands of a governor, deputy-governor, and twenty-four directors, eight of whom go out of office every year. The 'Bank Parlour' is the room where the directors meet the governor to discuss the affairs of the company. There are about 900 persons employed in the establishment, and the sum paid in salaries is about 210,000*l.* a year. A large amount of bullion is always kept in the vaults. This ranges in value from fourteen to seventeen millions sterling, and on the amount depends the rate of discount, i.e. the rate at which money is lent by the bank on bills of exchange. When the reserve falls the rate of discount goes up. A peculiar paper is made for their notes, and the printing is executed in the bank. There is an ingenious machine for detecting light gold coin, which is separated from the pieces of full weight in the process of weighing.

BANK'ER, one who traffics in money, by receiving the current cash of individuals free of interest, or at a small interest, and negotiating with it, either in the discount of bills, or the advance of money on sufficient securities. The moneyed goldsmiths, in the reign of Charles II., first acquired this name.——The Romans had a similar profession, but its duties were much more extensive than those of bankers among us it united the functions of brokers, agents, bankers, and notaries, managing the exchange, taking in money, assisting in buying and selling, and drawing the writings necessary on all these occasions.

BANK'RUPT (*banco rotto*, a broken bench: *Ital.*). It was a custom formerly observed, in some places, that the seat of the merchant who was found unable to meet his liabilities should be broken: hence the name. In a general sense, a Bankrupt is a person who fails or breaks, so as to be unable to carry on his business or to pay his debts. The policy of the bankrupt law was to distribute all the debtor's property among his creditors, and then to discharge him from all further liability in respect of their debts. This being regarded in the light of a privilege, was formerly allowed only in the case of traders, non-traders not being held entitled to a discharge from existing debts. The system under which the estates of non-trading debtors was wound up was called *insolvency*. The distinction between bankruptcy and insolvency was abolished in 1861, and all persons, whether traders or not, may now be made bankrupt. In all cases, some act of bankruptcy must be committed before a creditor can render his debtor a bankrupt: and an act of bankruptcy is an act of such a nature as evinces an intention on the part of a debtor to deprive his creditors of the security which they might have in the possession of his person or his property. The following are among the chief acts of bankruptcy, common to traders and non-traders. 1. Departing from the realm, or remaining abroad with intent to delay his creditors. 2. Making any fraudulent conveyance of his property.

BANN, in the Feudal law, a solemn proclamation or publication of anything. Hence the custom of publishing the banns before marriage.—In Military affairs, a proclamation made in the army, by beat of drum, sound of trumpet, &c., requiring the strict observance of discipline, the declaring a new officer, &c.—The word *ban* also means an edict of interdiction or proscription. Thus, to put a prince under the *ban* of the empire, was to divest him of his dignities, and to interdict all intercourse and all offices of humanity with the offender.

BAN'NER (*bannière*: *Fr.*), a square flag, or the principal standard belonging to a prince or state.

BAN'NERET (same *deriv.*), an ancient order of knights or feudal lords, who, possessing several large fees, had their own flag or banner. As the spirit of the feudal system declined, persons came to be created bannerets; and hence the institution must have become merely titular. The last knight of this description was Sir John Smith, on whom the honour was bestowed after the battle of Edgehill, for rescuing the standard of Charles I. On the day of engagement, the candidate presented his flag to the king or general, who, cutting off the train or skirt, and making it a square, returned it to him. Hence bannerets are sometimes called knights of the square flag.

BAN'NOCK, a kind of oat-cake, baked in the embers, or on a stone placed before the fire: it is common in Scotland and the northern parts of England.

BAN'QUETTE (a bench: *Fr.*), in Fortification, the elevation of earth behind a parapet, on which the garrison of a fortress may stand, on the approach of an enemy, in order to fire upon him.

BA'OBAB, the name of a tree growing in tropical Africa, the *Adansonia digitata* of botanists, nat. order, *Sterculiaceæ*. It is remarkable for the thickness of the trunk; specimens having been found having a diameter of 30 feet. The tree, however, is not high in proportion. The pulp of the fruit is agreeably acid, and a cooling drink is prepared from it which is useful in fevers. Some specimens of this tree have been supposed to have an age of 5,000 years. The African tree was until lately the only species of the genus, but another species has been discovered in the north-western part of Australia.

BAP'TISM (*baptismos*, from *bapto*, I dip: *Gr.*), a rite of the Christian religion, by which the members of the church are received into its communion. Almost all sects of Christians style baptism a sacrament, and consider its use as important; but the manner in which it ought to be performed, and the effects to be derived from it, have been subjects of much controversy.

BAP'TISTERY (*baptistērion*, from *baptizo*, I baptize: *Gr.*), with Ecclesiastical writers, a place in which the ceremony of baptism is performed. In the ancient church, it was one of the *exedræ*, or buildings distinct from the church itself, and consisted of a porch or ante-room where the persons to be baptized made their confession of faith, and an inner room where the ceremony of baptism was performed. Thus it continued till the 6th century, when the font began to be taken into the church porch, and afterwards into the church itself.

BAP'TISTS (*baptizo*, I baptize: *Gr.*), a denomination of Christians, who deny the validity of infant baptism. In this point, they agree with the *Anabaptists*, with whom, however, they are not to be confounded.

BAR (*barre*: *Fr.*), the partition which separates the members of a court of justice from those who have to report or hear. It is also applied to the benches where the lawyers are seated, because anciently there was a bar to separate the pleaders from the attorneys and others. Hence those who are called to the bar, or licensed to plead, are termed *barristers*, an appellation equivalent to *licentiate* in other countries.—In Heraldry, an ordinary in form of a fesse, but much smaller.—In Law, a plea of a defendant, which is sufficient if true to destroy the plaintiff's action.—In Music, a stroke drawn perpendicularly across the five lines of the stave, the space between each two bars including a certain quantity or measure of time.—**Bar**, a shoal often formed across the mouths of rivers.

BARB (*barba*, a beard: *Lat.*), one of the points in the heads of arrows or fishing-hooks, which prevent them from being drawn out easily.——The name of a horse of the Barbary breed, remarkable for its swiftness.

BARBA (*Lat.*), in Mammalogy, the tuft of hair dependent from the lower jaw.——In Ornithology, the feathers which, in some species of birds, depend from the skin covering the gullet.

BAR'BACAN, or BAR'BICAN, an outer defence to a city or castle, or a watch-tower for observing the enemy; also an aperture made in the wall of a fortress, through which to fire upon an enemy.

BARBA'RIAN (*barbaros: Gr.*), a name given by the ancient Greeks and Romans to all who were not of their own country, or were not instructed in their language, manners, and customs.

BAR'BARISM (*barbarismos: Gr.*), in a general sense, a rudeness of language or behaviour.——In Grammar, an offence against the purity of style or language, or a mode of speaking or writing contrary to the true idiom of any particular language.

BAR'BEL, a fresh-water fish, the *Barbus vulgaris* of naturalists, which takes its name from the processes termed *barbels*, or filamentary appendages about the mouth, of which it has four. It belongs to the carp family, and is therefore allied to the gudgeon, but is distinguished from that fish by the shortness of the under jaw, and by the possession of a strong serrated bony ray at the dorsal fin. It lies in holes near the banks, and feeds on testaceous animals, worms, &c.

BAR'BERRY. [See BERBERIS.]

BAR'BLES, or BARBS (*barba*, a beard: *Lat.*), in Farriery, the knots of superfluous flesh that grow in the channels of a horse's mouth; that is, in the intervals that separate the bars, and lie under the tongue.

BARD (*bardus: Lat.*), the name given to individuals of semi-barbarous tribes, particularly those belonging to the *Celtic* race, whose genius enabled them to describe events in elevated or measured language.

BARGE, a boat of state and pleasure. Also, the name of a flat-bottomed vessel employed for carrying goods on a navigable river.

BARIL'LA, the crude soda of commerce, formerly obtained by burning several species of *fucus* and shore plants, belonging chiefly to the genera *Salsola* and *Salicornia*, and then melting the ashes in a small kiln. Soda is now procured more cheaply from common salt.

BA'RIUM (*barus*, heavy: *Gr.*), a metal so called by Sir Humphry Davy, the discoverer; and obtained by the chemical decomposition of barytes. It has the colour and lustre of silver, but is soon tarnished by the oxygen of the air. It is malleable, and melts below a red heat It decomposes water. Its equivalent is 68·5.

BARK (*bergen*, to cover: *Ger.*), that part of a tree which is external to the wood. When young, it is cellular, and similar to the pith. Afterwards, it is composed of both cellular and vascular tissue, the latter being next the wood, and called *liber*. On the outside of the liber is the cellular envelope, and outside this is the outer covering, or rough bark. It is observed that trees stripped of their bark in the time of the sap, and suffered to die, afford heavier timber, more uniformly dense, stronger, and fitter for service than those which are cut down in their healthy state.

BARK, PERU'VIAN. [See QUININE.]

BAR'LEY, a valuable kind of grain, principally used in England in the state of malt for brewing.——PEARL BARLEY, or *French Barley*, the grain freed from the husk by a mill, and reduced to the size of small shot, all but the very heart of the grain being ground away.——BARLEYCORN, the least of our long measures, being the third part of an inch.

BARM, or YEAST, the head, or working out of beer, which is used as a ferment to lighten bread. By the aid of the microscope it has been found that yeast is a collection of vegetable cells of very rapid growth, in fact a species of fungus.

BAR'NACLE, or BER'NICLE GOOSE, a prettily-marked wild goose, which visits our islands in winter.

BAR'NACLES, the common name of a class of shell-bearing animals, called *Cirripedia*, allied to the Crustacea. Some of the sessile species, called acorn-shells, are common on every shore rock washed by the sea. Examples of the stalked species are to be seen on the bottom of most ships that have been to sea. It was once commonly supposed that these the true barnacles produced the barnacle goose, whence their name.——In Farriery, an instrument composed of two branches joined at one end with a hinge, and put upon a horse's nose, to confine him for shoeing, bleeding, or dressing.

BAR'OLITE (*baros*, weight; and *lithos*, a stone: *Gr.*), or WITHERITE, a ponderous stone, the carbonate of barytes. It usually occurs in small masses, which have a fibrous structure; and it is generally of a light yellowish-grey colour.

BAROM'ETER (*baros*, weight; and *metreo*, I measure: *Gr.*), an instrument for measuring the weight, or rather the pressure of the atmosphere. It is of various forms: the best and most usual is a straight tube of glass hermetically sealed at one end; having been filled with pure mercury, free from air, the open end is closed with the thumb, and it is inverted into a cup of mercury. The column of mercury will descend until its weight just balances the pressure of the atmosphere at the time. The empty space next the upper or closed end is called the *Torricellian vacuum*. The upper surface of the mercury never descends, in ordinary circumstances, more than a few inches; and this space is measured by a scale, aided by what is called a *vernier* [which see]. The real height of the column of mercury is the distance from the *surface* of the mercury in the cup to the upper surface of the column in the tube. This instrument is used for obtaining probable indications of the state of the weather. In dry weather, the air, being free from vapours, is heavy, and forces up the mercury; but in moist rainy weather, the atmosphere being charged with clouds and fogs, the air is lighter, and acts upon it with less effect. From the best observations that have been made on the barometer, it appears, however, that it is not so much the height of the mercury in the tube that indicates the weather, as its motion up and down; hence, in order to know whether the mercury is actually rising or falling, the following rules are of use:—1. If the surface of the mercury is convex, it is a sign that the mercury is then rising. 2. If the surface is concave, it is sinking. 3. If the surface is plain, or rather a little convex, the mercury is stationary. 4. If the glass is small, shake the tube, and if the air is grown heavier, the mercury will rise about half the tenth of an inch; if it is growing lighter, it will sink as much. Prof. Daniell constructed a barometer with water in place of mercury. This liquid being much lighter, requires a longer tube, and the tube of Daniell's instrument was forty feet long. The oscillations of the water are, of course, much more apparent than in a small barometer, and, in unsettled weather, it is very interesting to watch the movements of the liquid. As to the use of the barometer in measuring heights, see HYPSOMETRY; see, also, ANEROID BAROMETER.

BAR'OMETZ, or BAR'ANETZ, the name given to the stem of a woolly fern, when artfully prepared, so as to deceive persons into the belief that the deserts of Scythia contained creatures that were half animal, half plant. The name of Scythian lamb was also given to it.

BA'RON, a member of the lowest order of the nobility with us. Originally, the barons, being the feudatories of princes, were the proprietors of land held by honourable service; hence, in ancient records the word *barons* comprehends all the nobility. It is probable that formerly all those were barons who had lordships with courts-baron, and soon after the Conquest all such sat in the house of peers; but being very numerous, it was ordered that none should sit there but such as the king thought proper to call up by writ, which ran *pro hâc vice tantùm*. This state of nobility being very precarious, they at length obtained of the king letters patent, and were then called barons by patent, or creation. The coronet of a baron has only four pearls, and no leaves. Barons do not appear to have had the privilege of wearing a coronet until the time of Charles II.—— BARONS OF THE EXCHEQUER, the five judges of the court of Exchequer.

BARON AND FEMME (*femme*, a wife: *Fr.*), a term in Law for husband and wife, who are deemed but one person; so that, except under peculiar circumstances, as, for instance, in cases of high treason, or violence to the wife, she cannot be witness for or against her husband, nor he for or against his wife. The queen, whether queen regnant or queen consort, is, however, regarded by English law as a single woman.

BA'RONET, one having the lowest degree of honour that is hereditary. The order of baronets was founded by James I., when in want of money, at the suggestion of Sir Robert Cotton, when 200 were created at once, each of whom paid 1,095*l.*, and undertook to maintain 30 men for three years against the rebels in the Irish province of Ulster. To this number it was intended that they should always be restricted, but it is now enlarged, at the royal pleasure, without limitation. The baronetage of Scotland, of Nova Scotia in America, and of Ireland, was afterwards instituted. All indifferently bear the red hand of Ulster on their coat-armour, and have the right to prefix 'Sir' to their names; their wives being styled 'Lady.'

BAR'RACAN (*Fr.*), a kind of thick, strong stuff, something like camlet, but of a coarser texture. It is used to make cloaks, surtouts, and other outer garments.

BAR'RACKS, large buildings erected for the security and accommodation of soldiers, whether infantry or cavalry.

BARRACU'DA, a species of fish found in the West Indian seas, belonging to the genus *Sphyræna* of ichthyologists. It is sometimes taken ten feet long, and is very voracious.

BAR'RATRY (*baratta*, strife: *Ital.*), in Law, 'the moving and maintaining of suits, in disturbance of the peace, and the taking and detaining the possession of houses, lands, and goods, by false inventions.' It is indictable. In maritime assurance, it is the act of the master or mariners, of a criminal or grossly negligent nature, tending to their benefit, but to the prejudice of the owner of the ship. In Scotland, it is the crime of a judge who receives a bribe.

BARRICA'DE (*Fr.*), or BARRICA'DO, a fortification made in haste, of trees, earth, palisades, wagons, or anything that will obstruct the progress of an enemy, or serve for defence or security against his attack.

BAR'RISTER, a counsellor earned in the law, admitted to plead at the bar, and there to take upon him the protection and defence of clients. Barristers are termed *Juris consulti*; in some countries *Licentiati jure*; and anciently they were called *Apprentices* of the law: in Latin, *Apprenticii juris nobiliores*. In Scotland, they are called *Advocates*. Certain barristers are from time to time appointed to be the counsel of the crown, and are called king's or queen's counsel. These sit within the bar, and take precedence of all barristers not of that dignity. Without special license they cannot be employed against the crown, for example, in defence of persons accused of crimes. Before anyone can apply to be called to the bar, he must become a member of an inn of court, and keep twelve terms there. [See INN OF COURT, SERGEANT-AT-LAW.]

BAR'ROW, a large artificial hillock or mound of earth. Barrows are met with in many parts of the world, and on being opened are found to be repositories of the dead. By the Romans they were called *tumuli*. They are still to be seen in many parts of Great Britain and Ireland, as well as in several other countries. They are the most ancient monuments in the world. In this country, they are chiefly found in the chalk districts of Wilts and Dorsetshire. A mound of stones is usually called a cairn.

BAR'RY, in Heraldry, is when an escutcheon is divided bar-wise (that is, across from side to side) into an even number of partitions, consisting of two or more tinctures interchangeably disposed.

BAR'-SHOT, double-headed shot, consisting of a bar with a half ball or round head at each end; used for destroying the masts and rigging in naval combat.

BAR'TER, the exchanging of one commodity for another, the trucking of wares for wares, among merchants. Barter was the original and natural way of commerce, there being no buying till money was invented.——Also, the rule in Arithmetic by which the proportionate value of commodities is found.

BARYSTRON'TIANITE (a combination of the words *barytes* and *strontian*), a mineral called also *stromnite*, from Stromness, in Orkney. It is of a yellowish-white colour externally, but of a greyish-white within.

BARY'TA, or **BARY'TES** (*barus*, heavy: *Gr.*), the oxide of the metal BARIUM. It is white, and is soluble in water. The native carbonate (BAROLITE, or Witherite) and sulphate are found abundantly in lead mines, and are remarkable for their weight. The latter is frequently in the form of beautiful crystals. All the soluble salts of barytes are poisonous. Barytes and some of its salts are employed by chemists as tests.

BARYTO-CAL'CITE (*barytes*, and *calcium*), in Mineralogy, a mixture of carbonate of baryta, lime, and sulphate of baryta. It is of various forms, and of a grey colour.

BA'RYTONE (*barus*, heavy; and *tonos*, a tone: *Gr.*), in Music, a male voice, the compass of which partakes of the common bass and the tenor, being lower than the latter and higher than the former.

BASALT' (*basaltes: Lat.*), a heavy, stony rock of volcanic origin, and of the Trap series, composed of felspar, augite, and iron intimately mixed, with other minerals embedded, the commonest of which is *Olivine*. It is usually of a black or bluish colour. It is found in sheets of more or less thickness, and of variable width, alternating with the other products of volcanoes. It is frequently found split vertically into angular columns, which vary from the utmost degree of rudeness to columns of a very regular structure, such as are seen at the GIANT'S CAUSEWAY, and Staffa. It is very often the injected rock of a dike, and its tendency to split at right-angles to the cooling surfaces is then clearly shown.

BASALT'INE (last), in Mineralogy, a variety of common hornblende, often found in basalt and volcanic scoriæ.

BAS'ANITE (*basanos*, the touchstone: *Gr.*), in Mineralogy, Lydian stone, or black jasper; a variety of silicious or flinty slate, of a bluish-black colour, interspersed with veins of quartz. It is employed to test the purity of gold.

BASE (*basis*, a foundation: *Gr.*), in Geometry, the lowest side of the perimeter of a figure.—**BASE**, in Architecture, any body which bears another, but particularly the lower part of a column or pedestal. The base of columns is differently formed in different orders: thus, the Tuscan base consists only of a single torus, besides the plinth; the Doric has an astragal more than the Tuscan; the Ionic has a large torus over two slender scotias, separated by two astragals; the Corinthian has two toruses, two scotias, and two astragals; the Composite has an astragal less than the Corinthian; the attic base has two toruses and a scotia, and is proper for either the Ionic or Composite column.——In Chemistry, a term used to denote the metal which, with oxygen, forms an oxide, and the oxide which, with an acid, forms a salt. Thus, in oxide of iron or copper, the iron, or copper, is the base; in sulphate of baryta, baryta is the base.——In Fortification, the exterior side of the polygon, or that imaginary line which is drawn from the flanked angle of a bastion to the angle opposite to it.——**BASE COURT**, any court not of record.——**BASE FEE**, a *qualified* fee, which must be determined whenever the qualification annexed to it is at an end.——**BASE LINE**, in Perspective, the common section or a picture, and the geometrical plane.——**BASE TENURE**, in Law, the holding by villenage or other customary services, as distinguished from the higher tenures *in capite*, or by military service.

BASHAW' (a viceroy: *Turk.*), **PASHA'**, or **PACHA'**, a dignity under the Turkish government. *Bashaw*, used absolutely, denotes the prime vizier; other bashaws, who are generally governors of provinces or cities, being distinguished by the name of the places under their command. The appellation is given by way of courtesy to almost every person of any importance at the Grand Signior's court. The degree of a bashaw's dignity is marked by his bearing one, two, or three horses' tails.

BA'SIL, an aromatic plant of the genus *Ocymum*, of which there are many species, all natives of warm climates: nat. order, *Labiatæ*. The sweet basil is much used by the French in cookery.——**BASIL**, in Carpentry, the slope or angle of a chisel, plane, or other tool.

BASIL'ICA (*basilikos*, royal: *Gr.*), in Architecture, properly the palace of a king, but used to indicate a place where courts of justice were held. Its form was a parallelogram, with a portico at each end; being covered with a roof supported by rows of columns. Some of the basilicas were afterwards used for Christian churches: and many of the latter have, from this circumstance, been termed *basilicæ*.——In Anatomy, the interior branch of the axillary vein, running the whole length of the arm.

BASIL'ICON (same *deriv.*), in Medicine, an ointment consisting of resin, oil, wax, &c.; it was considered a sovereign kind of plaster. The word was also used as an epithet for many other compositions.

BASILI'DIANS (from *Basilides*, their founder), in Church History, a branch of Gnostics, who maintained that Christ's body was only a phantom, and that Simon the Cyrenean suffered in his stead.

BAS'ILISK (*basiliskos: Gr.*), a fabulous kind of serpent, called a cockatrice, said to be produced from a cock's egg, hatched by a serpent, and supposed to kill by its breath or sight only.——A large piece of ancient ordnance.

BA'SIN (*bassin: Fr.*), a hollow vessel for holding liquids.——In Hydraulics, any reservoir of water.——BASIN of a dock, a place where the water is confined by double flood-gates. The *basin of a haven* is that part which opens from a narrow passage into a spacious receptacle.——In Jewish Antiquities, the *laver* of the tabernacle.

BA'SIS (*basis*, a foundation: *Gr.*), in Medicine, the principal ingredient in a composition.——BASIS CEREBRI, in Anatomy, the lower and posterior part of the brain. ——BASIS CORDIS, the superior part of the heart, so called to distinguish it from the apex or small point.

BAS'KING-SHARK, the *Selachus maximus* of ichthyologists, has been frequently taken on the British coasts. It has been known to reach the length of 36 feet. It derives its common name from its habit of lying on the surface of the water and basking in the sun. It produces a great quantity of oil.

BASS (*bas*, low: *Fr.*), sometimes written *base*, the lowest or fundamental part in music, and important as the foundation of harmony. *Counter bass* is a second or double bass, where there are several in the same concert. *Ground bass* is that which commences with some subject of its own, that is continually repeated throughout the movement, whilst the upper parts pursue a separate air. *Thorough bass* is the science of harmony including the fundamental rules of composition. —— BASS, among gardeners, a soft kind of sedge or rush used in binding plants, &c.

BAS'SET, a miner's term, signifying the out-crop or emergence of a stratum at the surface of the earth.

BAS'SO (low: *Ital.*), in Music, the Italian term for *bass*. Thus, *basso concertante* is the bass of the little chorus; *basso ripieno*, the bass of the grand chorus; and *basso continuo*, that part of a composition which is set for the organ, &c.

BAS'SO RILIE'VO (*Ital.*), or BAS-RELIEF, sculpture in which the figures project but little from the plane on which they are formed. Prominent figures are said to be in *relief;* and when the work is low or flat it is called *bas-relief*, or *basso rilievo*, in distinction from *alto rilievo* and *mezzo rilievo.*

BASSOO'N (*bas*, low; and *son*, a sound: *Fr.*), a musical wind instrument, consisting of a very long tube of wood, with a reed for the mouthpiece.

BASTI'LLE, a general name in France, during the middle ages, for works outside a city; but commonly applied to a celebrated fortress in Paris, which was used as a state prison, and in which many persons who had incurred the resentment of the French monarchs or their ministers were immured. It was built at the latter part of the fourteenth century, and was demolished by the enraged populace at the commencement of the revolution, in 1789.

BASTINA'DO (*bastone*, a stick: *Ital.*), a mode of punishment used among the Turks, in which the offender is beaten on the soles of the feet.

BAS'TION, in Modern Fortification, a large mass of earth, usually faced with sods, but sometimes with brick, and in a few instances with stone, standing out from a rampart of which it is a principal part; and what, in ancient fortification, was called a *bulwark.* The bastion consists of two *faces*, and an opening towards the centre, called the *gorge.* Bastions are solid or hollow. A *flat* bastion is made in the middle of the curtain, when it is too long to be defended by the bastions in its extremes. A *demi* bastion is composed of one face only, with one flank and a demi-gorge. A *double* bastion is one raised on the plane of another.

BAT, the name of a family of mammalian animals, the *Cheiroptera* or *Vespertilionidæ*. Their distinguishing feature is that the fore and hind legs are connected by a membrane which spreads over the elongated finger bones, so as to form an apparatus for flying. They are nocturnal animals, with wonderful powers of sight. They are found in all parts of the world. The majority feed upon insects, and only a few upon fruits. Some of them are blood-suckers, and in South America there is at least one species which is troublesome to horses in this way. The family is divided into two sections: those which have upon the noses a leaf-shaped membrane, in which the nostrils are placed; and those which are destitute of such a membrane.

BATH (*bad: Sax.*). Natural warm baths are formed of the water of hot springs, of which there are many in different parts of the world, especially in countries where there are, or evidently have been, volcanoes. The chief natural warm baths in Great Britain are those of Bath and Bristol, in Somersetshire; and those of Buxton and Matlock, in Derbyshire; which latter are merely *tepid.* Some are impregnated with iron, and called *chalybeate;* others with sulphur, carbonic acid, and other mineral substances. They are often very efficacious in scorbutic, bilious, and dyspeptic complaints, as well as for the removal of various chronic diseases. The word *bath* also signifies any artificial contrivance which is to supply the place of a bath, as a *shower bath,* or an apparatus for applying water to the body in the form of a shower; a *vapour bath,* or a mode of conveying moisture to the body by means of steam. Among the ancients, the most magnificent edifices were erected for bathing in; such were the baths of Titus and Diocletian, the ruins of which still remain. At the present day, baths are in general use in the East.——BATH, in Chemistry, an apparatus used in various processes, particularly in distillations, and consisting in the use of different intermedia. When the degree of heat required is below that of boiling water, a vessel containing that fluid is interposed between the fire and the substance to be acted upon; and when a superior degree of heat is necessary, sand, or some other matter of a similar nature, is employed.

BATH, KNIGHTS OF THE, a military order of knighthood in England, supposed to have been instituted by Richard II., who limited the number of knights to four; but his successor, Henry IV., on the day of his coronation, increased them to forty-six. This order received its denomination from a custom of bathing before the knights received the golden spur. The badge or symbol of the order is a sceptre, rose, thistle, and three imperial crowns conjoined within a circle, upon which is the motto, 'Tria juncta in uno,' alluding to the three cardinal virtues—faith, hope, and charity. The order of the Bath, after remaining many years extinct, was revived under George I., in 1725, by the solemn creation of a great number of knights. There are three classes of the order: Knights Grand Cross (G.C.B.), Knights Commander (K.C.B.), and Companions (C.B.). The members of the two first are entitled to prefix 'Sir' to their names. Each class has a civil and military division.

BA'TON (*Fr.*), the staff or truncheon given to field-marshals as a symbol of authority.

BATOO'N, in Architecture, a moulding in the base of a column.

BATRA'CHIANS (*batrachos*, a frog: *Gr.*), an order of amphibious animals, which some naturalists have placed amongst the reptiles. They are divisible into two groups: the tailless and the tailed batrachians. To the first belong frogs and toads; to the second, salamanders and tritons, which run instead of leaping. All the batrachians undergo transformation. When hatched from the egg, they have gills like fishes, a tail, and no legs.

BAT'RACHUS (same *deriv.*), in Ichthyology, the sea-devil, a frog-like fish.——In Medicine, an inflammatory tumour under the tongue.

BAT'TA, allowances made to troops in India. *Dry batta* is money given in lieu of rations; *wet batta*, what is given in kind.

BATTA'LIA (*Ital.*), an army drawn up in order of battle.

BATTA'LION (*bataillon: Fr.*), a body of foot soldiers, consisting of from 600 to 1,000 men.

BAT'TEL, an ancient mode of trial by single combat, which was sanctioned by law, and was introduced into England by William the Conqueror. It was allowed in a civil action, called a writ of right, and also in *appeals*, which were actions by the subject demanding punishment for the crime on account of the private rather than the public injury. In the latter, the combat was between the parties, in the writ of right between the champions. The contest took place before the judges, on a piece of ground enclosed, and the combatants were bound to fight until the stars appeared, unless the death of one party sooner decided the contest. It is but in comparatively late years that this barbarous practice has been abolished.——An account of the expenses, for provisions and liquor, of a student at Oxford.

BAT'TEN (*bâton*, a stick: *Fr.*), a scantling or piece of wood, from two to four inches broad, and one inch thick.

BAT'TERING-RAM, a military machine, with which the ancients effected breaches in fortifications. This engine was variously constructed, and of different sizes; but in general it consisted of a vast beam suspended from a frame, and armed at one end with a head of iron, resembling that of a ram, from the butting of which animal the idea was doubtless derived. This being equally balanced, and furnished with a number of ropes at the extremity opposite to the ram's head, a great number of men threw it forward with violence, and thus, by a repetition of the strokes, the wall against which it was directed was demolished.

BAT'TERY (*batterie: Fr.*), in the Military art, any raised place where cannon or mortars are planted. A parapet covers the gunners and men employed about the guns from the enemy's shot, and is cut into embrasures for the cannon to fire through. A *battery of mortars* is sunk in the ground, and has no embrasures. *Battery d'enfilade*, is one that scours or sweeps the whole length of a straight line. *Battery en écharpe*, is that which plays obliquely. *Battery de revers*, that which plays on the enemy's back. *Cross-batteries* are two batteries which play athwart one another upon the same object, thus forming an angle, and producing great effect, because what one ball shakes the other throws down. A *camerade battery* consists of several guns which play at the same time upon one place. A *ricochet battery*, is one from which the cannon are discharged with a very small quantity of powder, and very little elevation, so as to carry the ball just over the parapet, where it rolls along the opposite rampart, and produces a destructive effect.——BATTERY, in Electricity, is a combination of coated surfaces of glass, commonly jars, so connected together that they may be charged at once, and discharged by a common conductor.——GALVANIC BATTERY, or *Pile*, an apparatus employed for accumulating the electricity of galvanism, which is produced by the natural agencies of certain metallic and carbonaceous substances and peculiar fluids. This instrument was invented by the celebrated Volta, and is often called the *Voltaic* battery. It has, at different times, assumed various forms, each more perfect than the preceding. The earlier species consisted of compound plates of zinc and copper, in cells charged with dilute acids. But the action of such batteries was very transitory. *Constant* batteries were then invented: they were so called from their prolonged action. Many of them are very effective and convenient; but the two kinds most generally used at present are *Smee's* and *Grove's*. The former consists of a very thin sheet of silver platinized—that is, covered all over with metallic platinum in the form of a black powder; at each side of this, but not in contact with it, is fixed a thick plate of zinc amalgamated; that is, well covered with metallic mercury. When this apparatus is immersed in tolerably strong sulphuric acid, there is no action until the zinc plates are connected by a wire or some metallic conductor with the platinized silver; violent action then occurs. Hydrogen in large quantities is given off from all parts of the platinized silver, and electricity is transmitted along the wire or other conductor. Grove's battery, called the *nitric acid battery*, consists of a flat cell of glazed porcelain, containing within it a smaller cell of porous earthenware. A plate of amalgamated zinc is bent, so as to receive the porous cell, and at the same time to lie in the glazed cell. Within the porous cell is a thin plate of platinum. When the glazed cell is charged with a mixture of one part oil of vitriol and six parts water, and the inner cell with strong nitric acid, action commences, as in Smee's battery, on uniting the two metals by a metallic conductor, and electricity is transmitted along the latter. With this battery no hydrogen escapes, as it forms water with some of the oxygen of the nitric acid, which it changes into nitrous. Prof. Bunsen has rendered Grove's battery much cheaper by substituting dense coke for platinum.——**Battery**, in Law, the striking, beating, or offering any violence to another person, for which damages may be recovered. It is distinguished from an *assault*, inasmuch as the latter does not necessarily imply a blow. There may be an assault without battery, but battery always implies an assault.

BAT'TLE-AXE, a military weapon which owes its origin to the Celts. It was not used by the Greeks or Romans, but was very common among the contemporaneous Celts. It was a favourite weapon in England, Scotland, and Ireland; and the Lochaber axe was particularly celebrated.

BAT'TLEMENTS (from *battle*), in Military Architecture, a wall or parapet on the top of a building, with embrasures or open places to look through, or discharge missiles against the enemy.

BATTOL'OGY (*battologia*, idle talk: *Gr.*), in Grammar, a superfluous repetition of some words or things.

BAT'TUE (*battre*, to beat: *Fr.*), in Sporting, the surrounding a portion of a forest, wood, or park, and, by beating the bushes and shouting, endeavouring to bring out the animals intended for the chase.

BAY (*baie*: *Fr.*), in Geography, an arm of the sea extending into the land; it is also often applied to large tracts of water, as the *Bay* of Biscay.——**Bay**, one of the colours of a horse, of which there are various shades.——**Bay**, or **Bay-tree**, the *Laurus nobilis* of botanists, an evergreen which grows wild in the south of Europe. A garland or crown made of bay leaves was awarded, among the ancients, as a prize for victory or excellence.

BAYEUX TAPESTRY, a linen web, 442 feet long, and 2 wide, said to have been embroidered by English women, under the direction of Matilda, the queen of William the Conqueror, the subject being the conquest of England. It is preserved in the cathedral of Bayeux.

BAY'ONET (from *Bayonne*, where it was first invented), a short pointed instrument, or triangular dagger, made to fit on the muzzle of a firelock or musket.

BAY'-SALT, a salt which crystallizes or receives its consistence from the heat of the sun or action of the air.

BAZAR', or **BAZAAR'** (a sale: *Pers.*), a kind of exchange or market-place among the Turks and Persians. Some of these buildings are remarkable not only for their extent, but for their magnificence.——This name has of late years been in use with us to denote certain large buildings containing a collection of shops or stalls, let to different persons, and in which a great variety of 'fancy goods' are exposed for sale.

BDEL'LIUM (*bdellion*: *Gr.*), a name given to certain gum-resins, the produce of different plants. African bdellium, which has a bitter nauseous taste, and a dark-brown colour, is yielded by a composite half succulent plant, called *Ceradia*, which grows in SW. Africa. Egyptian bdellium is produced by a palm, *Hyphæne thebaica*. Another bdellium is obtained from various species of Balsamodendron trees growing in India and Africa.

BEA'CON (*beacn*, to point out: *Sax.*), a signal erected on a long pole, upon an eminence. It consists of a pitch-barrel or other combustible matter, which is fired at night, to notify the approach of an enemy. Also, any object serving as an occasional signal, or as a constant sea-mark, by means of which ships may be warned of danger, or assured of their port.

BEAD (*beade*: *Sax.*), in Architecture, a round moulding, commonly made upon the edge of a board, &c. In the Corinthian and Roman orders, it is cut or carved in short embossments, like beads in necklaces.——**Bead**, in Metallurgy, the small ball or mass of pure metal separated from the scoria, and seen distinct while in the fire.——**Bead-proof**, a term amongst distillers for that proof of the strength of spirituous liquors denoted by the bubbles called *beads*, which rise and remain on the surface of the liquid for some time after it has been shaken.

BEAD'-TREE, a shrub growing in Spain and Portugal; so called, because the nuts which it bears are bored through, and strung as beads by the Roman Catholics of those countries. It belongs to the genus *Melia*.——A **Beadsman** is one who recites prayers for his patron, &c.

BEA'DLE (*bidel*, a public crier: *Sax.*), a messenger, or apparitor of a court, who cites persons to appear and answer in the court what is alleged against them.——A **Beadle** is also a person at a university, whose chief business it is to walk before the university officers with a mace in all public processions, &c. [See **Bedell.**]

BEA'GLE (*bigle*: *Fr.*), the name of a particular kind of hound or hunting-dog, of which there are several sorts.

BEAK (*bec*: *Fr.*), in a general sense, the upper end or point, as the upper part of the bill of a bird.——**Beak-head**, in a ship, a small platform at the fore-part of the upper deck.——**Beaked**, in Heraldry, an epithet in blazoning for birds whose beaks are of a different tincture from their bodies. In Botany, an epithet for the fruit when it is terminated by a process in the shape of a bird's beak.

BEA'KER (same *deriv.*), a drinking cup, so called from its having a spout like a bird's beak.

BEAM, the largest piece of timber in a building, laid across the walls, and serving to support the principal rafters. In ships, beams are the large main timbers that stretch across a ship to support a deck.——In Mechanics, the part of a balance, from the ends of which the scales are suspended. ——BEAM, among Hunters, the main stem of a deer's head, or that part which bears the antlers, royals, and tops.——BEAM-ENDS. A vessel is said to be on her beam-ends when she inclines so much on one side that her beams approach a vertical position.——ABEAM, in a direction perpendicular to the ship's length: amidship.——BEAM COMPASS, an instrument consisting of a square wooden or brass beam, having sliding sockets, and used for describing large circles.——BEFORE THE BEAM, is an arch of the horizon between a line that crosses the ship at right angles, and that point of the compass towards which she steers.

BEAM'-TREE, the *Pyrus aria* of botanists, nat. ord. *Pomaceæ*. This tree grows to the height of thirty or forty feet, and is particularly fitted for making axle-trees and the like.

BEAR (*bera : Sax.*), a family of mammalian quadrupeds, of which there are several species, agreeing in having large stout limbs, large heads, terminating in a prolonged snout; bodies clothed with shaggy hair, and feet furnished with hooked claws. The best-known species are:—1. The brown bear, which subsists chiefly on fruit, vegetables, and honey. 2. The American bear, which is smaller than the other, and feeds in like manner. 3. The Polar or maritime bear, which is only found in high northern latitudes: it is from eight to twelve feet long, of great strength and ferocity, devouring at sea fish, seals, and whales, and on land any animals which it can seize. ——BEAR, in Astronomy, a name given to two constellations called the greater and the lesser bear, or *Ursa major* and *Ursa minor*.

BEARD'ED (*barbatus*), in Botany, having tufts of hair.

BEAR'ER, in Architecture, a post or brick wall placed between the ends of a piece of timber, to support it.——In Heraldry, a figure in an achievement, placed by the side of the shield, and seeming to support it.

BEAR'ING, in Navigation and Geography, the situation of a place with regard to the points of the compass, or the angle which a line, drawn through two places, makes with the meridian of each.——Also a Sea-term found in several phrases; thus, when a ship sails towards the shore, before the wind, she is said to *bear in with the land* or harbour. To let the ship sail more before the wind, is to *bear up*. To put her right before the wind, is to *bear round*. A ship that keeps off from the land is said to *bear off*. When a ship that was to windward comes under another ship's stern, and so gives her the wind, she is said to *bear under her lee*, &c.——BEARINGS, in Heraldry, the coats of arms, or armorial figures, by which the nobility and gentry are distinguished from common persons, and from each other.

BEAT (*beatan*, to beat: *Sax.*), in Military phraseology, a word of various significations, expressive of giving a signal by *beat of drum*. As, 'To beat an *alarm*,' to give notice of danger. 'To beat a *charge*,' to give a signal for charging the enemy. 'To beat the *general*,' to give notice to the troops to march. 'To beat the *reveille*,' to give notice for leaving quarters. 'To beat the *tattoo*,' to give notice for retiring to quarters, as at bedtime. 'To beat the *troop*,' a signal for repairing to colours. 'To beat to *arms*,' to give a signal for the troops to arm themselves. 'To beat a *parley*,' a signal for a cessation of hostilities, to hold a conference with the enemy. These signals are now given with the bugle.——BEAT, in Music, a reversed shake, without a turn.

BEATIFICA'TION (*beatus facio*, I make happy: *Lat.*), an act of the Pope, by which he declares a person beatified or blessed after death, and the first step towards canonization, or the raising of any one to the dignity of a saint. No one can be beatified till fifty years after his death.

BEAT'INGS (*beatan*, to beat: *Sax.*), in Music, the regular pulsative swellings of sound produced in an organ by pipes which are not quite in unison, their vibrations not being exactly simultaneous or coincident.

BEAU MONDE (polished society: *Fr.*), a term implying the gay fashionable world.

BEA'VER (*befer: Sax.*) a mammalian animal belonging to the order *Rodentia*. The common beaver, *Castor fiber*, is a native of Europe and North America, living on the banks of rivers and unfrequented lakes, and remarkable for its ingenuity in building its habitation. It has short ears, a blunt nose, small fore feet, large hind feet, and a flat ovate tail. It walks slowly, swims dexterously, eats sitting on its haunches, and conveys its food to its mouth with its fore paws. This animal is valued both for its fur and for the oil which it yields.——BEAVER, that part of the helmet which defends the sight, and opens in front.

BECHE-DE-MER, or BICHO-DE-MAR, the commercial name of what is called *trepang* by the Malays, marine worm-like animals (*Holothuriæ*, belonging to the class of Echinoderms), which are collected in large quantities in the Eastern archipelago, for the Chinese, by whom they are esteemed a table delicacy. When taken from the sea they are plunged for a few minutes in boiling water, and then dried. Their integuments contain more or less carbonate of lime, in the form of minute plates or spicula.

BED, an article of furniture on which the body is stretched and composed for rest or sleep, and consisting generally of feathers enclosed in a case of tick. The ancient Romans had various sorts of beds, for various purposes: they had their chamber-bed, on which they slept; their table-bed, on which they ate in a recumbent posture. Three persons usually reclined on one bed, and the middle place, as well as the middle bed, was accounted the most honourable. They had also the bed on which they studied, and that on which the dead were carried to the funeral pile.——BED, in general, a hollow place in which anything rests; as, the *bed* of a mortar.——A stratum, or extended mass of anything, whether upon the earth or within it; as, a *bed* of sulphur, a *bed* of sand, &c.——The BED of a *river* is the bottom of a channel in which the stream or current usually flows.——*From bed and board*, in Law, a decree separating man and wife without severing the marriage tie, formerly granted by the ecclesiastical courts. The wife had a suitable maintenance, called alimony, allotted to her out of the husband's estate. It was usually expressed in Latin *a mensa et thoro*. It has been superseded by what is termed a judicial separation.

BEDELL. In the University of Cambridge there are two officers styled Esquire Bedells, whose duties are to precede the Vice-Chancellor with silver maces on all public occasions, to summon members of the Senate to the Chancellor's Court, &c.

BEDOUIN (dwellers in the wide: *Arab.*), nomadic tribes of the African desert, broken up into groups of families varying in number. At the head of each group is a chief called a sheikh, a dignity which is often hereditary for some generations. They are Mahometans.

BEE, a hymenopterous insect, of which there are numerous genera, but the most interesting and useful to man is the honey-bee, the *Apis mellifica* of entomologists. It is justly celebrated for its singular instincts, and highly prized for the valuable products of its industry. The honey-bees live in swarms or societies which amount to from 10,000 to 40,000, and contain three sorts of individuals: the female, or, as she is commonly called, the *queen* bee; the males, or drones; and the *neuters*, or working bees, by some naturalists called imperfect females. A hive usually consists of one mother or queen, from 600 to 800 males, and from 15,000 to 20,000 working bees. The office of the queen bee is to propagate the species; that of the workers to collect the honey, form the cells, and feed the young. Bees are furnished with a proboscis by which they suck the honey from flowers; they swallow this, and when it has undergone a peculiar process in the stomach, they disgorge it into the cells. The pollen of flowers settles on the hairs with which their body is covered, whence it is collected into pellets, by a brush on their second pair of legs, and deposited in a hollow in the third pair. It is called *bee-bread*, and is the food of the larvæ or young. The females and neuters have a barbed sting, attached to a bag of poison, which flows into the wound inflicted by the sting. The season of fecundation occurs about the beginning of summer. It is said that the female, in the spring, lays as many as 12,000 eggs in the lapse of twenty-four days. When a hive is overstocked, a new colony is sent out under the direction of a queen-bee; this is called *swarming*, and three or four swarms sometimes leave a hive in one season. The true honey-bee was originally confined to the old world, but has been transplanted to America.——The HUMBLE BEES (*Bombi*) are well known from their large size and humming noise. Some of the species form their nest low in the ground, others on the surface. They form rude cells of wax, and collect honey for the larvæ.

BEER (*bier: Germ.*), a drink made from malt and hops by the process of brewing.

BEE'TLES (*beetel: Sax.*), insects furnished with a pair of membranous wings, which are folded up when the animal is not flying under a pair of hard wing cases or *elytra*. They form the vast order of *Coleoptera*. They all of them undergo a complete metamorphosis. They issue from the egg in the shape of a grub, which in many species is very destructive to plants and wood. In time they assume the pupa form, and then emerge as perfect beetles. The forms of beetles are very varied; some are so minute as to require the assistance of a microscope in making out the parts, whilst others attain the size of four inches. The majority are plain in colour, but some are very brilliant. The *Scarabæus*, an object of reverence amongst the ancient Egyptians, the lady-bird of children, the cockchafer, the may-worm, the blistering cantharides, the weevils (so destructive to grain), the turnip fly, and the perfect animals of the nut maggot and the glow-worm, all belong to this order. Coleoptera have been divided into four suborders: 1. *Pentamera*, all the tarsi five-jointed; 2. *Heteromera*, four anterior tarsi five-jointed, two posterior four-jointed. 3. *Pseudotetramera*, all the tarsi five-jointed, the fourth very small. 4. *Pseudotrimera*, all the tarsi four-jointed, the third very small.

BEHE'MOTH (*Heb.*), an animal mentioned in the book of Job, which some naturalists suppose to be the same as the river-horse.

BEI'ZA (*beizath*, an egg: *Heb.*), in Hebrew Antiquity, a certain measure in use among the Jews. The beiza was likewise a gold coin of the Persians. When it was asserted that Philip of Macedon owed their king Darius a thousand beizas or golden eggs for tribute money, Alexander the Great refused to pay them, saying that the bird which laid these eggs had flown into the other world.

BELEM'NITE (*belemnon*, a dart; *Gr.*), the fossil *pen*, or internal shell of cuttle fishes. Belemnites, vulgarly called thunder stones, have been found ranging from the lias to the gault, and about 100 species have been described.

BELL (*bel: Sax.*), a hollow metallic body, ranked among the musical instruments of percussion. The constituent parts of a bell are the barrel, the clapper on the inside, and the ear or cannon by which it hangs to a large beam of wood. It is usually made of a composition called bell-metal, which contains three parts of copper and one of tin; and sometimes of cast steel, &c. The sound of a bell consists in a vibratory motion of its parts, much like that of a musical chord; and as the external surface of the bell undergoes alternate changes of figure, it gives that tremulous motion to the air which causes the sensation of sound. Bells are of high antiquity. The blue tunic of the Jewish high-priest was adorned with golden bells; and the kings of Persia are said to have had the hem of their robe adorned with them. They were introduced into English churches about the year 700, and used to be baptized before they were hung. The number of changes may be found by multiplying together the number of bells and all the integers between it and unity. Thus four bells will give 24 changes, since 4, 3, and 2 multiplied together make 24; six bells will give 720; and twelve bells 479,001,600 changes, which, at the rate of twelve per minute, could not be rung in less than nearly 78 years.——TO BEAR THE BELL, to be the first, or the leader: in allusion to the bell-wether of a flock, or the leading horse of a team that wears bells on his collar. Or it may be synonymous with *to bear away the bell*, which is thus explained. Race-courses were formerly called bell-courses, the prize given being a silver bell; therefore, to win the race was 'to bear away the bell.'——BELLS, in Naval language, half-hours of the watch, which are marked by striking the bell at the end of each.

BELLADON'NA, in Medicine, a preparation from the *Atropa Belladonna*, a poisonous plant growing wild in Britain, and belonging to the *Solanaceæ*.

BELLADON'NA LILY, the *Amaryllis Belladonna* of botanists, a bulbous rooted plant, with a handsome flower.

BELLES LET'TRES (*Fr.*), or POLITE LITERATURE, in its most obvious sense, is that description of literature which has a peculiar reference to matters of taste; but according to many writers, the term has a much more extensive signification, and is made to comprehend not merely every elegant acquirement, but nearly every branch of knowledge.

BELL'EVUE (a fine prospect: *Fr.*), a name given in France to small country-seats, or to arched bowers at the end of a garden or park, intended for the enjoyment of fresh air in the shade.

BEL'LIS (*bellus*, fair: *Lat.*), a genus of plants, nat. ord. *Compositæ*, including the common daisy.

BELLOC'ULUS (*bellus*, handsome; and *oculus*, an eye: *Lat.*), in Mineralogy, a precious stone resembling the eye, and formerly on that account supposed to be useful in diseases of that organ.

BEL'LOWS (*blowan*, to blow: *Sax.*), an instrument or machine for blowing fire, so contrived as to draw in and force out air alternately, by enlarging and contracting its capacity. It is used with organs and other pneumatic instruments, to give them a proper supply of air. The air which enters the bellows is compressed when they are closed, and flows with a velocity proportioned to the force by which it is compressed. Bellows of very great power are generally called *blowing machines*. One of the largest known is erected at the smithy in the royal dockyard at Woolwich; it is adequate to the supply of air for forty forge-fires, amongst which are several for the forging of anchors, &c.

BELL METAL, an alloy which, for large bells, is composed of 80 per cent. of copper and 20 per cent. of tin.

BEL-META'LO DI VO'CE (*Ital.*), in Music, an expression for a clear and brilliant-toned *soprano* voice.

BELTS (*balteus*, a belt: *Lat.*), or FASCIÆ, in Astronomy, two zones or girdles round the planet Jupiter, more lucid than the other parts of his body, and terminated by parallel straight lines, sometimes broader, and sometimes narrower, varying both in magnitude and position.

BELU'GA, the genus of cetaceous mammals, to which the white whale belongs. This whale, which yields good oil, inhabits the North Sea, and herds of 40 or 50 may sometimes be seen. Its usual length is from 12 to 18 feet.

BEL'VEDERE (a fine prospect: *Ital.*), a name given in Italy to the small buildings on the tops of palaces or large houses, which are ascended for the enjoyment of a fine prospect and the advantage of a pure air. It is the name also of a part of the Vatican, where the famous statue of Apollo is placed, and which, on this account, is called the *Apollo Belvedere*.

BEN, or PEN, a Celtic word, signifying rock or mountain. Ben Nevis, Scotland: Pen-y-ghent, Yorkshire; Pen-maen-mawr, Wales; and Penzance, Cornwall; are examples.

BENCH, in Law, a seat of justice, as the Queen's Bench at Westminster. Also, the persons sitting on a bench, as a bench of magistrates.

BENCH'ERS, a body of barristers, formally styled Masters of the Bench, in whom the management of each inn of court is vested. It is a self-elected body, and by it calls to the bar are made. The benchers have also the power of disbarring any barrister whose conduct may appear to them to deserve such a punishment.

BEND (*bendan*, to make crooked: *Sax.*), in Heraldry, one of the ten honourable ordinaries, drawn from the dexter or right corner, at the top of the escutcheon, to the sinister base, or left corner, at the bottom. It is supposed to represent a shoulder-belt, or scarf, and to show the bearer to be valiant in war. It is sometimes called a *bend-dexter*, to distinguish it from the *bend-sinister*, which is drawn from the left side of the shield to the right, and signifies illegitimacy.——BENDS, of a ship, are the strongest and thickest planks in her sides, and are reckoned from the water, first, second, or third bend. They have the beams, knees, and foot-hooks bolted to them, and are the chief strength of the ship's sides.

BEND'ING (same *deriv.*), in Seamanship, the tying of two ropes or cables together: thus, to 'bend the *cable*,' is to make it fast to the ring of the anchor; to 'bend the *sail*, is to make it fast to the yard.

BEND'LET (a *dim.* of *bend*), in Heraldry a little bend which is only half breadth.

BENEDIC'TINES, a celebrated order of monks, who profess to follow the rules of St. Benedict. They wear a loose black gown with large white sleeves, and on the head a cowl ending in a point. They are also called *black friars*.

BEN'EFICE (*beneficium: Lat.*), an ecclesiastical living, particularly a rectory and a vicarage. Bishoprics, deaneries, and prebendaries are usually styled *dignities*. In the middle ages the popes assumed feudal rights with reference to ecclesiastical patronage. The assumption of these aroused the jealousy of princes, and was one of the circumstances which led to the Reformation.

BEN'EFIT OF CLER'GY, a privilege, originating in a superstitious regard for the church, by which the clergy were either partially or wholly exempted from the jurisdiction of lay tribunals. It extended in England only to the case of capital felony, and was intended to apply to none but clerical felons. But, by the laws of England, everyone who could read was considered to be a clerk, so that, when the rudiments of learning came to be diffused, almost every person became entitled to this privilege. Clerks in orders were by it discharged on the felonies to which it was applicable, with no other punishment than forfeiture of goods, and might claim the privilege as often as they chose. Laymen were only allowed to claim their clergy once. By the statute of 7 and 8 Geo. IV., c. 28, it was decreed that 'benefit of clergy, with respect to persons convicted of felony, shall be abolished.'

BE'NE PLA'CITO (*Ital.*), in Music, a term denoting that the performer is to exercise his own taste.

BEN'ZINE, or **BEN'ZOLE**, a liquid hydrocarbon, which at 32° F. forms a white crystalline mass. It may be obtained by distilling benzoic acid with lime, but its chief source is coal tar. Having a strong affinity for fats it is employed to remove grease spots from clothes, &c.

BEN'ZOIC ACID, a combination of the compound radical called benzoyl and oxygen, principally obtained from gum-benzoin by sublimation. It is a solid in the form of thin plates or feathery crystals, and it forms salts with the alkalis and some of the metals.

BEN'ZOIN or **BEN'JAMIN**, a dry solid vegetable substance, a combination of benzoic acid and a resin, of a fragrant smell, and produced by an incision in the *Styrax*, *Benzoin*, nat. ord. *Styracaceæ* an Indian tree. It is brought from the East Indies, particularly from Siam and the islands of Java and Sumatra, in masses of various sizes, composed of small granules of a whitish or yellowish colour, with a purple cast on the surface. It is very inflammable, and diffuses a fragrant smell while burning, or when rubbed in the hand. When the benzoin tree is six years old, the natives cut it in several places in an oblique direction, and the benzoin flows out in the form of a balsamic juice, having a pungent taste and an agreeable odour. Benzoin was formerly very much esteemed as an expectorant, and is still often employed in medicine. A cosmetic is also prepared from it, which is much used in France, under the title of *lait virginal*; and the gum is a principal ingredient of court plaster, and of paregoric elixir.——The *Benzoin* of the chemists is a product obtained on distilling bitter almond-oil with lime and oxide of iron.

BER'BERIS, in Botany, a genus of shrubs including the *B. vulgaris*, the *Barberry tree*, a shrub rising to eight or ten feet high, well known as an ornament in our gardens. The leaves have a grateful acid taste; the flowers at a distance yield a pleasant smell, but very near they are rather offensive. The berries are so very acid that the birds seldom touch them; they are used in this country as pickles and preserves. The roots of the shrub boiled in lye give a fine yellow, which is used in Poland for dyeing leather; the bark, with the aid of alum, is used for the same purpose.

BERGAMOT', or **BERGAMOTTE** (*Fr.*), an essential oil obtained from the rind of a citron, the *Citrus bergamium*. It is used in perfumery.

BER'LIN, a kind of chariot, supposed to have obtained its name from the Prussian capital, where it was first made.

BERME, in Fortification, a space of ground left between the rampart and the moat or fosse, designed to receive the ruins of the rampart, and prevent the earth from filling the fosse.

BER'NARDINES, an order of monks, founded by Robert, abbot of Moleme, and reformed by St. Bernard. They wear a white robe with a black scapulary, and when they officiate they are clad in a large white gown with great sleeves, and a hood of the same colour.

BER'RY (*berig*, from *beran*, to bear: *Sax.*), the popular term for a succulent pulpy fruit, containing several seeds or granules, as the gooseberry, &c. It is the *bacca* of botanists.

BERTH, any situation or place where a vessel lies, either at anchor or in a wharf. ——An apartment in a ship where a number of officers or men mess or reside.——Also, the box or place for sleeping at the sides of a cabin, or the place for a hammock.

BER'YL (*berullos: Gr.*), in Mineralogy, the name of a class of crystallized minerals, to which the EMERALD and the precious beryl belong. They contain about 68 per cent. of silica, the rest being chiefly composed of alumina and glucina. Common beryl is of a light green colour, and found in the East Indies, Brazil, Peru, Siberia, &c. It is crystallized in six-sided prisms, which are either perfect or truncated on the edges and angles. It is nearly as hard as the topaz; can scarcely be melted without the addition of some other substance, but with borax fuses easily. It becomes electrical by rubbing, and is found in primitive rocks, accompanied with quartz, felspar, garnet, mica, and topaz.——A beautiful sea-green colour for the use of artists is also prepared under this name.

BER'YL-CRYSTAL, a species of crystal, which, after a certain kind of prayer termed *a call*, was supposed to have the power of showing those who looked into it the past or the future. It was a kind of looking-glass.

BE'TEL, the name of a creeping plant a

for two years, and then perish; their roots and leaves being formed the first year, and their fruit the second.

BIFA'RIOUS (*bifarius*, twofold: *Lat.*), in Botany, denotes that the leaves grow only on opposite sides of a branch.

BIF'ID (*bifidus*, divided into two parts: from *bis*, twice; and *findo* I cut: *Lat.*), in Botany, an epithet for anything cleft in two.

BIG'AMY (*bis*, twice: *Lat.*; and *gamos*, marriage: *Gr.*), double marriage, or the marrying of a second wife or husband while the first is alive, which is felony by statute, and the second marriage is absolutely void.

BIGA'RIUS (*Lat.*, from *bigæ*, a two-horsed chariot), in Antiquity, the charioteer of a two-horsed chariot. Money or medals stamped with this emblem were called *bigati*.

BIGEM'INATE (*bis*, twice; and *gemino*, I double: *Lat.*), in Botany, two-forked: used of a decompound leaf having a forked petiole, with several leaflets at the end of each division.

BIG'OT, a person who is obstinately and unreasonably wedded to a particular practice or opinion; or one who is illiberally attached to any form or system of belief.

BIJU'GOUS (*bijugus*, yoked two together: from *bis*, twice; and *jugum*, a yoke: *Lat.*), in Botany, composed of two pairs of anything. Thus, leaves pinnated with two pairs of leaflets.

BILA'BIATE (*bis*, twice; and *labium*, a lip: *Lat.*), in Botany, two-lipped; an epithet for the corolla and perianth.

BILACIN'IATE (*bis*, twice; and *lacinia*, a lappet: *Lat.*), a term in Botany applied to a leaf when the margin is cut into two segments.

BILAM'ELLATE (*bis*, twice: and *lamella*, a plate: *Lat.*), a term in Botany, used to denote that the part is of the form of a flattened sphere longitudinally bifid.

BIL'ANDER (*bilandre: Fr.*), a small merchant vessel with two masts, rigged in a peculiar manner, but now rarely used.

BILAT'ERAL (*bis*, twice; and *latus*, a side: *Lat.*), in a general sense, denotes something with two sides. Hence, bilateral cognation is kinship both by the father's and mother's side.

BIL'BOES, a punishment at sea, answering to the stocks on land. The offender is laid in irons, which are more or less ponderous, according to the quality of the offence of which he is guilty.

BILE (*bilis: Lat.*), a yellowish-green fluid, secreted by the liver, part of which is accumulated in the gall-bladder, and the rest is conveyed through a canal into the duodenum, where it helps to convert the chyme into chyle. The bile is properly of two kinds, which are distinguished by the names of cystic and hepatic. The *hepatic* bile is thin, almost insipid, and scarcely coloured; the *cystic* bile is thicker, more coloured, and very bitter. The use of the bile is to attenuate the chyle, to mix the oleaginous parts of the blood with the aqueous, to stimulate the intestines, and in part to change the acid of the chyle.

BIL'IARY CAL'CULI, or *gall stones*, concretions formed in the gall bladder, or bile ducts

BIL'IARY DUCTS (*ductus*, a conducting: *Lat.*), in Anatomy, small canals which convey the bile out of the liver into the hepatic duct, which is formed by the blending of these canals into one trunk.

BILINGUAL (*bis*, twice; and *lingua*, a tongue: *Lat.*), that which is written in two languages. The inscription on the Rosetta Stone is bilingual, being in Greek and Egyptian, the latter being copied in the different characters.

BILL (*bille*, to write in a list: *Sax.*), an account of goods sold, with their prices and total cost.——A BILL OF EXCHANGE is an order drawn on a person, requesting him to pay money to some person assigned by the drawer, or to his order, in consideration of value received. The person who draws the bill is called the *drawer;* the person to whom the request or demand is made, is called the *drawee*, or *acceptor*, after he has accepted it; and the person to whom the money is directed to be paid, is called the *payee*. Such a bill is frequently called a *draft*. Bills of exchange are very extensively used in carrying out mercantile transactions, and a large body of law has grown up respecting them.——A BILL OF ENTRY is a written account of goods entered at the custom-house, whether imported or intended for exportation.——A BILL OF LADING is a written account of goods shipped by any person on board of a vessel, signed by the master of the vessel, who acknowledges the receipt of the goods, and promises to deliver them safe at the place directed.——A BILL OF PARCELS is an account, given by the seller to the buyer, of the several articles purchased, with the price of each.——BILL OF SALE, in Law, an instrument in writing, by which the transfer of movables is effected. It may be either absolute or conditional. In the latter case it is usually a kind of mortgage given to secure payment of a debt, or repayment of a loan. To be valid against other creditors, a bill of sale must be registered within twenty-one days from the making thereof. If the goods assigned by a registered or unregistered bill of sale should continue in the possession of the original owner, they will, upon his bankruptcy, pass to the assignees for the general benefit of the creditors.——A BILL OF HEALTH is a certificate, signed by the proper authorities, given to masters of ships leaving ports suspected of being infected with particular diseases. It is of three kinds, *clean*, *foul*, and *infected:* each states the condition of the ship on sailing.——BILL OF RIGHTS, the declaration delivered by the two houses of parliament to the prince of Orange, February 13, 1688, on his accession to the throne, stating what acts of James II. were illegal, and asserting the rights and privileges of the people.——BILL, in parliament, an instrument drawn up by any member, and presented to parliament for its approbation or rejection. Should it be passed into a law, it then becomes an *act* of parliament.——BILL OF EXCEPTIONS; at a trial at *nisi prius*, if the judge is thought to make a mistake in the law, counsel may tender his objections to the judge's ruling, and require him to sign a bill of exceptions, which may be afterwards argued before a Court of Error.

BILLS OF MORTA'LITY, annual registers of the deaths and burials which formerly took place in and near London. These bills were first commenced in 1592, during the period of a great pestilence, when they included 109 parishes, but were not kept regularly until 1603. The ages at which deaths occur were not inserted until 1728.

BI'NARY ARITH'METIC (*binaire: Fr.*; from *binus*, by twos: *Lat.*), that in which two figures or characters, viz. 1 and 0, only, are used; the cipher multiplying everything by 2, as in the common arithmetic by 10: thus, 1 is 1, 10 is 2, 11 is 3, 100 is 4, 101 is 5, 110 is 6, 111 is 7, 1000 is 8, 1001 is 9, 1010 is 10; being founded on the same principles as common arithmetic. This species of arithmetic was invented by Leibnitz, who asserts that it is more expeditious than common arithmetic in discovering the properties of numbers, and in extensive tabular calculations.——BINARY STARS, two stars revolving about each other in regular orbits. They are to be distinguished from double stars which may be only optically so. Upwards of a hundred binary systems have been discovered. [See STARS.]

BIN'NACLE, or BIT'TACLE (*habitacle*, a small dwelling: *Fr.*), a wooden case, containing the steering compass on board a ship. It is fixed near the tiller or wheel, and is lighted at night.

BINOC'ULAR (*bis*, twice; and *oculus*, an eye: *Lat.*), capable of being used by both eyes at once.——BINOCULAR TELESCOPE, a kind of dioptric telescope fitted with two tubes, joined in such a manner that one may see a distant object with both eyes at the same time. Opera glasses are frequently made in this form.——BINOCULAR MICROSCOPE, an instrument with a tube for each eye, employed to obtain stereoscopic views of magnified objects. Several plans have been contrived, but that which has been most successfully carried out in this country is Mr. Wenham's. A small prism is introduced immediately above the object-glass. One half of the rays from the object take the usual course, whilst the other half are reflected by the prism into the second tube.

BINO'MIAL (*bis*, twice; and *nomen*, a name: *Lat.*), a term in Algebra for any quantity consisting of two names or terms, connected together by the sign + or −. Thus $a + b$ and $8 - 3$ are binomials, one consisting of the sum, and the other of the difference of two quantities.

BIOG'RAPHY (*bios*, life; and *grapho*, I write: *Gr.*), the story of an individual's life. When written by himself it is an autobiography (*autos*, himself: *Gr.*).

BIOL'OGY (*bios*, life; *logos*, a discourse: *Gr.*), that branch of scientific enquiry which is concerned with the nature and relations of living bodies. The discovery of the laws by which the beings of the organic world are governed is the object in view.

BIPAR'TITE (*bis*, twice; and *partitus*, divided: *Lat.*), an epithet for anything divided into two parts.

BIQUAD'RATE (*bis*, twice; and *quadratus*, squared: *Lat.*), in Algebra, an obsolete term for the square of the square. 16 is the biquadratic power of 2; for 2 × 2 is 4, and 4 × 4 is equal to 16. The biquadratic *root* of a number is the square root of its square root: thus the biquadratic root of 81 is 3; for the square root of 81 is 9, and the square root of 9 is 3. A biquadratic *equation* is an equation where the unknown quantity of one of the terms has four dimensions.——A *biquadratic parabola*, in Geometry, is a curve line of the third order, having two infinite legs tending the same way.

BIQUIN'TILE (*bis*, twice; and *quintilis*, the fifth: *Lat.*), in Astronomy, an aspect of the planets, when they are distant from each other by *twice the fifth* part of a great circle, that is, 144 degrees.

BIRDS. [See ORNITHOLOGY.]

BIRD'-BOLT (*bolis*, a missile: *Gr.*), a small arrow with three heads, which was discharged at birds from a cross-bow. The bird-bolt is still used as a bearing in coat armour.

BIRD'LIME (*Sax.*), a glutinous substance, made of the bark of holly, which is spread on the twigs of trees to catch birds.

BIRDS'-NEST, EDIBLE, the nest of the *Hirundo esculenta* or Indian swallow, a Chinese delicacy used in soups. Vast numbers of these birds are seen on the seacoasts of China, at certain seasons of the year: they leave the inland country at their breeding time, to build in the rocks on the coast. At one time it was thought that sea-weed furnished them with the matter of the nests; but it is now known that it is secreted by the birds themselves. The nests are of a hemispherical figure, of the size of a goose's egg, and in substance much resemble isinglass. They are esteemed a great luxury, and sell at a high price. [See SWALLOW.]

BISH'OP (*biscop: Sax.*; from *episcopos*, an overseer: *Gr.*), a prelate, or person consecrated for the spiritual government of a diocese. In Great Britain, bishops are nominated by the sovereign, who, upon request of the dean and chapter for leave to elect a bishop, sends a *congé d'élire*, or licence to elect, with a letter missive, nominating the person whom he would have chosen. This recommendation is equivalent to a command; it cannot be neglected without incurring a *præmunire*. The election by the chapter must be made within twelve days, or the king has a right to appoint whom he pleases. The jurisdiction of a bishop of the Church of England consists in collating benefices, granting institutions, commanding inductions, taking care of the profits of vacant benefices for the use of the successors, consecrating churches and chapels, ordaining priests and deacons, confirming after baptism, &c.; these functions depend upon the ecclesiastical law. A bishop of the Church of England, with an English diocese, is a peer of the realm (except in the case of the bishop last appointed), and he has a seat in the

House of Lords by virtue of a barony which he is supposed to have. He is styled 'Right Reverend Father in God,' and addressed as 'My Lord.'

BISHOP'S COURT, an ecclesiastical court in each diocese, the judge of which is the bishop's chancellor, who decides by the civil and canon law; and if the diocese is large, he has his commissaries in distant parts, who hold what are called consistory courts, for matters limited to them by their commission.

BIS'MUTH (*Germ.*), one of the metals, of a reddish or yellowish-white colour, and a crystalline structure. It is moderately hard, and so brittle that it not only breaks into pieces under the strokes of the hammer, but may even be beat into powder. It melts at about 500° F. When strongly heated, it volatilizes, and at a higher temperature burns with a blue flame. Its specific gravity is 9·9. Bismuth is more commonly found in a native state than any other metal. Most metallic substances unite with bismuth, and are rendered by it more fusible than before: hence it is used in making solder, printer's types, pewter, &c. An alloy of 8 parts of bismuth, 5 of lead, and 3 of tin, melts below the temperature of boiling water, and is known as *fusible metal*.

BIS'ON (a buffalo: *Gr.*), in Zoology, the *Bison Americanus*, often erroneously termed the buffalo. It has short black horns, very wide at the base; and on the shoulders is a large hunch, consisting of a fleshy substance, which, with the head, is covered with a long undulated fleece, divided into locks. In winter, the whole body is covered in this manner; but in summer, the hind part of the body is naked. The tail is about a foot long, with a tuft of hair at the end. The fore parts of the body are very thick and strong; but the hind parts are slender and weak. The bison inhabits the interior of North America, and congregates in vast herds on the prairies. It is a congener of the European BONASSUS.

BISSEX'TILE (*bissextilis:* from *bis*, twice; and *sextus*, the sixth: *Lat.*), or LEAP-YEAR, a year happening every fourth year, and every *fourth* hundredth year, and consisting of 366 days, on account of the addition of a day in the month of February, which then consists of 29 days. This day is added to include the nearly six hours which the sun takes up in his course, besides the 365 days allowed for it in other years. According to the Roman method of counting the days of the months, the 24th of February was called *Sexto Calendas Martii* (the sixth day before the calends of March): and when the calendar was corrected by J. Cæsar, the day added every fourth year was inserted in February; but to prevent interruption in the order of counting the days, the 24th of February was taken twice, the inserted day being named *bis* sexto Calendas Martii (the second sixth day before the calends of March). As the year does not consist of quite six hours more than 365 days, adding a whole day *every* fourth year would gradually cause another error, like that removed by the Gregorian correction [see CALENDAR]; and to prevent this, only the hundredth years whose numbers are divisible by 4, are leap-years. Thus, 1600 was a leap-year because 16 is divisible by 4; 1700, 1800, and 1900 are not leap-years, since 17, 18, and 19 are not divisible by 4; but 2000 will be a leap-year, since 20 is divisible by 4.

BIS'TORT, or *Snake-weed*, a species of *Polygonum* (*P. bistorta*), the roots of which afford an astringent decoction, which is variously applied in medicine.

BIS'TOURY, a small surgical knife of various forms, according to the purpose for which it is intended.

BIS'TRE, or **BIS'TER**, a pigment prepared from the soot of wood, especially the roots of beech.

BISUL'PHURET (*bis*, twice; and sulphuret), in Chemistry, a sulphuret with a double proportion of sulphur.

BIT (*bitan*, to make an incision: *Ang. Sax.*; when used for the iron of the bridle, it comes from *bite*), in Carpentry, a boring instrument, so constructed that it may be taken out of the handle.——Also, the iron attached to the bridle, which is put into the horse's mouth.

BITT, a sea term for the two upright pieces of timber, with a cross piece, to which the anchor cable, ropes, &c., are attached.

BIT'TERS, preparations from plants containing bitter principles, such as gentian Bitters are accounted stomachic and cleansing, and are considered to assist digestion; but their frequent use is injurious.

BIT'TERN, in Ornithology, the English name of the *Ardea stellaris*; it is about the size of the common heron. It haunts marshy places, and feeds at night. During the breeding season it makes a loud booming noise. It is allied to the storks and herons.——BITTERN (from its taste), in the salt works, is the brine remaining after the common salt is removed. It is used in the preparation of *Epsom salt*, the sulphate of magnesia, and of *Glauber's salt*, the sulphate of soda.

BIT'TER-SWEET, or *Woody Nightshade*, the *Solanum Dulcamara* of botanists, a British wild plant, with narcotic foliage, and dangerous berries.

BITU'MEN (*Lat.*; from *pitta*, pitch: *Gr.*), a combustible mineral, which is greasy to the touch, and if ignited emits a strong odour. True bitumen discloses no trace of organic structure, but it was probably derived from deposits of coal by the action of subterranean heat. Asphaltum is a form of bitumen, and *mineral caoutchouc*, or elastic bitumen, is another. Mineral tar is soft bitumen, and the liquids petroleum and naphtha are essentially the same substance.

BI'VALVE (*bis*, twice; and *valva*, the fold of a door: *Lat.*), an epithet given to molluscs which have two shells like the oyster and cockle, and also to such seed-pods as split in two through their whole length like the pods of the bean and pea.

BIV'OUAC, in Military affairs, a night-guard, performed by the whole army, when there is any apprehension of danger from the enemy; or an encampment in the open air.

BIX'A (*South Amer.*), in Botany, a genus of plants, nat. ord. *Flacourtiaceæ*, including the tree from which the colouring matter called **ANNOTTO** is obtained.

BLACK (*blac: Sax.*). Nearly all the rays which fall on black bodies are absorbed, instead of being reflected, hence the sensation of blackness. There are several species of black used in painting; as *Frankfort black*, of which there are two sorts, one a natural earth inclining to blue, and the other made from the lees of wine, &c., burnt, washed, and ground: *lamp black*, the smoke of resin, prepared by heating the resin in iron vessels; *ivory black*, made of burnt ivory, and used in miniatures; *Spanish black*, made of burnt cork, and first used by the Spaniards.

BLACK'-BOOK, a book kept in the exchequer of England, containing a description of that court, its offices, ranks, privileges, perquisites, and jurisdiction, with the revenues of the crown, in money, grain, and cattle. It is said to have been composed in 1175, by Gervais of Tilbury.——**BLACK-BOOK**, that compiled by the visitors under Henry VIII., giving an account of the enormities committed in convents.

BLACK'-CAP, a British song-bird, the *Motacilla atricapilla*, or mock-nightingale; so called from its black crown.

BLACK DEATH, the name given to a frightful epidemic, which in the fourteenth century swept away one quarter of the population of the old world within four years (1347-1350); and in England carried off one-half of the inhabitants. Altogether it is estimated that 25 millions of persons died. It originated in the East, and being attended with the breaking out of black spots over the body, it received the name which stands at the head of this article. The tongue and mouth also became black, whilst inflammatory boils appeared in great numbers. The pestilence was highly contagious, and almost everyone attacked died at farthest in three or four days, and many did not live more than twelve hours. Even dogs, cats, and other animals fell victims. The only king who died of it was Alphonso XI. of Castille. Boccaccio, in his 'Decameron,' has given a vivid description of the pestilence at Florence.

BLACK LEAD, otherwise called *Plumbago* and *Graphite*, is a mineral substance, composed almost entirely of carbon, with a minute quantity of iron intermixed. It is used in making pencils, in forming a composition for crucibles, and in covering the surface of iron utensils to preserve them from rust and give them a good appearance. It has a dark iron-black colour, a metallic lustre, and a thin slaty fracture; it is found in separate loose pieces of a fine grain, which are very soft, and leave, as is well known, dark traces on paper by friction. It is obtained chiefly in Cumberland, and forms a very valuable article of commerce. Recently a large deposit has been found in Siberia.

BLACK'-LETTER, the old English, or modern Gothic characters, introduced into England about the middle of the fourteenth century; the character generally used in manuscripts before the art of printing was publicly practised.

BLACK'-MAIL (*mail* rent, from an old kind of small money, called *maille*), a certain rate of money, corn, or cattle, anciently paid, in the north of England, and in Scotland, to certain persons connected with the moss-troopers or robbers, to be protected by them from pillage.

BLACK'-THORN, or **SLOE-TREE**, the *Prunus spinosa* of botanists. It is much used for hedges, its branches being armed with sharp strong spines.

BLAD'DER (*blædr: Ang. Sax.*), a thin membranous bag in animals, serving as the receptacle of some liquid: as the urinary bladder, gall bladder, &c.

BLANCHIM'ETER (*blancheur*, whiteness: *Fr.*; and *metreo*, I measure: *Gr.*), an instrument for measuring the bleaching power of chloride of lime, &c.

BLANCH'ING (*blanchir*, to whiten: *Fr.*), the art of making anything white, as (in Cookery) the blanching or peeling of almonds, or, as (in Horticulture) the method of whitening salads. Blanching *money* is the annealing, boiling, and cleansing it when it is coined. Copper is blanched in various ways, so as to make it resemble silver. Blanching is also the operation of covering iron plates with a thin coat or crust of tin.

BLANK (*blanc*, white: *Fr.*), a void space in any writing or printing. The word is applied in various ways, usually in the sense of destitution, or emptiness.

BLAN'KET (*blanchet: Fr.*), a warm woollen stuff, light and loosely woven; chiefly used in bedding.——**BLANKETS**, a sea term for combustibles made of coarse brown paper steeped in nitre, dried, and then steeped in tallow, resin, and sulphur. They are used in fire-ships.

BLANK VERSE, in Poetry, that which is without rhyme.

BLAST'-FURNACE, a large conical or quadrangular building, used at iron works for smelting iron-stones and ores. The outer stack is composed of stone or brick, covering a casing of masonry 14 inches thick, which, when the furnace requires to be renewed inside, can be taken down and rebuilt without injuring the outer fabric. A space of about six inches is compactly rammed with river sand, which is a bad conductor of heat. Lastly, there is a coating of fire-brick 14 inches thick. The total height is from 40 to 50 feet. When in full work it will contain 100 tons of material. A powerful blast of air is sent in at several places through tubes called tuyeres. One of the greatest improvements ever made in the manufacture of iron was the use of the *hot blast*, the effect of which, in fusing refractory lumps of cast iron, was discovered by accident about the year 1827. It is evident that a large quantity of cold air thrown upon a body at a high temperature must have an enormous cooling effect. The use of the hot blast causes a great saving, by allowing the use of coal where coke was formerly employed: and refractory ores not formerly smelted can now be profitably worked

BLAS'TING (*blæst*, to blow : *Sax.*), among miners, the splitting and tearing up of rocks, &c., by the force of gunpowder.

BLA'ZONRY, or BLA'ZONING (*blasen*, to blow : *Germ.*), in Heraldry, the art of expressing in proper terms all that belongs to coats of arms. This term is used, because the herald blew a trumpet, and called out the arms of a knight, when he entered the lists at a tournament. Blazonry requires a knowledge of the *points* of the shield—that is, the *tinctures* forming the ground of the coat, the *charges* or devices borne on the field, and the *ordinaries*. [See HERALDRY.]

BLEACH'ING (*bleichen*, to bleach : *Germ.*), the process of whitening linen by exposure to the sun and air, or, as is now more usual, by the application of chemical preparations, such as chlorine. Cotton is more easily bleached than linen. Wool is bleached by the fumes of burning sulphur or sulphurous acid ; also silk and straw.

BLEIME, in the Veterinary art, an inflammation arising from extravasated blood between the horse's sole and the bone of the foot towards the heels.

BLENDE (*blendan*, to mix : *Ang. Sax.*), in Mineralogy, *black jack*, a native sulphuret of zinc : one of its ores.

BLIGHT (*blihtan*, to alight : *Ang. Sax.* The term is specially applicable when it is caused by insects). A general name for various distempers incident to plants, corn, fruit-trees, &c. : the whole plant sometimes perishing by it, and sometimes only the leaves and blossoms, which will be scorched and shrivelled up, the rest remaining green and flourishing. The chief cause of blights seems to be a continued dry easterly wind, for several days together, without the intervention of showers or any morning dew. Another cause of blights in the spring is sharp hoar frosts, which are often succeeded by hot sunshine in the daytime : this is the most sudden and certain destroyer of fruits that is known. A third kind originates in *fungi*, which attack the leaves or stems of herbaceous and woody plants, and more particularly the most useful kinds of grain. These are variously known to farmers by the name of *red rust*, *red gum*, &c. Another cause consists in insects.

BLI'NDNESS (*blind*, to stop : *Ang. Sax.*), a total privation of sight, arising from an obstruction of the functions of the organs of sight, or from an entire deprivation of them. The causes of blindness are various, proceeding from cataracts, gutta serena, &c. There are also kinds of periodical blindness, as a defect of sight in some towards night, in others only in the day : the former of which is termed *nyctalopia*, the latter *hemeralopia*.

BLINDS (same *deriv.*), in the Military art, a sort of defence made of osiers or branches interwoven, and laid across two rows of stakes about the height of a man, and four or five feet asunder : used particularly at the heads of trenches, where they are extended in front towards the glacis, in order to shelter the workmen, and prevent their being overlooked by the enemy. The word *blinds* is, in fact, used to denote all preparations which are intended to intercept the view of the enemy ; and they are, of course, variously constructed, according to the situation or means of providing them.

BLI'NDWORM, or SLOWWORM, the *Anguis fragilis* of naturalists, a harmless British reptile, having very small eyes and a slow motion. It feeds on worms, snails, and insects, and is torpid during the winter.

BLIS'TER, a pustule in the skin, filled with serum.——In Medicine, the plaster or application that raises a blister, usually made of cantharides, or Spanish flies.

BLOCK (*belican*, to shut : *Ang. Sax.*), a sea term for a pulley, or series of pulleys, mounted in a frame, or shell, and serving to facilitate the passage of the ropes. The *blocks* now used in the navy are made in Portsmouth, by means of circular saws and other machinery of most ingenious construction, by which the several operations from the rough timber to the perfect *block* are performed in the completest manner possible : the whole being worked by means of a steam-engine. The block-making machine, as it now exists at Portsmouth dockyard, unites the action of fifteen different machines in one—nine for the shell, and six for the sheaf ; and ten men do the work of 110. It makes about 214 sorts and sizes of blocks ; viz. 72 sizes of thick blocks, 48 of thin blocks, ten of clewline blocks, 20 of sister blocks, 20 of topsail blocks, 24 of fiddle blocks, and 20 of jack blocks. The machines make 1420 blocks of different kinds a day.

BLOCKA'DE, in Military affairs, the blocking up a place, by posting troops at all the avenues leading to it, to keep supplies of men and provisions from getting into it, and by these means starving it out, without making any regular attack. Unlike a siege, it does not require trenches. In International Law, it is the right to exclude neutrals from the ports of an enemy ; but it is not justifiable unless it can be maintained effectually.——To *raise a blockade*, is to force blockading troops to retire.

BLOOD (*blut : Germ.*), a red fluid circulating through the arteries, veins, and other vessels of animal bodies ; serving for the support of life, and the nourishment of all their parts. It is found in the mammalia, in birds, in reptiles, and in fishes ; but in the last two classes of animals its temperature is much lower than in the former, for which reason they are termed *cold-blooded*. The average quantity in an adult man is about 28 lbs. Blood is of two kinds, *arterial* and *venous* : the former being nearly scarlet, the latter a dark crimson. The bright red colour is produced by the action of the atmosphere in the lungs ; and the change will take place even out of the body. All the blood takes its origin from the chyle, and deposits, by degrees, the nourishing particles requisite to the preservation and growth of the body. When examined with the microscope, blood is seen to consist of : 1, a transparent fluid, called *serum*, which chiefly consists of albumen and fibrin mixed with water; and 2, a great number of minute discs which make up the red part of the blood; though under the microscope they are pale and transparent. In most of the mammalia, these corpuscles are round discs; in the reptiles they are elliptical. As to the circulation of the blood, see AURICLE and HEART.—— BLOOD, in LAW, the relationship required in descent of lands; for a person must be next and most worthy of blood in order to inherit his ancestor's estate. A kinsman of the *whole blood* is one who descends from the same couple of ancestors; of the *half blood*, one who descends from one of them only.

BLOOD'-HORSE, one belonging to the breed of horses originally from the Arabian stock, the excellence of which consists in compactness of fibre, that adds to strength without increasing bulk.

BLOOD'HOUND, a hunting dog, of such exquisite scent that it will follow the track of men as well as of the lower animals. It is the *Canis sagax* of Linnæus.

BLOOM, a mass of iron which has undergone the first hammering, called *blomary*.

BLOW'ING MACHI'NES. The earliest and still a very usual form of blowing machine, is some modification of the ordinary bellows. When a constant blast is required, a receiver for the air, independent of the mere bellows, properly so called, is required; as in the smith's bellows. A very powerful kind of blowing machine consists of a cast-iron cylinder like that of a steam-engine, a piston, valves, &c. It acts as a large air-pump, the air being drawn from the atmosphere, and forced to where it is wanted by the arrangement of tubes and valves. The *fan* is another and very convenient form of blowing machine. A wheel, consisting of leaves instead of spokes, is put into rapid motion. The air which is drawn into the centre of the machine by the vacuum produced within it, is driven out through an aperture made for the purpose, by the tangential force caused by rapid rotation; and it passes with great velocity through a tube intended to convey it where it is to be used.

BLOW'PIPE, in Chemistry and Mineralogy, a wind apparatus used to increase the heat of a candle or lamp, in the same manner as a pair of bellows is employed for raising the temperature of a common fire or furnace. It is made of brass; and its most simple form is that of a tapering tube, about eight inches in length, and curved, nearly at right angles, within two inches of its smaller extremity, which is very slender and has a perfectly round aperture. The use of the blowpipe, both to the artist for the purpose of enamelling, and of softening and soldering small pieces of metal, to the glass-blower for making thermometers and other glass instruments, to the chemist and mineralogist for the examination of substances, and indeed whenever it is required to subject a small body to a strong heat, is very important.

BLUB'BER, the cellular membrane which contains the fat or oil of the whale. It varies in thickness from eight to twenty inches. The oil is extracted by cutting up the blubber and placing it on racks above casks into which the oil drains. Sometimes as many as 100 tons of oil are obtained from a single whale.——SEA-BLUBBER, a vulgar name for some of the *Medusidæ*, SEA JELLIES.

BLUE (*blau: Germ.*), one of the colours into which white light is decompounded when refracted through a prism. It is usually considered one of the three primitive colours, out of which all others may be formed. Blue, as a colour in painting, is distinguished into *ultramarine*, formerly made from the azure stone called *lapis lazuli: Prussian blue*, a colour next to ultramarine for beauty; *blue ashes*, used in fresco and miniature; *blue verditer*, a blue somewhat inclined to a green; and *bice*, which is the palest of all the bright blues. In dyeing, the principal ingredients for giving a blue colour are *indigo* and *woad*.

BO'A CANI'NA (*caninus*, pertaining to a dog: *Lat.*), a snake of South America, of a beautiful form, and about four feet long: the head of the animal is large and is furnished with long teeth, with which a dangerous bite can be inflicted, although it does not possess poison fangs. Its colour is green with white stripes.

BO'A CONSTRIC'TOR (*constringo*, I bind together: *Lat.*), the largest of the serpents, from twenty-five to thirty feet long, very ferocious, and so strong that, by coiling itself round the bodies of deer and other animals, it breaks their bones; after which it swallows them whole. The true boas are from South America; the large serpents brought into this country, though called *boa constrictors*, are generally *pythons*, obtained from Asia.

BOAT'SWAIN, the officer who has the boats, sails, anchors, and cables committed to his charge, and who directs whatever relates to the rigging of a ship.

BODE, LAW OF, an empirical law, the suggestion of which is ascribed to Prof. Bode, of Berlin, as to the progressive distances of the planets from the sun. Taking the distance of Mercury from the sun to be 4, the distance of Venus may be represented by 7, that is, 4 plus 3; the distance of the earth by 10, that is, 4 plus twice 3; the distance of Mars by 16, that is, 4 plus 4 times 3, and so on. This law of progression, however, is not strictly exact in numerical verification, and, in the case of Neptune, it is strikingly contravened, since its distance from Uranus is hardly more than one-fourth of what this law would make it.

BO'DY (*bodig: Sax.*), in Physics, an extended solid substance, of itself utterly passive and inactive, indifferent either to motion or rest.——BODIES, REGULAR, the name of five solids, consisting of the tetrahedron, or pyramid, with four triangular faces; the hexahedron, or cube, with six square faces; the octahedron, with eight faces; the dodecahedron, with twelve; and the icosahedron, with twenty faces.

BOG-ORE, oxide of iron sometimes found at the bottom of peat mosses.

BOIL'ING, or EBULLITION (*ebullio*, I boil up: *Lat.*), the bubbling up of any fluid. The term is most commonly applied to that bubbling which happens by the application of heat; though that which ensues in other cases, as on the mixture of an acid and carbonate, is sometimes also distinguished by the same name. Boiling, in general, is occasioned by the discharge of an elastic fluid through that which is said to boil; and the appearance is the same whether it is common air, carbonic acid, or steam that passes through the fluid. The boiling of water is occasioned by the lowermost particles being rarefied into vapour on account of the vicinity of the bottom of the containing vessel to fire. Being greatly inferior in specific gravity to the surrounding fluid on account of this rarefaction, they ascend with great velocity, and, agitating the body of water in their ascent, give it the tumultuous motion called boiling. Every liquid has a fixed point at which boiling commences, and this is called the *boiling point.* Thus water, in ordinary circumstances, begins to boil at the temperature of 212°. After a liquid has begun to boil, it will not become hotter; for although a stronger heat makes all liquids boil more rapidly, yet it does not increase their temperature, the additional heat being required to raise the extra quantity of vapour to the same temperature as that of the fluid from which it ascends: since gases and vapours require a greater amount of heat to keep them at a given temperature than fluids or solids. The boiling point of ether is 96°, that of alcohol is 176°, that of oil of turpentine is 316°, and that of mercury 662°.

BOLE (*bōlos*, a lump of earth: *Gr.*), an argillaceous earthy mineral, a silicate of alumina generally reddened by oxide of iron. Boles are soft and unctuous to the touch: they adhere to the tongue, and by degrees melt in the mouth, producing a slight sense of astringency. There is a great variety of these earths; which have been found in Britain, on the continent of Europe, and in India. They are no longer employed medicinally with us. In Germany a red paint is made from bole by calcining it.

BOLE'TUS (*Lat.;* from *bōlites*, a mushroom: *Gr.*), in Botany, a genus of fungi, one species of which, *B. edulis*, is esteemed as a delicate article of food.

BOL'LARDS (*bolle*, a round body: *Germ.*), large posts set in the ground, on each side of a dock: on docking or undocking ships, large blocks are lashed to them; and through these blocks are reeved the transporting hawsers which are to be brought to the capstans.

BOLO'GNIAN STONE, a *sulphate of baryta* found near Bologna in Italy, which, when heated with charcoal, becomes a powerful *solar phosphorus;* giving out light, after having been exposed to the sun's rays.

BO'LSTER (*polster*, from *polstern*, to stuff with hair or feathers: *Germ.*), a sea term, for a piece of timber cut and placed for the easement of the cable.

BOLT, among builders, a strong cylindrical pin of iron or some other metal, used as a fastening for doors and windows. Bolts are generally distinguished into three kinds, viz. plate, round, and spring bolts.——In Gunnery, there are prise-bolts transom-bolts, traverse bolts, and bracket-bolts.——In ships, bolts are used in the sides and decks, and have different names, as eye bolts, ring-bolts, chain-bolts, &c.

BO'LT-HEAD, in Chemistry, a long straight-necked glass vessel for distillations, which being fitted to the alembic or still, is called a *receiver.*

BO'LUS (*bōlos*, a lump of earth: *Gr.*), in Medicine, a very large pill, to be swallowed whole.

BOMB (*bombos*, a sound imitative of the sense: *Gr.*), a large shell or ball of cast-iron, round and hollow, with a vent to receive a fusee, and filled with combustible materials: the fusee, which is inserted in the vent, being set on fire, the bomb is thrown from a mortar, in such a direction as to fall into a fort, city, or enemy's camp, when it bursts with great violence, and often with terrible effect, blowing into pieces whatever may be in its way. At present, it is often made so as to explode on striking an object. Bombs, or, as they are commonly called, *shells*, seem to have been first used as part of the regular material of an army, about the year 1634, in the wars of the Netherlands.——BOMB-CHEST, a chest filled with bombs, or gunpowder only, and placed underground, in order to effect great destruction when it bursts.——BOMB-KETCH, a small vessel constructed for throwing bombs into a fortress from the sea.

BOMBAST' (*bombax*, an exclamation of mock admiration: *Gr.*), in Literary composition, an inflated style, by which, in attempting to raise a low or familiar subject beyond its rank, the writer seldom fails to be ridiculous.

BOM'BAX (*bombux*, a silkworm: *Gr.*), in Botany, a genus which includes the silk cotton trees, tropical plants of noble aspect. The seeds are enveloped in cottony fibres, but they cannot be made use of for spinning. They are natives of India and America, and belong to the nat. ord. *Sterculiaceæ.*

BOM'BAZINE (same *deriv.*), a fabric, of which the *warp* is silk, and the *weft* worsted. It is generally black, and used for mourning.

BOM'BYX (*bombux: Gr.*), in Entomology, the genus which includes the common SILKWORM, *B. mori.*

BONAS'SUS (*bonassos: Gr.*), or Aurochs, the European bison, the *Bison Bonassus* of naturalists, a fierce animal, which is wild in the Caucasus and some other parts of Europe.

BOND (*Sax.*), a legal obligation to perform a certain condition under the penalty of paying a sum of money.——BOND, in Carpentry, the binding of any two pieces together by tenoning, mortising, &c. In Masonry, it is the disposition of stones or bricks in a building, so that they are most effectually bound to one another.——*Bond-timbers* are the horizontal timbers bedded in stone or brick walls for strengthening them.

BONE (*ban: Ang. Sax.*). The bones are covered with a thin, strong membrane, called the *periosteum*, which has very little sensibility in a sound state, but when inflamed is extremely sensitive. Bones are traversed longitudinally by small canals which contain blood-vessels. These are known as Haversian canals. When a thin section of bone is examined under a microscope, many dark spots are seen with lines radiating from them. These are called *lacunæ* and *canaliculi.* The osseous substance is usually arranged in laminæ concentric with the Haversian canals. In the vertebrata, the middle of the long bones is filled with marrow. In some birds the bones are hollow. From the analysis of bones we learn that, although the proportion of ingredients varies in different animals, the general constituents of bone are as follows: 1. Gelatin, obtained by boiling rasped or bruised bones in water; 2. Oil or fat, separable during the boiling, by rising to the top of the water, and when cold concreting into a suet; 3. Phosphate of lime, carbonate of lime, carbonate of magnesia, and fluoride of calcium. Of these ingredients the phosphate of lime exists in far the greatest abundance, and it is this which gives bones their solidity. Man has 246 bones—the head and face 63, the trunk 59, the arms 64, and the lower extremities 60. That part of anatomy which treats of the bones is called *Osteology.*

BONI'TO, a fish of the tunny genus, growing to the length of three feet, and found in the Atlantic Ocean. It is marked with four dark bands on each side.

BON'NET (a cap: *Fr.*), in Fortification, a small work composed of two faces, usually raised before the salient angle of the counterscarp.

BONZE, an Indian priest, who wears a chaplet of beads about his neck, and carries a staff, having a wooden bird at one end. The bonzes of China are the priests of the Fohists, or sects of Fohi; and it is one of their established tenets, that there are rewards alloted for the righteous, and punishments for the wicked, in the other world; and that there are various mansions, in which the souls of men will reside, according to their different degrees of merit. The number of bonzes in China is estimated at fifty thousand, and they are represented as idle dissolute men. They profess celibacy, reside in monasteries, perform penances, practise rigorous mortifications, and wear long coarse gowns bound with cords, like the Franciscans.

BOO'BY, a species of gannet common on the coast of South America, so called from its stupid habits. Like the Solan goose, it belongs to the genus *Sula.*

BOOK (*boc: Ang. Sax.*), a literary composition, designed to communicate something which the author has invented, experienced, or collected, to the public; being printed, bound in a volume, and published for that purpose.——Plates of lead and copper, the bark of trees, bricks, stone, and wood, were among the first materials employed to engrave such things upon as men were desirous of transmitting to posterity. Josephus speaks of two columns, the one of stone, the other of brick, on which the children of Seth wrote their inventions and astronomical discoveries: Porphyry makes mention of some pillars, preserved in Crete, on which the ceremonies practised by the Corybantes in their sacrifices were recorded: Hesiod's works were originally written upon tables of lead, and deposited in the temple of the Muses, in Bœotia: the ten commandments, delivered to Moses, were written upon stone; and Solon's laws upon wooden planks. Tables of wood, box, and ivory, were common among the ancients: when of wood, they were frequently covered with wax, that people might write on them with more ease, or blot out what they had written. The leaves of the palm-tree were afterwards used instead of wooden planks, and the finest and thinnest part of the bark of such trees as the lime, the ash, the maple, and the elm; and hence comes the word *liber*, as applied to the inner bark of the trees. As these barks were rolled up, that they might be removed with greater ease, each roll was called *volumen*, a volume; a name afterwards given to similar rolls of paper or parchment.

BOOK'-BINDING, a very ingenious art, by which printed sheets are folded, gathered, pressed, sewed together, shielded with millboards, and covered with leather or cloth, which is lettered, and ornamented by the use of leaf gold and gilding tools.

BOOK'-KEEPING, the art of registering mercantile transactions for reference, statement, and balance; all of which must be so clearly done, that the true state of every part, and of the whole, may be easily and distinctly known.

BOOM (a tree: *Dut.*), a sea term, for a long pole extending along the bottoms of particular sails, as the *jib-boom*, and *studding-sail-boom.*——The *boom of a harbour* is a strong iron chain thrown across it, to prevent the entrance of an enemy; and a *fire-boom* is a strong pole thrown out from a ship to prevent the approach of fire-ships, &c.

BOO'MERANG, a wooden weapon used by the natives of Australia, in whose hands it performs marvellous feats, though in those of a European it is inert and intractable.

BOO'TES (*boōtes*, a herdsman; from *bous*, an ox: *Gr.*), a northern constellation containing Arcturus and 54 other stars. It is also known as Charles's Wain.

BORA'CIC ACID, in its native state, exists in several small lakes in Italy, and in certain hot springs, from whose waters it is deposited by natural evaporation. It is also obtained from the mineral called borax. The acid, when separated, appears in the form of a white, scaly, glittering substance, with hexahedral scales, soft and unctuous to the touch. Its taste is bitterish, with a slight degree of acidity. It is soluble in alcohol, which it causes to burn, when set on fire, with a green flame surrounded with a white one. Boracic acid was discovered by Sir Humphry Davy to be a compound of a peculiar base, which he called *boron*, and oxygen.

BO'RACITE (from *boron*), in Mineralogy, a native *borate of magnesia*; it is generally of a cubic form, and is remarkable for its electrical properties.

BO'RAX, *borate of soda*, a native salt found in certain waters, and discovered in them by its brackish and bitter taste; readily separable from them by evaporation, and appearing, on a careful solution and evaporation, in transparent crystals. It is chiefly obtained from Tuscany, where it issues from the earth combined with steam. It is also found in Thibet and China, and imported to this country under the name of tincal. Peru supplies a native borate of lime, from which it is also obtained. Borax makes no effervescence either with acids or alkalis; and, when heated, the water of crystallization being driven off, what is called *glass of borax* remains. Its use in soldering gold and other metals is well known. It is employed in metallurgy as a flux, and in remelting the small masses of gold and silver that are the produce of assays; by rubbing it over the vessels in which these are to be fused, it fills up all their small cavities, and leaves not the least roughness on the surface to retain any of the melted metal. It is used by dyers to give a gloss to silks; and it is also employed both as a cosmetic and as a medicine.

BOR'DURE (*border*, to edge: *Fr.*), in Heraldry, an edging on the shield, having a width of about one-fifth of the field; serving as a difference in a coat of arms, to distinguish families of the same name, or persons bearing the same coat.

BORE, a tidal phenomenon, occurring in some rivers that fall into estuaries. It is seen at spring tides as a violent rush of water up the stream, attended with much noise. The Severn, Trent, and Wye are subject to bores; but the most remarkable exhibition of the phenomenon occurs at the mouths of the Ganges and Brahmapootra.

BO'RING, in Mineralogy, a kind of circular cutting, or a method of piercing the earth with scooping irons, which, when drawn out, bring with them samples of the different strata through which they have passed By this means the veins of ore or coal may be discovered without opening a mine.——Boring for water has been very successfully practised of late. [See ARTESIAN WELLS.]

BO'RON, an elementary substance, the base of boracic acid. It is dark olive-coloured, and a non-conductor of electricity; is insoluble in water, and infusible. Heated to redness, it burns into boracic acid.

BOR'OUGH (*burg*, an enclosed place: *Sax.*). This word originally denoted a fortified city or town: but at present it is applied to a town or village which possesses certain municipal institutions, or the privilege of sending burgesses or representatives to parliament. By the regulations of the Municipal Reform Act, the corporation of a borough consists of the mayor, aldermen, and councillors, who form the council of the borough. The burgesses of the borough annually elect one-third of the whole number of councillors, and every third year there is an election of the aldermen to fill the place of those retiring, namely, one-half of the total number. The mayor is annually chosen by the aldermen and councillors, and he must be one of them.——BOROUGH ENGLISH is a customary inheritance of lands or tenements, in certain parts of England, by which they descend to the youngest instead of the eldest son, or, if the owner leaves no son, to the youngest brother. The custom goes with the land, and cannot be altered by any limitation of the parties.

BORSEL'LA, an instrument with which glass-makers contract or extend their glasses at pleasure.

BORS'HOLDER (borough holder, or borough's elder), among the Anglo-Saxons, one of the lowest magistrates, whose authority extended over only one tithing, or community of about ten families.

BOS (an ox: *Lat.*), in Zoology, a genus of ruminating quadrupeds (*Bovidæ*), including our common domesticated cattle.

BOS'SAGE (*bosse*, anything swollen out: *Fr.*), in Architecture, a term used for any stone that has a projecture, and is laid rough in a building, to be afterwards carved into mouldings, capitals, coats of arms, &c. ——BOSSAGE is also the name for what is otherwise called *rustic work*, which consists of stones that seem to project beyond the level of the building, by reason of indentures or channels left in the joinings. It is used chiefly in the corners of edifices, forming what are there called *rustic quoins*.

BOT'ANY (*botanê*, an herb: *Gr.*), that branch of natural history which treats of plants. It is divisible into: 1. Structural Botany, Organography, or Vegetable Anatomy, which has reference to the parts of which plants are composed. 2. Physiological Botany, which has reference to the processes carried on by living plants. 3. Systematical Botany, or Taxonomy, in which the relations of plants to one another are considered with a view to their arrangement and classification. Under the first the elementary organs or vegetable tissues are studied. All plants originate in, and in their simplest state wholly consist of, minute vesicles called cells, which are formed of an elastic membrane composed of cellulose. This is a compound of carbon, hydrogen, and oxygen. The tissues composed of it, for example the pith, are termed cellular or parenchymatous. Cells are usually round or oval, but they are sometimes prismatical, stellate, and other shapes. The other elementary tissue of plants is called Vascular, and consists of tubes much longer than wide. These are probably elaborated out of cells. Woody fibre or ligneous tissue is an instance of such tubes or elongated cells with thickened walls and pointed ends. All the vessels and channels through which fluids flow are composed of vascular tissue variously arranged. All the organs of plants are formed out of these two tissues. Of the form and structure of the root, stems, and leaves, we have no space to speak here, and must refer the reader to treatises on botany, and to the articles ROOT, AERIAL ROOTS, ENDOGENS, EXOGENS, LEAF. It may, however, be mentioned that botanists assign the term *phyllotaxis* to the arrangement of the leaves, with reference to the stem from which they spring; and the term *vernation*, is applied to the arrangement of the leaves in the bud. The corresponding terms *anthotaxis* or *inflorescence*, and *æstivation*, are given to the arrangement of the flowers with reference to the axis of the plant, and to the arrangement of the parts of the flower to each other before it opens. Referring now to the flower, or that part of the plant where the productive organs are situate, we may first notice the outer whorl or calyx, usually consisting of one or more green leaves. The *blossom* or *corolla* is that beautifully coloured part of a flower which principally attracts the attention. It is composed of one or more petals, or blossom leaves. When it consists of one, as in the polyanthus or auricula, it is termed monopetalous; but if it is composed of more than one, it is said to be polypetalous. Sometimes the calyx and corolla are so blended together that it is not easy to distinguish them, as in the lily and iris, and then the term *perianth* is applied to the whole. Sometimes neither calyx nor corolla is present, and the flower is then said to be naked or *achlamydeous*. If there is only one floral envelope, that is either calyx or corolla, the flower is termed *monochlamydeous*. The *stamens* are slender thread-like substances, placed within the blossom, and surrounding the pistil. They are composed of two parts—the *filament* or thread, and the *anther* or tip; but the latter is the essential part, as it contains the pollen, the fructifying principle which bursts forth in the form of a fine powder. This falling upon the stigma causes the ovary to produce fertile seed. A *pistil* consists of three parts, the germen or *ovarium*, the *style* or shaft, and the summit or *stigma*; but the second is often wanting. Some flowers have only one pistil; others have two, three, or more. The seed-vessel, in the newly opening flower, is called the *ovary*; but when it enlarges it is termed the seed-vessel. Some plants have no appendage of the kind, and then the seeds are uncovered, as in the dead nettle. The cup, however, usually encloses and retains the seeds till they ripen; and, in the tribe of grasses, this office is generally performed by what was previously called the blossom. *Nectaries* are those parts in a flower which usually contain a sweet nectarious liquor. They have generally the shape of spurs, but the name has been often extended to various unusual parts which have nothing to do with the secretion of honey. The receptacle is the seat or base to which the various divisions of a flower are affixed. Thus, if you pull off the calyx, the blossom, the stamens, the pistils, and the seeds or seed-vessels of a daisy, the body remaining on the top of the stalk is the receptacle.

Although the Linnæan system of arrangement has been abandoned for a natural classification, it is too intimately connected with the literature of botany to be altogether passed over, and we therefore give an outline of it. He divided all known plants into twenty-four *Classes*, distinguishing them according to the number or situation of the stamens, filaments, anthers, or male and female flowers in each plant, as follows:—

1. *Monandria*, plants having one stamen.
2. *Diandria* . . . . . . two stamens.
3. *Triandria* . . . . . . three stamens.
4. *Tetrandria* . . . . . . four stamens.
5. *Pentandria* . . . . . . five stamens.
6. *Hexandria* . . . . . . six stamens.
7. *Heptandria* . . . . . seven stamens.
8. *Octandria* . . . . . . eight stamens.
9. *Enneandria* . . . . . nine stamens.
10. *Decandria* . . . . . . ten stamens.
11. *Dodecandria*, from eleven to seventeen stamens.
12. *Icosandria*, many stamens inserted in the calyx.
13. *Polyandria*, twenty stamens and upwards, inserted in the receptacle.
14. *Didynamia*, four stamens in one flower, two longer than the rest.
15. *Tetradynamia*, six stamens, two shorter than the rest.
16. *Monodelphia*, the filaments connected in the form of a tube.
17. *Diadelphia*, the filaments forming two parcels.
18. *Polyadelphia*, the filaments forming several parcels.
19. *Syngenesia*, the anthers formed into a tube.
20. *Gynandria*, the stamens united with the pistil.
21. *Monœcia*, stamens and pistils in separate flowers, but in one plant.
22. *Diœcia*, stamens and pistils in separate plants.
23. *Polygamia*, stamens and pistils separate in some flowers, and united in others, either in the same plant, or in two or three different ones.
24. *Cryptogamia*, flowers inconspicuous, or invisible to the naked eye.

The *Orders*, or subdivisions of the classes, from class 1 to 13 inclusive, are marked by the number of styles or pistils in each plant; as *monogynia*, where there is but one pistil; and *digynia*, *trigynia*, *tetragynia*, &c., for two, three, four, or more pistils. In the 14th class, when the seeds are naked, the term *gymnospermia* denotes the order: when contained in a pericarp, *angiospermia*. In the 15th class, when the seeds are contained in a silique of different sizes, they are termed *siliquosæ*, if the pods are long; and *siliculosæ*, if they are short. The orders of the 16th, 17th, and 18th classes are marked by the number of stamens in each plant. The orders of the *Syngenesia* are determined by the arrangement of their flowers, and the sex of their florets. The orders of the 20th, 21st, and 22nd classes are distinguished by the number, &c. of the stamens. The two orders of the 23rd class depend on whether the genera are *monœcious* or *diœcious*. The last class, *Cryptogamia*, is divided into *Filices*, or ferns; *Musci*, or mosses; *Algæ*, or sea-weeds; and the different families of *Fungi*. Such an arrangement was evidently too artificial to continue in use after the study of anatomy and physiology had afforded data for a more philosophical classification. Many attempts have been made at such a classification, but no one has yet been proposed which has met with general acceptance. The following may be taken as one of the best. Plants are divided into three grand classes, of which the first contains the *Acotyledones*, or those which are destitute of seed-lobes. Such are the plants usually termed cryptogamic, and they may be separated into two sub-classes: 1. Those composed entirely of cellular tissue, such as lichens, fungi, and sea-weeds. 2. Those having a certain amount of vascular tissue along with cellular tissue, such as ferns and mosses.

The second class consists of *Monocotyledonous* (having one seed-lobe) or Endogenous plants, the latter term referring to the mode in which the wood grows, the exterior being the hardest part, and there being no true pith. There are three sub-classes. 1. *Glumaceæ*, the grass tribe. 2. *Petaloideæ*, plants with whorled floral envelopes, and leaves with parallel veins, including the orchid, iris, lily, palm, arum, and other orders. 3. *Dictyogenæ*, plants having whorled floral envelopes, and leaves with netted veins, including the yam, smilax, &c. The third class is composed of *Dicotyledonous* (having two seed-lobes) or Exogenous plants. These increase by additions at the outside, the hardest part being within. The sub-classes are: 1. *Monochlamydeæ*, plants with either no floral envelope, or one of a single whorl. Here are placed the *Gymnospermæ*, plants with naked ovules, which are fertilised by the direct application of pollen, without the intervention of a stigma, such as the Coniferous tribes, pines, cedars, larches, &c.; and the *Angiospermæ*, plants with seeds contained in an ovary, and fertilised by pollen acting on a stigma. Here are placed numerous orders, including the laurels, begonias, euphorbias, elms, and figs, as well as the catkin bearing plants, such as the willow, poplar, birch, plane, beech, chestnut, and oak. 2. *Corollifloræ*, plants having a calyx and a monopetalous corolla, which bears the stamens. A number of important orders fall into this sub-class, of which the salvia, verbena, primrose, convolvulus, and campanula, may be taken as examples. 3. *Calycifloræ*, plants having a calyx, and a polypetalous corolla, with stamens attached to the calyx. Here, also, are placed many orders, including those to which the pea and bean, the rose, myrtle, house leek, and carrot belong. 4. *Thalamifloræ*, plants having a calyx and a polypetalous corolla, with stamens which are inserted below the pistil. The water-lily, poppy, geranium, and all the cruciferous order may be cited as examples.

Several important orders of plants are noticed in various parts of this work, and the reader may consult the articles ACOTYLEDONS, ACROGENS, BULB, DICOTYLEDONS, MONOCOTYLEDONS, ENDOGENS, EXOGENS, ROOT, and AERIAL ROOTS.

BOTAR'GO, a kind of sausage, made of the roe of the mullet: it is much used on the Mediterranean coast as an incentive to drink.

BO'TRYOLITE (*botrus*, a bunch of grapes; and *lithos*, a stone: *Gr.*), in Mineralogy, a variety of siliceous borate of lime, which occurs in botryoidal concretions in a bed of magnetic iron in gneiss, near Arundel, and in Norway. Its colours are grey, reddish-white, and pale rose-red; and form concentric stripes.

BOTS, small worms found in the intestines of horses. They are the *larvæ* of a kind of gad-fly, the *Gasterophilus equi* of entomologists, a dipterous insect, which deposits its eggs on the tips of the hairs, generally of the fore-legs and mane, whence they are taken into the mouth and swallowed.

BOT'TOMRY (*botin*, the lowest place: *Sax.*), in Commerce, the act of borrowing money upon the keel or bottom of a ship; that is, the ship itself is pledged as security for the repayment of the money. If the ship is lost, the lender loses the money; but if the ship arrives safe, he is to receive the money lent, with the interest or premium stipulated, although it may exceed the legal rate of interest.

BOU'GIE (*Fr.*), a slender flexible tube intended for introduction into the urethra, œsophagus, or rectum, when those passages are obstructed by stricture or other disease.

BOU'LDERS, in Geology, large fragments of rock, either angular or rounded, lying detached on the surface of the earth, and evidently brought from a distance. They are believed to have been transported to their present sites by means of ice. They belong to a late geological period, and form part of what is termed the boulder formation.

BOUL'TINE, in Architecture, a convex moulding nearly the quarter of a circle: more usually called the egg or *quarter round*. It is placed next below the plinth in the Tuscan and Doric capital.

BOURGEOIS, a small kind of printing type, between long-primer and brevier. The type used in this work is four sizes smaller than *bourgeois*.

BOURSE (*Fr.*), on the continent of Europe, the name of an exchange, the building where merchants meet for the transaction of business.

BOUSTROPHE'DON (turning like ploughing oxen: *Gr.*), a term given to an ancient manner of writing, in which the lines are alternately to be read from right to left, and from left to right, as furrows are traced by the plough. The celebrated Sigean inscription and some other ancient Greek inscriptions in the British Museum have been cut in this manner.

BOUTS-RIME'S (*Fr.*), a term for certain rhymes disposed in order, and given to a poet, together with a subject, to be filled up with verses ending in the same words and in the same order.

BOW (past tense of *bygam*, to bend: *Sax.*), an instrument of war and hunting, formed of wood or other elastic material, which, after being bent by means of a string fastened to its two ends, throws out an arrow with great force and velocity. The bow is still used as a weapon of offence by many of the inhabitants of Asia, Africa, and America; and in Europe, before the invention of fire-arms, a part of the infantry was armed with bows, which were made of the yew-tree or ash, and were of the height of the archer. For several centuries the long-bow was the favourite national weapon in England, and many laws were made to encourage the use of it; the parliament under Henry VIII. complained of the disuse of long-bows, 'heretofore the safeguard and defence of this kingdom, and the dread and terror of its enemies.' The *cross-bow*, or arbalist, was a common weapon with the Italians, and was introduced into England in the thirteenth century; the arrows shot from it were called *quarrels*. Of the power of the Bow, and the distance to which it will carry, many remarkable anecdotes are related. Lord Bacon speaks of a Turkish bow which has been known to pierce a steel target, or a piece of brass; while other authorities declare they have seen an arrow shot from a bow a distance of 600 yards. [For further remarks, see ARCHERY.]——BOW, in Mechanics, is the name of several things so called from their curved figure; as, the *turner's bow*, a pole fixed to the ceiling and having attached to it the cord that whirls round the piece to be turned; the *bow of a saddle*, the piece of wood on each side, laid archwise to receive the upper part of a horse's back.——BOW is also the name of an instrument formerly used at sea for taking the sun's altitude; and consisting of a large arch of ninety degrees graduated, a shank or staff, a shade vane, a sight vane, and an horizon vane.——BOW, in Music, is the name of that well-known implement, consisting of a stick furnished with hair, by means of which the tone is produced from violins, &c.

BOWLS, a game played with wooden balls, which are rolled by the hand upon a fine smooth grassy surface, used solely for the purpose, and denominated a bowling-green.

BOX'-TREE. [See BUXUS.]

BRACE (*braccio: Ital.*; from *brachium*, the arm: *Lat.*), in Architecture, a piece of timber framed in with bevel joints, to keep the building from swerving either way. When the brace is fixed into the principal rafters, it is sometimes called a *strut* [see ROOF].——BRACES, in Marine language, are ropes belonging to all the yards of a ship, except the mizen, two to each yard, reeved through blocks that are fastened to pennants attached to the yard-arms.——*To brace about* is to turn the yards round for the contrary tack.——*To brace to* is to check or ease off the lee braces, and round in the weather ones, to assist in tacking.

BRA'CHIAL (*brachialis*, belonging to the arm; from *brachium*, the arm: *Lat.*), in a general sense, denotes something belonging to the arm; as, the *brachial artery*.——BRACHIALIS is particularly used for a thick and broad muscle of the arm, lying between the shoulder-bone and the elbow.

BRA'CHIATE (*brachiatus*, having boughs; from same: *Lat.*), an epithet for having branches nearly at right angles to the stem.

BRACHIOP'ODA (*brachion*, an arm; *poda*, feet: *Gr.*), a class of marine bivalve molluscs the shells being always equal sided, but never equivalve. One of the shells is perforated near the beak, to allow of the passage of the pedicle by which it is attached to some extraneous object. They have been termed lamp shells, from their resemblance to an antique lamp, the hole referred to being that through which the wick would pass in a lamp. The animals are destitute of any special breathing organ. Their scientific name was suggested by the two long arms furnished with cilia, with which they create currents that bring food to the mouth. 'Of all shell-fish,' says Mr. S. P Woodward, 'Brachiopoda enjoy the greatest range both of *climate* and *depth* and *time*. They are found in tropical and polar seas, in pools left by the ebbing tide, and at the greatest depths hitherto explored by the dredge. At present only 70 recent species are known, but above 1,000 extinct species are distributed through the sedimentary rocks of marine origin, from the Cambrian strata upwards. The oldest form of organic life at present known, both in the old and new world, is a Lingula.'

BRACHYCEPH'ALIC (*brachus*, short; *kephale*, the head: *Gr.*), a term applied by comparative anatomists to round skulls, such as those of the Calmucks; opposed to *dolicho-cephalic*.

BRACHYG'RAPHY (*brachus*, short; and *graphē*, a writing: *Gr.*), stenography, or the art of writing in shorthand.

BRACHYL'OGY (*brachulogia*: from *brachus*, short; and *logos*, a discourse: *Gr.*), in Rhetoric, the method of expressing anything in the most concise manner.

BRACHYPNŒ'A (*brachus*, short; and *pnoē*, breath: *Gr.*), in Medicine, short respiration at small intervals.

BRAC'TEA, or BRACT (*bractea*, a thin plate: *Lat.*), in Botany, an altered leaf, which grows on the flower stalk of many plants, below the calyx. It is the first attempt made by the common leaves to change into the floral organs, and may, in some cases, be mistaken for the calyx.

BRAC'TEOLATE (*bracteola*, a thin leaf: *Lat.*), in Botany, an epithet for plants which are furnished with bracteoles, or small bracts.

BRAH'MA. The religion of the Hindoos, that which is frequently styled Brahminism, inculcates a belief in a supreme deity under the name of Brahmă, who is an impersonal divine substance, the object merely of devout contemplation, not of worship. There is also Brahmā, the creator of the universe, and the first of the trimurti or triad of divinities; of whom Vishnu, the preserver, and Siva, the destroyer, are the others. In Sculpture, Brahmā is represented as having four faces. It is said that there are not any temples exclusively dedicated to him in India; but prayers are addressed to him, and he is worshipped along with the other members of the triad. Vishnu and Siva, however, have a great number of worshippers, and the sects who acknowledge each as their chief object of devotion are not to be counted. The greatest confusion exists as to the names and attributes of these deities. Great changes in belief have taken place in the progress of time, and the most learned Brahmin is unable to explain the great majority of the rites and articles of belief. Transmigration of souls is a leading tenet of Hindoo belief. The slaying of animals of the cow kind is forbidden, under the penalty of loss of caste. Brahminism must not be confounded with BUDDHISM, which see. See also the next article, and SIVA, VISHNU, PURANA, VEDAS.

BRAH'MINS (followers of *Brahma*), the highest caste amongst the Hindoos. Theirs is the exclusive duty of teaching the Vedas, and they were formerly considered bound to abstain from all laborious occupations, and to confine themselves to serving the gods and meditating on holy things. Though the members of this caste exact and receive respect from the other Hindoos, as their superiors, they are found following many occupations from which they are in strictness interdicted. The Gurus hold the first rank amongst them; they are the priests or spiritual advisers, having authority in matters of religion and education. [See CASTE.] To the Brahmins we are indebted for whatever we know of the Sanskrit, or ancient language of the country, in which their sacred books are written.

BRAIN (*brægen: Sax.*), in Anatomy, that soft white mass enclosed in the cranium or skull, in which all the organs of sense terminate, and the intelligent principle of man is supposed to reside. It consists of the *cerebrum*, which occupies the whole of the superior part of the cavity of the skull; the *cerebellum*, which occupies the lower back part; and the *medulla oblongata*, which is the smaller portion, lying at the base of the skull, beneath the cerebrum and cerebellum. The cerebrum is the largest portion of the brain in man, being nine times as heavy as the cerebellum. Above and behind it is divided into two 'hemispheres,' separated by a fold of the *dura mater*, but united below by the *corpus callosum*. The surface of the cerebrum is marked by a number of tortuous folds or convolutions. Its under surface is separated by transverse furrows, or *sulci*, into three lobes. The outer portion of the cerebrum consists of grey matter covering the internal white neurine. The cerebellum is protected from the pressure of the back part of the cerebrum by an extension of the dura mater, called *tentorium* cerebelli. It is divided into three lobes, of which the central one is small. The medulla oblongata gives rise to the spinal chord. The external portion of the brain is soft and vascular, and is called the *cortical* substance; the internal is called the *medullary*. Between the skull and the brain there are three membranes, called by the older anatomists *matres* (*mothers*), from the supposition that they gave rise to all the other membranes; the outer one is called the *dura mater*, which is strong, dense, and elastic; the next is the *pia mater*, which is very vascular; and the innermost is the *arachnoidea*, which is thin and nearly transparent. These membranes also invest the spinal chord. It is worthy of observation, that every part of the brain is exactly symmetrical with the part on the opposite side, and that irregularities in its structure are far more uncommon than in the other parts of the human body. It is stated that the brain of an average European child four years of age is twice as large as the brain of a full-grown gorilla. Notwithstanding the difference in size, Mr. Huxley says that, in cerebral structure, man differs less from the chimpanzee or the orang than these do from the monkeys, and that the difference between the brains of the chimpanzee and of man is almost insignificant, when compared with that between the chimpanzee brain and that of a lemur.

BRAIN STONE, the popular name of some stony corals growing in round masses and found in tropical seas, which bear some resemblance to the sinuous ridges of the brain. They are placed in the genus Meandrina and other allied genera.

BRAN, the skins or husks of grain, especially wheat, separated from the flour by a sieve or bolter.

BRAN'CHIÆ (*Lat.*, from *branchia: Gr.*), the gills or organs of respiration, answering to the lungs in other animals, with which all fishes are provided. There are usually four pairs on each side, and they consist of rows of threads, which absorb the oxygen from the atmospheric air contained in the water which passes over them. Fishes die when taken out of the water, not for lack of oxygen, but because the gills cling together and dry, so as to be incapable of performing their function.

BRANCHIOSTE'GAL RAYS (*branchia*, gills; *osteon*, a bone: *Gr.*), in Ichthyology, the slender bones upon which the membrane enclosing the branchial chamber is supported. There is a corresponding series on each side, the number varying in different fishes from three to ten times that number.

BRAN'DY (corrupted from *branntwein*, literally burnt wine: *Germ.*), a spirituous and inflammable fluid, chiefly alcohol, obtained from wine and other liquors by distillation. It is colourless, except when coloured artificially or by the cask. The wine-brandy, manufactured in France, is considered the best in Europe. It is made wherever wine is produced, and damaged wine is used for this purpose rather than what is good.

BRASS (*bræs: Ang. Sax.*), in Metallurgy, a factitious compound metal, of a yellow colour, consisting of copper, and from one-third to one-fifth its weight of zinc. It is more fusible than copper, and not so apt to tarnish; it is malleable when cold, but not when heated. It is so ductile, that fabrics for sieves, of extreme fineness, are woven with brass wire, in the same way as cambric.——CORINTHIAN BRASS has been famous in antiquity, and is a mixture of gold, silver, and copper. It is said that when L. Mummius sacked and burned Corinth, B.C. 146, this metal was formed from the gold, silver, and copper, with which that city abounded, and which, by the violence of the conflagration, were melted and run together.

BRAS'SICA (*Lat.*), in Botany, a genus of cruciferous plants, including the common cabbage and its numerous varieties, cauliflower, broccoli, &c. The cabbage was as much used by the ancients as it is by the moderns. The principal species are the *Brassica oleracea*, or common cabbage; and *Brassica Napus*, wild cabbage or rape.

BRAVU'RA (courage: *Ital.*), in Music, an air so composed as to enable the performer to show his skill in the execution of difficult passages. The term is sometimes used for the style of execution.

BRAZIL'-NUTS are the fruit of a large tree (*Bertholletia excelsa:* nat. ord. *Lethycidaceæ*) growing in tropical Brazil. On the tree they are contained in a woody case, as large and round as a cannon-ball. The nuts of the Sapucaya (*Lecythis ollaria*), a gigantic Brazilian tree belonging to the same order, are also edible. The hard capsules containing the nuts are called monkeys' drinking cups, and are furnished with a lid, which breaks off when the cups fall to the ground when the fruit is ripe. The nuts are thereby scattered over the ground, and are eaten by the wild animals of the forest. Hence this kind of nut is much scarcer than the other.

BRAZIL'-WOOD, the wood of the *Cæsalpinia Brasiliensis*, a lofty leguminous tree, found in the greatest abundance in the province of Pernambuco, in Brazil. The tree is large, crooked, and knotty: it is very hard, and susceptible of a fine polish; is pale when newly cut, but on exposure to the air is of a red colour. The juice of the Brazil-wood is made use of for dyeing silk of a crimson colour, but it is inferior to, and less permanent than, the crimson obtained from cochineal. It is also used, in combination with certain mordants and alkalis, for various shades of red, purple, and violet, in cotton and woollen cloths. The word *brazil* is of Portuguese origin (from *braza*, a live coal, or glowing fire), and the name was given to the wood from its colour. It is said that King Emanuel of Portugal called a part of America Brazil, on account of its producing this wood.

BRA'ZING, the soldering or uniting two pieces of metal together by means of thin plates of brass, melted between the parts that are to be joined. If the work be very fine, as when two leaves of a broken saw are to be brazed together, it is covered with pulverized borax, dissolved with water, that it may incorporate with the brass powder; or granulated hard solder, consisting of brass and zinc, and sometimes a little silver or tin, is applied to it. The piece is then exposed to the fire without touching the coals, and heated till the brass is seen to run.

BREACH (*brèche: Fr.*), in Fortification, a gap or opening made in any part of the works of a town by the cannon or mines of the besiegers, in order to facilitate an attack upon the place. The breach is called *practicable* if it is large enough to afford a reasonable hope of success in case of an assault.——*To repair a breach* is to stop or fill up the gap with gabions, fascines, &c., so as to prevent an assault.——In Law, a **Breach** is the violation of a contract.——**Breach of Pound** is the breaking any place where cattle are detained.——**Breach of Prison**, an escape by breaking out of prison.

BREAD (*brod: Germ.*), a preparation of flour and water, mixed with something, such as yeast, or a solution of carbonic acid, to make the mass spongy on being baked. It is the gluten which, by its viscidity, retains in the bread the gases which give it lightness by filling it with pores. Hence, only the flour of grains containing gluten will make spongy bread; and wheat flour, which contains it in so large a quantity, is usually mixed with every other kind in the making of bread. In the earliest antiquity, we find the flour or meal of grain used as food; and by degrees the artificial preparation of bread by proper fermentation was discovered: but it would appear that for many ages the meal derived from the bruised grain was merely mixed with milk and water, and the tough paste was made into balls. The superiority of wheat to all other farinaceous plants in the manufacture of bread is so very great, that, wherever it is successfully cultivated, wheaten bread is now used to the nearly total exclusion of others. But, in the 16th century, rye bread and oatmeal constituted the chief part of the diet of servants, even in great families; and in the reign of Charles I. barley bread was the usual food of the middle classes: nay, so lately as a century ago, not more than half the people of England fed on wheaten bread. The process of making bread is nearly the same throughout Europe, though the materials of which it is composed vary with the farinaceous productions of different climates and soils. The French, who particularly excel in the art of baking, have a great many different kinds of bread, from the *pain bis*, which is the coarsest of all, to the *pain mollet*, or soft bread, made of the purest flour, without any admixture. In this country we have fewer varieties of bread, and these differ chiefly in their degrees of purity. Our white or fine bread is made of the purest flour; our wheaten bread of flour, with a mixture of the finest bran; and our household bread, of the whole substance of the grain, without the separation either of the fine flour or coarse bran.——The *adulteration of bread*, by means of alum, has long been a prolific source of evil, inasmuch as the health of the public, and of children especially, is often seriously injured by it. It is, however, fortunate, that to discover this pernicious practice no chemical skill is required. For this purpose, a small piece of the crumb of new-baked bread is macerated in cold water sufficient to dissolve it, and if alum has been used by the baker, the water will acquire a sweetish astringency. When alum is present in bread, even in a minute quantity, it may be detected by treating the bread with distilled water, filtering the water first through calico, and next through filtering paper, till it becomes clear; then pouring it off into two vessels, and dropping into the one a little nitrate or chloride of barytes, and into the other some water of ammonia. In the former, if alum was present, a heavy white precipitate, indicating sulphuric acid, will appear, and in the latter a light precipitate of alumina, redissoluble by a few drops of solution of caustic potash. When chalk or plaster of Paris is used to sophisticate flour, they may be best detected by incinerating the bread, and adding to the ashes nitric acid, which will dissolve the chalk with effervescence, and the plaster of Paris without it. In both cases the calcareous matter may be rendered visible in the solution by oxalic acid, or better by oxalate of ammonia.

BREAD'-FRUIT-TREE, the *Artocarpus incisa* of botanists; nat. ord. *Artocarpaceæ*, to which order the JACK-TREE and the COW-TREE belong. It appears to have been first made known to Europeans by the great navigator Dampier. It is indigenous in Otaheite and other islands of the South Sea. The tree is of the size of a large apple-tree; the leaves broad, deeply lobed, and of a dark green. The fruit is appended to the boughs in the manner of apples, and is about the size of a pound of bread, enclosed with a tough rind, which, when ripe, turns a yellow colour. The internal part is yellow, soft and sweet. The natives bake it in an oven till the rind is black; and this being scraped off, they eat the inside, which is then white, resembling new-baked bread, having neither seed nor stone. Some of the trees have been planted in Jamaica and other West India islands, where the fruit is used as a delicacy; and whether employed as bread, or in the form of pudding, it is considered highly palatable. But in Otaheite the bread-fruit-tree not only supplies food, but clothing, and numerous other conveniences of life. The inner bark, consisting of a white fibrous substance, is formed into a kind of cloth; and the wood is used for the building of boats and houses.

BREAK'ERS, billows which break into foam over submerged rocks, or coral reefs, or upon the shore.

BREAKING GROUND, a Military term for opening the trenches and beginning the works for a siege.

BREAK'WATER a contrivance for weakening the effect of waves in a harbour. The largest breakwaters are those of Cherbourg and Plymouth.

BREAM, a name given to several fishes. The common bream is a well-known freshwater fish, of the Carp family, varying in colour from yellowish-white to yellowish-brown. The Spanish bream, the sea bream, and the black bream, are three closely allied marine fishes, belonging to the *Sparidæ*.——RAY'S BREAM, a rare fish on our coasts, is the *Brama Raii*, and belongs to the Dolphin family.

BREAST'PLATE, a piece of defensive armour worn on the breast; it was formerly deemed of great importance, but in modern warfare has fallen much into disuse. It forms a portion of the cuirass worn by the cuirassiers, and was first used, in modern times, in some of the First Napoleon's regiments.——In Horsemanship, a leathern strap running across the horse's breast, from one side of the saddle to the other, to keep it in its place.

BREAST'-PLOUGH, a sort of plough which is driven forward by the breast, and is used in paring off turf from the land.

BREAST'-WHEEL, a water-wheel, which receives the water at about half its height, or at the level of its axis.

BREAST'-WORK, a Military term for works thrown up to protect the besiegers against the fire of the besieged. It takes its name from its usual height.——A Sea term for the balustrade of the quarter-deck.

BREC'CIA, *Pudding Stone*, a natural conglomerate, consisting of fragments of stones united by some cement.

BREECH, or **BRITCH**, the hinder part of a gun, from the cascabel to the bore.——Also a Sea term for the angle of a knee-timber in a ship.

BREECH'ING, or **BRITCH'ING**, a rope used to secure the guns of ships of war, and prevent them from recoiling too much when discharged.

BREECH'-LOADERS, firearms which are charged not at the muzzle but at the other end of the barrel. Various contrivances have been adopted to render such a mode of charging easy and secure.

BREED'ING, in Husbandry, the rearing of cattle or live stock of different kinds, particularly by crossing or mingling one species or variety with another, so as to improve the species.

BREEZE (*brise: Fr.*), a shifting wind, that blows from sea or land for some certain hours in the day or night; common in Africa, and some parts of the East and West Indies. The sea-breeze is only sensible near the coasts; it commonly rises in the morning, about nine, proceeding slowly, in a fine small black curl on the water, towards the shore; it increases gradually till twelve, and dies away about five. Upon its ceasing, the land-breeze commences, which increases till twelve at night, and is succeeded in the morning by the sea-breeze again.——BREEZE (*braise: Fr.*), in Brick-making, small ashes and cinders, sometimes made use of instead of coals, for the burning of bricks.

BREVE (*brevis*, short: *Lat.*), in Music, a note equal in length to two semibreves, or, when dotted, to three: the *long* is twice the length of the breve, and the *large* twice the length of the long.

BRE'VET (*Fr.*), a Military term, expressive of nominal promotion without additional pay: thus, a brevet major does the duty of a captain, and draws pay as such. The word is borrowed from a French term signifying a royal act granting some favour or privilege; as *brevet d'invention*, a patent privilege.

BRE'VIARY (*breviarium*, a summary: *Lat.*), the book containing the daily service of the church of Rome. Originally everybody was obliged to read the breviary; but by degrees the obligation was confined to the clergy in holy orders or holding benefices, who are enjoined, under penalty of mortal sin and ecclesiastical censure, to recite it at home when they cannot attend to it in public. In the fourteenth century there was a particular reservation granted in favour of bishops, who were allowed, on extraordinary occasions, to pass three days without reciting the breviary. It was formerly much longer than at present: hence its name. The breviaries used in different places, and by different religious orders, are extremely different.——In Roman Antiquity, a book first introduced by Augustus, containing an account of the number of men in the army, the quantity of public money in the treasuries, &c., and other matters of importance.

BRE'VIATOR (an *abbreviator: Lat.*), an officer under the eastern empire, whose business it was to write and translate briefs.——One who draws up the Pope's briefs.

BREVI'ER (*brevis*, short: *Lat.*), in Printing, a small kind of type or letter, between *minion* and *bourgeois*.

BRI'BERY, the act of prevailing upon any individual to do a legal or illegal act for the sake of reward. A member of parliament proved to have been guilty of bribery loses his seat, and is fined 1000*l.* Any one attempting to obtain a seat in parliament by bribery, though unsuccessful, is subject to the same fine. The giving of a bribe directly or indirectly, for the purpose of obtaining an election to parliament, is a misdemeanour; and besides the punishment of this, the giver is to be fined 100*l.*, the receiver 10*l.* Meat, drink, or entertainment bestowed to corrupt a voter, is punishable with a forfeiture of 50*l.* by him who gives it, and incapacity of voting in him who receives it.

BRICK (*bricke: Dut.*), a composition of argillaceous earth, first moistened and made fine by treading and grinding, then formed into rectangular solids 8½ inches long, 2½ inches thick, and 4 inches wide, when burned. The dimensions of *fire* bricks are somewhat different; they are longer and thinner. The different varieties of bricks are—*malms*, which are yellowish, of a uniform colour and texture; *seconds*, which are somewhat inferior; red and grey *stocks; place bricks*, and *peckings*, which, being farthest from the fire, and not well burnt, have little durability; *burs* and *clinkers*, masses of brick run together by the heat; *fire-bricks, paving-bricks, compass-bricks* (made circular on the plan, and used for walling wells, &c.); *Dutch clinkers*, or *Flemish bricks*, which are of a very small size. Bricks are baked or burnt in a kiln, or in a *clamp*, to serve instead of stones in building. Place bricks and stocks are used in common walling; malms, which are of a fine yellow colour, hard, and well burnt, are used in the outside of buildings, and the best kind of them with red bricks, called cutting bricks, are used in the arches over windows and doors, being rubbed to a centre, and gauged to a height. An able workman will make, by hand, 5000 common bricks in a day, but machinery is now generally employed in the different operations of making bricks, tiles, and draining pipes. The use of unburnt bricks is of great antiquity; they are found in the Roman and Grecian monuments, and even in the ruins of Egypt and Babylon. They were dried in the sun, instead of being burned, and were mixed with chopped straw to give them tenacity. Owing to the extreme heat and dryness of the climate, they acquired such hardness as to last for several thousand years. The ancient Roman bricks were thinner, and of a different shape from ours; they were very durable, and vast quantities of them remain to the present day.

BRIDE (*bryd: Sax.*) Among the Greeks it was customary for the bride to be conducted from her father's house to her husband's in a chariot, the evening being chosen for that purpose to conceal her blushes: she was placed in the middle, her husband sitting on one side, and one of her most intimate friends on the other; torches were carried before her, and she was entertained on the journey with a song suitable to the occasion. As soon as they arrived, the axle-tree of the chariot they rode in was burned, to signify that the bride was never to return to her father's house. Among the Romans, when a bride was carried home to her husband's house, she was not to touch the threshold at her first entrance, but was to leap over it. In Germany the corresponding word *braut* is given to a woman between her betrothal and her marriage; and in that country she ceases to be a bride when she becomes one amongst ourselves.

BRI'DEGROOM (*bryd*, a bride; and *gyman*, to take care of: *Sax.*), a term used immediately before and after the marriage ceremony.

BRIDGE (*brieg: Sax.*), any structure carried across water or a roadway, and usually made of wood, stone, brick, or metal, but sometimes of basket-work or canes. Its strength depends on its form, its materials, and the permanence of the abutments. Among the bridges of antiquity, that built by Trajan over the Danube is considered to be the most magnificent; it was erected on twenty piers, of a hundred and fifty feet in height, and the opening from one pier to another was a hundred and seventy feet wide: the piers of this fine bridge are still to be seen on the Danube, between Servia and Moldavia, a little above Nicopolis. In Great Britain, the art of building bridges appears to have been diligently studied from early times. The most ancient bridge in England is the Gothic triangular bridge at Croyland in Lincolnshire, said to have been built in 860; but the ascent is so steep that none but foot passengers can go over it. The longest bridge in England is that over the Trent, at Burton in Staffordshire, built in the 12th century. It consists of thirty-four arches, and is 1545 feet in length. Among the great architectural works of our own times are Waterloo and New London bridges. The former consists of nine elliptical arches of 120 feet span each; it is 1250 feet long, and has a flat surface in its whole course. The latter, which was commenced in 1824, and finished in 1831, consists of five elliptical arches, the centre one being 152 feet span, and the least of them being larger than any stone arch of this description ever before erected. This magnificent structure, which was built after a design of the late John Rennie, contains about 120,000 tons of granite, measures 982 feet from the extremities of the abutments, with 53 feet of roadway between the parapets, and cost about two millions sterling. There are several cast-iron bridges in England, the chief of which is Southwark bridge, over the Thames. But all these structures have been much exceeded in vastness by the viaducts and bridges of railways.——SUSPENSION BRIDGES. Pendent or hanging bridges have by some been deemed a modern invention, but we find that the use of them is of great antiquity in mountainous countries; though the scientific principles which distinguish those of recent construction may perhaps be sought in vain among them. The most remarkable suspension bridge in existence is that built by Mr. Telford over the Menai strait, between the Isle of Anglesea and Caernarvonshire in Wales, which was finished in 1825. Others also, most elegant in their design, and fully answering all the purposes for which they were intended, have been erected over the Thames at Hammersmith and Battersea, and in many other places. In these the flooring or main body of the bridge is supported by strong iron chains or rods, hanging in the form of an inverted arch from one point of support to another. The points of support are the tops of strong pillars or small towers, erected for the purpose. Over these pillars the chain passes, and is attached, at each extremity of the bridge, to rocks or massive frames of iron, firmly secured underground. The great advantage of suspension bridges consists in their stability of equilibrium, in consequence of which a smaller amount of materials is necessary for their construction than for any other bridge. If a suspension bridge is shaken or thrown out of equilibrium, it returns by its weight to its proper form, whereas the reverse happens in bridges which are built above the level of their supporters.——A DRAWBRIDGE, in Fortification, is one that is fastened with hinges at one end only, so that the other may be drawn up; in which case the bridge stands upright, to prevent an enemy from passing the moat.——A BRIDGE OF COMMUNICATION is that made over a river, by which two armies, or forts, separated by that river, have a free communication with one another.——A BRIDGE OF BOATS consists of a number of common boats joined parallel to each other, at the distance of six feet, till they reach across a river. They are then covered with planks, so as to serve as a passage for men and horses. In military operations, temporary bridges are often formed by laying planks upon boats, pontoons, or such other buoyant supporters as readily present themselves. [See TUBULAR BRIDGE.]

BRIDOO'N (*bridon*, a *dim.* of *bride*, a bridle: *Fr.*), the snaffle and rein of a military bridle, which acts independently of the bit and curb, at the pleasure of the rider.

BRIEF (a letter: *Dut.*; from *brevis*, short: *Lat.*), in Law, an abridgment of the client's case, made out for the instruction of counsel on a trial or hearing.——A letter from the sovereign to the archbishops, bishops, &c., authorizing collections of money at the church-doors, for the repair of churches, &c. Its use has lately been discontinued. ——BRIEFS, APOSTOLICAL, letters or written messages of the pope, addressed to princes or magistrates, respecting matters of public concern.

BRIGA'DE (*Fr.*), a party or division of soldiers, either horse or foot. A brigade of infantry may consist of from one to six battalions; of cavalry, of two or three regiments; of artillery, of six pieces of ordnance; and of horse artillery, of twelve troops, each having a brigade of guns; and a brigade of sappers, of eight men. The commander of a brigade is called a brigadier-general.

BRIG'ANDINE (because worn by *brigands*), a kind of ancient defensive armour, consisting of thin jointed scales or plates so arranged as to be pliant and easy to the body.

BRIG'ANTINE (*brigantino: Ital.*), a small light vessel, which can both row and sail well, being adapted either for fighting or for chase.

BRIM'STONE, the vulgar name for sulphur, which see.

BRINE, a solution of common salt. It is either native, as sea water or the water flowing from salt springs; or artificial, as when formed by the solution of salt in water.

BRI'SE-VENT (*briser*, to break; and *vent*, the wind: *Fr.*), in Horticulture, shelters on the north side of melon beds, where walls

BRIS'TLE (*bristl: Sax.*), the hair of swine, which is much used by brushmakers, particularly that imported from Russia.

BRITAN'NIA, the name given by the Romans to the island of Britain, which is represented on their medals under the figure of a female resting her left arm on a shield. The name being of uncertain derivation has given rise to much discussion.

BRI'ZA (*brizo*, I nod: *Gr.*), in Botany, a genus of grasses, including our common Quaking-grass.

BRIZE, in Agriculture, a term for ground that has lain long untilled.

BROAD'SIDE, a Sea term for a discharge of all the guns on one side of a ship. In Printing, one full page printed on one side of a whole sheet of paper, of which a large posting-bill is an example.—A proclamation, or other old composition, printed on one side of a sheet, and formerly hawked about the streets for sale. They are objects both of curiosity and historical interest.

BROAD'SWORD, a sword with a broad blade, chiefly designed for cutting.

BROCA'DE (*Fr.*), a stuff of gold, silver, or silk, raised and enriched with flowers, foliages, and other ornaments, according to the fancy of the merchants or manufacturers.

BROGUE, a peculiar accent and style of pronunciation. The word is generally applied to that of the lower orders in Ireland.

BROKER (*broceur: Fr.*), in Commerce and Law, an agent who negociates between sellers and buyers, and is paid by a commission or brokerage. He is not, like a factor, entrusted with the possession of the goods, and he is not authorized to buy or sell in his own name. [See FACTOR.]

BROME GRASS (*brōma*, food: *Gr.*), a

sort of grass much resembling oats in the stalk, leaf, &c.; whence it has also been called oat-grass. It belongs to the genus *Bromus*.

BRO'MINE (*brōmos*, a bad odour: *Gr.*), in Chemistry, a liquid element of an intense red colour. It is very volatile, and boils at 145½° F. Its specific gravity is 2·9. Its vapour is very suffocating and has an offensive odour. Like chlorine, which it resembles in most of its properties, its solution in water has bleaching properties. It is obtained from the bittern of sea water or the washings of the ashes of seaweed.

BRON'CHI (*bronchos*, the throat: *Gr.*), in Anatomy, the ramifications of the trachea or windpipe, which convey the air to the lungs.—— *Bronchial Glands*, absorbent glands situated at the root of the lungs.—— *Bronchial Arteries* and *Veins*, those which accompany the bronchiæ into the lungs.

BRON'CHOCELE (*bronchos*, the throat; and *kēlē*, a tumour: *Gr.*), in Surgery, a tumour occurring in the anterior part of the neck. [See GOITRE.]

BRONCHOT'OMY (*bronchos*, the throat; and *temno*, I cut: *Gr.*), in Surgery, an incision made in the windpipe; which is necessary in many cases, and especially in a violent quinsy, to prevent suffocation from the great inflammation or tumidity of the parts. It is also sometimes called *laryngotomy* and *tracheotomy*.

BRONZE (*bronzo*: *Ital.*), an alloy which, when intended for statues, is composed of 91½ per cent. of copper, 5¼ per cent. of zinc, and about 1½ per cent. of tin and lead. The ancients used bronze for a great variety of purposes; hence, arms and other instruments, medals and statues of this metal, are to be found in all cabinets of antiquities. The moderns have also made much use of bronze, particularly for statues exposed to accidents or the influence of the atmosphere, and for casts of celebrated antiques. Bronze of a good quality acquires, by oxidation, a fine green tint, called *patina antiqua*, or *ærugo*, which appearance is imitated by an artificial process called *bronzing*.

BROOM, the *Spartium scoparium* of botanists, a well-known leguminous shrub, from which a yellow dye is obtained.—— The *Butcher's Broom* is a small shrub with prickly leaves, named by botanists *Ruscus aculeatus*, nat. ord. *Liliaceæ*.

BROWN'ISTS, in Church History, a religious sect, which sprang up in England towards the end of the 16th century, and was long known under the denomination of *Independents*. Their leader was Robert Brown, born at Northampton; yet his name was not adopted by them, but rather given to them by their adversaries as a nickname. They equally disliked episcopacy and presbyterianism. They condemned the solemn celebration of marriages in churches, maintaining that, matrimony being a civil contract, the confirmation of it ought to proceed from the magistrate; an opinion rather in accordance with recent enactments of our legislature on this subject. They also rejected all forms of prayer, and held that the Lord's prayer was not to be recited as such, being given only as a model upon which to found our supplications. Any lay brother was allowed the liberty of exhorting the congregation, and, after the sermon, of reasoning upon the doctrines that had been preached. In a word, every church on their model is a body corporate, amenable to no class, synod, convocation, or other jurisdiction whatever. During Elizabeth's reign, the laws were enforced against the Brownists with great severity, and accordingly many retired and settled at Amsterdam, where their church flourished nearly a century.

BRU'MAL (*brumalis*, from *bruma*, the winter solstice: *Lat.*), relating to the winter quarter of the year, which begins at the shortest day.

BRY'ONY, BLACK. [See YAM.]

BRY'ONY, WILD. [See CUCURBITACEÆ.]

BUB'BLE (*bobbel*: *Dut.*), a vesicle of water, &c., filled with air.——BUBBLE, in Commerce, a term given to any delusive scheme or project for raising money on imaginary or false pretences; as the famous 'South Sea bubble,' which see.

BU'BO, a genus of owls, to which our eagle owl belongs.——BUBO (*boubōn*, a gland in the groin: *Gr.*), in Medicine, the name of any tumour in the lymphatic glands of the groin or axilla.

BU'BONOCELE (*boubōn*, a gland in the groin; and *kēlē*, a tumour: *Gr.*), in Medicine, the inguinal hernia, a rupture of the groin, formed by a prolapsus of the intestines or omentum.

BUCANI'ER, or BUCCANE'ER, a name applied to those piratical adventurers, chiefly English and French, who, in the seventeenth century, committed the most terrible depredations on the Spaniards in America. The first French settlers in the island of San Domingo had been taught by the Caribbee Indians how to cure the flesh of the wild cattle and boars they killed, and the preserved meat was called *boucan* by the Indians. Whence the French formed a verb *boucaner*, to dry without salt, and from this came the words Boucanier and Buccaneer.

BUC'CINA (*Lat.*), an ancient musical and military instrument, somewhat similar to the modern trumpet.

BUCCINA'TOR (a trumpeter, from the last: *Lat.*), in Anatomy, a muscle of the cheek, so called from its office of forcing out the breath.

BUC'CINUM (same *deriv.*), a genus of molluscs, to which the common whelk belongs.

BUC'CULA (*Lat.*, from *bucca*, the cheek), in Antiquity, that part of the helmet which protected the cheeks.

BUCEN'TAUR (*boukentauros*, a centaur: *Gr.*), the name of the large vessel which the Venetians formerly used in the ceremony of espousing the sea. This took place annually on Ascension Day. The Doge threw a gold ring into the Adriatic, saying, 'Desponsamus te, mare, in signum veri perpetuique domini.' We wed thee, O sea, as a token of true and everlasting dominion.

BU'CEROS (*bous*, an ox; and *keras*, a horn: *Gr.*), a genus of birds belonging to the order of *Passeres*. They are the horn-bills of the tropical parts of Asia and Africa, remark able for having a large horny appendage of a cellular structure, growing on the upper division of the beak. Its use is not known.

BUCK (*bucc: Sax.*), the male of the fallow-deer. In his first year, a buck is called a **fawn**; in the second, a pricket; the third, a sorel; the fourth, a sore; the fifth, a buck of the first head; and the sixth, a great buck. The word is also used to denote the male of the hare and rabbit tribes.

BUCK'LER, a piece of defensive armour used by the ancients, commonly composed of hides, strengthened with plates of metal. —— BUCKLERS, VOTIVE, were those consecrated to the gods, and hung up in their temples, in commemoration of some hero, or as a thanksgiving for a victory obtained over an enemy, whose bucklers taken in war were offered as a trophy. —— BUCKLERS, in Naval language, are pieces of wood fitted together to stop the hawse-holes, so as to prevent the ship from taking in too much water in a heavy sea.

BUCK'RAM (*bougran: Fr.*), a sort of coarse cloth made of hemp, gummed, calendered, and dyed of several colours. It is used in drapery, garments, &c., which require to be kept stiff to their form.

BUCK'WHEAT, the seeds of the *Fagopyrum esculentum*, a plant belonging to the nat. ord. *Polygonaceæ*, cultivated as food.

BUCOL'IC (*boukolikos*, pastoral: *Gr.*), in ancient Poetry, a poem relating to shepherds and rural affairs. The most celebrated of the ancient bucolics are those of Virgil.

BUDD'HISM, or **BOOD'HISM**, an ancient system of religion which originated in India, where it is now extinct, and whence it was carried to Ceylon, Thibet, China, and Japan. Its adherents at the present day have been calculated to amount to several hundred millions. The priority of Buddhism and Brahminism, which have many points of identity, has been much disputed. The founder of this religion was, according to tradition, the son of an Indian king. He is known by several names, such as Sakyasinha, the lion of the race of Sakya, and Buddha or the sage. In China, the latter name has been corrupted into Fo-ta and Fo. After Sakyasinha's death, and to fill his place, a succession of perfectly virtuous souls have descended upon earth, and assumed human forms, for the welfare of mankind; and it is believed in Thibet that the Grand Lama of Thibet is his successor for the time being. [See LAMAISM.] The sacred writings of the Buddhists are very numerous; they were originally composed in Sanskrit, from which they were afterwards translated into other tongues. It would seem that there was a belief in a primeval Deity named Adi-Buddha, or the First Buddha, and that he was the first person of the trinity, the other two persons being Dhurma and Sunga, answering to Brahma, Siva, and Vishnu, of the Brahmins. The trident borne by the priests is emblematical of this trinity. The principal tenets of Buddhism are, that the world and all it contains are manifestations of the Deity, but of a transient and delusive character; that the human soul is an emanation of the Deity, and, after death, will be bound to matter, and subjected to the miseries of life, unless the individual to whom it belongs, by the attainment of wisdom through prayer and contemplation, secures its reabsorption into the Deity. The authority of the Vedas, the sacred books of the Brahmins, is rejected, as well as the sacrifices, ceremonies, and other religious observances of the Hindoos. There is no distinction of caste, and the priests, who are not forbidden the use of animal food, are obtained from all classes. Monasteries and nunneries abound wherever Buddhism flourishes. The ceremonies have so many resemblances to those of the Roman Catholic church as to strike European spectators with surprise. Amongst the characteristics of Buddhist temples are the dagobas and the images of Buddha. The former are stone structures of a hemispherical or pyramidal form, supported on cylindrical pedestals. The images represent a human form standing, reclining, or sitting, with curly hair, and ears drawn downwards. Besides many other monuments of the ancient worship of Buddha, there are two particularly remarkable—the ruins of the gigantic temple Boro-Budor in Java, and the five large subterranean halls, called Pantah-Pandu, on the way from Guzerat to Malwa. Tradition ascribes these astonishing works of ancient Indian architecture and sculpture, which far surpass the skill of the modern Hindoos, to the Pandus, the heroes of Indian mythology. Buddhism was expelled from India by the persecutions of the Brahmins between the fifth and seventh centuries of our era.

BUD'DING, a method of propagating plants. A bud with a small portion of bark is neatly cut off and transferred to another tree, a slit being first made in the bark of the latter to receive the bud. It is then bound round with thread until the bud has grown to and become part of the tree. The branch springing from the bud will afford flowers and fruit similar to those of the tree from which it was taken.

BUDE LIGHT (*Bude*, in Cornwall, where the inventor resided). This name was given by Mr. Gurney to a light in which oxygen gas was passed into the flame, instead of common air, which greatly increased the brilliancy of the light: but the expense prevented this arrangement from being used commonly. What is now called the *Bude* light is a gas flame, with two, three, or more concentric burners, chimneys supplied with common air, and reflectors of peculiar construction.

BUD'GET (*bougette*, a bag: *Fr.*), the name given to the annual statement of the public finances made to the House of Commons.

BUF'FALO (*boubalos: Gr.*), in **Zoology**, the popular name for some animals of the ox tribe, belonging to the genus *Bubalus*. The common buffalo, *B. buffelus*, has been domesticated in India, where they are also wild. They are very strong animals, and have horns sometimes measuring six feet in length. The Cape buffalo, *B. caffer*, lives in large herds in South Africa. It is a powerful beast, but has not been domesticated. Buffaloes have the most violent antipathy to a red colour, and are most furious and vindictive: they are fond of standing in the water, and swim the broadest rivers without hesitation. [See BISON.]

BUF'FERS (*bouffer*, to puff out: *Fr.*), elastic cushions attached to railway carriages for the purpose of breaking the shock when one carriage is pushed against another. They are usually formed of strong springs of steel, or of vulcanized caoutchouc.

BUFFET' (*Fr.*), anciently a little apartment separated from the rest of the room by slender wooden columns, for the disposing of china, glass, &c.

BUF'FO (*Ital.*), a singer, or actor, who takes the humorous part in comic operas, &c.

BU'FONITES (*bufo*, a toad: *Lat.*), in Mineralogy, a sort of stone formerly said to be found in the head of a toad, and hence vulgarly called *toadstone*.

BUG (*bugg*, terror: *Goth.*), a troublesome and disgusting insect; the *Cimex lectularius* of naturalists.

BU'GLOSS (*bouglōssos*: from *bous*, an ox; and *glōssa*, the tongue: *Gr.*), the *Ox-tongue*. In Botany, a name given to plants belonging to several distinct genera of plants, as *Anchusa*, *Lycopsis*, and *Asperugo*.

BUL, in the ancient Hebrew chronology, the eighth month of the ecclesiastical, and the second of the civil year; it has since been called Marshevan, and answers to our October.

BUL-BUL, an Indian name for the nightingale, whose loves with the rose are celebrated in eastern poetry.

BULB (*bulbus*: *Lat*; *bolbos*: *Gr.*), in Botany, is a subterranean leaf-bud covered with scales, from the centre of which proceeds a stem with leaves. At the base of the bulb is a sort of disc, from which the roots issue. Bulbs are said to be *solid* when composed of one uniform lump of matter, as in the tulip; *tunicated*, when formed of a great number of coats surrounding one another, as in the onion; *squamose*, or *scaly*, when composed of smaller flakes, as in the lily; *duplicate*, when there are only two to each plant; and *aggregate*, when there is a congeries of such roots to each plant.

BULI'MIA, or BU'LIMY (*boulimia*, hunger: *Gr.*), a disease in which the patient is affected with an insatiable and perpetual appetite for food.

BU'LIMUS (same *deriv.*), a very large genus of land molluscs allied to the common snails. About 700 species (including subgenera) have been described, and some of the African species are of very large size. The young have shells in the egg.

BULK'HEADS, partitions made athwart a ship, by which one part is divided from another; as in the great cabin, gun-room, bread-room, &c.

BULL (*bulle*: *Dut.*), in Astronomy, the constellation *Taurus*.——Also, an edict or mandate issued by the Pope, and sealed with the bulla, a leaden or gold seal.

BUL'LA (a bubble: *Lat.*), in Antiquity, a small round ornament of gold or silver, in the shape of a heart, worn about the neck or breast of the children of the nobility till the age of seventeen when they assumed the toga, and hung up the bulla as an offering to the *Lares* or household gods.——In Zoology, a large genus of gasteropod molluscs with ventricose shells which the animals more or less invest. The gizzard is furnished with three calcareous plates by which the food is triturated.

BUL'LATE (*bullatus*, from last), in Botany, an epithet for a leaf having protuberances on its surface resembling blisters.

BUL'LETIN, an official account of public transactions or matters of general interest.

BULL'-FIGHT, an entertainment frequent in Spain and Portugal, at which wild bulls are encountered by men armed with lances.

BULL'FINCH, a well known songster of the Finch family, the *Pyrrhula vulgaris* of ornithologists. The wild bird does much injury during the spring to gooseberry bushes, cherry trees and plum trees, by devouring their flower buds. Bullfinches which have been taught to warble particular tunes are imported in large numbers from Germany.

BULL'-FROG, the *Rana pipiens* of North America, the largest species of the genus, so called because its voice resembles the distant lowing of an ox.

BUL'LION (*bulla*, an ornament of metal: *Lat.*) uncoined and unwrought gold or silver, of any degree of fineness.

BULL'S'-EYE, a mark in the centre of a target, in the shape of a bull's eye, at which archers, &c., shoot by way of exercise.——In Astronomy, *Aldebaran*, a star of the first magnitude in the constellation Taurus.——Among seamen, a small obscure cloud ruddy in the middle, generally the immediate forerunner of a great storm.——In Architecture, any small circular opening or window.

BUL'WARK (*bol*, the trunk of a tree; and *werk*, a work: *Goth.*), in Fortification, a mound of earth capable of resisting cannon-shot. It is now termed a *bastion*.——The rails, &c., used to prevent persons from falling from the deck of a ship into the sea.

BUM'-BOAT, a sort of wherry used about harbours to carry provisions, &c., for sale to ships lying at a distance.

BUN'GALOW (*Ind.*), a house of one story with a thatched roof, such as is common in India.

BUNT (supposed to be a corruption of *bent*), in Nautical language, the middle part of a sail, formed into a sort of bag or hollow, that it may gather more wind.

BUN'TINE, or BUNT'ING, the thin woollen stuff of which the colours, or flags, and signals of ships are made.

BUN'TING (*buntinawg*, fat rump: *Wel.*), the appellation of several closely-allied birds, of which the Common Bunting, *Emberiza miliaria*, and the Yellow Bunting or Yellow-hammer, *E. citrinella*, may be taken as examples.

BUNT'LINES, small ropes fastened to cringles, which serve to force up the bunt of the sail for the better furling of it.

BUOY (*bouée*: *Fr.*), a short piece of wood or close-hooped barrel fastened by a rope to the anchor, to point out its situation.—— Also, conical vessels, generally of large dimensions and showily painted, that they may be seen at a distance, serving to mark out the course a ship is to follow in leaving a harbour, &c. Sometimes bells are attached to them, which ring by their motion, and denote their proximity in foggy weather.—— A LIFE-BUOY is intended to keep a person afloat till he can be taken from the water. It should be suspended from the stern of the ship, and let go as soon as anybody falls overboard, and a light may be attached to it which is kindled by its fall, if the accident happens by night. It usually consists of two hollow copper vessels connected together, and of buoyancy sufficient to support one man leaning upon them.

BU'PHAGA (*bous*, an ox; and *phago* I eat: *Gr.*), in Ornithology, a genus of South African birds allied to the Starlings. The species are termed Beef-eaters, or Cattle-pickers, from their settling upon the backs of oxen and other ruminants, to peck out with their beaks the maggots of bot flies deposited under the hide.

BUPRES'TIS (*bouprēstis: from bous*, an ox; and *pretho*, I swell out: *Gr.*), in Entomology, a genus of beetles belonging to a large family, the species of which are remarkable for the brilliant colours and metallic lustre of their wing cases. These are frequently employed in the decoration of ladies' dresses.

BUR'DEN, the contents of a ship, or the number of tons which a vessel will carry.—— BURDEN (*bourdon*, the drone of a musical instrument: *Fr.*), in Music, that part of a song which is repeated at every verse or stanza.

BUREAU' (an office: *Fr.*), in its primary sense, was a cloth covering a table; next a writing-table; and afterwards the chamber of an officer of government, and the body of subordinates who labour under his direction.

BUR'GAGE (*burgh*, a borough; from *beorg*: *Sax.*), an ancient tenure in boroughs by which the inhabitants hold their lands, &c. of the king, or other lord of the borough, at a certain yearly rent. There are also peculiarities as to descent. A dwelling-house in a borough was also formerly called a burgage.

BUR'GESS (*bourgeois: Fr.*), an inhabitant of a borough, or one who possesses a tenement within it. Also the representative of a borough in parliament. Also, the person who has the right to vote on the election of municipal officers.

BUR'GLARY (*burgi latrocinium*, robbery of a burgh: *Lat.*), in Law, the breaking and entering the dwelling of another in the night, with the intent to commit some felony. The like offence committed by day is called house-breaking.

BUR'GOMASTER, the chief magistrate of towns in Holland and Germany.

BU'RIN (*Fr.*), an instrument of tempered steel used for engraving on copper, &c. One end is ground off obliquely so as to produce a point, and the other is inserted in a short wooden handle.

BURLET'TA (*burlare*, to jest: *Ital.*), a light, comic species of musical drama.

BURN'ING. [See COMBUSTION.]

BURN'ING-GLASS, a convex lens which collects and concentrates to a focus the rays of heat that fall upon it from the sun; so that a piece of wood, or other body easily inflammable, is kindled when held in the focus.—— BURNING MIRRORS, or *specula*, are concave surfaces, which reflect the rays of heat to a focus. Among the ancients, the burning mirrors of Archimedes and Proclus are famous. By the former, the Roman navy was set on fire and consumed, at the distance of a bow-shot; and by the latter, according to Zonaras, the navy of Vitellius, while besieging Byzantium, was burnt to ashes. By means of a mirror made by Villette, a French artist of Lyons, a sixpence was melted in seven seconds and a half, and a halfpenny in sixteen seconds. This mirror was 47 inches wide, and ground to a spherical surface of 76 inches radius, so that its focus was about 38 inches from the vertex. Its substance was a composition of tin, copper, and bismuth.

BUR'REL-SHOT (*bourreller*, to torture: *Fr.*), small shot, nails, pieces of old iron, &c., put into cases, to be discharged out of ordnance.

BUR'SÆ MUCO'SÆ (mucous pouches, *Mod. Lat.*), in Anatomy, bags which secrete a mucous fat that serves to lubricate tendons, muscles, and bones, in order to render their motion easy.

BURR'-STONE, the hard tough stone of which the grinding stones of flour mills are made, cut out of some igneous rock. Millstones from the trachyte of the Eifel district on the Rhine are exported to many countries.

BUR'SAR (*bursa*, a purse: *Mod. Lat.*), in the English Universities, the treasurer of a college; in the Scotch Universities, a student whose success in his studies has gained for him a pension.

BUSH'-HARROW, an implement of husbandry for harrowing grass lands and covering grass or clover seeds. It consists of a frame with three or more bars, in which bushes are interwoven.

BUSH'MEN, or BOSJESMEN, a savage tribe living in South Africa, in the neighbourhood of the English settlements. They are more wild and ferocious than either the Caffres or Hottentots.

BUS'KIN, a kind of high shoe, anciently worn by tragedians; also a sort of leather stocking serving the purpose of a boot.

BUST, or BUS'TO (*Ital.*), in Sculpture, a figure or portrait showing only the head and shoulders, the arms being absent.

BUS'TARD, a name given to some birds belonging to the genus *Otis*, placed amongst the *Grallæ* or Waders. They are heavy birds, without much power of flight, and swift runners. The Great Bustard seems to have become extinct in England. The Little Bustard is occasionally a winter visitor.

BUTCH'ER-BIRDS, a species of LANIUS, which see.

BUT'TER (*bouturon: from bous*, a cow; and *turos*, cheese: *Gr.*), a fat unctuous substance, procured from the cream of milk by churning. This kind of oil, in its natural condition, is distributed through all the substance of the milk in very small particles, which are interposed between the caseous and serous parts, among which it is suspended by a slight adherence, but without being dissolved. Being in the same state as oil in emulsions, it causes the milk to be white; and separating by rest, it ascends to the surface, and forms a cream. It was only at a late period that the Greeks appear to have had any notion of butter; their poets make no mention of it, and yet they frequently speak of milk and cheese. The Romans used butter only as a medicine, never as a nutriment.——BUTTER, a name given in old books of chemistry to several metallic chlorides, on account of their appearance when newly prepared. Hence there are the butters of *antimony*, *arsenic*, &c.

BUT'TERCUP, the common name of some wild species of *Ranunculus*.

BUT'TERFLIES, a well-known tribe of lepidopterous insects, distinguished from moths by having the antennæ clubbed at the end, carrying the wings upright when in a state of repose, and being destitute of any apparatus to connect them during flight. [See LEPIDOPTERA.]

BUT'TER-TREE, a tree found by Mungo Park, in the interior of Africa, yielding from its kernels, by pressure, a white, firm, rich butter. The tree is supposed to have been some species of Bassia, nat. ord. *Sapotaceæ*, an order containing other trees with oily fruits.

BUT'TER-WORT, an English plant with purple flowers, growing in bogs, and belonging to the genus *Pinguicula*, nat. ord. *Lentibulariaceæ*.

BUT'TOCK (*aboutir*, to join end: *Fr.*) of a ship, is that part which is right astern, from the tack upwards; and a ship is said to have a broad or a narrow buttock, according as she is built broad or narrow at the transom

BUX'US (*Lat.*, from *puxos*: *Gr.*), a genus of evergreen shrubs belonging to the nat. ord. *Euphorbiaceæ*. One species, the common boxtree, is much used for the borders of flower-beds. Boxwood is extremely hard and smooth, and therefore capable of being wrought with great neatness by the turner. It is used for the same reason by engravers on wood.

BUZE, a wooden or leaden pipe to convey the air into mines.

BUZ'ZARD (*buse*: *Fr.*), a rapacious but sluggish bird of the Falcon tribe, the *Falco buteo* of naturalists.

BY'-LAWS, or BY'E-LAWS, private and peculiar laws for the good government of a city, court, or other community, made by the general consent of the members. All bye-laws are to be reasonable, and for the common benefit, not private advantage of any particular person; and they must be consistent with the public laws in force.

BYS'SOLITE (*bussos*, flax; and *lithos*, a stone: *Gr.*), a scarce mineral from the Alps, occurring in very delicate filaments, short, flexible, and elastic. The colour is olive-green, and the lustre rather silky.

BYS'SUS (*bussos*, flax: *Gr.*), a fine linen among the ancients, procured from India. Also that Egyptian linen, of which the tunics of Jewish priests were made.——BYSSUS, the fibrous matter by which some shell-bearing molluscs attach themselves to rocks and stones under water. The silky fibres of the byssus of the *Pinna*, a bivalve which grows to a large size, are made into gloves, and other articles of dress, in the island of Sardinia.

BYZAN'TINE, a gold coin of the value of 15*l.*, so called from being coined at Byzantium. Also an epithet for anything pertaining to Byzantium, an ancient city of Thrace, situated on the Bosphorus, nearly in the place where Constantinople now stands. Also a style of ARCHITECTURE.

C

C, the third letter, and second consonant of the alphabet, is pronounced like *k* before the vowels *a*, *o*, and *u*, and like *s* before *e*, *i*, and *y*. Before *h* it has a peculiar sound, as in chance, chalk; in chord and some other words, it is hard like *k*; but in many French words it is soft before *h*, like *s*, as in chaise, chagrin, &c. As a numeral, C stands for 100, and CC for 200, &c.; as an abbreviation, it stands for Christ, as A.C. or B.C., *Ante Christum*, or Before Christ. Also, in ancient authors, for Caius, Cæsar, consul, civitas, &c. For Civil, as D.C.L. *Doctor of Civil Law*; for Companion, as C.B. *Companion of the Bath*; for Cross, as G.C.B. *Grand Cross of the Bath*; for Commander, as K.C.B. *Knight Commander of the Bath*; for Company as E.I.C. *East India Company*. It was a symbol of condemnation in the Roman tribunals, as an abbreviation for *condemno*; being, on this account, called *litera tristis*, or a sorrowful letter, in opposition to *A*, for *absolvo*, a *litera salutaris*, or advantageous letter.——In Music, C after the clef is the mark of common time.

CAA'BA, or CAA'BAH (a square stone: *Arab.*), properly signifies the stone in the temple of Mecca, greatly reverenced by the Mahometans, as having been presented to the patriarch Abraham by the angel Gabriel. It is used also to indicate the edifice in which this stone is placed. The Mahometans always turn their faces towards this building when they pray, in whatever part of the world they happen to be. It enjoys the privilege of an asylum for all sorts of criminals; but is most remarkable for the pilgrimages made to it by the devout Mussulmans, who pay so great a veneration to it, that they believe a single sight of its sacred walls, without any particular act of devotion, is as meritorious, in the sight of God, as the most careful discharge of one's duty, for the space of a whole year, in any other temple.

CABAL', denotes a number of persons united in some close design, and is sometimes used synonymously with *faction*. This term was applied to the ministry of Charles II., from the initial letters of their respective names, viz., Clifford, Ashley, Buckingham, Arlington, and Lauderdale.

CAB'ALA, a mysterious kind of science pretended to have been delivered by revelation to the ancient Jews, and transmitted by oral tradition to those of our times; serving for the interpretation of the books both of nature and Scripture. It was of oriental origin, the work of Alexandrian Jews not long after the Christian era. It was alleged to have been divinely communicated to Esdras. It treated of the nature of the Deity, and of the various orders of spirits that had emanated from Him in long succession. For some centuries it fell into neglect, but was again studied in the middle ages. In the 15th century, the famous Picus of Mirandola was an enthusiastic disciple of it.

CAB'ALLINE (*caballus*, a horse: *Lat.*), pertaining to a horse; as, *caballine* aloes, so called from its being a medicine given to horses.

CAB'BAGE PALM. In the West Indies the *Areca oleracea* is known under this name, because its large terminal bud is eaten. Many other palms in different places also yield an eatable 'cabbage,' for instance, the *Euterpe edulis*, in Southern Brazil, a tall graceful tree, 40 or 50 feet high, with a stem so slender that it may be grasped by the two hands. The tree dies when the 'cabbage' is removed.

CAB'INET (*Fr.*), a place set apart for writing, studying, or preserving anything that is precious. Hence we say a cabinet of paintings, curiosities, &c.——Also, the closet or private room in the royal palace, where councils are held. Also, a certain number of the higher ministers of state who determine the measures and action of the government. These ministers are the First Lord of the Treasury, the Lord Chancellor, the President of the Council, the Lord Privy Seal, the Chancellor of the Exchequer, the five Secretaries of State for the Home, Foreign, Colonial, War, and Indian Departments, the First Lord of the Admiralty, the President of the Board of Trade, the Postmaster-General, the President of the Poor Law Board, and the Chancellor of the Duchy of Lancaster.

CABI'RI, deities greatly venerated by the ancient Pagans in Greece and Phœnicia, and supposed to preside over metals. Their nature and origin are involved in great obscurity.

CA'BLE, a large strong rope or chain, used to retain a vessel at anchor. An iron cable is not liable to be chafed on rocky ground, or to become rotten in moisture. A chain whose section is one inch breaks with sixteen tons pressure; and it is nearly equivalent to a hemp cable ten inches in diameter.

CABO'CHED, or CABO'SSE (*caboche: Old Fr.;* from *caput*, the head: *Lat.*), in Heraldry, having the head cut close, so as to have no neck left.

CABOO'SE, the cook-room or kitchen of a ship. It also signifies the box that covers the chimney of a ship.

CACA'DE (*kakos*, bad: *Gr.*), a French term for an unlucky enterprise in war, which has been ill concerted and ill conducted.

CACAO. [See COCOA.]

CACH'ALOT, the Physeter, or spermaceti whale.

CACHE'XIA (*Gr.*: from *kakos*, bad; and *hexis*, a habit), in Medicine, a bad state or habit of body.

CACH'OLONG (*Cach*, a river in Bulgaria; and *cholong*, a stone: *Calm.*), a milk-white chalcedony found on the borders of the river *Cach*.

CACOCHY'LIA (*kakos*, bad; and *chulos*, chyle: *Gr.*), in Medicine, a bad chylification, when the humour called chyle is not duly made.

CACO'CHYMY (*kakos*, bad; and *chumos*, juice: *Gr.*), a vicious state of the vital humours, especially of the blood, arising from a disorder of the secretions or excretions, or from contagion.

CACOE'THES (*Gr.: from kakos*, bad; and *ethos*, a characteristic disposition), an ill habit or propensity; as the *cacoethes scribendi*, an itch for authorship.

CACOPH'ONY (*kakos* bad; and *phōnē*, a sound: *Gr.*), in Rhetoric, an uncouth, bad tone of the voice, proceeding from the ill disposition of the organs; but more generally the term is applied to a harsh or disagreeable effect, produced by the too frequent repetition of the same letters, or the meeting of two or more monosyllables.

CACOT'ROPHY (*kakotrophia:* from *kakos*, bad; and *trophē*, food: *Gr.*), in Medicine, any sort of vicious nutrition.

CACTA'CEÆ, a nat. ord. of plants, all natives of America, and chiefly found in hot and dry places within the tropics. Many species are cultivated in our hothouses, and are well known for their bizarre shapes. Most of them are thickly set with spines. Several give beautiful flowers, the night-blowing Cereus for example; and some yield an edible fruit, called the Indian fig or prickly pear. Some are long, cylindrical, and undulating like a snake; others are spherical like a sea-urchin. Specimens of the latter shape have been known to measure between 6 and 7 feet in circumference. The cochineal insect feeds upon species of cacti, some of which have become naturalised in the south of Europe.

CAC'TUS (*kaktos*, a thorny plant: *Gr.*), the name of an American genus of plants, see the last article.

CADAS'TRAL (*cadrer*, to square: *Fr.*), a term applied to the measurement and mapping of a country on a uniform scale. The cadastral survey of Great Britain is to be on the scale of 25 inches to the mile. The ordnance survey of England and Wales, already executed, is on the scale of 1 inch to the mile.

CAD'DIS, or **CAD'DICE** (*kados*, a cask: *Gr.*), the worm-like larvæ of several species of four-winged flies, of the genus Phryganea (order *Trichoptera*), which haunt marshy places. The larvæ form cases, open at each end, of gravel, &c., in which they reside, immersed in water. Caddis worms are used as bait by anglers.

CA'DENCE (*cadenza: Ital.*), in Grammar, the fall of the voice; also the flow of verses or periods.—In Dancing, the term is used when the steps follow the notes and measures of the music.—In Horsemanship, the cadence is the measure or proportion observed by a horse in all his motions.—In Music, it is a pause or suspension at the end of an air, or at the termination of a proper chord.

CADET' (a younger brother: *Fr.*), one who is trained up for the army by a course of military discipline, such as that enforced at the military colleges of Woolwich, Addiscombe, &c.—CADETSHIP, the commission which was given to a cadet to enter the East India Company's service.

CA'DI, a civil judge or magistrate in the Turkish empire.

CAD'MIUM (*kadmia*, calamine, an ore of zinc: *Gr.*), a ductile and malleable white metal, which is like tin, but fuses and volatilizes at a lower temperature than that at which tin melts. Its specific gravity is 8·7. Its ores are associated with those of zinc. Cadmium is too scarce to be used generally in the arts, but it has been employed as a pigment.

CADU'CEUS (*Lat.*), the wand or sceptre of Mercury, being a rod entwined with two serpents, and tipped with wings; borne by that deity as the ensign of his office. Used on medals, &c., it is an emblem of peace; and it was carried by the Roman heralds when they went to proclaim peace. The rod signified power; the serpents, wisdom; and the wings, diligence and activity.

CADU'COUS (*caducus*, inclined to fall; from *cado*, I fall: *Lat.*), in Botany, denotes what is temporary and soon disappears or falls off.

CÆ'SAR, in Roman Antiquity, the family name of the first five Roman emperors, and afterwards adopted as a title by their successors. It was also used, by way of distinction, for the intended or presumptive heir of the empire. It was superseded in the eastern empire by the title of *Sebastocraton* (*sebastos*, venerable; and *kratos*, power; *Gr.*). The *Kaiser* of the Germans, and *Czar* of the Russians, are probably both corruptions of the word.

CÆSA'REAN OPERA'TION, the extraction of a child from the womb by an incision made for that purpose. Julius Cæsar is said to have been brought into the world in this way; and hence the term.

CÆSU'RA (*Lat.*, from *cædo*, I cut), a figure in Ancient Prosody by which a division or separation takes place in a foot that is composed of syllables belonging to different words. Also, in Modern Prosody, the pause which the voice makes in pronouncing a verse of many syllables. Thus, in the first line of the following couplet from Pope's 'Essay on Man,' the cæsura is between the fourth and fifth syllables whilst in the second line it is between the fifth and sixth:—

Lives thro' all life, extends thro' all extent,
Spreads undivided, operates unspent.

CÆ'TERIS PA'RIBUS (all things else being equal: *Lat.*), a term often used by mathematical and physical writers. Thus of a bullet it may be said '*cæteris paribus*, the heavier it is the shorter the range:'—that is, supposing the length and diameter of the piece and the quantity and strength of the powder to be the same.

CAFFERS, or **KAFIRS**, one of the savage races living in the southern part of Africa. The name is derived from the Arabic, and signifies infidel. The men are tall and well made, with clear dark-brown complexions and woolly hair. They are unsettled in their habits, and have frequently given much trouble to the English and Dutch colonists.

CA'GOTS (*Fr.*), a degraded race of uncertain origin, who were held accursed by their neighbours in the south of France. It is said they had a particular place set apart for them in the churches, with a separate entrance door.

CAINO'ZOIC (*kainos*, recent; *zoe*, life: *Gr.*), in Geology, a term applied to the tertiary series of strata, because the embedded organic remains are closely analogous to existing species.

CAIRNS, heaps of stones in a conical form, which are frequently to be met with in Scotland and Wales. They were intended as memorials or tombs, and differ from *barrows*, which were heaps of earth; but their object was probably the same.

CA'ISSON, or **CAISSOO'N** (*Fr.*), a wooden chest filled with bombs or powder, and laid in the way of an enemy, or buried under some work to blow it up. Also, the frame used in laying the foundations of a bridge. Also, a structure of wood or iron employed instead of gates to close the entry to a dock.

CA'JEPUT OIL, a stimulant oil distilled from the leaves of *Melaleuca cajeputi*, a tree belonging to the nat. ord. *Myrtaceæ*, growing at the Moluccas. It is a powerful sudorific, and is applied externally in chronic rheumatism.

CALABAR BEAN, the seed of a leguminous plant (*Physostigma venenosum*), growing on the west coast of Africa. It is a poison, and is used by the native chiefs as an ordeal to determine the guilt or innocence of suspected persons. It has been found that the extract of the bean possesses extraordinary power over the iris. A small quantity of the solution dropped into the eye causes contraction of the pupil to such an extent that the aperture becomes closed. Hence it is coming into use in the treatment of ophthalmic cases. Belladonna has the opposite effect, in causing such a dilatation of the pupil that the iris is scarcely visible.

CAL'ABASH-TREE (*calabacca*, a calabash: *Span.*), the *Crescentia cujete* of botanists, the gourd-like fruit of which is enclosed in a hard shell that serves the natives of the tropical parts of America for a drinking cup, a pot for boiling, and for various other domestic purposes.

CALAMAN'CO (*calamancus*, a hat: *Mod. Lat.*), a fine sort of woollen stuff, of a rich gloss, and chequered in the warp, so that the checks are seen only upon one side.

CALAMA'RY, or SQUID, common names for a section of cuttlefishes, having elongated bodies with short broad fins, and a horny internal pen or shell. The common calamary is the *Loligo vulgaris* of naturalists.

CALAMIF'EROUS (*kalamos*, a reed; and *phero*, I bear: *Gr.*), a Botanic term for plants having a long, hollow, knotted stem.

CAL'AMINE, or LAPIS CALAMINARIS, native carbonate of zinc: a name formerly given to the ore of zinc, used in making brass.

CAL'AMUS (*kalamos*, a reed: *Gr.*), a reed used anciently as a pen to write on parchment or papyrus.——The generic name of some Indian palms, including the dragon's blood calamus, and the rotang.——Also, a kind of reed, or sweet-scented cane, used by the Jews as a perfume.

CAL'ATHUS, in Antiquity, a basket or hamper, made of osiers or reeds, used to put needle-work in, or to hold flowers. The calathus was also a pan for cheese-curds and milk, and a cup for wine used in sacrifices.

CAL'CAR (*calcariæ*, a lime-kiln; from *calx*, lime: *Lat.*), a kind of furnace, used in glass works for the calcination of sand and potash.

CALCA'REOUS (*calcarius*, from *calx*, lime: *Lat.*), a term applied to anything composed of lime.

CALCA'REOUS SPAR (same *deriv.*), crystallized native carbonate of lime.

CAL'CEUS (*Lat.*, from *calx*, the heel), in Antiquity, a shoe or boot. The shoes were frequently open in front, leaving the toes bare. In the time of the Emperors, senators wore high shoes like buskins, fastened with four black thongs in front, and ornamented with a crescent.

CALCIF'EROUS (*calx*, lime: and *fero*, I bear: *Lat.*), having lime.

CALCINA'TION (*calx*, lime: *Lat.*), the process of the reduction of bodies to a pulverisable state by the action of fire, in the same way as lime is produced from limestone.

CAL'CIUM (*calx*, lime: *Lat.*), the metallic basis of lime. It is solid, rather yellowish, highly lustrous, but tarnishes quickly in the air. In contact with cold water it decomposes rapidly, and hydrogen is evolved. Heated to redness in the air, it burns and sends off sparks, but does not inflame. It is moderately hard, malleable and ductile, and has a specific gravity of 1·58. It is obtainable by the electrolysis of chloride of calcium.

CALCOG'RAPHY (*calx*, lime: *Lat.*; and *grapho*, I write: *Gr.*), an engraving after the manner of a drawing in chalk.

CALC-SINTER (*kalk*, lime; and *sintern*, to drop: *Germ.*), incrustations of carbonate of lime; also, the stalactites attached to the roofs of caverns.

CALC-TUFF, a deposit of carbonate of lime by water holding it in solution.

CAL'CULARY (*calculus*, a pebble: *Lat.*), a congeries of stony secretions found in the pulp of a pear and other fruits.

CAL'CULATING MACHINES. Mathematical calculations, both simple and complicated, enter so largely into the common concerns of life, that any machine capable of facilitating them must be considered of deep importance. The earliest contrivance of this kind was the *abacus*, which see. Within the last hundred years, several of great ingenuity have been devised, which were capable of performing simple operations. Their principle may be understood by supposing some number of wheels, each having a dial with ten numbered divisions and an index, and driving one another by pinions, so arranged that ten revolutions of one shall produce one revolution of that which it drives. Such a machine will represent the *decimal* system, and will indicate, without the possibility of error, the total number of impulses, each of which is expressed by one division of the first dial. This is the principle on which the gas meter registers the revolutions of its revolving part. It is the principle, also, of many contrivances for recording the number of strokes made by steam-engines in a given time, the number of persons passing over bridges at which toll is paid, &c. A very few wheels suffice to register enormous numbers. It is clear that such a train of wheels may be made to represent any system as well as the decimal. Pascal constructed a machine suited to the currency used in his time in Upper Normandy. These contrivances were not, however, calculated to supply a want most seriously felt — the production of arithmetical and other tables rigorously correct. From the imperfection of the human mind, and the impossibility of keeping the attention invariably fixed on any one object, errors must creep into such tables, and these errors must be highly inconvenient if connected with navigation, &c. The process of multiplication is not very complicated; yet, in an extensive table prepared by Dr. Hutton for the Board of Longitude, forty errors were detected in a single page, taken at random. These considerations led Mr. Babbage, nearly forty years ago, to make a machine which should construct tables of an important kind without the chance of error. It would be impossible to give any idea of his ingenuity and labours here. Government made grants at various times to meet the expenses of the mechanical processes required; but no recompense has been accepted by Mr. Babbage for his mental exertions. Considerable progress was made in what he called a 'difference engine,' but after about 17,000*l.* had been expended, and several years had been spent in the experiment, it was abandoned. The incomplete machine has been placed in the museum of King's College, London. Mr. Babbage has since invented a still more powerful machine, which he calls an 'analytical engine,' but it has never been constructed Meantime, a calculating machine has been a work for some years in the office of the Registrar-General, London. This was designed by Messrs. Scheutz of Stockholm, and has been found of great use. It not only calculates tables but prints them.

CALCULA'TION (*calculatio*, from *calculus*, a pebble: *Lat.*), the art of computing, deriving its name from the methods anciently used to facilitate calculations. [See ABACUS.]

CAL'CULUS (a pebble: *Lat.*), a name generally given to hard abnormal concretions, not bony, which are formed in the bodies of animals. *Biliary calculi* are those found in the gall bladder; *urinary calculi*, those found in the urinary bladder. The disease of calculus in the bladder is called *lithiasis*; in the kidneys, *nephritis*.——In Mathematics, the term *calculus*, taken in its widest sense, extends from the simplest numerical operations to the highest combinations of the transcendental analysis. Leaving out of view the simple processes of numerical computation the object of the calculus may be said to be the discovery of unknown quantities from known quantities.

CALEFA'CIENTS (*calefacio*, I make warm: *Lat.*), in Medicine such preparations as have a tendency to stimulate the action of the blood.

CAL'ENDAR (*calendæ*, the first of the month, from *calo*, I call: *Lat.*), a register of time, divided into months, weeks, and days throughout the year; together with an account of such matters as serve for the daily purposes of life. The Roman and Julian calendars were in use among the Romans; the Gregorian and reformed have been adopted by the moderns. [See STYLE.] The calendar received its name from its being the custom, in the early ages of Rome, for the pontiffs to call the people together on the first day of the month (the *calendæ*), to inform them what days in it were to be kept sacred.

CAL'ENDER (*caleo*, I am warm: *Lat.*), the process being literally a *hot-pressing*), a machine used in manufactories, to press stuffs, silks, linens, &c., to give them a fine gloss and wavy appearance. It consists of two thick rollers or cylinders, revolving so nearly in contact with each other that cloth passed through between them is not only smoothed, but glazed by their powerful pressure.

CALEN'DULA, a genus of plants of the nat. order *Compositæ*, including the common marigold.

CAL'ENTURE (*caleo*, I am warm: *Lat.*), a violent fever, incident to sailors in hot climates; the principal symptom of which is their desire to rush into the sea, which it is said, they imagine to be a green field.

CAL'IBER COM'PASSES, a particular instrument used by gunners for measuring the diameter of shot, shells, &c. They resemble other compasses, except in their legs, which are arched, so that the points may touch the extremities of the arch.

CAL'ICO, cloth made of cotton. It is called *calico*, because originally brought from *Calicut*, a kingdom of India on this side of the Ganges, on the coast of Malabar. Cotton cloths, whether plain, printed, dyed, stained, or painted, chintz, or muslins, are all included under this one general denomination.

CAL'ICO-PRINTING, the art of impressing cotton cloth with coloured patterns. It has been for many centuries practised by the oriental methods in Asia and the Levant, but it was unknown in this country till the end of the 17th century. The patterns are printed from revolving cylinders. Of late years great improvements have been made, especially in the chemical part of the art. Whilst silk and wool have a strong affinity for colours, cotton will not retain soluble colours without the aid of MORDANTS, which render the colours insoluble and thereby permanent. By varying the mordants, many changes of colour may be obtained from the same dye-stuff.

CAL'IGA (*Lat.*, from *calx*, the heel), in Antiquity, a heavy shoe worn by the Roman soldiers. *Caligæ* were sometimes adorned with gold and silver nails. The *caligula* was a smaller kind of military boot, from wearing which the emperor Caligula derived his name.

CA'LIN, a compound of lead and tin, of which the Chinese make tea-canisters, &c.

CA'LIPH (*khalifah*, a deputy: *Arab.*), the chief sacerdotal dignitary among the Saracens or Mahometans, vested with absolute authority in all matters relating both to religion and politics. It is at this day one of the Grand Seignior's titles, as successor of the Prophet [see SULTAN]; and of the Sophi of Persia, as successor of Ali. The government of the original caliphs continued from the death of Mahomet till the 655th year of the hegira, that is, from A.D. 632 to 1277.

CALK'ING, or CAULK'ING, the driving oakum, or old ropes untwisted, into the seams of a ship, to prevent their leaking or admitting water; after which they are covered with melted pitch or resin.——In Painting, the covering of the back side of a design with red chalk, and tracing lines through on a waxed plate or wall, so as to leave an impression of the colour there.

CALK'INS, in Farriery, the prominent parts at the extremities of a horse-shoe, bent downwards, and forged to a sort of point.

CALL OF THE HOUSE, a parliamentary term implying an imperative call or summons, sent to every member on some particular occasion.

CALLION'YMUS (*kalos*, beautiful; and *onoma*, a name: *Gr.*), a genus of spiny finned fishes, including the dragonet of our coasts.

CALLISTEI'A, in Grecian Antiquity, a Lesbian festival, at which the women presented themselves in the temple of Juno, in order that the prize might be assigned to the fairest. There was a similar festival of Ceres Eleusinia among the Parrhasians; and another among the Eleans, where the most beautiful man was presented with a complete suit of armour, which he consecrated to Minerva.

CALLO'SUM COR'PUS (the callous body: *Lat.*), in Anatomy, a medullary prominence in the brain, seen on separating the two lateral parts of the cerebrum. Its fibrous structure extends into the two hemispheres, and unites them organically together.

CAL'LUS (a hard thick skin: *Lat.*), the new growth of osseous matter between the extremities of fractured bones; or any dense, insensible knob or horny substance on the skin.

CA'LOMEL (*kalos*, beautiful; and *melas*, black: *Gr.*), a heavy white tasteless powder, the sub-chloride of mercury, prepared by heating a mixture of metallic mercury with corrosive sublimate (the protochloride of mercury). Calomel sublimes as a vapour. The name is an old one, and the reason of applying it to a white powder is not known.

CALOR'IC (*calor*, heat: *Lat.*), the old name of the principle of heat, as distinct from the sensation, when it was considered to be matter.

CALORIM'ETER (*calor*, heat: *Lat.*; and *metron*, a measure: *Gr.*), an instrument for measuring the heat given out by a body in cooling.

CALORIMO'TOR (*calor*, heat; and *motor*, a mover: *Lat.*), a galvanic instrument, in which the calorific effects are attended by scarcely any electrical power.

CALO'TE (*calotte*: *Fr.*), a sort of skull-cap worn by the French cavalry under their caps, as a guard against the blows of a sabre.

CAL'OTYPE (*kalos*, beautiful; and *tupos*, a sketch: *Gr.*), a process for obtaining photogenic drawings on paper by the action of light upon certain salts of silver. This process is also called *Talbotype*. [See PHOTOGRAPHY.]

CAL'TROPS. [See CROW'S FEET.]

CAL'UMET, a symbolical instrument of great importance among the Indians of America. It is a smoking pipe, the bowl of which is generally made of a soft red marble, and the tube of a very long reed, ornamented with feathers. This instrument, the use of which bears a great resemblance to the caduceus of the Greeks, is a pledge of peace and good faith. The calumet of war, differently made, is used to proclaim war.

CAL'VINISM, in Theology, the tenets of John Calvin, who, in the 16th century, flourished at Geneva, where his doctrines still subsist; they relate both to doctrine and discipline. The doctrinal parts of this system differ from that of other reformers of Calvin's period, chiefly in what regards the absolute decrees of God, by which, according to this teacher, the future and eternal condition of the human race was predetermined: in other words, Calvin denied the free agency of man, and maintained predestination. The discipline established by Calvin rejected episcopacy, and has been adopted by the Presbyterians of France, &c.

CALX (lime: *Lat.*), a name given by the alchemists to the remains of metals, minerals, &c., after they have undergone the action of fire, and have lost all their humid parts. On account of the combined oxygen, metallic calxes are heavier than the metal from which they are produced.

CALYCIFLORÆ (*calyx*, a flower cup; and *flos*, a flower: *Lat.*), a sub-class of dicotyledonous plants, having a calyx with the stamens attached to them, and a corolla of several distinct petals. Leguminous plants belong to this sub-class.

CALY'CIFORM (*calyx*, a flower cup; and *forma*, a shape: *Lat.*), in Botany, an epithet for the involucrum, when it has the appearance of a calyx.

CAL'YCLE (*kalukion*, a *dim.* of *kalux*, a flower-cup: *Gr.*), in Botany, a row of leaflets, at the base of the calyx on the outside.

CALYP'TRA (*kaluptra*, a covering: *Gr.*), in Botany, a thin membranaceous cap, or cowl, usually of a conic figure, which covers the parts of fructification in mosses.

CA'LYX (*kalux*: *Gr.*), in Botany, the flower-cup, or that whorl of the floral organs which is external to the corolla. It may consist of one or several leaflets. Its usual colour is green, but in the iris, lily, and some other flowers, its leaves are mixed with those of the corolla, from which they are not easily distinguished.

CAMARIL'LA (*Span.*), the private chamber of the sovereign of Spain; but the term is generally applied to his immediate confidants, and is synonymous with *clique*.

CAM'BER-BEAM (*cambrer*, to bend: *Fr.*), in Architecture, a beam cut hollow or archwise in the middle, commonly used in platforms.

CAM'BERED (same *deriv.*), an epithet applied to the deck of a ship, the flooring of which is highest in the middle; also when it is defectively so, or what is sometimes called *broken-backed*.

CAM'BRIAN SYSTEM, in Geology, a series of sedimentary rocks lying below the Silurian beds, and being the lowest fossiliferous rocks yet discovered. They are divisible into two groups, upper and lower. The latter is seen in North Wales, and in Wicklow, Ireland, where a few zoophytes have been found in them. The former group is to be seen in North Wales and Shropshire, and has yielded some shells, trilobites, crustaceans, and polyzoa. This system has a thickness of many thousand feet. It has received its name from the place of its chief development.

CAM'BRIC, a species of fine white linen, made of flax, said to be named from Cambray, in Flanders, where it was first manufactured.

CAM'EL (*kamelos*: *Gr.*), a genus of hornless ruminant quadrupeds, containing two species, which are only known in the domesticated state. The dromedary, or African camel (*C. dromedarius*), has one hunch on the back; the common, or Asiatic camel (*C. Bactrianus*), has two humps. They are distinguished from other bovine animals by the possession of cutting teeth in the upper jaw. The camel, by its power of sustaining abstinence from drink for many days, from the peculiar formation of its stomach, and of subsisting on a few coarse shrubs, is peculiarly fitted for the parched and barren lands of Asia and Africa. The Arabians live chiefly on the milk of their camels; and without them they could neither carry on trade, nor travel over their sandy deserts.

CAMEL'LIA, in Botany, a genus of plants, well known in conservatories for their beautiful flowers. They are natives of China and Japan. The tea-plant belongs to the same nat. ord.: *Ternströmiaceæ.*

CA'MELOPARD (*kamēlos*, a camel; and *pardalis*, a leopard: *Gr.*), or GIRAFFE. This animal, whose existence was at one time disputed, is a native of several parts of Africa, living in forests, and feeding on the leaves. It has two straight horns, without branches, six inches long, covered with hair,' truncated at the end, and tufted. The shoulders are of such a length as to render the fore part of the animal much higher than the hind part. The neck is very long, the head slender and elegant, and the colour of the body is a dusky white, with large rusty spots. It is mild and inoffensive, and in cases of danger has recourse to flight for safety, but when obliged to stand on self-defence, it kicks its adversary. It derives its name from a supposed resemblance to both the camel and the leopard. It is a ruminant animal of the ox family, and has been named *Giraffa camelopardalis* by naturalists.

CAMELOPAR'DALIS (the camelopard: *Gr.*), in Astronomy, a constellation consisting of 58 stars, situated between Cepheus, Perseus, Cassiopeia, Ursa Major and Minor, and Draco.

CAM'EO, or CAMA'IEU, a peculiar sort of onyx; or a stone or shell on which figures are cut in relief on a differently coloured ground.——The name is likewise given to such paintings as have but one colour, where the lights and shades are made on a ground of gold or azure.

CAMERALIS'TICS (*kameralien*: *Germ.*; from *kamera*, a chamber: *Gr.*; strictly, a place with a vaulted roof), the science of finance or public revenue, comprehending the means of raising and disposing of it.

CAM'ERA LU'CIDA (a bright chamber: *Lat.*), an optical instrument, for throwing upon paper the image of an object, so that it can be drawn.

CAM'ERA OBSCU'RA (a dark chamber: *Lat.*), an optical instrument. The light being collected and thrown through a single aperture, external objects are exhibited distinctly, and in their natural colours, on any white surface placed within it.

CAMISA'DE (*camisa*, shirt: *Languedocian*), a French term for attacking or surprising an enemy by night. It obtained the name from the *Camisards*, or French Protestants, in the Cevennes, who, after the revocation of the Edict of Nantes, suffered much persecution from the government in the early part of the last century. Going about at night, they were accustomed to wear a shirt over their other clothes, that they might recognize each other. They called themselves 'Enfants de Dieu.' Gibbon has alluded to 'the boldness, the crimes, and the enthusiasm of the fanatics of Languedoc.'

CAM'LET (*camelus*, a camel: *Lat.*), a sort of stuff originally made of camel's hair and silk mixed, but now of wool and silk.

CAMP (*campus*, a field: *Lat.*), the residence of an army resting in tents; or the place and order of tents for soldiers in the field. On the continent of Europe the armies *bivouac* in the open air, or, if the time will allow it, lodge in huts built of branches, &c. In the progress of the military art, camps have become slight and simple. The Romans carried the art of encamping to great perfection. Their camp was quadrangular: it was surrounded by regular entrenchments, and so arranged that each cohort, legion, and individual, knew exactly the point he should occupy, and the place to which he should proceed in case of alarm.

CAMPA'IGN (*campagne*, the country: *Fr.*), the space of time during which an army is kept in the field. A campaign is usually from spring to autumn; but sometimes armies make a winter campaign.

CAMP'ANILE (*Ital.*), a bell tower, frequently standing apart from the building to which it belongs.

CAMPAN'ULACEÆ, a natural order of herbs or undershrubs, with monopetalous bell-shaped flowers (whence the name, *campanula*, a little bell: *Lat.*). They are natives of temperate regions. Our common hare-bell and the flower called Canterbury-bells, are examples. The order yields little that is of value to man.

CAMPAN'ULATE (same *deriv.*), or CAMPAN'IFORM (*campana*, a bell; and *forma*, a form: *Lat.*), in Botany, an epithet for the corolla, or calyx, when either is bell-shaped.

CAM'PHENE (*camphor*, an artificial kind of which is made from oil of turpentine), a hydro-carbon, consisting of highly rectified spirit of turpentine.

CAM'PHOR (*caphura*: *Arab.*), a white concrete crystalline substance, of an acrid bitter taste, and a penetrating smell. It is extracted from the *Camphora officinarum*, nat. ord. *Lauraceæ*, a large tree growing wild in China, Borneo, Sumatra, &c. To obtain camphor, the tree is cut down, and divided into pieces, and the camphor is taken out; being found in small whitish flakes in and near the centre. It is also obtained by distilling the wood with water. Like most of the essential oils it is a hydrocarbon, combined with oxygen. It slowly sublimes and wholly disappears at the ordinary temperature of the atmosphere. It is soluble in alcohol, ether, and strong acetic acid, but very sparingly in water.

CAM'PION, in Botany, the *Agrostemma* of Linnæus. The rose campion, or *Agrostemma coronaria*, is a well-known garden flower.

CAM'PUS MA'II (the field of May: *Lat.*), an anniversary assembly of our ancestors, held on May-day, when they confederated together for defence of the kingdom against all its enemies.

CAM'PUS MAR'TIUS (the field of Mars: *Lat.*), among the Romans, a field, by the side of the Tiber, where the youth exercised themselves in warlike exercises. It was so called on account of a temple that stood on it, consecrated to the god Mars. The consuls Brutus and Collatinus are said to have made it the place for holding the comitia or assemblies of the people: and, in after times, it was adorned with a great number of fine statues. It constitutes the principal part of the modern city of Rome.

CAM'WOOD, a material from which a brilliant red colour is obtained by dyers. It is the produce of a leguminous tree growing in India, the *Baphia nitida* of botanists.

CAN'ADA BAL'SAM, a very pure turpentine; a natural combination of resin with the essential oil, chiefly extracted from the Balm of Gilead Fir (*Abies balsamea*) growing in Canada. It is employed in medicine, and as a medium for mounting microscopic objects on glass slides.

CANAL' (*canalis : Lat.*), an artificial river, provided, if required by the nature of the place through which it passes, with locks and sluices, and sustained by banks and mounds.——In Anatomy, a duct or passage in the body of an animal, through which any of the juices flow, or other substances pass.

CANA'RIUM AUGU'RIUM (*canarius*, belonging to a dog; and *augurium*, an augury : *Lat.*), in Antiquity, a sacrifice among the Romans of a red dog, for the purpose of appeasing the fury of the dog-star on the approach of harvest.

CANA'RY BIRD, a beautiful yellow singing bird much bred in England, brought originally from the Canary Islands, where it is of a green colour. It is a species of finch, and was introduced into Europe in the sixteenth century.

CANCELLA'RIA CU'RIA (*Lat.*), in Archæology, the Court of Chancery.

CANCEL'LI (*Lat.*), in Architecture, trellis or lattice work, made of cross bars of wood or iron. Also the balusters or rails encompassing the bar of a court of justice.

CAN'CER (a crab : *Lat.*), in Medicine, a hard ulcerous and exceedingly painful swelling, generally seated in the glandulous parts of the body. Its extirpation affords the only chance of recovery. It obtained its name from the large blue veins which ramify round a cancer of the breast, compared by old authors to the claws of a crab.——In Zoology, a genus of crabs, to which the large edible crab of our coast belongs.——In Astronomy, a constellation, and the fourth sign in the zodiac, which the sun enters on the 21st of June, thence called the summer solstice.——TROPIC OF CANCER, a small circle of the sphere, parallel to the equator, and passing through the beginning of Cancer.

CANDELA'BRUM (*Lat.*), originally signified a candlestick amongst the ancients, afterwards a support for a lamp. They were made of wood, metal, or marble, and were carved into a variety of elegant shapes. A shaft, standing on three short legs, was a common form.

CAN'DIDATE (*candidatus*, clothed in white; from *candidus*, white : *Lat.*), a person who seeks or aspires to some public office. In the Roman commonwealth, the *candidati* were obliged to put on a white robe while soliciting a place. According to Plutarch, they wore this garment without any other clothes, that they might not be suspected of concealing money for purchasing votes, and also that they might the more easily show the scars of those wounds they had received in fighting for the defence of the commonwealth.

CANDIDA'TI MIL'ITES (soldiers clothed in white : *Lat.*), an order of soldiers, among the Romans, who served as the emperor's body-guards to defend him in battle. They were the tallest and strongest of all the troops, and were called *candidati* in consequence of being clothed in white.

CAN'DLE (*candela : Lat.*). Candles, formerly made only of tallow and wax, are now made of other substances, such as *palm oil*, *paraffine* and *stearic acid* (or stearine), either pure or mixed with *margaric acid*. The candle manufacture is a very extensive one in this country, notwithstanding the enormous consumption of gas and oils. Tallow, spermaceti, stearic acid, and paraffine candles are cast in moulds, but wax candles are made by pouring melted wax over each wick as it hangs over a pan of wax, until the requisite thickness has been obtained. It is then rolled on a table until it acquires a cylindrical shape.

CAN'DLE-BERRY-TREE, the *Myrica cerifera*, or wax-bearing myrtle, nat. ord. *Myricaceæ*, a shrub common in North America, from the berries of which a kind of wax is produced of which candles are made.

CAN'DLEMAS-DAY (*candle-mass*, from the candles consecrated at the mass of that day), the festival observed on the 2nd of February, in commemoration of the purification of the Virgin Mary. In the Roman Catholic church the candles then blessed at the mass are used in processions and other ceremonies throughout the year.

CAN'DY (*candidus*, white : *Lat.*), a preparation of sugar made by melting and crystallizing it several times.

CAN'DYTUFT (same *deriv.*), a common garden annual, belonging to the genus *Iberis* : nat. ord. *Cruciferæ*.

CANE'PHORÆ (*kanēphoroi* : from *kanē*, a basket; and *phero*, I bear : *Gr.*), the noble Athenian virgins who carried the baskets at public festivals.—— In Architecture, figures of young women bearing baskets on their heads, and often confounded with *Caryatides*.

CAN'FARA, a sort of ordeal by fire, as it once existed in this kingdom. The accused carried hot irons in his hands, and if he came off unhurt, he was deemed innocent.

CANIC'ULAR DAYS (*canicularis*, pertaining to the dog-star; from *canicula*, the dog-star : *Lat.*), a period of the year commonly called the *dog days*. It lasts about forty days, beginning the 3rd of July, and ending the 11th of August. *Sirius*, or the dog-star, rose in ancient times heliacally, that is, just before the sun, at the beginning of July; and the sultry heat, which had a tendency to render dogs mad, was ascribed to the malignant influence of that star. The precession of the equinoxes has caused the heliacal rising of the dog-star to take place later, and in a cooler season; so that the dog-star has not now the same reference to hot weather. The Ethiopians and Egyptians began their year at the rising of the dog-star, reckoning to its rise again the next year: and hence it is called the *canicular year*.

CA'NIS (*Lat.*), a genus of quadrupeds, class *Mammalia*, order *Feræ*. It comprehends animals that differ very essentially from each other in their habits, as the dog, the wolf, the fox, and the jackal. ——CANIS, in Astronomy, the name of two constellations in the southern hemisphere; namely, Canis Major and Canis Minor.

CAN'KER (*cancer*, a crab: *Lat.*), a corroding disease which occurs frequently in fruit trees.——Also a fungous excrescence in the feet of horses.

CAN'NEL-COAL, or CANDLE-COAL, a hard, opaque, inflammable jet-black fossil coal, which burns with a bright white flame, like a candle. It is sufficiently solid to be cut and polished, and, like jet, is often made into trinkets. In Scotland it is called parrot coal.

CAN'NEQUIN, white cotton cloth brought from the East Indies, made in pieces of about eight ells long.

CAN'NON (*canna*, a pipe made of reed: *Lat.*), a piece of ordnance, or a heavy metallic gun for a battery, mounted on a carriage. Cannon are made of iron, steel or brass, and are of different sizes, carrying balls varying from three pounds weight to several hundred. The explosive force being directed by the tube, balls and missiles are carried to great distances with destructive power. In a field of battle they are often drawn by horses on light carriages, and are then called field pieces, or flying artillery. The different parts of a cannon are, the *breech*, or solid metal, from the bottom of the bore to the *cascabel* or extremity of the solid end; the *trunnions*, which project at each side, and form an axis, on which it turns; the *bore*, or cylindrical cavity, which at present is not cast, but formed in the solid metal by a boring machine; and the *chamber*, which is a recess for the powder, formed at the end of the bore, and of smaller diameter. Cannon were originally made of longitudinal bars, bound with strong hoops; and this mode of manufacture has been, in some instances, revived.

CANO'E, a small boat, formed of the trunk of a tree, hollowed out by cutting or burning; and sometimes also of pieces of bark joined together. It is impelled by a paddle instead of an oar, and is used by uncivilized nations in both hemispheres.

CAN'ON (*kanōn*, a rule: *Gr.*), is a word of many meanings. Thus it signifies the laws and ordinances of ecclesiastical councils. ——The authorized and received catalogue of the books of Scripture.——A dignitary in cathedral and collegiate churches who, when he performs the duties of his office, is termed *residentiary*.——Originally, canons were priests who lived in community, residing near the cathedral church, and assisting the bishop; but, by degrees, shaking off their dependence, they formed separate bodies: in time they freed themselves from their rules, and at length ceased to live in a community.——In modern Music, a *canon* is a kind of perpetual fugue, in which the different parts, beginning one after another, repeat incessantly the same air.——In Mathematics, it is a general rule for resolving all cases of a like nature in geometry, algebra, &c.

CANON'ICAL (*kanonikos*, from same *deriv.*), in Ecclesiastical Polity, signifies agreeable to the canons of a church; as, *canonical hours*, or hours prescribed by the canons for prayers.

CANONIZA'TION (*kanōn*, an example, or model: *Gr.*), an act of the Roman Catholic church, by which it takes upon itself to rank a deceased person in the catalogue of the saints; but the act is preceded by beatification, and by a kind of inquiry into the life and 'miracles' of the deceased. The life of the person proposed for examination is considered with special reference to the austerities and observances which the Roman Catholic church considers as indicative of sanctity.

CAN'ONRY, or CAN'ONSHIP, the benefice filled by a canon. It differs from a prebend, inasmuch as a prebend may subsist without a canonicate; whereas a canonicate always involves a prebend: again, the rights of suffrages, and other privileges, are annexed to the canonicate, and not to the prebend.

CANO'PUS, in Astronomy, a star of the first magnitude in the rudder of Argo, a constellation of the southern hemisphere. It is the α Argûs of astronomers. 'Sidus ingens et clarum,' a large bright star, wrote Pliny.

CAN'OPY (*kōnōpeion*, literally a mosquito curtain; from *kōnōps*, a gnat: *Gr.*), a magnificent covering raised over an altar, throne, chair of state, pulpit, &c, In figurative language the *sky* is called a canopy.

CANT, in Architecture, a term expressing the position of any piece of timber not standing square.——CANT-MOULDING, a moulding with a bevelled surface applied to the capitals of columns.——In Ship-building, CANT-TIMBERS are those timbers which are situated at the two ends of a ship, and *canted* or raised obliquely from the keel.

CANTAB'ILE (*Ital.*, from *canto*, I sing: *Lat.*), in Music, a term applied to movements intended to be in a graceful and melodious style.

CANTAN'TE (a singer: *Ital.*, from same), in Music, a term to denote the vocal part of the composition.

CANTA'TA (*Ital.*, from same), a song or composition, intermixed with recitative, airs, and different movements, chiefly intended for a single voice, with an instrumental accompaniment.

CANTEE'N (*cantine*: *Fr.*), a public-house licensed in every barrack or fort to sell liquors. Also a semi-cylindrical tin-case over a soldier's knapsack, to carry his cooked victuals in.

CANTHAR'IDES (*Gr.*), the plural form of *Cantharis*, the name of a genus of beetles, including the *C. vesica*, or Spanish-fly, extensively used in this country as a material for raising blisters. The beetle is found generally in the south of Europe, but our chief supply comes from Spain. It is usually about half an inch in length, of a shining green colour, but of a fœtid smell. Taken internally they are a most energetic acrid poison.

CANTHAR'IDIN (from *cantharides*), that peculiar substance existing in cantharides, which causes vesication.

CAN'THARUS (*kantharos: Gr.*), in Antiquity, a tankard sacred to Bacchus.

CAN'THI (*kanthos*, the corner of the eye: *Gr.*), in Anatomy, cavities at the extremities of the eyelids, commonly called the corners of the eye: the internal or greater canthus is next the nose; the external or lesser near the temple.

CAN'TICA (*Lat.*), songs in Roman comedy sung to music by one person, and supposed to have been introduced as interludes.

CAN'TICLES (*canticulum*, a little song: *Lat.*), the Song of Songs, in the Bible. It is supposed by some to be a marriage song written by Solomon, and must be explained by compositions of a similar nature in Eastern countries. Other writers consider it to be a series of sacred idyls, each distinct and independent of the other. It was forbidden to be read before a mature age by the Jews and early Christians, lest it should be misunderstood.

CANTILE'NA (a song: *Lat.*), in Music, the treble melody, or upper part of any composition.

CAN'TO (a song: *Ital.*), a part or division of a poem, answering to what in prose is called a book. In Music, it signifies the first treble, or highest vocal part.

CAN'TON, a small division: hence, in Heraldry, a small square, separated from the rest of the coat, is called a *canton*.——In Military affairs, troops billeted into different quarters or divisions are said to go into *cantonments*.——In Geography, a small district of territory, constituting a distinct state or government: as the cantons of Switzerland.

CAN'TONED, in Architecture, is when the corner of a building is adorned with a pilaster, an angular column, rustic quoins, or anything that projects beyond the level of a wall.——In Heraldry, a shield is cantoned by two lines proceeding from the top or sides, and meeting at right angles. A canton *dexter* is always meant, unless it is otherwise expressed.

CAN'VAS (*canevas: Fr.*; from *kannabis*, hemp: *Gr.*), a coarse sort of cloth, of which there are several kinds. Among others are —1. That worked regularly in little squares as a basis for tapestry; 2. That which is called buckram; 3. The cloth used for pictures; 4. That employed for sails of ships, tents, &c.

CAN'ZONE, or CANZO'NA (a song: *Ital.*), in Music, a song or air in two or three parts, with passages of fugue and imitation. The term is sometimes applied to a kind of lyric poem, in Italian, to which music may be adapted in the style of a cantata.

CANZONET' (*canzoneta*, the *dim.* of *canzone*, a song: *Ital.*), in Music, a short song, in one or two parts.

CAOU'CHOUC, or CAOU'TCHOUC, improperly called *elastic gum*, and more commonly *india-rubber*, is obtained from the milky juice of several plants and trees, particularly from the *Siphonia elastica* of Cayenne. Its elasticity is such that it can be stretched to a great extent, and its pliancy is increased by heat. From its softness, impermeability to water, &c., it is used in the manufacture of many articles. It is easily dissolved by purified naphtha obtained from coal tar, which does not change its properties, and the solution has been most extensively employed to give a thin covering to cloth, so as to render it impervious to moisture. It is also used for over-shoes, and, when dissolved in oil, forms a flexible varnish. Caoutchouc is principally obtained from South America, but latterly it has been imported in great quantities from Africa and Asia. It is usually brought to Europe in the form of pear-shaped bottles, which are formed by allowing the juice to flow from the tree over a mould of clay, then drying by exposure to the sun or to the smoke of burning fuel, after which the clay in the inside is moistened with water, and picked out.——*Vulcanized india-rubber*. In its ordinary state, india-rubber becomes rigid by cold, and soft by heat: hence it loses its value in hot or cold countries; but when combined with a little sulphur, at a temperature of 320° F. (this process being termed vulcanization), it becomes highly elastic: it is not affected by the most intense cold, nor by a temperature less than that which is sufficient to char it; moisture, however long continued, seems to produce no action upon it; and it is unaffected by any of the ordinary solvents, such as grease, oils, ether, turpentine, naphtha, or acid solutions. In this state it is very largely employed in the arts. Subjected to a higher degree of heat, and for a longer time, it is converted into *Hard india-rubber*, *Ebonite*, or *Vulcanite*, and in this condition it can be employed in the place of bone and wood for a great number of articles, such as knife-handles, combs, cups, and boxes.

CAP (*caput*, the head: *Lat.*), a part of dress made to cover the head. The use of caps and hats is referred to the year 1449, the first seen in Europe being at the entry of Charles VII. into Rouen: from that time they began to take the place of hoods or chaperons.——CAP, in Architecture, the uppermost part of any assemblage of principal or subordinate parts.——In Ship-building, a square piece of timber which is placed over the head or upper end of a mast.——In Botany, the *pileus*, or top of the fungus, generally shaped like a bonnet. ——CAP OF MAINTENANCE, one of the ornaments of state, carried before the kings of England at their coronation. It is of crimson velvet, faced with ermine; and is also frequently met with above the helmet, instead of wreaths, under gentlemen's crests, &c.——CAP-A-PIE (*Fr.*), from head to foot.

CAPA'CITY (*capacitas*, from *capax*, able to hold: *Lat.*), in a general sense, means the power of containing or holding.——In Chemistry, that quality of bodies by which, according to some theorists, they absorb and contain heat, which was considered an imponderable fluid.——In Geometry, the solid contents of a body.

CAPE (*caput*, a head: *Lat.*), in Geography, a part of a continent projecting into the sea, as the Cape of Good Hope, Cape St. Vincent, &c.

CAPEL'LA (a kid: *Lat.*), a star of the first magnitude in the constellation of the Charioteer; it is the Aurigæ of astronomers. Its distance from the earth has been calculated at 390,000 millions of miles, and yet its spectrum has been photographed by the scientific man. The light that effected the impression on the sensitive plate must have left the star 68 years before.

CA'PERS, the pickled flower-buds of the *Capparis spinosa*, a shrub belonging to the nat. ord. *Capparidaceæ*, growing in the south of Europe.

CA'PET, the name of the French race of kings, which has given 118 sovereigns to Europe, viz. 36 kings to France, 22 kings to Portugal, 5 kings to Spain, 11 kings to Naples and Sicily, 8 kings to Hungary, 3 kings to Navarre, 3 emperors to the east, 17 dukes to Burgundy, 12 dukes to Brittany, 2 dukes to Lorraine, and 4 dukes to Parma.

CA'PIAS (you are to take: *Lat.*), in Law, certain writs by one of which, the *capias ad respondendum*, a party is arrested at the commencement of a suit, if there is ground for supposing that he is about to fly the country. Another is the *capias ad satisfaciendum* (called briefly *Ca. Sa.*), a writ of execution, by which the sheriff is commanded to take the body of the defendant in execution.

CAPIL'LAIRE, a kind of syrup in which the Maiden-hair fern, *Adiantum capillus veneris*, is an ingredient.

CAPIL'LARY (*capillus*, a hair: *Lat.*), an epithet given to things on account of their hair-like fineness.——**CAPILLARY ATTRACTION**, or **CAPILLARITY**, that property which causes fluids to rise, contrary to gravity, when in contact with other bodies. If a piece of clean sheet glass is placed partly in water, the fluid will rise at each side. If a fine tube is treated in the same way the fluid will rise in the tube above the level of the rest, and the finer the tube the higher it will rise.——**CAPILLARY ORES**, in Mineralogy, the same with those otherwise denominated arborescent, or striated.——**CAPILLARY TUBES**, tubes of hair-like fineness.——**CAPILLARY VESSELS**, in Anatomy, the smallest and extreme parts of the ramifications of the veins and arteries.

CAP'ITAL (*capitalis*, important; from *caput*, the head: *Lat.*), in Commerce, the fund or stock, in money and goods, of a merchant, manufacturer, &c., or of a trading company.——**CAPITAL**, in Architecture, the uppermost part of a column or pilaster, serving as the head or crowning, and placed immediately over the shaft, and under the entablature.——**CAPITAL**, in Geography, the metropolis, or chief city or town of an empire, kingdom, state, or province.

CAPITAL PUN'ISHMENT (*caput*, physical life; literally, the head: *Lat.*), the extreme penalty of the law, by which the criminal's life is taken.

CAP'ITATE (*capitatus*, *Lat.*), in Botany, that which has a head or thickened summit.

CAPITA'TION (*capitatio*, a poll-tax; from *caput*, the head: *Lat.*), a tax or imposition levied on each person in a state. It is a very ancient kind of tribute, and answers to what the Latins called *tributum*, by which taxes on persons are distinguished from taxes on merchandise, called *vectigalia*.

CAP'ITE (*caput*, the head: *Lat.*), in Law, a sort of ancient tenure, by which a man held lands of the crown, by knight's service or in socage.

CAP'ITOL (*caput*, a head: *Lat.*), a collection of buildings in ancient Rome, on the Mons Capitolinus, in one of which the senate assembled. On the same spot is still the city-hall or town-house, where the conservators of the Roman people hold their meetings. It is asserted, but without much authority, that it was thus called on account of the head of a person named *Tollus* having been found in digging its foundations; but the appellation is sufficiently accounted for by its being the chief post of the city. The ascent to it was by 100 steps; and among the other structures it contained was the magnificent temple of Jupiter, both the inside and outside of which were enriched with numerous ornaments, the most splendid being the statue of that deity. Augustus gave to this temple 2,000 lbs. weight of gold; the gilding of its arch cost 21,000 talents; and its gates were of brass, covered with gold.

CAP'ITOLINE GAMES, annual games said to have been instituted by Camillus, in honour of Jupiter Capitolinus, and in commemoration of the preservation of the capitol from the Gauls. There was also another kind of Capitoline games, instituted by Domitian, and celebrated every five years, at which rewards and crowns were bestowed on the poets, champions, orators, historians, &c.

CAPIT'ULA RURA'LIA (rural chapters: *Lat.*), assemblies or chapters held by rural deans and parochial clergy within the precinct of every district deanery.

CAPIT'ULARY (*capitulum*, a chapter: *Lat.*), the body of laws or statutes of a chapter, or of an ecclesiastical council.

CAPITULA'TION (*capitulum*, a head: *Lat.*; in the original sense, a drawing up of the different heads of agreement), in Military affairs, a treaty made between the garrison of a place besieged and the besiegers, for yielding on certain conditions. The term is also applicable to the surrender of troops in any situation in which they are compelled to submit to a victorious enemy.

CAPIT'ULUM (*Lat.*, from *caput*, the head), in Antiquity, a transverse beam in the military engines of the ancients, having holes for the strings with which they were set in motion.——In Anatomy, the small head, or protuberance of a bone received into the concavity of another.——In Botany, a mode of inflorescence, when several flowers form a kind of *head* or ball.

CAP'NIAS (smoky, from *kapnos*, smoke: *Gr.*), in Mineralogy, a kind of jasper, of a smoky colour.

CAPONNIE'RE, in Fortification, a covered lodgment placed in the glacis, at the extremity of the counterscarp, and in dry moats, with embrasures or loopholes through which the soldiers may fire.

CAPO'TE (*Fr.*), a great-coat, with a hood or cowl, which is sometimes worn by sentinels in bad weather.

CAP'PARIS (*Gr.*). [See CAPERS.]

CAPRE'Æ (*capra*, a goat: *Lat.*), in Zoology, a family of mammalian quadrupeds, including the common goat, the Cashmere goat (whose wool is the material of which Cashmere shawls are made), and the ibex or steinbock, which inhabits various mountain ranges in Europe.

CAP'REOLATE (*capreolus*, a tendril: *Lat.*), in Botany, having the tendrils, or filiform spiral claspers, by which plants fasten themselves to other bodies, as in vines, peas, &c.

CAPRE'OLUS (*Lat.*), in Anatomy, the helix of the ear.——In Botany, the clasp or tendril of a vine or other plant.

CAPRIC'CIO (a whim: *Ital.*), in Music, the term for that irregular kind of composition in which the composer, without any restraint, follows the bent of his humour. It denotes also that the movement before which it is written is to be in a free and fantastic style.

CAP'RICORN (*caper*, a he-goat; and *cornu*, a horn: *Lat.*), in Astronomy, a southern constellation, and one of the twelve signs of the zodiac, which the sun enters on the 21st December.——TROPIC OF CAPRICORN, a small circle of the sphere, parallel to the equinoctial, passing through the beginning of Capricorn or the winter solstice, which is the sun's greatest southern declination, viz. 23½ degrees.

CAPRIFICA'TION (*caprificus*, the goat-fig, the *wild fig tree*: *Lat.*), a method used in the Levant for ripening the fruit of the domestic fig tree, by means of insects bred in that of the wild fig tree. The caprification of the ancient Greeks and Romans corresponds in every circumstance with what is practised at this day in the Archipelago and in Italy. Ancient writers agree in declaring that the wild fig tree, *caprificus*, never ripened its fruit, but was absolutely necessary for ripening that of the garden or domestic fig tree, over which husbandmen suspended its branches.

CAP'RIOLES (*capreolus*, a wild goat: *Lat.*), in Horsemanship, are those leaps which a horse makes in the same place without advancing, in such a manner that when he is at the height of the leap, he jerks out with his hind legs.

CAP'SICUM, a genus of South American plants, belonging to the order *Solanaceæ*. Their ground capsules and seeds afford the red or Cayenne pepper of our tables.

CAP'STAN (*cabestan*: *Fr.*), in a ship, a strong massy column of timber, of the nature of a windlass, which is placed behind the mainmast, and is used for weighing, or raising up anchors, or any other purpose for which great power is required.

CAPSULA'RES ARTE'RIÆ (*capsula*, the *dim.* of *capsa*, a box: *Lat.*), in Anatomy, the arteries of the renal glands, so called because they are enclosed by a capsule.

CAP'SULE (same *deriv.*), in Botany, a dry seed vessel, opening by valves or pores. The seed vessels of the foxglove and the poppy may be taken as examples.——In Chemistry, a porcelain or other dish for boiling or evaporating.

CAP'TAIN (*capitaine*: *Fr.*; from *caput*, head: *Lat.*), in the Army, the commander of a company of foot or of a troop of horse; and in the Naval or merchant service, the commander of a vessel.——A CAPTAIN-LIEUTENANT is an officer in the guards who, with the rank of captain and pay of lieutenant, commands a company or troop.——A POST-CAPTAIN, in the British navy, is an officer commanding any man-of-war, from a ship of the line down to a ship-rigged sloop.

CAP'TION (*captio*, a taking; from *capio*, I take: *Lat.*), in Law, the act of taking any person by any judicial process.

CAP'UCHINS, an order of Franciscan friars in the Roman Catholic church, so called from the *capuche* or hood sewed to their habits, and hanging down their backs.

CA'PUT (*Lat.*), in Anatomy, the HEAD, which is divided into the skull (*cranium*) and the face (*facies*). The skull consists of the crown, or *vertex*; the posterior part, or *occiput*; the anterior part, or *sinciput*; and the temples, or *tempora*.——CAPUT OBSTIPUM, a wry neck, which is generally a spasmodic disorder.

CA'PUT MOR'TUUM (a dead head: *Lat.*), in Chemistry, the residuum in the retort after the operation of distilling.

CAPYBA'RA (*Hydrochærus capybara*), a large rodent animal, sometimes called the water hog, which inhabits the neighbourhood of lakes and rivers in South America. It may be likened to a colossal guinea-pig. It feeds on fish and vegetables. It is of a sluggish disposition, is easily tamed, and enjoys having its skin rubbed like a pig. Its body is covered with coarse brown hair. It utters a low peculiar grunt. Specimens have been brought alive to this country.

CAR'ABINE, or CAR'BINE (*Fr.*), a short gun used by cavalry soldiers.

CARACA'RAS, birds of prey, inhabiting South America, and belonging to the Falcon family. The caracara eagle (*Polyborus brasiliensis*) derives its common name from its cry. It is a carrion feeder, and, like the rest of its tribe, has its cheeks and part of its throat bare of feathers.

CAR'ACOLE (*Fr.*), the half wheel which a horseman makes either to the right or left. The cavalry make a caracole after each discharge, in order to pass to the rear of the squadron.

CAR'ACOLY, a mixture of gold, silver, and copper, of which are made rings and other ornaments, for bartering with savage tribes.

CA'RAITES, a sect among the Jews which adheres closely to the text and letter of the Scriptures, rejecting the rabbinical interpretations and the cabala.

CARAM'BOLA, the fruit of some East Indian plants belonging to the genus *Averrhoa*: nat. ord. *Oxalidaceæ*. It is intensely acid, and is only tolerable to Europeans in the shape of pickles.

CAR'AMEL, burnt sugar, used for colouring spirits or gravies. It is a shining black substance, soluble in water, which it renders brown. The French dissolve it in lime water.

CARAPA'CE, the hard external coat with which certain animals, such as the armadillo and the tortoise, are covered. The shell protecting the body of the crab is called the carapace.

CAR'AT, or CAR'ACT (*kyrat*, a weight: *Arab.*), the twenty-fourth part of an ounce Troy. It is a term employed in speaking of the fineness of gold. Pure gold is 24-carat gold, whilst 23-carat gold is the metal alloyed with one twenty-fourth by weight of copper. The British gold coinage is 22 carats fine, that is, one-twelfth of the whole weight is composed of copper. What is called jeweller's gold is a much debased form of the metal, the usual degree of fineness being 16 carats, that is, only two-thirds of the total weight are gold.——**Carat**, a weight of four grains, employed in weighing precious stones.

CARAVAN' (*carvan*, a trader: *Pers.*), in the East, a company of travellers, and more particularly of merchants, who, for greater security, proceed in a body through the deserts of Arabia, or any other region infested with robbers. Such a company often has more than a thousand camels to carry the baggage and goods; and, as the travellers walk in single file, the line is often a mile long. Proper officers, the chief of whom has the title of *Caravan-Bachi*, are appointed to regulate everything during their march.

CARAVAN'SERA, or CARAVAN'SERY (*cairawan: Arab.*), a large building or inn for the reception of travellers and the caravans. It commonly forms a square, in the middle of which is a spacious court; and under the arches or piazzas that surround it there runs a bank, raised some feet above the ground, where the merchants and travellers take up their lodgings, the beasts of burden being tied to the foot of it. In the upper part there are generally private apartments, the use of which is costly. In many cases, however, the hospitality is gratuitous, it being by no means uncommon for a pious Mussulman to establish, during his life or by will, one or more of these caravanseries.

CAR'AWAY, an umbelliferous plant, the *Carum carui* of botanists, the seeds of which have an aromatic smell and a warm pungent taste. Caraway seeds are used in cakes, &c., and are distilled with spirituous liquors.

CAR'BON (*carbo*, charcoal: *Lat.*), an elementary body, the essential part of charcoal. Though this substance abounds throughout the vegetable kingdom, and is also contained in animal and even mineral bodies, yet it is very rarely to be met with in a state of absolute purity. The diamond is nothing but pure crystallised carbon. For many ages the diamond was considered as incombustible; and Newton was the first who conjectured, from its great refractive power, that it was capable of combustion. Graphite, or plumbago, is nearly pure carbon. Coal consists in great part of carbon. By the union of carbon with oxygen, it produces two gaseous substances, the first of which is *carbonic acid*, formerly called *fixed air*; and the second, containing less oxygen, *carbonic oxide*.

CAR'BONATE, in Chemistry, a compound formed by the combination of carbonic acid with different bases, as carbonate of copper, carbonate of lime, &c.

CARBON'IC ACID, in Chemistry, a colourless elastic fluid, a compound of one atom of carbon and two of oxygen, formerly called *fixed air*: it is one and a half times heavier than atmospheric air. It will neither support animal life nor combustion. It is liquefied by a pressure of thirty-six atmospheres, or 540 lbs. to the square inch; and the resulting liquid solidifies by spontaneous evaporation. It is the gas which is generated by fermentation, and which so often proves destructive to those who inhale it in mines, wells, or very confined apartments. All kinds of spring and well water contain carbonic acid, which they absorb from the atmosphere, and to which they are partly indebted for their agreeable flavour; but water is wholly deprived of it by boiling. It renders lime water turbid, if transmitted through it, carbonate of lime being formed. The effervescence of the so-called soda-water is due to the escape of this gas which had been forced into the liquid. All the limestone and chalk of the earth consists chiefly of a carbonate of lime.

CARBONIF'EROUS SYS'TEM, in Geology, a series of strata belonging to the Primary, or Palæozoic period. It is divisible into two parts. The lower portion includes the mountain limestone formation, rich in organic remains, and largely developed in the north of England, where it sometimes attains the thickness of 900 feet. The upper portion contains the millstone grit, a coarse quartzose sandstone with beds of shale, sometimes 600 feet thick; and the coal measures, so important for the immense mass of vegetable remains they contain in England, North America, and elsewhere. In the north of England the coal measures have a thickness of 3,000 feet. The carboniferous flora abounded in coniferous trees, ferns, mosses, equiseta, and plants belonging to families that are not now existing. [See Coal.]

CARBUN'CLE, in Surgery, an inflammatory tumour, or painful gangrenous boil, which being seated deeply, in parts provided with cellular membrane, does not soon discover its whole dimensions, nor the matter it contains.——It is also the name of a very beautiful gem, of a deep red or scarlet colour, known to the ancients as the *anthrax*. When this is held up against the sun, it loses its deep tinge, and becomes exactly of the colour of burning charcoal, whence the propriety of the name given to it. It has, however, been supposed by some modern mineralogists that the carbuncle of the ancients was garnet.——**Carbuncle**, in Heraldry, a charge or bearing, consisting of eight radii, four of which make a common cross, and the other four a saltier.

CAR'BURET, in Chemistry, a substance formed by the combination of carbon with metals and other simple combustibles.

CAR'BURETTED HY'DROGEN GAS, two compounds, consisting of hydrogen and carbon: the one called *light* carburetted hydrogen is composed of six parts by weight of carbon and two of hydrogen. It is inflammable, and is the marsh gas of pools, and the fire-damp of mines. The other compound is OLEFIANT GAS, which see.

CAR'CANET (*carcan*, a collar: *Fr.*), in Archæology, a chain for the neck.

CAR'CASS, in Building, the shell of a house, before it is lathed and plastered or the floors laid.——In Gunnery, an iron case or hollow vessel, of an oval figure, filled with combustible and other substances, to be thrown from a mortar into a town, to set fire to buildings. It has two or three apertures from which the fire blazes, and its light is sometimes used for ascertaining the direction in throwing shells. It is furnished with pistol barrels, loaded with powder to the muzzle, which explode as the composition burns down to them.

CARCINO'MA (a cancer: *Gr.*), in Medicine, a cancerous tumour. Also a disease in the cornea of the eye.

CAR'DAMOMS (*cardamom*, a cress: *Gr.*), the seeds of several closely allied plants growing in India and Ceylon, and belonging to the nat. order *Zingiberaceæ*. They are aromatic and stimulating.

CAR'DIALGIA (*kardia*, the heart; *algos*, grief: *Gr.*), the heartburn, a hot sensation in the throat arising from indigestion.

CAR'DINAL (*cardinalis*, from *cardo*, a hinge: *Lat.*), that on which anything turns; and, metaphorically, anything which is chief or principal. Thus Justice, Prudence, Temperance, and Fortitude, are called the four *cardinal virtues*.——In the Roman hierarchy, an ecclesiastical prince, who has a voice in the conclave at the election of a pope, and who may be advanced to that dignity himself. He is generally a bishop, though, as a cardinal, he may be only a *priest*, *deacon*, or *subdeacon*. Thus the famous Richelieu was a cardinal priest, and Mazarin only a cardinal deacon. There are about seventy cardinals, and when assembled they compose the Sacred College. They form the Pope's Council, and preside at special and general congregations. When the pontifical throne is vacant they govern the church. The red hat they wear was first given by Innocent III. in 1245; and their purple dress by Boniface VIII. in 1294. A cardinal is addressed as 'Your Eminence.' [See POPE.]——The CARDINAL NUMBERS are one, two, three, &c., in distinction from the ordinal numbers, first, second, third, &c.——The CARDINAL POINTS of the compass are the north, south, east, and west.——The CARDINAL SIGNS, in Astronomy, are Aries, Libra, Cancer, and Capricorn.

CAR'DINAL-FLOWER, an ornamental garden plant belonging to the genus *Lobelia*.

CAR'DING MACHINE (*carder*, to comb: *Fr.*), an instrument of modern invention for combing and cleansing wool and cotton. It consists of cylinders, thick-set with teeth, and put in motion by the force of water, steam, &c.

CAR'DIOID (*kardia*, the heart: and *eidos*, form: *Gr.*), in Mathematics, an algebraic curve, so called from its resemblance to a heart.

CARDI'TIS (same *deriv.*), in Medicine, inflammation of the heart.

CAREEN'ING (*carina*, the keel: *Lat.*), in Sea language, the bringing a ship to lie on one side in order to clean and caulk the other.

CAR'GO (*carico*, a burden: *Ital.*), the goods, merchandise, and effects which are on board a ship, exclusive of the crew, rigging, ammunition, provisions, guns, &c. The lading within the hold is called the *inboard cargo*, in distinction from horses, cattle, &c., carried on deck.

CARIBS, a race identical in outward appearance with the African negro, found in the Caribbean Islands, when Europeans first visited them. They afterwards decreased in number, and the remainder of them was transported to the Bay of Honduras, where their descendants are still to be found.

CAR'ICA (a dried fig: *Lat.*). [See PAPAW.]

CAR'ICOUS (*carica*, a dried fig: *Lat.*), in Medicine, an epithet given to tumours resembling a fig.

CARIL'LON (a chime: *Fr.*), a species of chime frequent in the Low Countries, particularly at Ghent and Antwerp, and played on a number of bells in a belfry, forming a complete series or scale of tones or semitones.

CAR'INATED (*carinatus*, from *carina*, a keel: *Lat.*), in Botany, applied to anything provided with a keel.

CAR'LINE, a piece of timber in a ship, ranging fore and aft, from one deck beam to another, directly over the keel, and serving as a foundation for the body of the ship. *Carline knees* are timbers lying across from the sides to the hatchway, and serving to sustain the deck.

CAR'LOCK, a kind of isinglass obtained from Russia, made of the sturgeon's bladder, and used in clarifying wine.

CAR'MELITES, an order of mendicant friars, very numerous in Italy and Spain. Their name is founded on their assertion that they derive their origin, through an uninterrupted succession, from Elijah, Elisha, and the children of the prophets, who, they say, were the founders of their order on Mount Carmel. They wear a scapulary, or small woollen habit, of a brown colour, thrown over the shoulders.

CARMIN'ATIVES (*carmen*, a charm: *Lat.*), medicines which expel wind, promote perspiration, and are antispasmodic.

CAR'MINE (*Fr.*), a red pigment procured from cochineal, employed by water-colour painters. Rouge is a preparation of carmine.

CARNA'TION (*caro*, flesh: *Lat.*, from its colour), a beautiful plant, obtained from the wild *Dianthus caryophyllus*, having its bright colours equally marked all over the flowers.——In Painting, flesh colour.

CARNE'LIAN (same *deriv.*), a precious stone, either red, flesh-coloured, or white. The finest carnelians are those of the East Indies: there are some beautiful ones in the rivers of Silesia and Bohemia, and some of a quality not to be despised in Britain. They are made into seals, brooches, &c.

CAR'NIVAL (*carni vale*, farewell to flesh: *Lat.*), the feast or season of rejoicing previous to Lent, celebrated with great spirit throughout Italy, when there are numerous feasts, balls, operas, concerts, masquerades, &c. The churches are filled with choristers, and the streets with masks. This festival flourishes more particularly at Rome. It is celebrated during the week before the commencement of Lent.

CAR'OB-TREE (*karob: Arab.*), the *Ceratonia Siliqua*, a native of Spain, Italy, and the Levant. It is an evergreen tree, belonging to the nat. ord. *Leguminosæ*, and produces long, flat, brown-coloured pods, composed of a mealy succulent pulp, of a sweetish taste. Though not accounted very wholesome, these pods are often eaten by the poorer classes in times of scarcity; and form an excellent food for cattle. The bean-like seeds are hard and useless. This tree is thought by some to be that which bore the 'locusts' eaten by St. John in the wilderness.

CAROLIT'IC COL'UMNS, in Architecture, columns with foliated shafts, decorated with leaves and branches winding spirally around them, or forming crowns and festoons.

CA'ROLUS (Charles: *Lat.*), a gold coin first struck in the reign of Charles I., and then valued at twenty shillings, but afterwards current at twenty-three.

CAROT'ID AR'TERIES (*karoo*, I put into a deep sleep: *Gr.*), in Anatomy, two arteries in the neck, which convey the blood from the aorta to the brain. If these vessels are tied, the animal goes to sleep: hence the name.

CARP (*carpe: Fr.*), the *Cyprinus carpio* of ichthyologists, a common fish in ponds. Carps breed rapidly, grow to a large size, and live to a great age; but they are greatly indebted to cooks, says Yarrell, for the estimation in which they are held. Our petted gold fish is a carp introduced from China.

CAR'PENTER'S RULE, an instrument marked with a scale of feet, inches, &c., and with tables of figures for facilitating calculations.

CAR'PENTRY (*carpentum*, a two-wheeled carriage: *Lat.*), the art of cutting, framing, and joining timber in the construction of buildings; it is subservient to architecture, and is divided into *house-carpentry* and *ship-carpentry*.

CAR'POLITE (*karpos*, fruit; and *lithos*, a stone: *Gr.*), petrified fruits, the most remarkable of which are nuts converted into silex.

CARPOL'OGY (*karpos*, fruit; and *logos*, a discourse: *Gr.*), that branch of Botany which treats of fruits.

CAR'PUS (*karpos*, the wrist: *Gr.*), in Anatomy, the wrist. The human wrist is composed of eight bones, forming an arch, the convexity of which is next the arm. These bones consist of two rows of four each, the first row articulating above with the radius, and the second row with the metacarpal bones, i. e. those forming the palm of the hand.

CAR'RACK (*Port.*), a large armed vessel, employed by the Portuguese in the East Indian and Brazilian trade.

CARRA'RA, a hard white kind of marble, somewhat resembling the Parian; so called from the town of Carrara, in Italy, where it is found. It is largely employed by sculptors. Geologists believe that the fine crystalline grain is the effect of subterranean heat.

CAR'RICK-BITTS, in a ship, the bitts which support the windlass.——CARRICK-BEND, a particular kind of knot.

CAR'RONADE (from *Carron*, a village in Stirlingshire, where it was first made), a short piece of ordnance, having a large bore, and a chamber for the powder, like a mortar.

CARTE (*Fr.*), in Fencing, a thrust at the inside of the upper part of the body.

CARTE-BLANCHE (a white card: *Fr.*), a blank paper, signed at the bottom with a person's name, and given to another with permission to fill it up as he pleases; applied generally in the sense of unlimited powers being granted.

CAR'TEL (*Fr.*), a challenge. Also an agreement between two states for the exchange of their prisoners of war.——CARTEL-SHIP, a ship commissioned in time of war to exchange the prisoners of any two hostile powers; also to bring any particular request from one power to another. The officer who commands her is ordered to carry no cargo, ammunition, or implements of war, except a gun for the purpose of firing signals.

CARTE'SIANS, those who adhere to the opinions of Descartes. This philosopher has laid down two principles, the one metaphysical, the other physical. The metaphysical proposition is this:—'I think, therefore I am;' the physical one—'Nothing exists but substance.' He makes substance of two kinds; the one that which thinks, the other that which is extended; whence actual thought and actual extension are the essence of substance.

CARTHAGI'NIAN, a native of ancient Carthage, or something pertaining to that celebrated city, which was situated on the northern coast of Africa, about twelve miles from the modern Tunis. It was founded by the Phœnicians, and destroyed by the Romans.

CARTHU'SIANS, a religious order, founded in the year 1086 by St. Bruno. They received their name from Chartreuse, the place of their institution; and are remarkable for their austerity, as their rules do not permit them to speak to any person without leave, or to quit their cells.

CAR'TILAGE (*cartilago: Lat.*), or, in common language, GRISTLE, a tough flexible substance of the animal body. Bones first appear as cartilage, and then become gradually strengthened by the deposit of earthy matter therein.

CARTILA'GINOUS FISHES (*cartilaginosus*, having cartilage: *Lat.*), those having cartilaginous instead of bony skeletons. Many of them are viviparous, as the ray and shark; others oviparous, as the sturgeon.

CARTOO'N (*cartone*, pasteboard: *Ital.*), a design drawn upon large sheets of paper for the purpose of being traced upon any other substance, on which the subject is to be executed. The most celebrated cartoons in existence are those of Raphael, seven of which are at Hampton Court; they were originally designed for tapestry.

CARTOUCH' (a cartridge: *Fr.*), a case of wood holding about four hundred musket-balls, besides from six to ten iron balls to be fired out of a howitzer. Also, a portable box for charges.——In Architecture, CARTOUCHES are blocks or modillions used in the cornices of wainscoted apartments; also ornaments representing a scroll of paper.——Champollion gave this name to the mark cut round the hieroglyphic figures indicating a royal name on the sculptured stones of Egypt. It is now believed to be the outline of a signet ring.

CAR'TRIDGE (*carte*, pasteboard: *Fr.*), a case of paper, &c., filled with gunpowder, and used in the charging of guns. The cartridges for cannon and mortars are made of pasteboard, tin, or wood, but most frequently of flannel: those for small arms, prepared for battle, contain both powder and ball. Cartridges without balls are called *blank cartridges*.——CARTRIDGE-BOX, a case of wood covered with leather, with cells for cartridges. It is worn upon a belt thrown over the left shoulder.

CAR'TULARY, or CHAR'TULARY (*charta*, paper: *Lat.*), a register-book, or record, as that of a monastery.

CAR'UCATE (*charrue*, a plough: *Fr.*), in old deeds, as much land as one team can plough in a year.

CAR'UNCLE (*caruncula*, a *dim.* of *caro*, flesh: *Lat.*), in Surgery, a small fleshy excrescence, either natural or morbid. In Botany, a fleshy protuberance seen upon some seeds, for example, those of the common milkwort, *Polygala vulgaris*.

CARYAT'IDES, in Architecture, columns or pillars shaped like the bodies of females. They were first erected as trophies, and were intended to represent the women of the city of Caryæ in Arcadia, who were taken captive by the Athenians, after the men had been slain for joining the Persians after the battle of Thermopylæ.

CARYOPHYL'LACEÆ (*karuon*, a nut; and *phullon*, a leaf: *Gr.*), a nat. ord. of polypetalous plants, natives chiefly of the cold and temperate parts of the world. The majority are mere weeds, but it includes those favourite garden flowers, the pinks, carnations, and lychnis, as well as the corn-cockle.

CAS'CABEL, the knob at the end of a cannon: it serves for a handle.

CASCA'DE (*Fr.*; from *casus*, a fall: *Lat.*), a small waterfall, either natural or artificial. The word is applied to such as are less than a cataract.

CASCARIL'LA (a *dim.* of *cascara*, bark: *Span.*), originally applied to Peruvian bark, but now to the aromatic and tonic bark of various species of croton, euphorbiaceous shrubs growing in the West Indies and Mexico.

CASE (*casus*, from *cado*, I fall: *Lat.*), the particular state, condition, or circumstances that befall a person, or in which he is placed. ——Also (*casse*: *Fr.*) any outside covering which serves to enclose a thing entirely, as a packing-case or a knife-case. In Carpentry, the case of a door is the wooden frame in which it is hung. In Printing, the case is a frame of wood, with numerous small partitions for the letters.——CASE, in Grammar, the inflection of a noun implying an action on the thing named.——*Action on the case*, in Law, is an action in which the whole cause of complaint is set out in the writ.

CA'SE-HARDENING, a method of preparing iron, so as to render its outer surface hard, by converting it into steel.

CAS'EIN (*caseus*, cheese: *Lat.*), a component of milk and the principal part of curds. It closely resembles albumen, and consists of more than 50 per cent. of carbon with hydrogen, nitrogen and oxygen.

CA'SEMATE, in Fortification, a vault of mason's work in the flank of a bastion, next to the curtain, serving as a battery to defend the opposite bastion and the moat. Also a vaulted work, to protect the troops from shot and shell when not on duty.

CA'SEMENT, a window that opens on hinges. Also, a hollow moulding.

CA'SE-SHOT, or CAN'ISTER-SHOT, musket-balls, stones, old iron, &c., put into cases and discharged from cannon.

CASH (*caisse*: *Fr.*, literally a chest for keeping money), money in hand, or ready money, distinguished from bills and securities.

CASHEW-NUT (*caju*, native name), the produce of a Brazilian tree (*Anacardium occidentale*), belonging to the same order as the Pistacia of southern Europe and the Mango of India. The fruit of this tree is of a singular structure. It has an enlarged fleshy disk shaped like an apple, and to the apex of this is attached the kidney-shaped nut, of which the kernel is eaten, whilst from the shell is extracted an acrid inflammable oil employed in varnishes.

CASHI'ER (*caissier*, from *caisse*, a chest: *Fr.*), a person who is entrusted with the cash of some public company. In a banking establishment, the cashier has charge of the books, payments, and receipts; he also signs or countersigns the notes, and superintends all transactions, under the order of the directors.

CASH'MERE (from *Cashmere*, in Hindostan), a delicate woollen fabric, manufactured from the downy wool found about the roots of the hair of the Thibet goat. The fine *shawls* made of this material were first imported from Cashmere.

CASQUE (*Fr.*; from *cassis*, a helmet: *Lat.*), defensive armour, to protect the head and neck in battle.

CASSA'DA, or CASSA'VA, a coarse flour, prepared from the roots of two shrubs belonging to the euphorbiaceous genus *Jatropha*, growing in South America. It is largely consumed in that country in the shape of bread and cakes. *Tapioca* is the roasted starch extracted from the same roots. The juice of the bitter cassava plant (*Jatropha manihot*), abounds with prussic acid, and is poisonous, but it soon disappears on exposure to the air, or on the application of heat.

CASSA'TION, COURT OF (*casser*, to quash: *Fr.*), one of the most important institutions of modern France, which gives to the whole jurisdiction of that country coherency and uniformity, without endangering the necessary independence of the courts. It was established by the first national assembly, and has been preserved, in every essential respect, under all the changes of France since the great revolution. Cassation properly signifies the annulling of any act or decision, if the forms prescribed by law have been neglected or justice has been perverted.

CAS'SIA (*Gr.*), in Botany, a genus of leguminous plants, including many species. They grow in Arabia and Africa, and yield various products employed in medicine. Senna consists of cassia leaves. The bark called cassia, frequently used as a substitute for true cinnamon, is the bark of several species of *Cinnamomum*, belonging to the laurel family.

CAS'SIDA (a helmet: *Lat.*), a genus of beetles, often called *tortoise beetles*.

CAS'SIOBERRY BUSH, the *Viburnum levigatum* of botanists, a North American evergreen shrub, with white flowers and red berries.

CASSIOPE'A (*Gr.*), a constellation in the northern hemisphere, situated opposite the Great Bear, on the other side the pole. In the year 1572, a remarkable new star appeared in this constellation, surpassing Sirius or Lyra in brightness. It seemed to be larger than Jupiter; but after a few months it declined, and in a year and a half entirely disappeared.

CAS'SOCK (*casaque*, a great coat: *Fr.*), the vestment worn by clergymen under their gowns.

CAS'SOWARY, the *Casuarius galeatus* of ornithologists, belonging to the ostrich family. It is a native of Malacca and the Indian Archipelago. It is only exceeded in size by the ostrich. The wings are imperfectly developed, and it cannot raise itself in the air, but it runs with great swiftness. It carries on its head a sort of horn. The eggs are left in the sand to be hatched by the sun.

CAST (*kasta*, to cast: *Goth.*), among artists, any statue, or part of a statue, of bronze, plaster of Paris, &c. A cast is that which owes its figure to the mould into which the matter of it has been poured while in a fluid state; and thus differs from a model, which is made by repeated efforts with a ductile substance, as any adhesive earth; and from a piece of sculpture, which is the work of the chisel.

CASTA'NEA (a chestnut: *Lat.*), in Botany, a genus of amentaceous trees, including the Spanish chestnut, *Castanea vesca*.

CASTANET'S (*castagnettes*: *Fr.*, from last), instruments formed of small concave shells of ivory or hard wood, which are struck against one another, being fastened to the thumb and middle finger. The Spaniards and Moors use them as an accompaniment to their saraband dances and guitars.

CASTE, a name derived from the Portuguese settlers in India, and used to indicate the classes into which the population of India is divided according to the religious laws of Brahma. That of *Brahmins* is the highest; and though, strictly speaking, it should be devoted entirely to religious exercises, it mingles in the ordinary pursuits of life. That of *kshatriya* (protection) is the soldier class; that of the *vaisya* (wealth) is the commercial class; that of the *sudra* (labour) constitutes the tillers of the soil, and is so degraded that the reading of the sacred books is prohibited to it. A large part of the population does not, however, belong to any of the pure castes, but are the offspring of marriages between persons of different castes. It is said that there has been much exaggeration as to the strictness of caste regulations. A learned writer declares that almost every occupation is open to all the tribes alike. The limitations far from being rigorous reserve only one regular profession, that of the Brahmins, which consists in teaching the Vedas, and assisting at religious ceremonies. Rules of caste, however, are very often made an excuse for escaping the performance of disagreeable duties. The *pariahs*, and some others, are supposed to have no caste. The origin of the institution is unknown, but there are various absurd traditions connected with the subject. It is said that the Egyptians, and probably the Assyrians, also the Athenians and Cretans, in early times, were divided into castes.

CAS'TELLAIN (*castellum*, a castle: *Lat.*), in feudal times, the owner, lord, or governor of a castle or fortified place.

CAS'TING, with Founders, the running of metal into a mould; among Sculptors, the taking casts or impressions of figures, &c. [See FOUNDRY.]—CASTING, in Natural History, that process by which some animals shed their skins, horns, &c., when the old fall off to make room for the new.

CAS'TLE (*castellum*, a *dim.* of *castrum*, a camp: *Lat.*), a fortress or place rendered defensible either by nature or by art. English castles, designed for residence as well as defence, are for the most part of no higher date than the Conquest. Those previously erected had been suffered to fall into ruin; and many writers have assigned this circumstance as a reason for the facility with which William the Norman made himself master of the country. It was the policy of this able general to build a considerable number; and in process of time the martial tenants of the crown erected them for themselves; so that, towards the end of Stephen's reign, we are told that there existed upwards of eleven hundred. At this period castles were an evil of the greatest magnitude to both the sovereign and the subject; considerable struggles appear to have taken place with regard to their continuance; several were demolished; and their general decline commenced. A complete castle consisted of a ditch or moat; an outwork, called a barbican, which guarded the gate and drawbridge; an artificial mount; an outer and inner ballium or enclosure; and the keep, or lofty tower, in which the owner or governor resided, and under which were the dungeons.—

CASTLE-WARD, or **CASTLE-GUARD**, a tax imposed for the purpose of maintaining watch and ward within a castle.

CAS'TOR (*kastor*: *Gr.*), in Zoology, the *Beaver*. Also a reddish-brown substance, of a strong penetrating smell, taken from two oval pouches situated near the anus of the beaver; it is a powerful antispasmodic.

CAS'TOR OIL, an oil obtained from the seeds of the *Ricinus communis*, or Palma Christi, an East Indian tree with handsome palmate leaves belonging to the nat. order, *Euphorbiaceæ*.

CAS'TOR AND POL'LUX, two fine stars in the constellation Gemini. They are the α and β Geminorum of astronomers.

CAS'TORIN, or **CAS'TORINE** (*castorinus*, pertaining to the beaver: *Lat.*), in Chemistry, an animal principle obtained from *castor*, when it is boiled in alcohol.

CASTRAME'TATION (*castra*, a camp; *metor*, I set out: *Lat.*), the art of laying out a camp.

CAS'UISTRY (*casus*, a case: *Lat.*), the science of resolving cases of doubtful propriety, or of determining the lawfulness or unlawfulness of an act, by rules and principles drawn from the Scriptures, from the laws of society, or from reason.

CA'SUS BELLI (*Lat.*), a ground upon which to begin a war.

CA'SUS FŒD'ERIS (the case of the league: *Lat.*), the case stipulated by treaty, or which comes within the terms of compact.

CA'SUS OMIS'SUS (an omitted case: *Lat.*), a term used by lawyers with reference to a state of circumstances which has been unprovided for by a statute, treaty, &c., apparently by an oversight.

CAT. The wild cat, *Felis catus*, is found in the woods of Europe, but seems to be extirpated from those of our island, except in the north of Scotland. It destroys poultry and even lambs and kids. It seems to be doubtful whether our domestic cat is descended from it.——**CAT**, a term for a ship usually employed in the coal trade.——Also a sort of strong tackle for drawing up the anchor. And a military term for a kind of shed under which soldiers conceal themselves while filling up a ditch or mining a wall.

CAT'-HEAD, in Marine language, a strong beam projecting horizontally over a ship's bows.——**CAT-HARPINGS**, ropes serving to brace in the shrouds of the lower masts behind their respective yards.——**CAT'S-PAW**, a light breeze perceived in a calm, by a rippling on the surface of the water.

CAT'S-EYE, in Mineralogy, a sub-species of quartz, penetrated with fibres of asbestos. It is very hard and transparent, of a glistening grey, with a tinge of green, yellow, or white, much resembling the mutable reflections from the eye of a cat; and hence the name. It is found in Ceylon and Malabar.

CAT'S-TAIL GRASS, or **BULRUSH**, a water plant allied to the sedges, and belonging to the genus *Typha*. The common name has been suggested by the brown cylindrical heads forming the inflorescence.

CATACHRE'SIS (*Gr.*, from *katachraomai*, I abuse), in Rhetoric, a trope which borrows the name of one thing to express another. Thus Milton, in describing Raphael's descent from the empyreal heaven, says—

> 'Down thither prone in flight
> He speeds, and thro' the vast ethereal sky
> *Sails* between worlds and worlds.'

So in Scripture we read of the '*blood* of the grape.' A catachresis, in fact, is the abuse of a trope, or when a word is too far wrested from its original signification.

CATACLA'SIS (*Gr.*, from *kataclao*, I break in pieces), in Medicine, a breaking or distortion in general, but particularly that of the eyes.

CAT'ACOMB (*kata*, down; and *kumbos*, a hollow place: *Gr.*), a grotto or subterraneous place for the burial of the dead. The term is generally applied to a vast number of subterraneous sepulchres, in the Appian Way, near Rome, supposed to be the cells in which were deposited the bodies of the primitive Christian martyrs. But there are many other catacombs, as those in Paris, Naples, &c.

CATACOUS'TICS (*kata*, against; and *akoustikos*, belonging to hearing: *Gr.*), that branch of science connected with the laws of reflected sound, called also *cataphonics* (from *kata*, against; and *phōnē*, a voice: *Gr.*).

CATAGMAT'IC (*kata*, against; and *agmos*, the fracture of a bone: *Gr.*), in Anatomy, an epithet for that which has the quality of promoting the union of fractured bones.

CATALEP'SIS or **CAT'ALEPSY** (*katalēpsis*, from *katalambano*, I seize: *Gr.*), a kind of apoplexy, in which the patient is speechless, senseless, and fixed in one posture, with his eyes open, though without seeing or understanding.

CAT'ALOGUE RAISONNEE' (a methodical catalogue: *Fr.*), a catalogue of articles carefully classed, and accompanied with explanatory notes.

CATAL'PA (*Ind.*), in Botany, a genus of trees belonging to the Bignonia order. The *C. Syringæ folia*, a native of North America, is an ornamental tree in English pleasure-grounds.

CATAL'YSIS (*katalusis*, dissolution: *Gr.*), in Chemistry, the action possessed by some substances, of decomposing others with which they are in contact, without change to themselves. Thus, if binoxide of manganese be heated in contact with chlorate of potash, oxygen will be given off by the decomposition of the chlorate, whilst the manganese remains unaltered.

CATAMARAN', a sort of floating raft originally used as a fishing boat by the Indians on the Coromandel coast.——Also the floating batteries with which the French, at the commencement of this century, meditated the invasion of England.

CAT'AMOUNT, in Zoology, the wild cat, or cat of the mountain, of North America.

CAT'APHRACT (*kataphractēs*, a coat of mail; from *kataphrasso*, I shelter: *Gr.*), in the ancient military art, a piece of heavy defensive armour, formed of cloth or leather, strengthened with scales or links, and used to defend the breast or whole body, or even the horse as well as the rider.

CAT'APLASM (*kataplasma*, from *kataplasso*, I spread over: *Gr.*), a poultice applied to some part of the body, to excite or repel heat, or to relax the skin, &c. When mustard is an ingredient, it is called a *sinapism*.

CATAPUL'TA, or CAT'APULT (*catapulta*: *Lat.*; from *katapallo*, I shake down: *Gr.*), in Antiquity, a military machine used for throwing arrows, darts, and stones upon the enemy. Some of these engines projected stones of a hundred weight. Josephus takes notice of their surprising effects, and says that the stones cast out of them beat down the battlements, knocked off the angles of the towers, and levelled a whole file of men from one end to the other. The catapulta differed from the balista, inasmuch as the former threw stones only, whereas the latter threw darts and javelins. Both were strong *cross-bows*.

CAT'ARACT (*katarraktēs*, from *katarrēgnumi*, I break down: *Gr.*), a great fall of water over a precipice in the channel of a river, caused by rocks or other obstacles to the course of the stream; as that of Niagara, those of the Nile, the Danube, and the Rhine.——CATARACT, in Medicine, an affection of the crystalline lens of the eye, or its capsule, which becomes so opaque as to prevent the rays of light from passing to the optic nerve. *Incipient cataract* is only a suffusion of the eye, when little clouds seem to float before it. *Confirmed cataract* is when the front of the eye is either wholly or in part covered, so that the rays of light cannot pass to the retina.

CATARRH' (*kattarrheo*, I flow down: *Gr.*), commonly denominated a *cold*, is an increased secretion of mucus from the nose, fauces, and bronchiæ, with fever, cough, lassitude, &c. When a catarrh is epidemic, it is called an *influenza*.

CAT'ARRHINE (*kata*, downwards; *rhin*, the nose: *Gr.*), a term applied by zoologists to the monkeys of the *old* world, which have the division between the nostrils wedge-shaped. It is in contradistinction to *platyrrhine* (*platus*, broad; *rhin*, the nose: *Gr.*), a term applied to the monkeys of the *new* world, which have the nasal septum hour-glass shaped. In the former the lower angles of the nostrils rapidly converge over the mouth; in the latter they diverge.

CATAS'TASIS (*Gr.*, from *kathistēmi*, I arrange). In Poetry, the third part of the ancient drama: being that in which the plot, or action, is supported, carried on, and heightened till it is ripe for unravelling in the catastrophe.

CATAS'TROPHE (*Gr.*, from *katastrepho*, I bring to an end), in Dramatic Poetry, the fourth and last part in the ancient drama, or that immediately succeeding the catastasis. It consists in the unfolding and winding up of the plot, clearing up difficulties, and closing the play. A fall from grandeur to extreme misery, banishment, death, &c., form a catastrophe, in tragedy; marriage, in comedy.

CATCH (*cacciare*, to pursue: *Ital.*), in Music, a piece for three or four voices, one of which leads, and the others follow in the same notes. But perhaps it may be more correctly described as a fugue in the unison, in which, to humour some conceit in the words, or to give them a different meaning, the melody is broken, and the sense is interrupted in one part, and *caught* and supported by another.

CAT'ECHISM (*katechismos*, from *katecheo*, I instruct: *Gr.*), a form of religious instruction conveyed in questions and answers. The catechism of the Church of England originally consisted of no more than a repetition of the baptismal vow, the creed, and the Lord's Prayer; but James I. ordered the bishops to add to it a short and plain explanation of the sacraments.

CAT'ECHIST (*katechistēs*, from same: *Gr.*), an officer in the primitive Christian church, whose business was to instruct the catechumens in the first principles of religion, and thus prepare them for the reception of baptism.

CAT'ECHU, an inspissated juice with astringent properties, employed in medicine, and obtained in India chiefly from an acacia. It consists chiefly of tannin.

CATECHU'MENS (*katechoumenoi*, from *katecheo*, I instruct: *Gr.*), a name formerly given in the Christian church to such as were prepared to receive the ordinance of baptism. They were anciently the children of believing parents, or pagans not fully instructed in the principles of the Christian religion; and were admitted to this state by the imposition of hands and the sign of the cross.

CATEGO'RICAL (see the next), in Logic, a proposition that makes an absolute statement, and without any hypothesis, is said to be categorical.

CAT'EGORY (*katagoreuo*, I give information of: *Gr.*), in Logic, a general term in reference to a less general, included under it. The school philosophers distributed all the objects of our thoughts and ideas into certain genera or classes, which classes the Greeks called *categories*, and the Latins *predicaments*. Aristotle made ten categories, viz. substance, quantity, quality, relation, action, passion, time, place, condition, and habit.

CATE'NA PA'TRUM (a chain of the fathers: *Lat*), in Ecclesiastical Literature, a book containing the sentiments of the ancient Christian fathers, with respect to doctrines; the separate passages being brought together so as to form one work.

CATENA'RIA, or CATE'NARY (*catenarius*, belonging to a chain: *Lat.*), in Geometry, the curve which a rope or chain suspended at each end forms by its own weight. It differs very little from a parabola.

CAT'ERPILLAR, in Entomology, the larva of lepidopterous insects, produced from the egg. It is transformed first into the chrysalis or nympha, and afterwards into the butterfly. Caterpillars generally feed on leaves or succulent vegetables, and are sometimes very destructive; they are composed of thirteen distinct segments, the first of which is a strong horny head, armed with a mouth and powerful jaws. The first three segments are invariably provided with short legs, and frequently some of the other segments have eggs

Caterpillars moult at least three times, and those of some species moult as many as ten times. Many caterpillars are gaily coloured; others are adorned with tufts of hair. In this state insects eat voraciously, and do immense damage to vegetation. When about to change into the pupa form, they retire to some place where they may remain undisturbed until the final metamorphosis. [See LEPIDOPTERA.]

CAT'GUT, the name for the strings made from the dried and twisted peritoneal coverings of the intestines of sheep and other animals. They are used for musical instruments, for lathe-bands, whips, bows, &c. Great quantities of catgut are imported from Lyons and Italy.

CATHAR'TICS (*kathartikos*, fit for purifying; from *kathairo*, I purify: *Gr.*), medicines which cleanse the stomach and bowels by acting as purgatives.

CATH'EDRA (*kathedra*, a seat: *Gr.*), in Archæology, a term used to denote the pulpit, or the professor's chair. It originally signified any chair.——Among Ecclesiastical writers it signifies a bishop's see or throne. Hence, *ex cathedrâ* is a phrase much used among the clergy of the Roman Catholic church, in relation to the solemn decrees of the pope.

CATHE'DRAL (same *deriv.*), the episcopal church, or a church where there is a bishop's seat or see.

CATH'ERINE-WHEEL (from the wheel on which St. Catherine of Alexandria is said to have been martyred), in Architecture, a large circular Gothic window. Also a firework constructed in the form of a wheel, which revolves when it is let off.

CATH'ETER (*kathetēr*, from *kathiēmi*, I send down: *Gr.*), in Surgery, a tubular instrument, usually made of silver, and introduced into the bladder, in order to search for a calculus, or draw off the urine when suppressed; also a bougie made of silver or caoutchouc.

CATH'ETUS (*kathetos*, a perpendicular; from same: *Gr.*), in Geometry, a line or radius falling perpendicularly on another line or surface; as the two sides of a right-angled triangle.——In Architecture, a perpendicular line, supposed to pass through the middle of a baluster, column, &c.——CATHETUS OF INCIDENCE, in Catoptrics, a right line drawn from a point of the object, perpendicular to the reflecting line.——CATHETUS OF OBLIQUATION, a right line drawn perpendicular to the speculum, in the point of incidence or reflection.——CATHETUS OF REFLECTION, or *of the eye*, a right line drawn from the eye, perpendicular to the reflecting line.

CATH'OLIC (*katholikos*, universal: *Gr.*), an epithet properly signifying universal. Originally this appellation was given to the Christian church in general.——CATHOLIC EMANCIPATION was the abolition of those civil and ecclesiastical restraints to which the Roman Catholics of Great Britain and Ireland were formerly subjected. The first step towards this took place in 1793, when an act of parliament was passed, which conferred upon them the elective franchise, and threw open to them all employments in the army, and all offices in the navy. In 1801, the legislative union of Great Britain and Ireland took place; but though full emancipation was said to have been promised as a consequence of this union, it was not conceded; and many unsuccessful attempts were afterwards made to obtain it. At length, in 1829 (April 10), a *relief bill*, abolishing the civil disabilities of Roman Catholics, by repealing the oaths of supremacy, &c., was carried by the Wellington administration. By this bill, they are eligible to all offices of state, excepting the lord-chancellorships of England and Ireland, the lord-lieutenancy of Ireland, the office of regent or guardian of the united kingdom, and that of high commissioner to the church of Scotland.——CATHOLIC MAJESTY, the title given to the king or queen of Spain.

CATHOL'ICON (same *deriv.*), a remedy for all diseases; a soft purgative electuary, so called, as being supposed a universal and efficacious purge of all humours

CAT'KIN (*katteken*: *Dut.*), in Botany, or *amentum*, a kind of inflorescence consisting of a spike of unisexual flowers, each with a protecting scale, the whole separating from the stem at an articulation. The male flowers of the willow and hazel are in catkins. The resemblance to a cat's tail suggested the name. The nat. order, AMENTACEÆ, is founded on the possession of male catkins.

CAT'ODON (*kata*, down; and *odous*, a tooth: *Gr.*), a genus of cetaceans, the characters of which are, that they have no teeth in the upper jaw, nor any fin on the back. It includes the SPERM WHALE, which see.

CATOP'SIS (a sight: *Gr.*), in Medicine, an acute and quick perception, particularly that acuteness of the faculties which accompanies the latter stages of consumption.

CATOP'TRICS (*kata*, against; and *optikos*, belonging to sight: *Gr.*), that part of optics which treats of reflected light, and of the images found by reflecting surfaces whether plane or curved.

CAU'DA (a tail: *Lat.*), in Astronomy, a term prefixed to the names of several constellations, to denote certain stars in their tails; as *cauda Capricorni*, *cauda Leonis*, &c.

CAU'DEX (*Lat.*), in Botany, the stem of a shrub.

CAUK, a name given by miners to certain specimens of the compact sulphate of barytes. The same word is sometimes applied to masses composed of concentric lamellar concretions.

CAUL (*kulle*: *Goth.*), in Anatomy, a membrane in the abdomen, covering the greatest part of the lower intestines, and usually furnished with a large quantity of fat. It is more properly termed the *omentum*, or, from its net-like structure, the *reticulum*.——The word CAUL is also used for a membrane which encompasses the head of many newborn children, to which vulgar superstition absurdly annexes the charm of preservation from drowning.

CAULES'CENT (*kaulos*, a stem: *Gr.*), in Botany, having a stem different from that which produces the flower.

CAULIF'EROUS (*kaulos*, a stem; and *phero*, I bear: *Gr.*), an epithet given to such plants as have a perfect caulis or stem.

CAU'LIFLOWER (*caulis*, a cabbage: *Lat.*), a much-esteemed species of *Brassica*, or cabbage.

CAU'LINE (from next), in Botany, growing immediately on the stem, without the intervention of branches; as a *cauline* leaf, bulb, peduncle, &c.

CAU'LIS (*Lat.*), in Botany, the stalk of herbaceous plants: this in shrubs is called the *caudex*; and in grasses the *culmus*, or stem.

CAUSAL'ITY or **CAUSA'TION** (*causa*, a cause: *Lat.*), among Metaphysicians, the action or power of a cause in producing its effect.

CAU'SALTY, among Miners, the light earthy parts of ore, carried off by washing.

CAUSE (*causa: Lat.*), that from which anything proceeds, or by virtue of which anything is done: it stands opposed to *effect*. That which produces is the *cause*; that which is produced, the *effect*. According to some, we derive the idea of cause and effect from experience: according to others, it is an innate idea independent of experience. Causes are distinguished, by the schools, into efficient, material, final, and formal.——EFFICIENT CAUSES are the agents employed in the production of anything. MATERIAL CAUSES, the subjects on which the agents work, or the materials of which the thing is produced. FINAL CAUSES are the motives inducing an agent to act, or the design and purpose for which the thing was done. FORMAL CAUSES are those which must supervene to matter, in order to give the thing its precise individual existence as that thing, and no other.——CAUSE, among civilians, is the same as *action*; denoting any legal process which a party institutes to obtain his demand, or by which he seeks his supposed right.

CAU'SEWAY, or **CAU'SEY** (*chaussée: Fr.*), a way raised above the natural level of the earth, by stones, stakes, clay, or fascines; serving either as a road in wet marshy places, or to prevent a river from overflowing the lower grounds. It is also very generally used for a raised way or path in any ordinary road.

CAUSTIC (*kaustikos*, corrosive; from *kaio*, I burn: *Gr.*), in Medicine, any substance that, being applied, it corrodes and destroys the texture of the parts. Caustics differ from cauteries in performing their effects more slowly, and with less force and pain.——CAUSTIC CURVE, in Geometry, a curve, to which the rays of light reflected or refracted by another curve are tangents.——LUNAR CAUSTIC, a preparation of nitrate of silver, obtained by fusing it and then casting it in cylindrical moulds.

CAU'TERY (*kauterios*, corrosive, from same: *Gr.*), in Surgery, a medicine for burning, eating away, or corroding any solid part of the body. The act of burning or searing some morbid part is termed *cauterization*.

CAVALCA'DE (*Fr.*; from *caballus*, a horse: *Lat.*), a pompous procession of horsemen, equipages, &c., by way of parade to grace a triumph, public entry, or the like.

CAV'ALIER (a horseman: *Fr.*, from same), a gallant armed horseman. It was also an appellation given to the partisans of Charles I. to distinguish them from the parliamentarians, who were called Roundheads.——In Fortification, a work raised within the body of a place, above the other works, to defilade them from the fire of an enemy on an adjacent height, or to command the trenches of the besiegers.

CAV'ALRY (*cavalerie: Fr.*), a body of soldiers on horseback; a general term for light-horse, dragoons, lancers, and all other troops who are armed and mounted. The chief use of cavalry is to make frequent excursions to disturb the enemy, and intercept his convoys; in battle to support and cover the infantry, and to break through and disorder the enemy; and its application to this purpose is probably almost as ancient as war itself. At the present day, the cavalry is divided into *light* and *heavy horse*, which are employed for different purposes. The heavy cavalry, sometimes equipped with defensive armour, and then termed cuirassiers, is generally used where force is requisite; the lighter, in small detachments where swiftness and continued effort are necessary.

CA'VEAT (let him take care: *Lat.*), an entry made in certain courts and offices, after which no proceedings are taken in the matter to which it relates, without notice to the person making the entry.

CA'VEAT EMP'TOR (let the buyer be on his guard: *Lat.*), a legal maxim, the meaning of which is that a man entering into a bargain is bound to exercise a proper amount of caution.

CAV'ERN (*caverna*, from *cavus*, hollow: *Lat.*), a natural cavity, or deep hollow place in the earth. Among the grandest natural caverns known is Fingal's cave, in Staffa, one of the western islands of Scotland. The grotto of Antiparos, in the Archipelago, is remarkable for its magnificence. In some parts of it, immense columns of stalactites descend to the floor; in others are the appearances of trees and brooks turned to marble. The Peak Cavern, in Derbyshire, is also a celebrated curiosity of this kind. It is nearly half a mile in length, and, at its lowest part, six hundred feet beneath the surface. In the Cevennes mountains, in France, are caverns and grottoes of great extent. But the largest known is the cavern of Guacharo, in South America, which is said to extend for leagues.

CAVET'TO (the *dim.* of *cavo*, hollow: *Ital.*), in Architecture, a hollow member, or round concave moulding, containing the quadrant of a circle, and used as an ornament in cornices.

CAV'EZON (*cavezzone: Ital.*), a sort of nose-band, either of iron, leather, or wood, sometimes flat, and at other times hollow or twisted. It is put on the nose of a horse, to wring it, and thus to forward his breaking and training.

CAVIA'RE (*caviar: Fr.*), the spawn or hard roes of sturgeon, which, being made into cakes, is salted and dried in the sun. It is much used in Russia, and other parts of the continent.

CAV'IN (*cavus*, hollow: *Lat.*), in Military affairs, a natural hollow, sufficiently capacious to lodge a body of troops, and facilitate their approach to a place.

CAV'OLINITE (*cavolino*, a cabbage : *Ital.*), a mineral, occurring in the interior of calcareous balls, &c.

CAYENN'E PEPPER. [See CAPSICUM.]

CAY'MAN, a species of alligator inhabiting Brazil, the *Caiman palpebrosus* of naturalists. It is less in size, and not so ferocious as the alligator. On the eyebrows are large bony knobs which give it a peculiar appearance.

CEDAR OF LEBANON, the *Cedrus Libani* of botanists (*kedros : Gr.*; from *heder*, to mourn : *Heb.*), is an evergreen coniferous tree, growing to a large size, and having a noble appearance. Its timber is very durable, but wanting in strength. Cedar wood in good preservation was found in the temple of Apollo at Utica, where it had been for 2,000 years. Solomon employed the wood in the building of the temple of Jerusalem. The cedars on Mount Lebanon in Syria are now much reduced in number, only about 400 being now remaining, and there are far more specimens of the tree in England, where it is much planted as an ornament on lawns, than on its native hill. The cedar of the Atlas mountains, and that of the Himalayas, though they have received distinct names from botanists, on account of differences in their habits, are suspected to belong to the same species as the Lebanon cedar.——The term *cedar* is popularly applied to various species of juniper and cypress. The cedar-wood used for pencils is obtained from *juniperus Bermudiana*, *J. Virginiana*, and other species. In North America, the *Thuja occidentalis* is called white cedar. The cedar of Goa is *Cupressus lusitanica*, a handsome tree, but too tender for our climate.

CE'DRAT (*Fr.*), a variety of the lime, from the fruit of which a perfume is obtained.

CEIL'ING (*ciel*, the heaven: *Fr.*), in Architecture, the upper part or roof of a room, being a layer or covering of plaster over laths, nailed on the bottom of the joists which bear the floor of the room next above, or on joists put up for that purpose where there is no upper room—hence called ceiling joists.

CEL'ESTINE (*cœlestis*, heavenly : *Lat.*), in Mineralogy, native sulphate of strontian; it receives its name from its occasionally being of a delicate blue colour.

CELES'TINS, a religious order, reformed from the Bernardins by Pope Celestin V. The Celestins rise two hours after midnight to say matins: they eat no flesh, except when sick, and fast often. Their habit is a white gown, a capuche, and a black scapulary.

CE'LIBACY (*cœlebs*, unmarried: *Lat.*), an unmarried or single state of life. Among the ancient Romans, men who remained unmarried were subjected to certain disabilities. In the early Christian church, the ministers of religion were not obliged to observe celibacy. An attempt was made at the council of Nice, in A.D. 325, to render it obligatory on the clergy, but without success; it was adopted, however, at that of Arles, in A.D. 340, and at the end of the sixth century its observance had become common; the council of Trent confirmed the obligation. In the Greek church, clerics under the degree of bishops are allowed to marry; and hence the higher dignities in that church are filled by monks.

CELL (*cella : Lat.*), in its first and obvious sense, a small, close apartment; in a less restricted sense, it denotes any small cavity or hollow place.—— In Physiology, cells are the vesicles or sacs of which animal and vegetable structures are composed, under various forms and modes of connection. The structure and development of cells occupy a large portion of the physiologist's attention, and the study can only be pursued with the assistance of the microscope.

CEL'LULAR TISSUE, a white fibrous tissue, generally diffused throughout the bodies of vertebrate animals. It fills up the spaces between the different organs, and forms part of most of them. It consists chiefly of gelatine.

CEL'LULOSE (same *deriv.*), the proximate principle composing the cell membrane of plants. Sulphuric acid readily dissolves it. It becomes blue when treated with iodine, and this is the ordinary test for it.

CEL'TIC (*Keltai*, the Celts : *Gr.*), a branch of the great Indo-European or Aryan family of languages. The Kymric and Gadhelic are the only remaining dialects. To the former belong the Welsh, Cornish, and Armorican (Brittany); to the latter, the Irish and Gaelic. The ancient Celts lived in Britain, Belgium, Gaul, Switzerland, Northern Italy, and Spain.

CEMENT', amongst builders, signifies a binding material which hardens quickly under water. It is made by calcining limestones, which contain from 40 to 60 per cent. of silicates, or it is prepared by calcining a mixture of slaked lime and blue clay. In the latter case, the cement is called artificial.

CEMENTA'TION, in Chemistry, the act of surrounding any substance with the powder of some other, and exposing them, in a close vessel, to a heat not sufficient to fuse them. The formation of steel from iron, by means of the application of charcoal, is effected in this way. Layers of bars of malleable iron and of charcoal being arranged one upon another, out of contact with the air, they are placed in a suitable furnace; the fire is then rendered very intense, and kept up for a certain time; after which the bars are allowed to cool gradually. The result is *blistered steel*, so called from the appearance of its surface. And this, broken in pieces, and melted, is *cast steel*.

CEM'ETERY (*koimētērion*, from *koimao*, I put to sleep: *Gr.*), a repository for the dead. Among modern improvements, perhaps few are more deserving of commendation than the custom, recently introduced, of appropriating an eligible spot of ground, at a convenient distance from populous towns, for the purpose of human interment.

CEN'OTAPH (*kenotaphion*: from *kenos*, empty; and *taphos*, a tomb: *Gr.*), in Antiquity, an empty tomb, erected in honour of the deceased, and differing from a sepulchre, in which the body was actually deposited.

CEN'SER (*encensoir: Fr.*), in the religious rites of the ancients, a vase containing the incense to be burned in sacrificing to the gods. Censers were likewise in use among the Jews as we find in 1 Kings vii. 50. Solomon, when he prepared furniture for the temple of the Lord, among other things made censers of pure gold. Censers are used in Roman Catholic churches.

CEN'SOR (*Lat.*, from *censeo*, I reckon), the name of two magistrates at ancient Rome. Their office was regarded as sacred, and higher than all others except the dictatorship; but they were not allowed lictors, the sign of imperial authority. They had an irresponsible control of a general nature over the conduct and morals of the citizens. It was part of their duty to keep a register of the citizens and their property, and they were concerned in the management of the finances of the state. The censorship existed from B.C. 443 to B.C. 22, a period of 421 years.

CEN'SURE (*censura*, a severe judgement: *Lat.*), a sentence which condemns some book, person, or action, or more particularly a reprimand from a superior.——ECCLESIASTICAL CENSURES, penalties by which, for some striking misconduct, a member of a church is deprived of its communion, or prohibited from executing the sacerdotal office.

CEN'SUS (*Lat.*, from *censeo*, I reckon), in Roman Antiquity, an authentic declaration made before the censors, by the several subjects of the empire, of their respective names and places of abode. This declaration was registered by the censors, and contained an enumeration of all their estates, lands, and inheritances — including their quantity and quality, with the wives, children, domestics, tenants, and slaves of each citizen. The census was held every five years. The word *Census* is still used to signify an enumeration of the inhabitants of any kingdom or state, taken by the government.

CENT, an abbreviation of the Latin word *centum*, a hundred, used in giving the ratio of anything with reference to that number. Thus a profit of ten per cent. means a profit on the capital employed at the rate of ten pounds in a hundred.

CEN'TAUR (*kentauros: from kenteo*, I goad; and *tauros*, a bull; *Gr.*), in Classic Antiquity a monster, half man and half horse. A savage race dwelling between Pelion and Ossa, in Thessaly, and extirpated in a war with the neighbouring Lapithæ. A favourite subject with ancient poets and sculptors; Ovid and others have described it, and Phidias represented it in marble. Hercules and Theseus were the leaders of the Lapithæ.

CEN'TAURY (*kentaurion: Gr.*), the English name of the genus *Centaurea*, which includes a large number of species of composite plants. It is said to have derived its name from Chiron the Centaur having cured himself with it, after wounding himself with one of the arrows of Hercules. The *Lesser Centaury* (*Erythræa*), is an English wild plant belonging to the Gentian order.

CEN'TIPEDE (*centipes:* from *centum*, a hundred; *pes*, a foot: *Lat.*), a name given to the species of the annulose genus *Scolopendra*, on account of their numerous feet.

CEN'TO (a garment made of patchwork: *Lat.*), in Poetry, a work wholly composed of verses or passages, taken from various authors, and disposed in a new order.

CEN'TRE, or CEN'TER (*centrum: Lat.*; from *kentron*, a point: *Gr.*), a point equally distant from certain other points in a line, figure, or body.——CENTRE OF GRAVITY, that point about which all the opposite points of a body exactly balance each other, in any situation.——CENTRE OF MOTION, the point which remains at rest, while all the other parts of a body move round it.

CENTRIF'UGAL FORCE (*centrum*, a centre; and *fugio*, I fly: *Lat.*), the tendency with which bodies, forced to move in a curve, endeavour to fly off in a tangent to its periphery. This property of matter has been taken advantage of to effect several useful purposes. Watt's pendulum governor is one of its applications. Centrifugal pumps of great power have been constructed, their principle being that as the water is thrown off above by the rapid revolution of arms, or a cylinder, a fresh supply of the liquid is forced upwards by the pressure of the atmosphere into the revolving parts. Centrifugal machines have also been invented for driving the moisture out of wet textile fabrics, and from concentrated cane syrup in the manufacture of sugar, the fabrics and sugar being made to revolve with great rapidity, whilst the moisture escapes through a close net-work of wire which forms the periphery of the revolving cylinder.

CENTRIP'ETAL FORCE (*centrum*, a centre; and *peto*, I go towards: *Lat.*), the tendency with which bodies move, or endeavour to move, towards the centre of a system of bodies. Such is gravity, or that force by which bodies tend towards the centre of the earth; and that by which the planets are continually drawn back from rectilinear motions, and made to move in curves.

CENTUM'VIRI (one hundred men: *Lat.*), in Roman Antiquity, judges appointed to decide common causes among the people. They formed a definite body or collegium.

CENTU'RION (*centurio*, from *centum*, a hundred: *Lat.*), among the Romans, an officer in the infantry, who commanded a century. This should, from its name, consist of a hundred men, but it rarely did so, as the legion was seldom complete. Two centuries constituted one *maniple;* three maniples, one *cohort;* and ten cohorts, one *legion*. The centurion of the first century of the first maniple of the *Triarians* presided over all the others; had charge of the eagle, or chief standard; and ranked with the knights. The badge of a centurion was a *vine rod*.

CEN'TURY (*centuria*, from same: *Lat.*), in a general sense, denotes a hundred, or anything divided into or consisting of a hundred parts. The Roman people, when they were assembled for the electing of magistrates, enacting of laws, or deliberating upon any public affair, were always divided into centuries, which were supposed to contain one hundred, though this was not necessarily the case; and voted by centuries, in order that their suffrages might be the more easily collected; whence these assemblies were called *comitia centuriata*. ——In Chronology, a *century* means the space of one hundred years, and this is the most common signification of the word. As we begin our ordinary computation of time from the incarnation of Christ, the word is generally applied to some term of a hundred years subsequent to it.

CEPH'ALIC (*kephalē*, the head: *Gr.*), an epithet for medicines which are good for the head-ache.

CE'PHALOPODS (*kephalē*, a head; and *pous*, a foot: *Gr.*), the highest class of molluscs, including the CUTTLE FISHES and the NAUTILUS. Around the head are placed a number of muscular arms, which, in several species, are of great length, and beset with sucking disks. The class is divided into two orders: 1. *Dibranchiata*, with two branchiæ, sessile eyes, and an internal shell; here are placed the sepia, poulp, octopus, CALAMARY, paper nautilus (the last having an external shell) and the animals of which the fossils known as belemnites have been the internal shells.—2. *Tetrabranchiata*, with four branchiæ, stalked eyes, and an external shell. Of 1400 extinct species there is only one living representative, the *nautilus pompilius*, which inhabits the Chinese seas and Indian Ocean.

CE'PHEUS (*Gr.*), in Astronomy, a constellation of the northern hemisphere.

CERA'MIC (*keramos*, potter's clay: *Gr.*), a term applied to articles formed of baked clay, such as pottery and fictile vases.

CER'ASIN (*kerasos*, a cherry-tree: *Gr.*), a gummy substance which swells in cold water, but does not readily dissolve in it.

CERAS'TES (*kerastēs*, a horned serpent; from *keras*, a horn: *Gr.*), in Zoology, a genus of venomous vipers, natives of Africa. The *C. nasicornis* has a very repulsive appearance, and carries a pair of horns on its snout.

CE'RATE (*ceratum*, from *cera*, wax: *Lat.*), in Medicine, a composition made of oil, wax, and other ingredients; used externally in several diseases, where plasters are necessary.

CERATI'TES (*keras*, a horn: *Gr.*), a genus of fossil nautili found in the muschelkalk of Europe.

CE'RATOGLOS'SUS (*keras*, a horn; and *glōssa*, the tongue: *Gr.*), in Anatomy, the name of a pair of muscles serving to draw the tongue directly into the mouth. If only one of them acts, it draws the tongue to one side of the mouth.

CERATO'IDES (*keras*, a horn; and *eidos*, appearance: *Gr.*), in Anatomy, a name for the *tunica cornea* of the eye.

CER'BERUS (*Gr.*), Pluto's three-headed dog, the issue of the serpent-woman Echidna, by the giant Typhon. He was placed at the entrance of hell, to keep living mortals from entering, and the dead from escaping. He was, however, appeased with cakes by those heroes who visited Pluto's realm when alive. Orpheus, in search of Eurydice, lulled him to sleep with his lyre. Hercules, going for Alceste, dragged him away.

CEREBEL'LUM (a *dim.* of *cerebrum*, the brain: *Lat.*), the part of the brain in the back of the skull, divided into two lobes; its removal, or injury, deprives the animal of the power of volition.

CER'EBRUM (the brain: *Lat.*), that part of the brain which occupies the front and top of the skull; its removal, or injury, deprives the animal of sensation. [See BRAIN.]

CER'EMONY (*cærimonia: Lat.*), an assemblage of several actions, forms, and circumstances, serving to render a thing more magnificent and solemn; particularly used to denote the external rites of religious worship, the formality of introducing ambassadors to audiences, &c.——MASTER OF THE CEREMONIES, an officer instituted by James I. for the more honourable reception of ambassadors and strangers of quality, and for the regulation of all matters of etiquette in the assemblies over which they preside.

CE'RES, a small planet, which revolves round the sun in four years, seven months, and ten days, at the distance of 250,000,000 of miles. It is only 160 miles in diameter.

CE'REUS, in Botany, a genus of Cactaceæ, including the torch thistle, night-blowing Cereus, and other plants with beautiful flowers.

CE'RIN (*kērinos*, waxen: *Gr.*), in Chemistry, one of the two proximate principles of bees'-wax, the other being myricin. They are separated by boiling alcohol, and are both white crystalline substances, which chemists consider compound ethers.

CERIN'THIANS, the followers of Cerinthus, one of the first heresiarchs in the church. They denied the divinity of Christ, but they held that a celestial virtue descended on him at his baptism in the form of a dove, by which he was consecrated and made Christ.

CE'RITE, the silicious oxide of *cerium*, a rare mineral, of a pale rose-red colour, with a tinge of yellow, found in Sweden.

CE'RIUM (from the planet *Ceres*), a metal, of a flesh-red colour, obtained from CERITE. It becomes friable from heat, but does not melt. Its equivalent is 47. It is of no known use. Cerium combines with several acids, and forms salts.

CERO'MA (*kerōma*, from *keros*, wax: *Gr.*), an ointment made of oil and wax, with which the ancient wrestlers rubbed themselves, to render their limbs more supple. ——Also, that apartment in the bath where the ointment was used.

CER'THIA (*kerthios: Gr.*), in Ornithology, the name of a genus of birds in the Passerine order, including the European *Certhia familiaris*, a very small bird, that ascends tree trunks, searching the crevices for insects.

CERTIF'ICATE (*certus*, certain; and *facio*, I make: *Lat.*), in a general sense, a testimony given in writing to declare or certify the truth of anything.

CERTIORA'RI (pas. infin. pres. of *certioro*, I give information: *Lat.*), a writ issuing out of some superior court, to call up the records of an inferior court, or remove a cause there depending, that it may be tried in the superior court.

CERU'MEN (*cera*, wax: *Lat.*), the wax, or viscid yellow liquid which collects in the ear, and hardens on exposure to the air.

CE'RUSE, CE'RUSS (*cerussa: Lat.*; from *razaz: Arab.*), or white lead, a carbonate of lead, usually made by exposing plates of that metal to the vapour of vinegar, assisted by the high temperature of fermenting tan. The vinegar vapour only acts as a carrier between the carbonic acid evolved by the fermenting tan and the oxide found under the influence of the acid vapour.

CER'VUS (a stag: *Lat.*), in Zoology, a genus of deer, including the red deer, the Wapiti deer, and other species. [See DEER.]

CER'VUS VO'LANS (the flying stag: *Lat.*). [See STAG BEETLE.] The French apply the name *Cerf-Volant* both to this beetle and to a boy's kite.

CESSA'TION OF ARMS, an armistice, or occasional truce, agreed to by the commanders of armies, to give time for a capitulation, or for other purposes.

CESSA'VIT (he has ceased: *Lat.*), in Law, a writ formerly used to recover lands, when the tenant or occupier had *ceased* for two years to perform the service which constituted the condition of his tenure, and had not sufficient goods or chattels to be distrained.

CES'SION (*cessio: Lat.*), in a general sense, a surrender; but particularly a surrender of conquered territory to its former proprietor or sovereign by treaty.——CESSION, in the Civil Law, is a voluntary surrender of a person's effects to his creditors, to avoid imprisonment.——In the Ecclesiastical Law, when an ecclesiastical person is created a bishop, or when a parson of a parish takes another benefice without dispensation, their first benefices become void by cession, without resignation.

CES'TUS (*kestos*, embroidered; from *kenteo*, I prick: *Gr.*), a girdle said to be worn by Venus, to which Homer ascribes the power of exciting love towards the wearer. It was also a marriage girdle, richly studded, with which the husband girded his wife at the wedding, and afterwards loosed.

CE'TACEA (*cetos*, a whale: *Gr.*), an order of mammals living in water, and having more or less the appearance of fishes, from which, however, they are broadly distinguished by having warm blood, which is oxygenated by means of lungs, not gills; and by bringing forth living young, which are nourished with milk secreted by the mother. The windpipe opens at the top of the head by one or two blow-holes, through which the water taken into the mouth is ejected. There are six families:—1. *Balænidæ*, true WHALES. 2. *Catodontidæ*, or *Physeteridæ*, or SPERM WHALES. 3. *Delphinidæ*, DOLPHINS. 4. *Manatidæ*, MANATEES. 5. *Halichoridæ*, DUGONGS. 6. *Rhytinidæ*.

CE'TUS (the whale: *Lat.*), in Astronomy, the *Whale*, a large constellation of the southern hemisphere, containing 97 stars.

CHABA'SITE, in Mineralogy, a precious stone, white, and sometimes transparent: a kind of *zeolite*.

CHA'FERY (*chauffer*, to warm: *Fr.*), a forge in an iron mill, where the iron is hammered into bars, and finished.

CHA'FE-WAX (same *deriv.*), an officer of the court of chancery, who prepares the wax for sealing writs, &c.

CHAF'FINCH, the English name of the *Fringilla cœlebs*, a well-known bird, with an iron-coloured breast, and black wings spotted with white.

CHAIN (*chaine: Fr.*), a series of connected rings or links fitted into one another. Chains are made of various metals, and their different sizes and forms are suited to different purposes.——In Nautical language, CHAINS are strong links or plates of iron, the lower ends of which are bolted through a ship's sides to the timbers.——CHAIN-BOAT, a large boat adapted for getting up mooring chains, anchors, &c.——A CHAIN-PUMP consists of a long chain fitted with a sufficient number of plates, that are moved through a tube, and over two wheels, one above the other, by a long winch, on which several men may be employed at the same time.——CHAIN-SHOT, two half-balls of metal connected by a chain: they are used at sea for cutting the shrouds and rigging of a ship.——CHAIN-WALES, of a ship, are broad and thick planks projecting from a ship's side, abreast of and behind the masts.——CHAIN-WORK, work consisting of threads, cords, and the like, linked together in the form of a chain, as tambour or net-work, &c.——A SURVEYING CHAIN is a measure of length, made of a certain number of links of iron wire, serving to measure land, &c. Gunter's chain consists of a hundred such links, each 7·92 inches in length, and consequently, it is equal to 66 feet or 4 poles.——A TOP-CHAIN, on board a ship, is a chain to sling the sail-yards, to prevent their falling, when the ropes that support them are shot away.

CHAIR (*chaise: Fr.*), anciently the *suggestum*, or pulpit, whence the priest or public orator spoke to the people. [See CATHEDRA.] The word is still applied to the place whence professors in universities deliver their lectures; thus we say the professor's chair. It is commonly used with reference to the speaker or president of a public council or assembly, as the *speaker's chair*; and, by a metonymy, means the speaker himself, as to address the *chair*.——CURULE CHAIR, in Roman Antiquity, an ivory seat appointed to be used by the chief magistrates of Rome, and those to whom the honour of a triumph was granted.——CHAIR, in railway engineering, is the iron box into which the rails are wedged at intervals, and by means of which they are secured to the sleepers.

CHALA'ZA (hail: *Gr.*), among Naturalists, the white knotty string at each end of an egg, which connects the yolk and white together.——In Medicine, a disorder in the eyelids, well known by the name of a *stye*.——In Botany, the organic base of the nucleus of seeds, indicating the cotyledonary extremity of the embryo.

CHAL'CEDONY, or CAL'CEDONY (from

Chalcedon, where it was originally found), in Mineralogy, the name given to some forms of quartz which agree in being in uncrystallized masses, which have frequently a botryoidal, reniform, or nodular shape. It is of many colours, is usually semi-transparent, and is found all over the world. It occurs in small veins, or in cavities of other minerals, and appears to have been formed by the infiltration of silicious matter. HELIOTROPE, ONYX, SARD, and SARDONYX, are considered varieties of Chalcedony, and JASPER is nearly allied.

CHAL'CEDONYX (*chalcedony*, and *onyx*), a variety of agate, in which white and grey layers alternate.

CHAL'CITE, sulphate of iron, of a red colour, so far calcined as to have lost a considerable part of its acid.

CHALDEE', or CHALDA'IC, the *language* spoken by the Chaldeans, or people of Chaldea: it is a dialect of the Hebrew.

CHAL'ICE (*calix*: *Lat.*; from *kulix*: *Gr.*), the communion cup, or vessel used to administer the wine, in the sacrament of the eucharist.

CHALI'ZA (a disengaging: *Heb.*), in Hebrew Antiquity, the ceremony by which a woman, left a widow, pulled off the shoes of a brother-in-law, who should have espoused her; after which she was at liberty to marry whom she pleased.

CHALK (*calx*, limestone: *Lat.*), a well-known calcareous earth of an opaque white colour, called in pharmacy *creta* and *terra creta*. It forms immense deposits of the secondary period of geologists. [CRETACEOUS SYSTEM.] It consists of carbonate of lime, and the whole of it consists of animal remains in a more or less minute state of division. England is thought to derive its name *Albion* (*albus*, white) from its chalk cliffs.——BLACK CHALK, a kind of ochreous earth, of a close structure and fine black colour, used in drawing.——RED CHALK, an indurated clayey ochre employed by painters and artificers.

CHAL'LENGE, in a general sense, a summons to fight, whether in a duel or in a pugilistic contest.——In Law, an exception to jurors, made by one who is put on his trial: or the claim of a party that certain jurors shall not sit in trial upon his cause. The right of challenge is given both in civil and criminal cases, and extends either to the whole panel, or only to particular jurors. In criminal cases, a prisoner may challenge twenty jurors, without assigning a cause; which is called a *peremptory* challenge.

CHALY'BEATE (*chalybeius*, belonging to steel: *Lat.*; from *chalups*, steel: *Gr.*), an epithet for waters in which iron forms the principal ingredient, as those of Tunbridge Wells. Chalybeates act chiefly as absorbents and deobstruents.

CHAM, or KHAM, the title of the sovereign prince of Tartary. It is likewise applied to the principal noblemen of Persia.

CHA'MA (*Lat.*; from *chēmē*, a gaping: *Gr.*), a genus of marine conchiferous molluscs, the species of which are attached by one of the valves to rocks and stones. They are abundant in tropical seas, especially amongst coral reefs.

CHAMA'DE (a parley: *Fr.*), in War, a signal made by beat of drum or sound of trumpet, for a conference with the enemy, either to invite to a truce, or to propose a capitulation.

CHAM'BER (*chambre*: *Fr.*), in Polity, the place where certain assemblies are held; also the assemblies themselves. Of these some are established for the administration of justice, others for commercial affairs. In many languages, *chamber* is used to designate a branch of government whose members assemble in a common apartment. ——CHAMBER, in Gunnery, that part of a mortar or cannon which contains the powder when it is loaded.——CHAMBER OF A LOCK, the space between the gates of a canal lock, in which the barge rises and sinks, so as to pass to a different level.——CHAMBER OF A MINE, a place, generally of a cubical form, where the powder is confined.——POWDER-CHAMBER, a place underground for holding powder, &c., that it may be secure from the rain, &c.——PRIVY-CHAMBER. Gentlemen of the privy-chamber are servants of the sovereign, who are to wait and attend at court.

CHAM'BERLAIN (*chambellan*: *Fr.*), in a general sense, a person who has the management and direction of a chamber, or chambers.——LORD GREAT CHAMBERLAIN of England, not of the household, the sixth great officer of state, to whom belong various duties on the coronation day, and to whom also appertain many privileges—such as serving the sovereign with water before and after dinner, and having the basin and towels for his reward. The office was made hereditary by Henry I., in the family of De Vere, Earl of Oxford.——CHAMBERLAIN OF THE HOUSEHOLD, one of the three great officers of the royal household. He has the control of all the officers above stairs, except those within the precinct of the sovereign's bedchamber, which is under the government of the *Groom of the Stole*. In virtue of his situation, he precedes dukes. The emblem of the office of chamberlain, in European courts, is a gold key, generally worn suspended from two gold buttons.——CHAMBERLAIN OF LONDON, an officer of the corporation, who keeps the city money, presides over the affairs of citizens and their apprentices, and presents the freedom of the city to those who have faithfully served their apprenticeships.

CHAM'BERS, rooms or apartments belonging to the inns of court.——In Anatomy, two spaces between the crystalline lens and the cornea of the eye, divided by the iris.

CHAM'BRE AR'DENTE (burning chamber: *Fr.*), a chamber hung with black cloth, in which state prisoners in France, if of high rank, were tried by torchlight. When Francis II., in the 16th century, established a court to try the Protestants, who were usually condemned to be burned, the people called this court by the same name, in allusion to its awful sentences.

CHAME'LEONS (*chamaileōn*, literally the earth-lion: from *chamai*, on the earth; and *leōn*, a lion: *Gr.*), reptiles of the lizard order, forming the family of *chamælionidæ*, and distinguished from the other members of the order by having a long prehensile tail, a long slender protrusile tongue, and the toes arranged in two groups, three pointing forwards and two backwards, forming an apparatus for grasping. Their lungs are capable of great extension. The common chameleon (*C. vulgaris*), an animal about 12 inches long, including the tail, is a native of Asia, Africa, and the south of Spain. Tradition has assigned fabulous properties to it. The change of colour for which it is remarkable is supposed to arise from the *rete mucosum*, containing two differently coloured layers, the interior movable, and therefore capable of modifying the exterior. The chameleon is exceedingly slow, dull, and almost torpid. Its long tongue is covered at the extremity with a viscid mucus, and is darted out for the purpose of capturing the insects upon which it subsists. Its eyes are capable of being moved independently of each other.

CHAM'OIS (*Fr.*), the *Rupicapra tragus* of naturalists, a species of antelope, approaching the goats in structure. It lives on the Alpine ranges of Europe and Western Asia. It is very agile, and of difficult access, so that only the most daring sportsmen can succeed in killing it with their rifles. It is about three feet in length, and two in height. Its head resembles that of the common goat, but it has no beard. Its skin is made into soft leather, called *shammy*.

CHAM'OMILE (*chamaimēlon*, literally earth-apple: from *chamai*, on the earth; and *mēlon*, an apple: *Gr.*), a plant belonging to the order of *Compositæ*, well known for its medicinal virtues.

CHAMPA'GNE, a fine brisk kind of wine, so called from the district in France where it is produced.

CHAM'PERTY (*champ*, a field; and *parti*, divided: *Fr.*), in Law, an illegal bargain made with either plaintiff or defendant in any suit, for giving part of the land, debt, &c., sued for, to the party who undertakes the process at his own expense.

CHAM'PION (*campione*, from *campo*, a field: *Ital.*), a person who undertakes a combat in the place of another; sometimes the word is used for him who fights in his own cause. In ancient times, when two champions were chosen to maintain a cause, it was always required that there should be a decree of the judge to authorize the combat. When the judge had pronounced sentence, the accused threw down a gage or pledge, originally a glove or gauntlet, which being lifted up by the accuser, they were both taken into safe custody till the day appointed for battle. Before the champions took the field, their heads were shaved to a kind of crown, which was left at the top: they then made oath that they believed the persons who retained them to be in the right, &c. They always presented an offering to the church, that God might assist them in the battle.—CHAMPION OF THE KING, an officer who rides armed into Westminster Hall on the coronation day, while the sovereign is at dinner, and by herald makes proclamation, 'That if any man shall deny the king's (or queen's) title to the crown, he is there ready to defend it in single combat.' The sovereign drinks to him, and afterwards presents him with the cup for his fee. The manor of Scrivelsby in Lincolnshire is held by the tenure of fulfilling the duties of the sovereign's champion, and the championship is annexed to the manor, so that whoever is its owner has the privilege of acting as the royal champion. This arose by express grant to a Marmion by the Conqueror. The manor passed by a female heir to the Dymoke family in which it is still vested. At George IV.'s coronation one of this family appeared as the king's champion. Since then there has been no coronation banquet.

CHAN'CEL. The choir of a church is called chancel from the *cancelli* (*Lat.*), the screen or lattice-work partition dividing it from the body of the church, but not intercepting the sight.

CHAN'CELLOR (*cancellarius*: *Lat.*), under the Roman emperors, a chief notary or scribe; but in England an officer invested with high judicial powers. The Lord High Chancellor of Great Britain is one of the principal officers of the civil government, created without writ or patent, by the mere delivery of the king's great seal into his custody. He has precedence next after the Archbishop of Canterbury, who comes next after the royal family. He is a privy-councillor by his office, and prolocutor of the House of Lords by prescription. He appoints all the justices of the peace throughout the kingdom. Persons exercising this office in former times having been ecclesiastics, and superintendents of the royal chapel, the Lord Chancellor is styled *keeper of the king's conscience*; and for the same reason he is visitor, in right of the king, of all hospitals and colleges of the king's foundation, and is patron of all the king's livings rated under the value of 20*l.* per annum in the king's books. He is the general guardian of all infants, idiots, and lunatics; has a control over all public charities, and a jurisdiction of vast extent, as the head of the law, in his court of chancery; but there is an appeal from his decision to the House of Lords.—CHANCELLOR OF A CATHEDRAL, an officer who hears lessons read in the church, inspects schools, hears causes, writes letters, applies the seal of the chapter, keeps the books, &c. —CHANCELLOR OF A DIOCESE, a lay officer under a bishop, versed in the canon and civil law, and judge of his court.—CHANCELLOR OF A UNIVERSITY, an officer who seals the diplomas, or letters of degree, &c. The chancellors of Oxford and Cambridge are generally selected from among the prime nobility or highest personages in the country, and hold office for life. Their duties are generally performed by vice-chancellors.—CHANCELLOR OF THE DUCHY OF LANCASTER, an officer appointed chiefly to determine controversies between the king and his tenants of the duchy land, and otherwise to direct all the king's affairs referable to his court. The holder of the office is a member of the cabinet.—CHANCELLOR OF THE EXCHEQUER, an officer who holds the highest place in that court, and takes care of the interests of the crown. He is always a member of the House of Commons, and has a seat in the cabinet. The financial measures of the government are in his charge. He has power, with the lord-treasurer, to lease the crown lands, and with others to compound for forfeiture of lands, on penal statutes; he has also great authority in managing the royal revenues, and in all matters relating to the finances of the state.——CHANCELLOR OF THE ORDER OF THE GARTER, and other military orders, an officer who seals the commissions and mandates of the chapter and assembly of the knights, keeps the register of their proceedings, and delivers their acts under the seal of their order.

CHAN'CE-MEDLEY (a corruption of *chaude mêlée*, an eager conflict: *Fr.*), in Law, the accidental killing of a person, not altogether without blame, though without any evil intention.

CHAN'CERY. According to Lord Coke, the name is derived from *Cancellarius*, the judge of the court, who is so styled *a cancellando*, because part of his duty is to cancel the royal letters patent when wrongly granted. In this court are two tribunals: the legal, or common law court, and the court of equity. The former has jurisdiction in *scire facias*, to repeal letters patent, and out of it issue all original writs which pass under the great seal, all commissions of uses, sewers, idiotcy, lunacy, &c. The equity side of the court is that great court of equity and conscience, whose object is to moderate the rigour of the other courts that are bound by the strict letter of the law. In this court, also, is administered relief which the common law courts are unable to give, or in which the relief given by them is inadequate, as in cases of contracts, for instance, when the courts of law can only give damages for the breach of them, the court of chancery will enforce specific performance. So, also, the latter court will grant injunctions to restrain wrongful acts, while the courts of common law, for the most part, can only give damages for the injury done by the wrongful act when committed. The court of chancery has also larger powers than are possessed by other courts, of causing the defendant to make discovery of matters known only to him, and which may be material to the plaintiff's case. Cases of trust and mortgage are cognizable only in the court of chancery, so also, practically speaking, are the administration of the assets of deceased persons, cases of partnership, accounts, &c. The judges of this court, as now constituted, are the lord-chancellor, the master of the rolls, two lords justices of appeal, and three vice-chancellors. The decisions of the master of the rolls and the vice-chancellors may be reviewed either by the lord-chancellor or by the court of appeal in chancery, which is a court composed of the lord-chancellor, and both or either of the lords justices, or of the lords justices sitting by themselves. From the decisions of the lord-chancellor, or of the court of appeal, there is an appeal to the House of Lords.

CHAN'CES, DOCTRINE OF, a branch of Mathematics, which estimates ratios of probability.

CHAN'GEABLE ROSE, the *Hibiscus mutabilis* of Linnæus, or *Martinico Rose*. Its flowers are white at their first opening; they then change to a blush-rose colour.

CHAN'GES, in Mathematics, the permutations or variations which any number of things may undergo, in regard to position or order, &c.; as, the different ways letters may be transposed, the changes that may be rung on a given number of bells, &c.

CHAN'NEL (*canalis*, a canal: *Lat.*), the deeper part of a strait, bay, or harbour, where the principal current flows, either of tide or fresh water, or which is most convenient for the track of a ship.——Also, a narrow sea between two continents, or a continent and an island; as the British, or Irish *channel*.

CHAN'SONS, or CHAN'ZOS, the amatory poems of the Provençals. They usually consisted of five stanzas and an envoy.

CHAN'TRY (*canto*, I sing: *Lat.*), a place in which to say mass for souls, or sing in divine worship.

CHA'OS (*Gr.*), that confusion in which matter is supposed to have existed before the world was produced by the creative power of Omnipotence; or, in other words, the unformed primeval matter of which everything was made.

CHAP'EAU (*Fr.*), in Heraldry, an ancient cap of dignity worn by dukes, made of scarlet velvet and lined with fur.

CHAP'EL (*chapelle: Fr.*), a place of divine worship, served by an incumbent under the denomination of a chaplain. There are various kinds of chapels; as *parochial chapels*, distinct from the mother church; *chapels of ease*, built in large parishes for the accommodation of the inhabitants; *free chapels*, which were founded by different kings; *chapels* belonging to particular *colleges; domestic chapels*, erected by noblemen or gentlemen for the use of their families; and dissenting meeting-houses, which are sometimes denominated *chapels*.

CHAP'ELRY (*chapellerie: Fr.*), the precinct belonging to a chapel, in distinction from a parish, or that belonging to a church.

CHAP'LAIN (*chapelain: Fr.*), an ecclesiastic who performs divine service in a chapel; but it more commonly means one who attends upon a king, prince, or other person of quality, for the performance of clerical duties in the private chapel.

CHAP'LET (*chapelet: Fr.*), in a general sense, a garland or wreath to be worn on the head.——In Architecture, a small moulding, carved into beads, pearls, &c.——CHAPLET, a string of beads used by the Roman Catholics, for counting their prayers, called *paternosters* and *ave-marias*. This practice is believed to have been introduced by St. Dominick. The chaplet is used also by Mahometans at their devotions; but their beads are all of the same size, and are not divided into *decades*. They have a smaller and a larger chaplet: the smaller contains 60 beads, and the larger 100 divided into three parts. Other orientals make use of chaplets, termed *chains*, consisting either of beads or links.

CHAP'TER (*chapitre: Fr.*), in Ecclesiastical polity, an assembly for the transaction of such business as comes within its cognizance. Every cathedral is under the superintendence of its dean and *chapter*. A meeting of the members of an order of knighthood is also called a *chapter*.

CHA'RACTER (*charaktēr*, from *charasso*, I mark: *Gr.*), in its most obvious sense, denotes a mark or sign made by writing, engraving, &c. Characters are *literal*, as the letters of an alphabet; *numeral*, as the arithmetical figures; and *emblematical*, when they represent things or ideas.

CHARA'DE (*Fr.*), a riddle, said to be named from its inventor; and made upon a word the syllables of which, when separately taken, are themselves words. It consists of two parts — the first describing the syllables separately, the second alluding to the entire word; and it may be considered complete if the whole unites in an epigrammatic point.

CHAR'COAL, an artificial fuel, consisting of wood deprived of its volatile constituents. It is usually prepared in the following manner: the wood is cut into proper lengths, and duly arranged in piles or stacks; and these being coated over with turf, and the surface covered with plaster made of earth and charcoal-dust well tempered together, to exclude the air almost entirely, and prevent waste by combustion, are set on fire. In two or three days, when the wood is known to be sufficiently charred, the apertures, which had been left to give vent to the flames, are closed up; and, all access of the external air being excluded, the fire goes out of itself. The vapour of burning charcoal is highly noxious: it is *carbonic acid*, and is found to possess many remarkable properties. Charcoal is black, brittle, light, and inodorous, and resists decay for an indefinite period. That made from a dense wood has the curious property of condensing gases and vapours in its pores. The greatest part of charcoal consists of the element carbon.——**ANIMAL CHARCOAL**, or charred bones, is extensively employed as a filter, in the purification of saccharine juices.

CHARGE (*Fr.*), in a general sense, that which is enjoined, committed, intrusted, or delivered to another, implying care, custody, superintendence, or fulfilment of duty on his part.——**CHARGE**, in Law, the instructions given by the judge to a jury.——In Ecclesiastical Law, the instructions given by a bishop to the clergy of his diocese.——In Electricity, the accumulation of electric matter on the coatings of electric jars.——In Gunnery, the quantity of powder and ball, or shot, with which a gun is loaded.——In Heraldry, whatever is borne on coats of arms.——In Military affairs, a signal to attack; as to sound the *charge*. Or the attack itself, which consists in rushing on an enemy with fixed bayonets, &c.; and the word is used for an onset of cavalry as well as of infantry.

CHA'RIOT (*carrhod: Wel.*), in Antiquity, a car or vehicle used formerly in war, and called by the several names of *biga*, *triga*, *quadriga*, &c., according to the number of horses which drew it. When the warriors came to an encounter in close fight, they alighted and fought on foot; but as soon as they were weary they retired into their chariots, and thence annoyed their enemies with darts and missive weapons. We find also frequent mention of *currus falcati*, or chariots armed with hooks or scythes, with which whole ranks of soldiers were cut down together: they were used not only by the Persians, Syrians, Egyptians, &c., but even by our British ancestors. The Roman *triumphal chariot*, generally made of ivory, was of a cylindrical figure, sometimes gilt at the top and ornamented with crowns; and, to represent a victory more naturally, it was even stained with blood. It was usually drawn by four white horses, but often by lions, elephants, tigers, bears, leopards, &c.

CHAR'LATAN (*Fr.*), one who makes unwarrantable pretensions to skill, and talks much in his own favour. The word originally meant an empiric, or quack, who retailed his medicines on a public stage, and drew the people about him by his buffooneries.

CHARLES'S WAIN, in Astronomy, seven stars in the constellation called *Ursa Major*, or the Great Bear.

CHAR'LOCK, the English name of a plant called by botanists *Raphanus Raphanistrum*, nat. ord. *Cruciferæ*. It is a weed very pernicious among grain.

CHARM (*carmen*, a verse: *Lat.*), magical words, characters, verses, &c., imagined to possess some occult and unintelligible power; by which some have pretended to do wonderful things.

CHART (*charta*: *Lat.*; from *chartēs*, a leaf of paper: *Gr.*), a hydrographical map, drawn for the use of navigators, and showing the situation of coasts, rocks, sand-banks, and sea-marks; also the course of currents, the depth of soundings, and the direction of regular winds.——**GLOBULAR CHART**, a meridional projection, in which the distance of the eye from the plane of the meridian, upon which the projection is made, is supposed to be equal to the sine of an angle of 45 degrees.——**HELIOGRAPHIC CHARTS** (*helios*, the sun; and *grapho*, I write: *Gr.*), representations of the sun, and of the maculæ or spots observed on its disk.——**MERCATOR'S CHART**, one on which the meridians are straight lines, parallel and equidistant; the parallels are also straight lines, but the distance between them increases from the equator towards either pole, so as to bear always the same ratio to the degrees of longitude which they do on the sphere itself.——**SELENOGRAPHIC CHARTS** (*selēnē*, the moon; and *grapho*, I write: *Gr.*), representations of the moon.

CHAR'TER (same *deriv.*), in Law, a written instrument, executed with certain forms, by which the sovereign bestows privileges on towns, corporations, &c. Magna Charta is the name applied to the Great Charter of Liberties granted to the people of the whole realm by King John.

CHAR'TER-PARTY (*parti*, divided: *Fr.*)

in Commerce, an agreement respecting the hire of a vessel and the freight.

CHAR'TISTS, a political party in England, composed chiefly of the working classes, who have embodied their principles in a document called the 'People's Charter,' the leading points of which are universal suffrage, vote by ballot, annual parliaments, electoral districts, abolition of property qualification, and payment of members of parliament.

CHAR'TULARY. [See CARTULARY.]

CHARYB'DIS (*Charubdis: Gr.*), a vortex at the entrance of the Sicilian straits, which was much dreaded by the ancients.

CHASE (*chasse: Fr.*), in Law, a franchise, anciently granted by the crown to a subject, empowering him to keep wild animals for his diversion, within a certain precinct; but not authorizing the establishment of forest law within it.——CHASE-GUNS, in Maritime language, those used to fire on a vessel that is pursued, in contradistinction to *stern-chasers*, which fire on the pursuer.

CHA'SING (*chasser*, to drive out: *Fr.*), in Sculpture, the art of embossing, or representing figures on metals by a kind of *basso rilievo*, punched out from behind, and carved on the front with small gravers.

CHAS'SEURS (*Fr.*), a term for a select body of infantry, formed on the left of a battalion, and required to be particularly light, active, and courageous.——CHASSEURS À CHEVAL, a kind of light horse in the French service.

CHAT'EAU, a French word formerly used for a castle or baronial seat in France, but now simply for a country residence. *Chateaux en Espagne* (*Fr.*, literally castles in Spain), castles in the air.

CHATOY'ANT (*chatoyer*, to sparkle: *Fr.*), in Mineralogy, a hard semi-transparent stone, generally very small, which, when cut smooth, reflects an undulating or wavy light, and is of a yellowish grey or green colour.——The word CHATOYANT is also used to express a changing undulating lustre, like that of a cat's eye in the dark.

CHAT'TELS (*catalla: Lat.*), in Law, a term applied not only to movable goods but also to such things as rents issuing out of land.

CHECK'-MATE (*échecs*, chess: *Fr.*), the termination of a game of chess, when the adversary's king is in such a position that although it is threatened with capture at the next move it cannot escape.

CHECK'Y (same *deriv.*), in Heraldry, a term for the shield, or any part of it, when it is divided into checks or squares.

CHEEKS, a general name among mechanics for those pieces of timber, &c., in any machine which form corresponding sides, or which are double and alike.

CHEESE (*caseus: Lat.*), the curd of milk coagulated by rennet, and separated from the whey, then pressed or hardened in a vat, hoop, or mould.——CHEESE-PRESS, a machine for pressing curd in the making of cheese.——CHEESE-VAT, the case in which curds are pressed into the form of a cheese.

CHEF-D'ŒUVRE (principal work: *Fr.*), a masterpiece, or best performance of any artist.

CHE'GOE, or JIGGER (*Ind.*), a species of flea, the *Pulex penetrans* of naturalists, which in warm countries bores into the human foot and lays its eggs, which as they increase in size cause painful irritation and inflammation if not extracted.

CHEE'TAH, or Hunting Leopard, the *Felis jubata* of naturalists. It is a native of both Asia and Africa. In India it is trained to hunt antelopes. It stands rather higher than the leopard, with the same length.

CHEIROP'TERA (*cheir*, the hand: *pteron*, a wing: *Gr.*), the scientific name for the family of bats. [See BAT.]

CHELO'NIA (*chelone*, a tortoise: *Gr.*), an order of shielded reptiles, comprising the turtles and tortoises, which have horny jaws, something like a bill, destitute of teeth. Bony plates above and below form a sort of box, which has holes through which project the head, tail, and legs. More than 130 species have been discovered, divided into five families:—1. *Testudinidæ*, land tortoises feeding on vegetables. 2. *Emydidæ*. 3. *Chelydidæ*. The species of both these families inhabit ponds of fresh water, and feed on an animal diet. 4. *Trionycidæ*, inhabiting rivers, and feeding on both animals and vegetables. 5. *Chelonidæ*, the true turtles, dwelling in the warmer seas: some species feed on marine plants; others on mollusca.

CHEM'ISTRY, or CHYM'ISTRY, the science which investigates the intimate nature of bodies, their composition and properties, together with the changes they undergo. As an art, it is very ancient; as a science, it may be considered to have had its origin in the beginning of the 17th century. The alchemists were the first who cultivated it, expecting to find a means for the transmutation of metals into gold, and a universal remedy for disease. They, of course, failed in these objects; but we owe to them many important discoveries, and the invention of much of the chemical apparatus still in use. To chemistry, more or less scientifically pursued, numerous arts owe their birth and progress; and to it also, the physiologist must resort for the explanation of phenomena that, without its aid, can only be spoken of by conjecture, although on a correct knowledge of them our health and happiness eminently depend. To facilitate the study of this important science, it is considered from different points of view, and thrown into divisions and subdivisions. It includes all that relates to chemical affinity, and the circumstances by which it is modified. It also considers the effects of light, heat, and electricity; the nature of simple and compound bodies, and the laws of their combination. The chemist distinguishes bodies into simple and compound substances. *Simple substances* comprehend such as have not hitherto been decomposed. *Compound substances* are formed by the union of simple or compound substances with each other. Chemical union is not simply a mixture of the components, such as would take place if we were to shake together a quantity of white and black sand. An entirely new substance is formed with properties quite different from any of the constituents. When the constituent parts of bodies are separated from each other, the bodies are said to be decomposed, and the act of separating them is called *decomposition*; on the other hand, when bodies are so intimately united as to form new and distinct substances, their union is distinguished by the name of *combination*. The chemical investigation of bodies, therefore, proceeds in two ways: by *analysis*, the separation of bodies by a series of decompositions, that we may arrive at the knowledge of their constituent parts; and by *synthesis*, a series of processes giving rise to new compounds; and these two forms of investigation may accompany and assist each other. Chemical combinations take place in definite proportions, the ratio of the elements being constant; and when a body is capable of uniting in several proportions with another, these proportions bear a simple numerical relation to each other. It has, moreover, been found, that if a body A unites with other bodies X Y Z, the quantity of any of the latter which unites with A will represent the quantity of it which will unite with the others, in case any union takes place. Lastly, the combining quantity of a compound is represented by the sum of the combining quantities of its components. Upon these laws, which have been ascertained by experiment, have been founded the equivalents of simple and compound bodies, that is, the numbers which represent the relations in which they unite one with another to form compounds. [See EQUIVALENT.] When gases combine, the combination between equal volumes, or between volumes which bear a simple relation to each other, it generally happens that a body unites with another in more than one proportion; thus, oxygen unites with nitrogen in five different proportions, and in one compound there is five times as much oxygen as in another. Each of these compounds has different properties from the others. What is very singular is, that the same constituents combined in the same proportions sometimes form compounds of different properties. [See ISOMERIC.] As to the nomenclature of chemical substances, it must be explained, that whilst the elementary bodies receive arbitrary names (those of newly discovered metals, however, being made to terminate in *um*), the names of compounds are framed according to definite rules. When non-metallic elements unite with metallic bodies, or with other non-metallic bodies, the compound is known by a name ending in *ide*, taken from the non-metallic element, or from that one which is most opposed in character to a metal. Thus, compounds formed by oxygen and the metals are termed oxides, those of iodine and the metals, iodides, &c. The oxides, however, are divided into three groups. Those which resemble potash and soda, or the oxides of silver and lead, are termed alkaline, or basic oxides. Those which possess properties opposed to the former, and have a strong tendency to unite with them, are termed acids, such as sulphuric acid. The third group consists of oxides, which show little disposition for forming combinations, and are styled neutral oxides. When two acids are formed by oxygen and another element, the name of that which has the less proportion of oxygen terminates in *ous*, and that with the greater proportion of oxygen in *ic*; thus sulphurous and sulphuric acids. The salts which these acids form, when combined with bases, are distinguished as sulphites and sulphates. For a list of the elementary bodies, see EQUIVALENT.

CHENOPODI'ACEÆ, in Botany, a natural order of apetalous exogens, composed of herbaceous plants or small shrubs. Many weeds belong to this order, but other members of it are of great value to man. Shore plants of the genera *Salicornia*, *Salsola*, and *Suæda*, were formerly the sources from which soda was obtained. Common spinage (*Spinacia oleracea*), mangold wurzel, and beet (both belonging to the genus *Beta*), and garden orach (*Atriplex hortensis*), belong to the order. The seeds of *Chenopodium quinoa* are extensively employed as food in Peru, under the name of rice. Another *Chenopodium* is cultivated as a grain crop in the western Himalayas. The common weed goose-foot is a species of the same genus.

CHER'RY (*cerise*: *Fr.*, from *Cerasus*, a city in Pontus, whence it was first brought to Rome), the *Prunus Cerasus*, a fruit, the original stock of which is the wild cherry. The gradual effect of cultivation has been the production of several varieties, all superior to the fruits of the parent stock. The wood of the cherry tree is much used by turners, cabinet-makers, &c. The gum that exudes from its bark is said to be, in many respects, equal to gum arabic.

CHER'RY-LAUREL, the name popularly given to the *Cerasus Laurocerasus*, a shrub belonging to the same nat. ord. as the almond, plum, and cherry. It is not related to the true laurels. The leaves abound with prussic acid.

CHER'SONESE (*chersonēsos*: *Gr.*), a tract of land, of any indefinite extent, which is nearly surrounded by water, but is united to a larger tract by a neck of land or isthmus: a *peninsula*. The peninsula of Greece was called the Chersonese.

CHERT, in Mineralogy, a sub-species of rhomboidal quartz, which often occurs in metallic veins. It is somewhat translucent, and of various colours.

CHER'UBIM (*Heb.*, the plural of *cherub*), an order of angels, two of which, by the command of God, were represented as overshadowing the propitiatory or mercy seat. The form usually given to them by painters and sculptors is a child's head between wings. In the celestial hierarchy they are placed next in order to the seraphim.

CHESS (*échecs*: *Fr.*), a game played by two persons sitting opposite to each other, and having between them a chequered board, containing sixty-four squares, alternately white and black. It is a game of Asiatic origin, but it has become a favourite with all civilized nations. The Chinese pretend to have known it 200 years before the

Christian era. In the 6th century it was brought from India to Persia, whence it was spread by the Arabians and the Crusaders all over the civilised world. The chess-board is so placed that each player has a white square at his right hand. Each side has eight men, consisting of a king, queen, two knights, two bishops, and two rooks or castles, besides eight pawns or foot-soldiers. The object of the game is to bring the adversary's king into such a situation that he would be taken at the next move, which is called *checkmating*. [See CHECKMATE.]

CHEST (*cista*: *Lat.*; from *kistē*, a chest: *Gr.*), in Anatomical language, the *thorax*, that cavity of the body which is between the neck and the belly, and contains the lungs, heart, &c.

CHEST'NUT, or CHES'NUT (*châtaigne*: *Fr.*). The SPANISH-CHESTNUT is a noble tree, the *Castanea vesca* of botanists. It produces a well-known edible fruit.——The HORSE-CHESTNUT, a tree of the genus *Æsculus*, the fruit of which is not eaten. The common kind is a native of the north of Asia, and admired for the beauty of its flowers. The *scarlet-flowering horse-chestnut* is a native of Carolina and Brazil.

CHEVAL'-DE-FRISE (a Friesland horse: *Fr.*), generally used in the plural, CHEVAUX-DE-FRISE, spikes of wood, pointed with iron, five or six feet long, fixed in a strong beam and used as a fence against cavalry, or to stop a breach, &c.

CHEVALI'ER (*Fr.*), a foreign title; a cavalier or knight.——In Heraldry, a horseman armed at all points.

CHEVET (*Fr.*), in Architecture, a peculiar form of apse, almost exclusively confined to French-Gothic churches, but something like it is to be seen in Henry VII.'s chapel, Westminster Abbey. It has been defined as an apse enclosed by an open screen of columns, and opening into an aisle which is in connection with apsidal chapels.

CHEVRETT'E (an andiron: *Fr.*), a military term for a kind of gin, or machine, for raising guns or mortars into their carriages.

CHEV'RON (a rafter: *Fr.*), in Heraldry, an honourable ordinary, representing two rafters of a house joined together, or meeting at the top.——PER CHEVRON, a division of the field by two single lines, rising from the two base points, and meeting in a point above, in the same way as the chevron.

CHIAROSCU'RO (the clear obscure: *Ital.*), the art of distributing lights and shadows in painting, so as to give effect to the composition. It is of the highest importance, and is one of the most difficult branches of an artist's study, because of the want of precise rules for its execution. Rembrandt has rendered himself famous for the striking effect of his *chiaro-oscuro*.

CHIAS'TOLITE (*chiastos*, marked with the Greek x, a cross; and *lithos*, a stone: *Gr.*), a curious kind of crystallized mineral, sometimes called *macle*. It consists chiefly of silex and alumina, with a little oxide of iron.

CHICA'NERY (*chicanerie*: *Fr.*), mean or unfair artifices used to perplex a cause or obscure the truth; applied either in a legal sense, when justice is intended to be perverted, or to disputatious sophistry.

CHI'CORY, the popular name of the plant known to botanists as *Cichorium intybus*, nat. ord. *Compositæ*. The root is roasted, reduced to powder, and mixed with ground coffee.

CHIEF (chef: *Fr.*), in Heraldry, one of the honourable ordinaries, which occupies the upper part of the escutcheon. As the head is the chief part of a man, so is the chief the principal part of the escutcheon: it contains a third part of the field.

CHIL'BLAIN, a tumour occasioned by suddenly warming a cold part, or suddenly cooling a heated part: hence the portions of the body most subject to chilblains are the toes, fingers, ears, &c.

CHIL'IAD (*chilias*, a thousand: *Gr.*), the sum or number of one thousand. Hence *Chil'iarch* denotes the military commander or chief of a thousand men; *Chil'iarchy*, a body consisting of a thousand men; *Chiliahe'dron*, a figure of a thousand equal sides; and *Chil'iagon*, a figure of a thousand angles and sides.

CHILL'ED IRON, iron cast in metal moulds, in consequence of which its surface is rapidly cooled, and it is rendered harder than when cast in ordinary moulds.

CHIL'TERN-HU'NDREDS, a range of chalky hills, extending through parts of Oxfordshire and Buckinghamshire, belonging to the crown, and having the office of Steward of the Chiltern Hundreds attached to it. As it is an established rule that a member of parliament receiving a place under the crown cannot continue to sit unless re-elected, the acceptance of the stewardship of the Chiltern Hundreds is a formal manner of resigning a seat. The term *Chiltern* is applied, generally, to hundreds that lie in the hilly part of a county.

CHIME'RA (*chimaira*: *Gr.*), in its modern acceptation, a vain or idle fancy; a creature of the imagination, full of contradictions and absurdities. In fabulous history, a monster with three heads, that of a lion, a goat, and a dragon, vomiting flames. The fore parts of the body were those of a lion, the middle was that of a goat, and the hinder parts were those of a dragon.

CHIMES (*chiamare*, to call: *Ital.*), the musical sounds of bells struck with hammers, often arranged, and set in motion by clockwork. In a clock, a kind of periodical music, produced at certain hours by a particular apparatus.

CHIM'NEY (*cheminée*: *Fr.*; from *kaminos*, a furnace: *Gr.*), in Architecture, a structure of brick or stone containing a funnel to convey smoke and other volatile matter through the roof of a building, from the grate or hearth.

CHIMPAN'ZEE, the *Troglodytes niger*, a large ape, inhabiting the western coast of Africa from about 10° N. to 10° S. of the equator. It attains the height of four feet, and its body is clothed with long coarse black hair, but the hands, face, and large ears are naked. The teeth resemble those of man. The head is flattened above, and has a retiring forehead, and a high bony crest over the high brows. The facial angle is 85°. The fore-fingers, when the animal is upright, do not quite reach the knee. In walking, they tread on the outer edge of the foot. It is said that they live in societies in the wood. Specimens have been brought alive to this country, and, though good-tempered when young, they become ferocious as they grow older.

CHINA, GREAT WALL OF. This wonderful work was erected about 2000 years ago, for the purpose of protecting the Chinese people from the attacks of the northern Tartars. Its length is computed at 1250 miles, and it proceeds up the hills and through the valleys, regardless of the difficulties of the way. There are square towers, about 37 feet high, at irregular intervals. The interior of the wall is earth or rubbish, cased on each side with stone or brick, and having on the top a platform of square tiles. Its height is about 20 feet, with a thickness of 25 feet at the base, and 23 feet at the top. Millions of labourers were employed upon it, by the first universal monarch of China, for ten, or, as some think, for only five years. It is now falling to ruin.

CHI'NA-WARE, takes its name from China, whence the Dutch and English merchants first brought this species of ceramic manufacture into Europe; and is also called *porcelain*, from the Portuguese *porcellana*, a cup or vessel. [See PORCELAIN.] The Japan china is considered superior to all other, of oriental manufacture, in its close and compact granular texture, its sonorousness when struck, its extreme hardness, its smooth and shining appearance, and its capability of being used for boiling liquids. With the Chinese potters, the preparation of the clay is carried on constantly, and it usually remains in the pits from ten to twenty years prior to being used; for the longer it continues there, the greater is its value. The Dresden china has some qualities which render it decidedly superior to the oriental. It exhibits a compact, shining, uniform texture, resembling white enamel, while it possesses firmness, solidity, and non-fusibility by heat. The manufacture of china has been carried to a pitch of great excellence in France and England. The requisite materials for the best hard china are sparingly supplied by nature; but modern chemistry has thrown much light on the ceramic art, not only in enabling the manufacturer to analyze more perfectly the bodies which constitute these wares, but also in determining the exact proportions in which they combine; and if proper attention is paid to the proportions of the several components, there is seldom any failure. Silica obtained from *flints*, and alumina, are the indispensable ingredients; and when these substances are properly combined by means of water, their reciprocal tendencies cause so strong a union that, although hardened merely by evaporation, they resist decomposition by the atmosphere. China is either painted by the hand, which is the most beautiful, but most expensive way; or the designs are very ingeniously transferred from an engraved copper plate, by means of paper. The colours or enamels with which these designs are executed on the glazed surface of ware, with substances so vitrifiable as readily to acquire lustre at a moderate heat, have not yet been in use quite a century.

CHINTZ, a peculiar pattern on calico, in which flowers and other devices are printed in five or six different colours, on a white or coloured ground.

CHIRA'GRA (*Gr.*: from *cheir*, the hand; and *agra*, a catching), in Medicine, a name for gout in the hand.

CHI'ROGRAPH (*cheirographon*: from *cheir*, the hand; and *grapho*, I write: *Gr.*), among the Anglo-Saxons, any public instrument of gift or conveyance, attested by the subscription or crosses of witnesses. A deed requiring a counterpart was engrossed twice on the same piece of parchment, with a space between, on which was written *chirograph*; and the parchment being cut through this word, one portion was given to each party. The chirograph was also anciently used for a fine; and this manner of engrossing fines, and cutting the parchment in two pieces, was, until recently, retained in the chirographer's office, in the Court of Common Pleas.

CHIROL'OGY (*cheir*, the hand; and *logos*, speech: *Gr.*), the art or practice of communicating thoughts by signs made with the hands and fingers, as a substitute for language.

CHI'ROMANCY (*cheir*, the hand; and *manteia*, prophecy: *Gr.*), a species of divination, drawn from the different lines and lineaments of a person's hand. The modern word is *palmistry*. Several books which rank amongst the curiosities of literature have expounded the mysteries of chiromancy. When credulity was more general than at present, chiromancy was much practised. Sir Thomas Browne had evidently an inclination to it, from the way he spoke of 'certain mystical figures in our hands.'

CHIRON'OMY (*cheironomia*: from *cheir*, the hand; and *nemo*, I manage: *Gr.*), in Antiquity, the art of representing any transaction by the gestures of the body, more especially by the motions of the hands. This made a part of liberal education; it had the approbation of Socrates, and was ranked by Plato among the political virtues.

CHIS'LEU, the ninth month of the Jewish year, answering to the latter part of November and the beginning of December.

CHI'TON (a coat of mail: *Gr.*), a genus of marine mollusca, remarkable for the eight plates with which the upper part of the body is protected. The under part forms the disk-like foot by which the animal moves. The genus is placed amongst the Gasteropoda, and more than 200 species are distributed throughout the world. Ten species are known on our own shores.

CHIV'ALRY (*chevalerie*: *Fr.*), the name anciently given to knighthood; also the martial exploits and qualifications of a knight. Chivalry, as a military dignity, is supposed by some to have been first established soon after the death of Charlemagne, and by others to have arisen out of the crusades, because in these expeditions many chivalrous exploits were performed, and a proud feeling of heroism was engendered. In describing the origin, object, and character of this military institution, Gibbon, the historian, thus speaks of a successful candidate for the honour of knighthood, and eulogises the profession: 'He was created a knight in the name of God, of St. George, and of St. Michael the Archangel. He swore to accomplish the duties of his profession: and education, example, and the public opinion, were the inviolable guardians of his oath. As the champion of God and the ladies, he devoted himself to speak the truth; to maintain the right; to protect the distressed; to practice *courtesy*, a virtue less familiar to the infidels; to despise the allurements of ease and safety; and to vindicate in every perilous adventure the honour of his character. The abuse of the same spirit provoked the illiterate knight to disdain the arts of luxury and peace; to esteem himself the sole judge and avenger of his own injuries; and proudly to neglect the laws of civil society and military discipline. Yet the benefits of this institution, to refine the temper of barbarians, and to infuse some principles of faith, justice, and humanity, were strongly felt, and have been often observed. The asperity of national prejudice was softened; and the community of religion and arms spread a similar colour and generous emulation over the face of Christendom. Abroad in enterprise and pilgrimage, at home in martial exercise, the warriors of every country were perpetually associated; and impartial taste must prefer a Gothic tournament to the Olympic games of classic antiquity. Instead of the naked spectacles which corrupted the manners of the Greeks, and banished from the stadium the virgins and matrons, the pompous decoration of the lists was crowned with the presence of chaste and high-born beauty, from whose hands the conqueror received the prize of his dexterity and courage.

CHLA'MYS (*Lat.*, from *chlamūs: Gr.*), in Antiquity, a broad woollen upper garment, or scarf, worn by Grecian horsemen, particularly by those belonging to the army.

CHLO'RAL (an abbreviation formed from the *chlor* of chlorine, and the *al* of alcohol), a chemical substance, consisting of chlorine, carbon, and oxygen, obtained by the action of chlorine on alcohol. It is a limpid, colourless liquid, similar in odour and appearance to the oily fluid which chlorine forms with olefiant gas; but differing from it essentially in density and volatility.

CHLO'RATE, in Chemistry, a compound of chloric acid with a salifiable base.

CHLO'RIDE, in Chemistry, a compound of chlorine with another substance, as the chloride of azote, chloride of calcium, &c.

CHLO'RINE (*chlōros*, green: *Gr.*), a greenish gas, discovered by Scheele in 1774. It is not only irrespirable, but produces the most injurious effects when incautiously inhaled. It is an elementary body, and is nearly twice as heavy as water. Submitted to pressure, it forms a liquid. Phosphorus, and some of the metals, in a finely divided state, take fire spontaneously in it. Its most remarkable property is its power of bleaching; and it has rendered the old and tedious method of exposure to the air unnecessary. It is liberated from sea salt by sulphuric acid and peroxide of manganese. It combines with hydrogen to form a powerful acid, the hydrochloric.

CHLO'RITE, a mineral of a grass-green colour, opaque, and composed of small shining grains. It is usually found in small masses in schist, and it is considered a form of mica.

CHLORO-CARBON'IC ACID, a compound of chlorine and carbonic oxide, formed by exposing a mixture of the two gases to the direct solar rays.

CHLO'ROFORM (*chlorine* and *formyle*), called also *chloro-formyle*, or the *perchloride of formyle*; a new anæsthetic agent, used as a substitute for sulphuric ether in surgery. Its constituents are two atoms of carbon, one of hydrogen, and three of chlorine. It is a dense, limpid, colourless liquid, readily evaporating, and possessing an agreeable, fragrant, etherial odour, and a saccharine pleasant taste. When poured upon water the greater part sinks in globules, which are of a milk-white appearance if the chloroform is not perfectly free from alcohol. It is prepared, on the large scale, by cautiously distilling a mixture of good commercial chloride of lime, water, and alcohol. The whole product passes over with the first portion of the water. When its vapour is inhaled, it induces insensibility more rapidly and effectually than the vapour of ether; hence its use in the performance of painful surgical operations. A little of the liquid diffused upon the interior of a hollow-shaped sponge, a pocket-handkerchief, or a piece of linen or paper, and held over the mouth and nostrils so as to be fully inhaled, generally suffices in about a minute or two to produce the desired effect, but from its action on the heart, it ought never to be administered except under the superintendence of a medical man.

CHLORO'PAL (*chlōros*, green; and *opallios*, the opal: *Gr.*), a greenish-yellow mineral, associated with the opal of Hungary. It is a hydrated silicate of iron.

CHLO'ROPHANE (*chloros*, green; and *phaino*, I make to shine: *Gr.*), in Mineralogy, a variety of fluor spar, found in Siberia. When placed on a heated iron it gives a beautiful emerald green light.

CHLO'ROPHYL (*chloros*, green; and *phullon*, a leaf: *Gr.*), the green matter of the leaves of vegetables.

CHLORO'SIS (*chloros*, green: *Gr.*), a disease incident to females, characterized by a pale or greenish hue of the skin.

CHOC'OLATE, a cake or paste, made from the kernel of cocoa, mixed with sugar and some aromatic substance, such as cinnamon or vanilla.

CHOIR (*choros: Gr.*), that part of a cathedral where the service is performed. Also, the body of singers there assembled. Hence the word *chorister* is used for a singer whose vocal powers are exercised in divine service.

CHO'KE-DAMP, the miner's name for

carbonic acid gas, which is frequently found in mines and is irrespirable. [See DAMPS.]

CHOL'AGOGUES (*cholos*, bile; and *ago*, I conduct; *Gr.*), medicines which expel or evacuate bilious fæces.

CHOL'ERA (*Gr.*, from *cholē*, bile), a disease of which there are two species: *Cholera spontanea*, which happens in hot seasons without any manifest cause: and *Cholera accidentalis*, which occurs after the use of food that digests slowly and irritates. In warm climates it is met with at all seasons of the year, and its occurrence is very frequent; but in England and other cold climates it is prevalent in the middle of summer, particularly in the month of August, and the severity of the disease has usually been greater in proportion to the intensity of the heat. It is characterized by an evacuation of bile, attended with anxiety, painful gripings, vomitings, spasms of the abdominal muscles, and those of the calves of the legs. The disease sometimes proceeds with violence, and, if unchecked in its early stages, great depression of strength ensues, and it may quickly terminate in death. But it must not be confounded with the

CHO'LERA MOR'BUS (*cholera* and *morbus*, a disease: *Lat.*), the *Asiatic*, or *spasmodic cholera*. In Hindostan, spasmodic cholera has probably always existed as a comparatively mild disease; but there is no evidence to show that the Indian cholera ever bore the epidemic character, or was entitled to rank with pestilential scourges of the worst description, till August, 1817, when it suddenly broke out with unprecedented malignity, attacking the natives first, and manifesting itself among the Europeans in the following month. It raged with great violence, from January to May, 1818, extending its destructive influence across the country from the mouth of the Ganges to its confluence with the Jumna. It appeared in its most malignant form at Benares, where in two months 15,000 persons perished. In the district of Gorrakpore 30,000 were carried off in a month. By November the epidemic had reached the grand army, commanded by the Marquis of Hastings, consisting of 10,000 troops and 80,000 followers: and in twelve days nearly 9000 men had fallen victims to it. Previous to the 14th, it had overspread the camp, sparing neither age nor sex; from the 14th to the 20th, the mortality had become so extensive that the stoutest hearts were yielding to despair, and the camp wore the aspect of a general hospital. The noise and bustle almost inseparable from the presence of a multitude of human beings had nearly subsided into stillness: and nothing was to be heard but the groans of the dying, or the wailing for the dead. In 1819 it reached the kingdom of Arracan: it then extended itself into Siam, and after destroying 40,000 in Baku, the capital, it passed into the peninsula of Malacca. From thence it travelled to China. Canton was attacked in 1820; and at Pekin the mortality was so frightful that the government was obliged to have the dead interred at its own expense. From China it passed to the Philippine and Spice Islands. Thus, in little more than two years, did it traverse a space, in Eastern Asia, of 1300 leagues from north to south, and about 1000 leagues from west to east. During the next two years Arabia, Persia, Mesopotamia, and Syria, were overrun by the dreadful pestilence. In September, 1823, it entered Astracan, a large and populous town on the northern shore of the Caspian. As soon as this became known to the Russian government, a medical commission, composed of six physicians, was despatched to investigate its character, and every preventive measure was resorted to. How far these precautions were connected with the result it may be difficult to decide; but certain it is, the disease got no farther in that direction that year than Astracan, and did not again visit Russia until towards the close of 1828, when it unexpectedly appeared at Orenburg, and in 1830 it again made its insidious entrance at Astracan. At length it reached Moscow, where a *cordon sanitaire* was speedily established, temporary hospitals erected, and the emperor himself visited the town when the disease was at its height. At first the mortality was as great as nine-tenths of all who were attacked, but the number who were infected gradually decreased, and the mortality proportionately diminished. Poland, Prussia, and other parts of Germany, soon after felt its devastating effects: in November, 1831, it reached England; in March, 1832, it broke out at Paris, where 20,000 fell a sacrifice to it in a short time; and in June, 1832, it appeared at Quebec, in Canada, and subsequently spread over the whole American continent. In 1849 and 1854 it reappeared in all its terrors, and, as in 1832, made the tour of the globe; the main points in which it differed from the former visitation being the longer continuance of the disease in the places visited, the greater tendency to subside and reappear, and the higher mortality it occasioned. The most remarkable feature of this disease is the suddenness of its attack. It begins with watery diarrhœa, or other generally slight indisposition, which is followed by vomiting or purging of a white or colourless fluid, violent cramps, and great prostration and a *collapse*, which occur at the same time with the vomiting and cramps, or shortly after them. Should the patient survive the last train of symptoms, a state of excitement and fever supervenes. For a considerable time the medical world was much divided in opinion as to the contagious or non-contagious nature of cholera; the disputes on this subject, however, have now nearly subsided, the great majority of medical men being persuaded that the disease is epidemic, and not contagious in its character.

CHOLES'TERIC ACID (*cholē*, bile; and *stereos*, solid: *Gr.*), a peculiar acid, formed from *cholesterine* and *nitric acid*. It is in crystals of a yellowish-white colour, scarcely soluble in water, but perfectly so in boiling alcohol.

CHOLES'TERINE (same *deriv.*), a pearly substance, found abundantly in human biliary calculi.

CHONDROL'OGY (*chondros*, a cartilage; and *logos*, a discourse: *Gr.*), a description of cartilages.

CHOP'STICKS, the Chinese substitutes for our knife and fork at meals. They are thin pieces of ivory, ebony, or bamboo, and are used with extraordinary dexterity in carrying food to the mouth, the smallest pieces being readily laid hold of and conveyed to the lips. More than 400 millions of the human race employ these simple implements.

CHORD (*chordē*, the string of a lyre: *Gr.*), in Music, the combination of two or more sounds heard at the same time, and forming a concord or discord; as a third, fifth, and eighth.——In Geometry, a right line drawn from one part of the arc of a circle to another.

CHORE'A (*choros*, a dance: *Gr.*), a disease which manifests itself in convulsive motions of the limbs, face, head, and trunk, and is called *St. Vitus's dance.* It is most common in early life, from ten or twelve to puberty. The early stages should be attentively watched, and great care should be taken in the cure, lest relics of it be retained through life.

CHORE'US (*Lat.*; from *choreios*, literally, belonging to a dance: *Gr.*), in Ancient Poetry, a foot of two syllables, the first long, and the second short; the *Trochee*.

CHORIAM'BUS, in Ancient Poetry, a compound foot, consisting of a choreus and an iambus.

CHOROG'RAPHY (*chorographia*, from *chōra*, a district; and *grapho*, I write: *Gr.*), the art of delineating or describing some particular country or province. It differs from *geography* as a description of a particular country differs from that of the whole earth, and from *topography* as the description of a country from that of a town or district.

CHO'ROID (*chorion*, leather; and *eidos*, appearance: *Gr.*), in Anatomy, the coat of the eye immediately under the sclerotica; also the inner membrane investing the brain, the pia mater, &c.

CHO'RUS (*choros*: *Gr.*), in ancient dramatic poetry, one or more persons present on the stage during the representation, uttering an occasional commentary on the piece, preparing the audience for events that are to follow, or explaining circumstances that cannot be distinctly represented. Several examples of its use may be referred to by the English reader in the plays of Shakspeare. In Tragedy, the chorus was at first the sole performer; at present it is wholly discontinued on the stage.——CHORUS, in Music, those parts of a song at which the whole company are to join the singer in repeating certain couplets or verses.

CHOUGH (*ceo*: *Sax.*), or red-legged crow, the *Fregilus graculus* of naturalists. It is nearly of the size of the common crow, and mischievous like the magpie. In this country it builds in cliffs and old buildings near the sea, and is chiefly found in Cornwall, but it is an inhabitant of various parts of Europe, and has been met with in the Himalayas. Its plumage is black, the bill, legs, and feet red.

CHRISM, or **CHRIS'OM** (*chrisma*, an ointment: *Gr.*), in the Romish and Greek churches, the oil used in the administration of baptism, confirmation, ordination, and extreme unction. It is consecrated in Holy Week, with many ceremonies.

CHRIST'MAS-ROSE, the *Helleborus niger* of botanists, a plant belonging to a poisonous genus. It takes its common name from putting forth its white flowers about Christmas.

CHRIST'S-THORN, the *Paliurus aculeatus* of botanists, nat. order, *Rhamnaceæ*, a deciduous thorny shrub, which grows in the south of Europe and Judæa. It is thought that the crown of thorns at the crucifixion was taken from this plant. The fruit is curious, somewhat resembling a head with a broad-brimmed hat.

CHRO'MATE, in Chemistry, a salt or compound formed by the union of chromic acid and a base.

CHROMAT'IC (*kroma*, colour: *Gr.*), in Music, a term indicating that which proceeds by several consecutive semitones.

CHROMAT'ICS (same *deriv.*), that part of optics which explains the several properties of light and colour. Newton showed that colour is not a quality inherent in bodies. If viewed in light of any particular colour, they are of that colour. Every substance, however opaque in ordinary circumstances, if sufficiently thin, is capable of transmitting light: thus gold. Hence, all ponderable matter absorbs some light: the rest is reflected, or, if not extinguished in its passage, is transmitted. A portion of the light which falls on every body passes through its surface, and is to some extent reflected back by its particles. But the different coloured rays are unequally absorbed, which gives rise to the production of colours with that portion of the absorbed rays which are reflected back, and reach the eye of the spectator. Colour is produced by the interference of rays [see INTERFERENCE], and also when white light is decomposed by means of a refracting body of appropriate shape. [See SPECTRUM.]

CHRO'MIUM (same *deriv.*), in Mineralogy, a metal which in its highest degree of oxidation is an acid (chromic acid) of a ruby red colour. It takes its name from the various and beautiful tints which its oxide and acid communicate to the minerals into whose composition they enter. Thus chrome gives a fine deep green to the enamel of porcelain, &c. *Chrome yellow*, the artificial chromate of lead, is a beautiful pigment. Chromium itself is obtained from the oxide by exposing it along with charcoal, to the highest heat of a powerful furnace. It is hard, brittle, and of a greyish white colour. It is very difficult to melt, and the strongest acids have little effect upon it. Its specific gravity is 5·9; its equivalent 26·7. Bichromate of potash, which forms fine red tabular crystals, is largely manufactured for the use of dyers, photographers, and others.

CHRO'MO-LITHOG'RAPHY. The obtaining lithographic impressions by means of coloured inks. [See LITHOG'RAPHY.]

CHRON'IC (*chronos*, time: *Gr.*), in Medicine, a term applied to inveterate diseases or those of long duration; in contradistinction to those which make more rapid progress, and are termed *acute*.

CHRON'OGRAM (*chronos*, time; and *gramma*, a writing: *Gr.*), an inscription in which a certain date or epoch is expressed by some of the letters. They are sometimes in a larger character. Thus, in a medal of Gustavus Adolphus, 'chrIstVs DVX, ergo trIVMphVs,' 'Christ was our leader, hence our success.' 'MDXVVVII' indicates the year MDXXVII.

CHRONOL'OGY (*chronologia*: from *chronos*, time; and *logos*, a discourse: *Gr.*), the science which determines the dates of events and the civil distinctions of time. The divisions of time are either natural or artificial; the *natural* are the year, month, week, day, and hour, deduced from the motions of the heavenly bodies and suited to the purposes of ordinary life; the *artificial* are the various *eras*, commencing with arbitrary *epochs*, or important events. The confusion and doubt attending chronological research arise not only from the number of eras, but from their subdivision. The natural divisions of time are not always employed. Thus, the lapse of time has been frequently estimated by generations, or the reigns of kings. And even when the solar year was used, as neither its beginning nor end is marked by any striking event, its precise length was not at first accurately ascertained. Sometimes the solar year was adopted, and sometimes the lunar; at others, as among the Jews, a combination of both. Hence there is little agreement between chronologers regarding the most important events of antiquity. There have been upwards of 200 different calculations of the number of years between the creation and the commencement of the Christian era; and there are 3501 years of difference between the longest and shortest period assigned.

CHRONOM'ETER (*chronos*, time; and *metron*, a measure: *Gr.*), a watch of a peculiar construction, or any instrument that measures time with great exactness. Chronometers are at present much employed by navigators in determining the longitude at sea. They differ from watches chiefly in the principle of their escapement, which is so constructed, that the balance is entirely free from the wheels during the greater part of its vibration, and is compensated for changes of temperature: also the balance spring, unlike that of a watch, is a spiral, whose coils are all of the same size, and not in the same plane.

CHRYS'ALIS (*chrusallis*, from *chrusos*, gold: *Gr.*), or AURE'LIA (*aurum*, gold: *Lat.*), the second metamorphosis of a lepidopterous insect, after which it becomes a butterfly or moth.

CHRYSAN'THEMUM (*chrusos*, gold; and *anthos*, a flower: *Gr.*), in Botany, a genus of plants with handsome flowers appearing in autumn, nat. ord. *Compositæ*.

CHRYS'OBERYL (*chrusoberullos*: from *chrusos*, gold; and *berullos*, a beryl: *Gr.*), a yellowish gem, generally found in small round pieces, or crystallized in eight-sided prisms. It is used in jewellery, and is next to the sapphire in hardness. Its chief constituents are alumina and glucina. It has been found in Brazil and North America.

CHRYS'OLITE (*chrusos*, gold; and *lithos*, a stone: *Gr.*), a mineral of a greenish hue, often transparent. It is sometimes granular, and at other times occurs in small crystals. It is found in Upper Egypt, and is employed in jewellery. It is composed of magnesia, silica, and oxide of iron. Olivine is considered a variety of it.

CHRYSOM'ELA (*chrusos*, gold; and *melas*, black: *Gr.*), a genus of phytophagous beetles. The elytra usually possess a metallic lustre.

CHRYSOPŒ'IA (*chrusos*, gold; and *poieo*, I make: *Gr.*), in Alchemy, that part of the art which professes to teach the making of gold out of less perfect metals.

CHRYS'OPRASE (*chrusos*, gold; and *prason*, a leek: *Gr.*), in Mineralogy, an amorphous quartz, coloured light green by oxide of nickel. It has been found in Silesia and North America.

CHRYSOSPLE'NIUM (*chrusos*, gold; and *splēn*, the spleen: *Gr.*, from its supposed power in diseases of the spleen), a genus of plants, nat. ord. *Saxifragaceæ*, including the golden saxifrage, a herb wild in Britain.

CHURCH (*kirche*: *Germ.*), in religious affairs, a word which is used in several senses. It means:—1. The collective body of persons professing one and the same religion; or that religion itself: thus, we say the Church of Christ. 2. Any particular congregation of Christians associating together; as the Church of Antioch. 3. A particular sect of Christians; as the Greek Church, or the Church of England. 4. The body of ecclesiastics, in contradistinction to the laity. 5. The building in which a congregation of Christians assembles, &c.

CHURCHWAR'DENS, officers annually chosen by the minister and vestry to superintend the church, its property, and concerns.

CHYLE (*chulos*: *Gr.*), a white or milky fluid in the stomach, consisting of the finer and more nutritious parts of the food, which is received into the lacteal vessels, assimilated into blood, and gradually converted into the different substances which constitute the animal body.

CHYLIFAC'TION (*chulos*, chyle: *Gr.*; and *facio*, I make: *Lat.*), the process of digestion by which the aliment is converted into chyle.

CHY'LO'POIE'TIC (*chulos*, chyle; and *poieo*, I make: *Gr.*), having the power to convert into chyle.

CHYME (*chumos*, juice: *Gr.*), the result of the action of the stomach upon the food conveyed to it before its conversion into chyle.

CICA'DA (a tree cricket: *Lat.*), a genus of homopterous insects, allied to the grasshoppers and locusts. They feed on the juice of shrubs and trees, having a peculiar apparatus for piercing the bark. The organ of sound is peculiar to the male, and is situated on each side of the lower and anterior part of the abdomen. In warm regions, such as the south of France and

Italy, these insects, in summer, make a loud and continual noise. This chirping song has been celebrated by the ancient poets of Greece and Rome. The manna of the shops is the inspissated juice of the *Fraxinus Ornus*, poured out from wounds inflicted by the *Cicada Orni*.

CICATRIC'ULA (a *dim.* of *cicatrix*, a scar: *Lat.*), a small whitish speck in the yolk of an egg, supposed to be the germinating point or first rudiment of the chick. Whatever way the egg is turned, the part of the yolk containing it is always uppermost.

CIC'ATRIX, or CIC'ATRICE (*cicatrix: Lat.*), in Surgery, a scar, or elevation on the skin, caused by callous flesh, and remaining there after a wound or ulcer has healed.

CICATRI'ZANT (same *deriv.*), a medicine or application that promotes the formation of a cicatrix, called also an escharotic, agglutinant, &c.

CICERO'NE (probably from the Italian guides having been ironically compared, on account of their garrulous eloquence, with Cicero), an individual who acts as a *guide*.

CICERO'NIANS, epithets given by Muretus, Erasmus, &c., to those moderns who were so ridiculously fond of Cicero as to reject every Latin word, as obsolete or incorrect, that could not be found in some one or other of his works. The word *Ciceronian* is also used as an epithet for a diffuse and flowing style, and a vehement manner.

CICISBE'O (*Ital.*), one who dangles about females. It was formerly the custom for almost every fashionable Italian lady to have a *cicisbeo* in her train.

CID, Romances of the, a number of ancient Spanish poems, celebrating the martial deeds and love adventures of Rodrigo Laynez, who was born in the reign of Sancho, King of Castille, towards the beginning of the 11th century, and died in 1099. He was surnamed by some Moorish generals whom he had conquered, Es Sayd, or My Lord, corrupted by his countrymen into Cid, who also shortened his Spanish name to Ruy Dias. He is the hero of many poems and dramas of a later age, written in the Spanish and other languages. The Cid was more instrumental, says Sismondi, than even the princes whom he served, in founding the monarchy of Castille, and he is intimately connected with all our ideas of the glory, the love, and the chivalry of the Spanish nation. In the foreground of their history and their poetry, the Cid stands conspicuous, while the renown of his name fills the age in which he lived.

CI'DARIS, in Antiquity, the mitre used by the Jewish high-priest.——In Zoology, a genus of sea-urchins.

CIL'ERY (*cilium*, the eyelid: *Lat.*), in Architecture, a term applied to ornaments of foliage and drapery on the capitals of columns.

CIL'IA (*Lat.*), in Anatomy, the *eyelashes*; certain rigid hairs situated on the arch or tarsus of the eyelids, and bent in a very singular manner. Their object is to keep external bodies out of the eye, and moderate the influx of light.—Also certain microscopic threads, attached by one end to the surfaces of some parts of animals and plants. They have a vibratory or rotatory motion, by means of which certain objects are effected. In man there are cilia in the larynx, trachea, bronchi, and other internal parts. The heads of wheel animalcules possess rings of them.

CIL'IARY (same *deriv.*), in Anatomy, an epithet for several parts belonging to the *cilia*, or eyelashes; as the *ciliary glands*, &c.

CIL'IATED (same *deriv.*), in Botany, furnished or surrounded with parallel filaments, somewhat like the hairs of the eyelids.

CILI'CIUM (*Lat.*; from *kilikion*, made from Cilician goat's hair: *Gr.*), in Hebrew Antiquity, a sort of habit of coarse stuff, formerly in use among the Jews in times of mourning and distress. It is the same with what the Septuagint and Hebrew versions call sackcloth.

CIM'BRIC, pertaining to the Cimbri, the inhabitants of the Cimbric Chersonese, now Jutland.

CIMME'RIAN, pertaining to the country of the Cimmerians, whose chief town was *Cimmerium*, at the mouth of the Palus Mæotis. The ancients pretended that its unexplored portion was involved in darkness; whence the phrase 'Cimmerian darkness,' to denote a deep or continual obscurity. The country is now called the *Crimea*.

CIM'OLITE (from *Cimolus*, now Argentiera, where it abounds; and *lithos*, a stone: *Gr.*), a species of earth, of which there are several varieties; one, of a purple colour, is the steatite, or soap rock: and from another, found in the Isle of Wight, tobacco pipes are made. It is chiefly composed of alumina.

CINCHO'NA. [See QUININE.]

CINC'TURE (*cinctura*, from *cingo*, I bind round: *Lat.*), in Architecture, a ring, list, or orlo, at the top and bottom of a column, separating the shaft at one end from the base, and at the other from the capital.——Also, the cord used in the Roman Catholic church to tie up the alb, or linen garment, of the priest, &c., and fasten other portions of his dress.

CINEMATICS, or KINEMATICS (*kinēma*, a movement: *Gr.*), a branch of Geometry having for its subject the comparison of motions with each other without reference to their causes.

CINERI'TIOUS (*cinericius*, similar to ashes: *Lat.*), an appellation given to different substances, on account of their resembling ashes, either in colour or consistence.

CIN'NABAR (*kinnabari*: *Gr.*), a compound of mercury which is either native or factitious. *Native cinnabar*, the only valuable ore of that metal, a sulphuret, is moderately compact, very heavy, and of a fine striated red colour, chiefly found in New Castile and Carniola. It is called native vermilion, and when used by painters is rendered more beautiful by grinding with gum-water and a little saffron. It is found amorphous, or under some imitative form, and crystallized. *Factitious* cinnabar, the bisulphuret of mercury, is purified by sublimation, and thus rendered of a fine red colour.

CIN'NAMON (*kinamon : Heb.*), a fragrant spice, the bark of the *Cinnamomum Zeylanicum*, a Ceylon tree, belonging to the nat. ord. *Lauraceæ*, which yields, by distillation, an extremely pungent and volatile oil. There is an inferior and insipid kind, often found in commerce; but the true cinnamon is a most grateful aromatic, and one of the best cordial carminative spices. The leaves resemble those of the olive, and the fruit has neither the smell nor taste of the bark; both yield an essential oil.

CINQUECEN'TO (*Ital.*), in the Fine Arts, an expression applied to architectural works, carvings, &c., executed in Italy in the 15th century, or afterwards in imitation of them. The chief architects of that time were Brunelleschi and Bramante; Michael Angelo, Sansovino, and Palladio, adopted the same style, and are classed with the cinquecentists. The words *cinque cento* literally mean five hundred: they are an abridgement of the Italian phrase for one thousand five hundred.

CINQ'UEFOIL (*cinq*, five; and *feuille*, a leaf : *Fr.*), *five-leaved clover*, a leguminous perennial. This plant is sometimes borne in coats of arms.——In Architecture, an ornamental foliation used in arches, the tracery of windows, panellings, &c. It is formed by projecting points, or cusps: so arranged that the intervals between them resemble five leaves.

CINQUE-PORTS (five harbours : *Fr.*), the five ancient ports on the east coast of England, opposite to France: namely, Dover, Hastings, Hythe, Romney, and Sandwich, to which were afterwards added, as appendages, Winchelsea, Seaford, and Rye. As places where strength and vigilance were necessary, and whence ships might put to sea in cases of sudden emergency, they formerly received considerable attention from government. They have several privileges, and are within the jurisdiction of the Constable of Dover Castle, who is called Warden of the Cinque-Ports. Until the time of Henry VIII. the crown seems to have had no permanent navy; the Cinque-Ports having always furnished nearly the whole of the shipping required for the purposes of the state. The jurisdiction of the Cinque-Ports extends along the coast continuously from Birchington, which is to the north-east of Margate, to Seaford in Sussex; and each of them includes one or more ports or towns, some of which are corporate, and others not.

CI'PHER, or CY'PHER (*saphar*, to number: *Heb.*), one of the Arabic characters used in computation, formed thus, 0. A cipher standing by itself signifies nothing; but when placed at the right-hand side of a digit in the *integer's* place, it increases the value of the digit tenfold; thus 500 is ten times greater than 50. But, placed at the left-hand side of a digit in the *decimal's* place, it decreases its value tenfold: thus, ·005 is ten times less than ·05.——CIPHER, a secret or disguised manner of writing; in which certain characters arbitrarily invented and agreed on by two or more persons are made to stand for letters or words. It was not unknown to the ancients: for we learn from Suetonius, that when Julius Cæsar wrote to Cicero, and other friends, regarding his domestic affairs, he used a kind of cipher.

CIP'OLIN (*cipolla*, an onion : *Ital.*), a green marble containing white zones, something like those in the section of an onion.

CIP'PUS (*Lat.*), in Antiquity, a low column either round or rectangular, erected on the high roads or in other places, to show the way to travellers, to serve as a boundary mark, or as a monument over a grave. In the latter case the letters STTL were frequently cut upon it, signifying *Sit tibi terra lævis*, 'may the earth be light upon thee.' Examples of cippi may be seen in the British Museum, and other collections of antiquities.

CIRCE'AN, pertaining to Circe, the fabled daughter of Sol and Perseus, who was supposed to possess a knowledge of magic and venomous herbs, which enabled her to charm and fascinate. Ulysses, according to Homer, was detained a whole year by Circe on her island.

CIRCEN'SIAN GAMES (*Circenses ludi*), a general term, under which were comprehended all combats exhibited in the Roman circus, in imitation of the Olympic games in Greece. Most of the feats of the Romans were accompanied with Circensian games: and the magistrates and other officers of the republic frequently presented the people with them, in order to gain their favour; but the great games were held for five days, commencing on the 15th of September.

CIR'CINATE (*circino*, I make round : *Lat.*), in Botany, an epithet applied to plants whose leaves are rolled in, spirally, and downwards, the tip occupying the centre, as in ferns.

CIR'CLE (*circulus : Lat.*), in Geometry, a plane figure bounded by a curved line, which is called its circumference, and is everywhere equally distant from a point within, called its centre; also, the circumference or periphery itself. A circle is described with a pair of compasses, by fixing one foot in the centre and turning the other round to trace out the curved line. The circumference of every circle is supposed to be divided into 360 equal parts, which are called degrees, and are marked °; and each degree into 60 minutes, marked ′. The rectification of the circle, or the determination of the ratio of the circumference to the diameter, is a problem which has exercised ignorance in all ages. In a rough way, the diameter may be considered as one-third of the circumference. But more accurately, and in ordinary measurements, it may be assumed to have the ratio of 113 to 355; that is, to find the circumference multiply the diameter by 355, and divide the result by 113. These numbers are easily remembered, since they are the three first odd numbers repeated twice, 113 355. The areas of circles are as the squares of their diameters. Thus the areas of two circles, one two feet in diameter and the other three, are as

4 is to 9; 4 and 9 being the squares of 2 and 3. ——**CIRCLES OF LATITUDE** are great circles perpendicular to the plane of the ecliptic, passing through its poles, and through the different stars and planets.——**CIRCLES OF LONGITUDE** are lesser circles parallel to the ecliptic, and diminishing as they recede from it.——**DIURNAL CIRCLES** are circles apparently described by the several stars and other points in the heavens during the rotation of the earth on its axis.——**HORARY CIRCLES**, in Dialling, are the lines which show the hour on dials.

CIR'CUITS (*circuitus*, a going round: *Lat.*), certain districts or divisions of the kingdom, in which the judges hold courts and administer justice, usually during the vacations after Hilary and Trinity terms. The six jurisdictions into which England is divided by the judges are called the Home, Norfolk, Midland, Oxford, Western, and Northern circuits. Wales is divided into North and South circuits; and Scotland into South, West, and North.

CIRCULA'TION (*circulatio*, from *circulor*, I go round: *Lat.*), in Anatomy, the natural motion of the blood in a living animal, by which it proceeds *from* the heart to all parts of the body by the arteries, and returns *to* the heart by the veins. The *circulation of the blood* is performed in the following manner. It is returned to the right auricle of the heart, by the descending and ascending vena cava, which, when distended, contracts and sends it into the right ventricle; from the right ventricle it is propelled through the pulmonary artery, to circulate through and undergo a change in the lungs, being prevented from returning into the right auricle by the closing of valves. Having undergone this change in the lungs, it is brought to the left auricle of the heart by the four pulmonary veins, and thence is evacuated into the left ventricle. The left ventricle, after having been distended, contracts, and throws the blood through the aorta to every part of the body, by the arteries, to be returned by the veins into the vena cava. It is prevented from passing back from the left ventricle into the auricle by a valvular apparatus; and the beginning of the pulmonary artery and aorta is also furnished with similar organs which prevent its returning into the ventricles. [See **AURICLE**.]

CIR'CULUS (*Lat.*), in Anatomy, any round or annular part of the body: as the *circulus oculi*, the orb of the eye.

CIRCUMAM'BIENT (*circum*, about; and *ambio*, I encompass: *Lat.*), an epithet given to anything that surrounds or encompasses another on all sides: it is chiefly used in speaking of the air.

CIRCUMCIS'ION (*circumcisio*, from *circumcido*, I cut round: *Lat.*), a ceremony in the Jewish and Mahometan religions, performed by cutting off the prepuce, or foreskin. The time for performing this rite, according to the Judaical law, was the eighth day, that is, six full days after the child was born. The Jews distinguished their proselytes into two sorts, according as they had been circumcised or not: those who submitted to this rite were looked upon as children of Abraham, and obliged to keep the laws of Moses; the uncircumcised were only bound to observe the precepts of Noah, and were called *Noachidæ*. Circumcision was practised very generally in ancient times by the eastern nations, but not perhaps as a religious ceremony. It is enforced by the Koran on all the disciples of Mahomet.

CIRCUMFERE'NTOR (*circumfero*, I carry round: *Lat.*), a mathematical instrument used by land-surveyors for taking angles by the magnetic needle. It consists of a graduated brass circle, with an index, all of one piece, and a magnetic needle, suspended above the centre of the circle. The index is first directed to one object, and the angle which it makes with the magnetic meridian is noted: it is then directed to the second object, and the angle it makes with the same meridian is also noted. The sum or difference of these angles gives the angle between the objects. The circumferentor is much used in surveying in and about woodlands, commons, harbours, sea-coasts, and in the working of coal-mines, &c., where great accuracy is not necessary.

CIR'CUMFLEX (*circumflexus*, from *circumflecto*, I bend: *Lat.*), in Grammar, an accent said to be a combination of the grave and acute, as used by the French and the ancient Greeks: it lengthens the syllable, and is generally employed where a contraction has taken place, or to distinguish one word from another which is spelt in the same way.

CIRCUMGYRA'TION (*circum*, around; and *gyrus*, a circle: *Lat.*), in Anatomy, the turning a limb round in the socket.

CIRCUMLOCU'TION (*circumlocutio*, from *circumloquor*, I use a periphrasis: *Lat.*), a periphrastical method of expressing one's thoughts, or the saying in many words that which might have been said in few.

CIRCUMPO'LAR (*circum*, around; and *polus*, the pole: *Lat.*), an appellation given to those stars which, from their vicinity to the pole, seem to revolve round it without setting.

CIRCUMSTAN'TIAL EV'IDENCE (*circumstantia*, a circumstance: *Lat.*), in Law, indirect and inferential evidence. Its value varies from absolute proof to a case of vague conjecture.

CIRCUMVALLA'TION (*circumvallo*, I surround with a rampart: *Lat.*), or **LINE OF CIRCUMVALLATION**, in the art of War, is a trench bordered with a parapet, thrown up round the besiegers' camp, or a besieged city. It is composed of earth dug from the ditch, and is rendered more effective by sharp stakes planted in it.

CIR'CUS (*Lat.*; from *kirkos*, a circle: *Gr.*), in Antiquity, a long narrow building, rounded at the ends, its length being generally four times its breadth. It was divided down the centre by an ornamental barrier, called the *spina*, and was used by the Romans for chariot races, &c.: the Circus Maximus, at Rome, was nearly a mile in circumference.——In modern times, the word is applied to designate a circular enclosure for the exhibition of feats of horsemanship, and is often termed a hippodrome

CIR'RI (*cirrus*, a tendril: *Lat.*), in Botany, the fine strings or thread-like filaments, by which some plants fasten themselves to walls, trees, &c., such as those of the vine and passion-flower.——CIRRI, in Ichthyology, certain soft appendages, not unlike little worms, hanging from the under jaws or mouths of some fishes, and commonly called beards. Amongst fresh-water fishes, the barbel and gudgeon—amongst marine fishes, the cod and haddock, have cirri.——CIRRI, in Meteorology, light thin clouds at a considerable elevation in the air: they are often curved, and present an appearance of fibres like a lock of hair.

CIRRIF'EROUS (*cirrus*, a tendril; and *fero*, I bear: *Lat.*), in Botany, an epithet for a plant bearing tendrils.

CIRRI'PEDIA, CIRRI'PEDES (*cirrus*, a tendril; *pedes*, feet: *Lat.*), a class of invertebrate animals, allied in structure to the crustaceans. [See BARNACLES.]

CISAL'PINE (*cisalpinus*: from *cis*, on this side; and *Alpes*, the Alps: *Lat.*), on this side the Alps, as regards Rome. It must be observed, however, that what was *Cisalpine* with respect to the Romans is *Transalpine* with reference to us.

CIS'PADANE (*cispadanus*; from *cis*, on this side; and *Padus*, the Po: *Lat.*), on this side the river Po, with regard to Rome—that is, on the south side.

CISTER'CIANS (*Citeaux*, near Dijon, in France), in Church History, a religious order founded in the 11th century by St. Robert, a Benedictine.

CIS'TUS (*cista*, a chest: *Lat.*), from the seeds being enclosed in a capsule), in Botany, a genus of plants, nat. order *Cistaceæ*, including the rock rose. Many of the species are beautiful evergreen flowering shrubs, and most of them natives of the southern parts of Europe.

CITA'TION (*cito*, I summon: *Lat.*), in Ecclesiastical Courts, the same with *summons* in Civil Courts.——In the Civil Law, reference to an authority or precedent in the course of pleading is termed a *citation*: and hence the same term is applied to a quotation of some law, authority, or passage from a book.

CITH'ERN (same *deriv.*), an ancient stringed instrument, supposed to bear a resemblance to the guitar.

CIT'RATE (*citreum*, the citron: *Lat.*), in Chemistry, a neutral salt, formed by the union of citric acid with a base.

CIT'RIC ACID (same *deriv.*), in Chemistry, an acid which is found in the juices of lemons and limes, and gives them a sour taste. It is a compound of carbon, hydrogen, and oxygen. The crystallized form of the acid contains water. This is one of the acids employed to make effervescing draughts.

CIT'RINE (same *deriv.*), a species of crystal, of a beautiful yellow colour. It is found in columns, which terminate in an hexangular pyramid.

CIT'RON (same *deriv.*), the fruit of the citron-tree (the *Citrus medica* of botanists), which has an upright smooth stem, rising from five to fifteen feet, with a branching head, and large oval spear-shaped leaves. The tree is a native of Upper Asia, from whence it was brought into Greece, and afterwards transplanted into Italy. The citron is cultivated on account of its rind, which is candied or otherwise preserved.——CITRON, a species of melon, used in America, for making a preserve, which resembles the ordinary preserved citron of Europe.

CITY (*cité*: *Fr.*). The word signifies in England a town which is or has been the seat of a bishop, or the capital of his see. It differs from a borough, merely in being of superior dignity. Some cities and a few boroughs, are counties in themselves. War having rendered it requisite that cities should be defensible posts, the smallness of the space they occupied became a consideration of importance. Their inhabitants, therefore, were obliged to crowd themselves together as much as possible; and among the expedients resorted to was that of building apartments over one another, to multiply the number of dwellings without increasing the superficial magnitude of the place. Trade, by collecting a multitude of persons on one spot, has been the origin of many cities. They usually possess, by charter, a variety of peculiar privileges which, though now apparently the result of a narrow policy, were, in their institution, grants of freedom at that time possessed nowhere else; and by them the spell that maintained feudal tyranny was gradually broken.

CIV'ET (*civette*: *Fr.*; from *sibetta*, a scent: *Arab.*), a brown soft unctuous substance, like musk, and resembling it in smell. It is contained in a bag, growing from the lower part of the belly of the civet-cat, the *Viverra civetta*, a carnivorous animal, a native of North Africa. Civet was formerly in high repute for its medicinal qualities, but is now used only as a perfume.

CIV'IC CROWN (*corona civica*), in Antiquity, a crown or garland composed of oak-leaves, given by the Romans to any soldier who had saved the life of a citizen. Various marks of honour were connected with it: the person who received it wore it at the theatre, and when he entered, the audience rose up as a mark of respect.

CIV'IL (*civilis*, pertaining to citizens: *Lat.*), an epithet applicable to whatever relates to the community as a body, or to the policy and the government of the citizens and subjects of a state. It is opposed to *criminal*: thus, a *civil* suit is between citizens alone, and not between the state and a citizen. It is also distinguished from *ecclesiastical*, which relates to the church; and from *military*, which includes only matters relating to the army and navy.——CIVIL ARCHITECTURE, that which is applied to buildings constructed for the purposes of civil life, in distinction from military and naval architecture.——CIVIL DEATH, in Law, that which cuts off a man from civil society, or its rights and benefits (thus banishment, outlawry, &c.), as distinguished from *natural* death.——CIVIL LAW is properly the peculiar law of each state, country, or city; but, as a general term, it means a body of laws which was composed out of the best Roman laws, and is comprised in the Institutes, Code and Digest of Justinian, &c., and, for the most part, was received and observed throughout all the Roman dominions for above 1200 years. The civil law was formerly used under certain restrictions in our ecclesiastical courts, as also in the university courts and the court of admiralty. ——CIVIL LIST, the revenue appropriated to support the civil government, also those officers of the civil government who are paid from the public treasury. It is the sum granted to every British monarch, at the beginning of his reign, for the support of his court and household, of ambassadors, and of the civil government in general. The amount of the civil list, settled on Her Majesty for life, is 385,000*l.* per annum, payable quarterly, of which 60,000*l.* is assigned for Her Majesty's privy purse. The sovereign is empowered to grant pensions, to the amount of 1200*l.* per annum, to those who by their services or discoveries, have merited the gratitude of their country.——CIVIL WAR, a war between people of the same state, or citizens of the same city.——CIVIL YEAR, the legal year, or that form of year which each nation has adopted for the computation of time. The civil year in England and other countries of Europe consists of 365 days for the common, and 366 for leap year.

CIVIL'IAN (same *deriv.*), a doctor or professor of the civil law; or, in a more extended sense, one who is versed in law and government.

CLAIR'VOYANCE (clear sightedness: *Fr.*), a peculiar mode of sensation, or second sight, brought on when the patient is supposed to be in what is called the *mesmeric trance*, or *artificial catalepsy*. The reality of this state has been much disputed; and it is certain that great imposture has been practised in simulation of it.

CLAMP (*klammer*, from *klammern*, to hold fast: *Germ.*), in general, something that fastens or binds; as a piece of iron screwed on the corners where boards meet, &c.——In brick-making, a pile of bricks, arranged for burning, in which the end of one is laid over another, and a space is left between them for the fire to ascend.——In ship-building, a thick plank on the inner part of a ship's side, used to sustain the ends of the beams.—— In joiner's work, a piece of board fastened across the end of another.

CLAN (*clann*, descendants: *Gael.*), a family or tribe, living under one chief. This appears to have been the original condition of the savages of northern Europe. All the members of a clan held their lands of the chief, followed him to war, and were expected to obey him in peace. It is probable that, in time, several clans united into one: the name of the whole henceforward being that of the most powerful or the most respected portion.

CLAR'ENCIEUX, the second king-at-arms, an officer in Herald's College. Lionel, third son to Edward III., having by his wife the honour of Clare, in the county of Thomond, was declared duke of Clarence. But this dukedom afterwards escheating to Edward IV., he made its herald king-at-arms. The office of this functionary is to marshal and arrange the funerals of all baronets, knights, and esquires on the south side of the Trent.

CLAR'ENDON, CONSTITUTIONS OF, certain ecclesiastical laws drawn up at Clarendon, near Salisbury, A.D. 1164. They were sixteen in number, and all of them tended to restrain the power of the pope and clergy. The prelates and barons readily assented to them, except Archbishop Becket, who opposed them at first, but was afterwards prevailed upon to sign them. Pope Alexander III., however, annulled most of them.

CLARE-OBSCURE (*clarus*, clear; and *obscurus*, obscure: *Lat.*). [See CHIARO-SCURO.]

CLAR'ICHORD, or CLAV'ICHORD (*clavis*, a key; and *chorda*, a musical string: *Lat.*), an instrument of music, in the form of a spinnet. It is now out of use, all such instruments having been superseded by the pianoforte.

CLARIFICA'TION (*clarificatio*: from *clarus*, clear; and *facio*, I make: *Lat.*), the process of clearing or fining any fluid from all heterogeneous matter or fæculence. It is often effected by involving the matters producing turbidity in some other, which causes them to be so heavy as to sink down. Coffee is cleared with isinglass by this method. It differs from filtration, which is merely a straining through paper, cloth, &c.

CLAR'ION (*clarus*, clear: *Lat.*), a kind of trumpet whose tube is narrower, and its tone more acute and shrill, than that of the common kind.

CLASS (*classis*, a division: *Lat.*), a term applied in the scientific distribution of any subject. Classes are *natural* or *artificial*, according as they are founded on natural relations or resemblances, or are formed arbitrarily.

CLAS'SICAL (*classicus*, a citizen of the first class: *Lat.*), a term signifying excellent or of the highest order. It is said to owe its origin to the division of the Roman people into classes, the first of which was called, by way of eminence, the *classic*. The word *classical* is also applied to authors of standard authority, and particularly to the chief writers among the Greeks and Romans.

CLAUSE (*clausula*, from *claudo*, I shut: *Lat.*), in Law, an article in a contract or other writing: a distinct part of a contract, will, agreement, charter, &c.——In Grammar, a subdivision of a sentence, in which the words are inseparably connected with each other in sense, and cannot with propriety be separated by a point.

CLAUS'TRAL (*claustra*, an enclosure: *Lat.*), relating to a cloister or religious house; as a *claustral* prior.

CLA'VATE (*clava*, a club: *Lat.*), in Botany, an epithet for parts of plants which are club-shaped, or grow gradually thicker towards the top.

CLAV'ICLES (*clavicula*, a *dim.* of *clavis*, a key: *Lat.*), in Anatomy, two bones situated transversely and a little obliquely opposite to each other, at the superior and anterior part of the thorax, between the scapula or shoulder-bone, and the sternum or breast-bone.

CLAY (*klay: Teut.*), a species of earth which is firmly coherent, weighty, compact, and hard when dry, but stiff, viscid, and ductile to a great degree when moist: smooth to the touch, not easily diffusible in water, and when mixed with it not readily subsiding from it. Clays become soft by absorbing water, but so tenacious as to be capable of being moulded into any shape: and hence they are the materials of bricks, pottery-ware, &c. They consist essentially of alumina, with variable quantities of silica.

CLE'AVAGE (*kleben*, to cleave: *Germ.*), in Mineralogy, a term used in relation to the fracture of minerals which have natural joints and possess a regular structure.

CLECHE, in Heraldry, a kind of cross, charged with another cross of the same figure, but of the colour of the field.

CLEDGE, in Mining, a thin stratum of clay, or fuller's earth.

CLEF, or CLIFF (*clef*, a key: *Fr.*), a character, in Music, placed in the beginning of a stave, to determine the degree of elevation occupied by that stave in the general claviary or system, and to point out the name of the notes which are in the line of that clef.

CLE'MATIS (*Gr.*, from *klēma*, a vine twig, because it climbs trees with its slender twigs), a genus of climbing shrubs, nat. ord. *Ranunculaceæ*, including *Virgin's Bower* and *Traveller's Joy*, the latter a wild plant in English hedges, the *Clematis Vitalba* of botanists.

CLEPSAM'MIA (*klepto*, I steal; and *psammos*, sand: *Gr.*), an ancient instrument for measuring time by sand, like an hour-glass: it obtained its name from the *stealthy* motion of the sand.

CLEPSY'DRA (*klepsudra:* from *klepto*, I steal; and *hudor*, water: *Gr.*), a Roman and Grecian time-piece, or water-clock: an instrument to measure time by the fall of a certain quantity of water. [See CLEPSAMMIA.]

CLERE'STORY, a row of windows in a Gothic church above the arches of the nave and choir.

CLER'GY (*kleros*, literally an inheritance: *Gr.*, because clerics were supposed to take the 'portion of the Lord' as their inheritance), a general name given to the body of ecclesiastics of the Christian church, in distinction from the laity. Ethelwulf, in 855, gave the Anglo-Saxon priests a tithe of all the goods, and a tenth of all the lands in England, free from all secular services, taxes, &c. The charter in which this was granted to them was confirmed by several of his successors; and William the Conqueror, finding the bishoprics so rich, made them baronies, each of which contained at least thirteen knights' fees.

CLERK (*klerikos*, from same *deriv.*), a word originally used to denote a learned man, or man of letters. The term afterwards came to be appropriated to ecclesiastics. In legal documents the clergymen of the Church of England are styled clerks to this day.

CLEW'-LINES, and CLEW'-GARNETS, in Marine language, a sort of tackle fastened to the clews of the sails, to truss them up to the yard.

CLI'ENT (*cliens, Lat.*), a person who seeks advice of a lawyer, or commits his cause to the management of one, either in prosecuting a claim, or defending a suit in a court of justice.——Among the Romans, a citizen who put himself under the protection of a man of distinction and influence called his *patron*.

CLIMAC'TERIC (*klimakterikos*, from *klimax*, a ladder: *Gr.*), in Astrology, a critical year or period in a person's life. The superstitious distinction of years is said to have originated in the doctrines of Pythagoras. According to some, every seventh year is climacterical; but others allow only those years produced by multiplying 7 by the odd numbers 3, 5, 7, 9, to be such; for these, they say, bring with them some remarkable change with respect to health, life, or fortune: the grand climacteric is the sixty-third year.

CLI'MATE (*klima*, the slope of the earth from the equator towards the pole; *Gr.*), in a popular sense the term *climate* is given to any country or region differing from another in the temperature of the air, or with respect to the seasons, without any regard to the length of the days, or to geographical position. Thus we say a warm or cold climate, a genial climate, &c. Climate depends chiefly on distance from the equator, and height above the level of the sea: but the effect of these is greatly modified by other circumstances, such as the configuration and extent of the country, its inclination and exposure, the direction of the chains of mountains by which it is intersected, or which are in its neighbourhood, the nature of its soil with reference to radiation and evaporation, its distance from the sea, the action of winds having the temperature of different latitudes, the quantity of forest land, and the degree of cultivation. The diminution of forest and increase of tillage have, since the time of the ancient Romans, improved the climate in the neighbourhood of the Rhine, which is not now, as formerly, intensely frozen during winter.

CLI'MAX (*klimax*, a ladder: *Gr.*), a figure in Rhetoric, consisting of an assemblage of particulars, rising, as it were, step by step. The word is sometimes erroneously employed instead of *acme*, the highest step of the climax. An *anticlimax* is a descent. For an accidental example, see the article ELYSIAN FIELDS.

CLIN'ICAL (*klinikos*, from *klinē*, a couch: *Gr.*), in its literal sense, anything pertaining to a bed. Thus, a *clinical lecture* is a discourse from notes taken at the bedside of a patient by a physician, with a view to practical instruction in the healing art. *Clinical medicine* is the practice of medicine on those in hospital or in bed. And the term *clinic convert* was applied by the ancient ecclesiastical historians to one who received baptism on his death-bed.

CLINOM'ETER (*kline*, a bed; *metron*, a measure: *Gr.*), an instrument employed by geologists and miners for ascertaining the strike and angle of dip of stratified rocks.

CLOA'CA (a common sewer: *Lat.*), the sewer of ancient Rome. It was constructed before the establishment of the republic, of immense blocks of stone, in such a solid manner, that it remains to the present day, and continues to fulfil the purpose for which it was intended. It was so spacious that a wagon loaded with hay might pass through it.——This name is applied also to the excrementitious cavity, in birds, &c.

CLOCK (*cloche*, a bell: *Fr.*), a machine for measuring time. Its invention has been attributed to Pacificus, archdeacon of Verona, in the 9th century; and even to Bœthius, in the early part of the 6th. The first clock made in England was constructed about the year 1288, and remained until the time of Elizabeth. The most ancient clocks, of which we have any distinct account, were that erected in a tower of the palace of Charles V. of France, about the year 1364, and that made at Strasburg about the year 1370. In the following century public clocks became very common in Europe. The first method used for regulating clocks was by a *fly-wheel;* but this, being affected by the variable resistance of the air, acted very imperfectly. The great improvement in clockmaking was the application of the *pendulum* in the 17th century; but it is uncertain by whom it was first employed. Some attribute it to Galileo, who first announced its isochronism; and others to Huygens, who first explained its principle. The compensation pendulum was invented by Hooke in 1715; and the method of compensation by the unequal expansion of different metals by Graham. A clock consists of wheels moved by weights, and is so constructed that, by a uniform vibration of a pendulum, the hours, minutes, and seconds are measured with great exactness; and it indicates the hour, not only by a dial, but by the stroke of a hammer on a bell. Sometimes, also, it strikes the half-hours and quarters. The clock measures 24 *mean* hours, but the solar day is of various lengths, according to the situation of the earth in its orbit, and to the declination of the sun. Hence the clock is sometimes a few minutes faster or slower than the sun.

CLOIS'TER (*cloître: Fr.;* from *claustrum*, an enclosure: *Lat.*), part of a regular monastery, consisting of an arcade or colonnade, surrounding an open court. It served for exercise in wet weather, and sometimes for the transcription of books, &c. The word is used also to signify the convent itself. In a general sense, *cloisters* mean covered passages, such as were formerly attached to religious houses.

CLOTH (*clath: Ang. Sax.*), any kind of stuff that is woven or manufactured in the loom, whether made of wool, hemp, flax, or cotton.

CLO'THING. It has been very justly said that nothing is more necessary to a comfortable state of existence than that the body should be kept in nearly a uniform temperature. The chief end proposed by clothing ought to be protection from the cold; and it never can be too deeply impressed on the mind (especially of those who have the care of children) that a degree of cold amounting to shivering cannot be felt under any circumstances without injury to the health, and that the strongest constitution cannot resist the benumbing influence of a sensation of cold constantly present, even though it be so moderate as not to occasion immediate complaint, or to induce the sufferer to seek protection from it. Such a degree of cold often lays the foundation of the whole host of chronic diseases, foremost amongst which are found scrofula and consumption: and persons engaged in sedentary employments must be almost constantly exposed to it, unless the apartment in which they work is heated to a degree that subjects them, on leaving it, to all the dangers of a sudden transition, as it were, from summer to winter. The inactivity to which they are condemned, by weakening the body, renders it incapable of maintaining the degree of warmth necessary to comfort, without additional clothing or fire. To heat the air of an apartment much above the ordinary temperature of the atmosphere, we must shut out the external air; and the air within becoming extremely rarefied and dry, it is doubly dangerous to pass from it to the cold, raw external air. But in leaving a moderately warm room, if properly clothed, the change is not felt; and the full advantage of exercise is derived from any opportunity of taking it that may occur. The only kind of dress that can give the protection required by the changes of temperature to which high northern climates are liable, is *woollen;* and those who would receive the advantage which the wearing of it is capable of affording must place it next the skin; for it is in this situation only that its health-preserving power can be felt. The great advantages of woollen cloth are briefly these:—the readiness with which it allows the escape of the matter of perspiration through its texture; its power of preserving the sensation of warmth to the skin under all circumstances, from the slowness with which it conducts heat; and the softness, lightness, and pliancy of its texture. *Cotton cloth* must be esteemed the *next best* material of which clothing can be made; but *linen* is the *worst* of all the substances in use.

CLOUD, a collection of vapour suspended in the atmosphere; a congeries of watery particles, arising in the first instance by evaporation from the land and seas, and afterwards condensed into a visible shape. Clouds are of various kinds, according to their peculiar form, or the quantity of electric fluid they contain. Massive round clouds, increasing upwards from a horizontal base, are termed *cumulus* (*cumulo*, I heap up: *Lat.*); horizontal layers, which include fogs and mists, are termed *stratus* (*stratus*, scattered: *Lat.*); and fibres or curling streaks, which diverge in all directions, are termed *cirrus* (*cirrus*, a lock of hair: *Lat.*). From these are formed four other varieties, the *Cirro-cumulus*, the *Cirro-stratus*, the *Cumulo-stratus*, and the *Cumulo-cirrostratus*, or nimbus (*nimbus*, a sudden shower: *Lat.*), into which the others resolve themselves when rain falls. The compound names of these clouds sufficiently indicate their nature. It is probable that, when the watery vapour is separated by decreased temperature from the air in which it is dissolved, it becomes highly electrical, in accordance with one of the electrical laws; and that this state of electricity, by its repulsive tendency, keeps the aqueous particles from uniting suddenly and forming heavy rain. When this electricity is gradually dissipated, or suddenly during thunderstorms, rain falls. Clouds are likewise screens interposed between the earth and the scorching rays of the sun, which are often so powerful as to destroy the more tender vegetables.

CLOVE, a very pungent aromatic Indian spice; the unexpanded flower-bud of the *Caryophyllus aromaticus*, a tree twenty feet high, belonging to the myrtle order, and growing in the Moluccas.

CLO'VER, the common name of leguminous plants belonging to the genus *Trifolium*. They are also called trefoil. Red clover is generally cultivated for fodder, and for enriching land. White clover is an excellent food for cattle, and the bee collects no small amount of honey from its flowers.

CLYS'TER (*klŭstĕr*, from *kluzo*, I wash: *Gr.*), in Medicine, a liquid substance injected into the lower intestines, usually for the purpose of promoting alvine discharges, but sometimes for the support and nourishment of patients who cannot swallow aliment.

COACH (*coche*, a caravan: *Fr.*), a vehicle of pleasure, distinguished from others, chiefly by being a covered box hung on springs. The oldest carriages were used by the ladies in England, and were termed *whirlicotes*: we find that the mother of Richard II., who, in 1360, accompanied him in his flight, rode in a carriage of this sort. But coaches, properly so called, were introduced into England from Germany, or France, in 1580, in the reign of Elizabeth. In 1601, the year before the queen's death, an act was passed to prevent men from riding in coaches, as being effeminate: twenty-five years afterwards, however, hackney-coaches were in use.

COAD'UNATE (*coaduno*, I join together: *Lat.*), in Botany, an epithet for several leaves united at the base.

COAL, a solid inflammable mineral substance, capable of being used for fuel. There are several kinds, the principal being anthracite, true coal, lignite, and bituminous shale. Of these, true coal is the most abundant and most valuable. There are many varieties of it, from steam coal, which approaches anthracite, to jet, which some consider a variety of lignite. Analysis shows that it is composed of carbon and hydrogen, with oxygen, nitrogen, and sulphur, combined with an earthy basis, which, when burnt, forms ash. Steam coal has little hydrogen, and it is useless for gas-making. The coals best suited for this are deficient in heating power: such is Cannel coal. Coal is found in the Liassic and Oolitic members of the secondary formation, but chiefly in the carboniferous beds which derive their name from this circumstance. These belong to the Primary or Palæozoic formation. There are very large deposits of it in these beds in England, Wales, and Scotland; in Belgium, Prussia, France, and Spain. The coal fields of North America are of enormous extent. It has been ascertained, by the aid of the microscope, that coal consists almost entirely of vegetable remains, and from the class of plants discovered, it has been inferred that they grew in a warm damp climate. The manner in which these deposits were brought together and fossilised, has been much discussed by geologists, but the difficulties of the question are not yet cleared away. The total area of the English and Welsh coal fields is estimated at 3,000 square miles, and the Scotch coal fields comprise a further area of 1,600 square miles. Notwithstanding this extent, such is the large quantity excavated, and so great is the waste, that apprehensions are entertained of their being worked out within a short period. In 1862, there were 3,088 collieries in Great Britain, and in the preceding year about 235,600 colliers were employed. The quantity of coals produced and sold in 1862 amounted to 84,500,000 tons, and the coals exported the same year amounted to 7,670,000 tons. The most remarkable mines in our island are those of Whitehaven and Newcastle. The former are worked under the sea; the latter have been excavated to the depth of 1,500 feet.

COAT, in Anatomy, the membranous cover of any part of the body: as the coats of the eye, the stomach, &c.—COAT OF ARMS, in the modern acceptation, a device, or assemblage of devices, supposed to be painted on a shield, which, in the language of heraldry, is called the *field*.—COAT OF MAIL, armour made in the form of a shirt, and consisting of a kind of network of iron rings.

COATI-MONDI, a carnivorous animal, with a long snout, belonging to the bear family, and nearly allied to the racoon. It is a native of Brazil and Central America, and is called by naturalists *Nasua rufa*.

COAT'ING, in Chemistry, what is used for the purpose of defending certain vessels from the immediate action of fire; thus, the inside of some furnaces is covered with fire-clay, &c.

COBALT' (*kobold*, a devil: *Germ.*), a metal thus named by the miners, before its value was known, and when it was hated, on account of its presence being considered unfavourable to that of other metals. It is of a greyish-white or reddish-grey colour, is very brittle, and easily reducible to powder. It is strongly magnetic, and has a specific gravity of 8·5. It requires a high temperature to melt it. Its equivalent is 29·5. It is never found in a pure state, but usually as a metallic oxide, combined with a large quantity of arsenic. The impure oxide of cobalt is called *zaffer*; but when fused with three parts of silicious sand and an alkaline flux, it is converted into a blue glass, called *smalt*. This metal is used principally to give a permanent blue colour to glass, and enamels. The chloride of cobalt in solution affords a blue sympathetic ink. Characters written with this ink are invisible until exposed to heat. If the paper is laid aside for some time, the writing will again disappear.——**Cobalt Bloom**, acicular arseniate of cobalt. ——**Cobalt Crust**, earthy arseniate of cobalt.

CO'BRA DE CAP'ELLA (the hooded cobra: *Port.*), the *Naja tripudians* of naturalists, a very venomous snake of India, which, when irritated, puffs out its neck in the form of a hood, and this is marked with a streak resembling a pair of spectacles.

CO'CA, the native name of a tree (the *Erythroxylon coca* of botanists), the leaves of which when dried, powdered, and mixed with chalk or the ashes of other leaves, are chewed by the inhabitants of Peru and parts of Brazil, upon whose nervous system they produce such a stimulating effect that they are rendered capable of continued laborious work, without taking food, to an extraordinary degree.

COC'COLITE (*kokkos*, a kernel; and *lithos*, a stone: *Gr.*), in Mineralogy, a variety of *augite* or *pyroxene*. It is of a greenish hue, and is composed of granular concretions.

COC'CULUS IN'DICUS, an Indian berry, the fruit of a climbing shrub belonging to the genus *Anamirta*, nat. ord. *Menispermaceæ*. A preparation of it is said to be employed in communicating a narcotic quality to intoxicating drinks. A few handfuls of it, ground to a coarse powder, and thrown into a fish pond, will in a few hours bring the fish to the surface in a poisoned or intoxicated state; but putting them into fresh water recovers them. A poisonous principle called picrotoxine has been extracted from cocculus indicus.

COC'CUS (*kokkos*, the kermes berry: *Gr.*—what was considered by the ancients a *berry*, is now known to be an *insect*), in Entomology, a genus of homopterous insects, of which only the male has wings. One of the species affords the cochineal of commerce. Other species infest valuable plants to such an extent, forming what gardeners call *scale*, that great injury is done to them. [See Cochineal and Kermes.]

COC'CYX (*Gr.*), the lowest portion of the vertebral column, which in man consists of four small bones soldered together. They form the rudiments of a tail. The upper end joins the sacrum. [See Vertebræ.]

CO'CHINEAL (*cochenille*: *Fr.*, from *coccineus*, of a scarlet colour: *Lat.*), the *Coccus Cacti* of entomologists, an insect which in hot countries feeds upon various species of cactus. It has a plump wrinkled body, and somewhat resembles a seed cut in two. The female, after selecting a spot on a juicy leaf, thrusts in its beak and there remains sucking for the remainder of its life. Plantations of cactus are made for them, to which the insects are carefully removed when young. When fully grown they are brushed off, and killed either in a hot oven or by boiling water. Cochineal is employed for dyeing scarlet and crimson, and carmines and lakes are prepared from it. It takes about 70,000 insects to make up a pound weight. In some years 1400 tons of cochineal have been imported; but the demand has much lessened of late, in consequence of the introduction of the dyes of aniline.

COCH'LEA (*kochlias*, a snail: *Gr.*), in Anatomy, a portion of the internal ear; so called from its shape in mammals, being similar to that of a snail's shell.

COCHLEA'RIA (*cochleare*, a spoon: *Lat.*, from their leaves being hollowed out, like the bowl of a spoon), in Botany, a genus of plants, nat. ord. *Cruciferæ*. The species chiefly consist of various kinds of *scurvy grass*.

COCKATOO'S, a tribe of parrots forming the *Cacatuinæ* of ornithologists. They possess beaks that are much curved, and crests on the head which they can elevate or depress at pleasure. The white cockatoos, which are sometimes brought alive to this country from India and Australia, belong to the genus *Cacatua*.

COCK-CHA'FER, known also by the name of *May-bug*, a species of coleopterous insect. It is the *Melolontha vulgaris*, and is remarkable for the length of time it continues in the grub or larva state, as also for the injury it does to vegetation. It lives only about a week in the perfect state; but the grub remains in the earth for three years before it is transformed into the perfect insect, and, in the mean time, is very destructive to the roots of plants. Each female produces about two hundred eggs.

COCK'-PIT, in ships of war, an apartment situated near the after hatchway, under the lower gun-deck, in which wounds are dressed. The fore cock-pit, when there is one, is a place leading to the magazine passage and the store-room of the boatswain, gunner, and carpenter.

COCK'-ROACH, a name given to orthopterous insects of the genus *Blatta*. The *B. orientalis* is the 'black beetle' of our houses, an insect which is very active by night, when it devours whatever food may lie in its way: it is also very destructive to woollen cloths, &c.

COCK'SWAIN (contracted into *coxon*), an officer who has charge of the boat belonging to a ship, and the boat's crew.

COCK'ET, a seal belonging to the custom-house: likewise a scroll of parchment, sealed and delivered by the officers of the custom-house to merchants, as a proof that their merchandise is entered.

COC'KLE (*coquille*, a shell: *Fr.*), the common name of marine shell-fish belonging to the genus *Cardium*, several species of which are known on our coasts.

CO'COA, a palm tree, the *Cocos nucifera* of botanists. It grows in both the East and West Indies, is about sixty feet in height, and produces a fruit called the cocoa-nut. The shell of the latter is a woody substance; it contains a white fleshy kernel and a sweet refreshing liquor. These nuts, which are from three to seven inches long, hang in clusters on the top of the tree; their kernels yield a considerable quantity of oil, which is now made available in the manufacture of candles and soap; and the filaments of their outer coat are made into cables. If the body of the tree be bored there exudes from the wound a white liquor called palm wine or toddy. The leaves are wrought into sacks, hammocks, &c. The Cingalese have a saying that this tree serves for ninety-nine known things, the hundredth, man is not able to discover.——COCOA, more correctly CACAO, the chief ingredient in chocolate, is obtained from a small tree growing abundantly in Demerara and the region of the Amazons. This is the *Theobroma cacao*, which is allied to the baobab and silk cotton trees, nat. ord. *Byttneriaceæ*. The fruit has an oblong form, and is about five inches long. It grows from the stem and larger branches. Within a hard shell lie the oily seeds, nestling in white pulp, and these being dried, are manufactured into chocolate.

COCOO'N, the fibrous case which some caterpillars weave around themselves, when they assume the pupa or chrysalis form. The threads being unwound afford the silk of commerce.

COD, or COD'-FISH (*codde: Sax.*), the English name of the *Morrhua vulgaris*, one of the most valuable of fishes. The abdomen is thick and prominent; the head and eyes are large. It has dusky fins, the dorsal and anal being rather large, the pectoral and ventral rather small. The upper jaw is longest, and the lower is bearded at the tip by a single cirrus. It inhabits the northern seas, particularly the banks of Newfoundland, and sometimes attains a very large size.

COD'-LIVER OIL, an oil which is obtained from the liver of the cod-fish, and has lately acquired much reputation for its remedial powers. It is used in the dose of a tablespoonful three or four times a day, in pulmonary phthisis, in various scrofulous affections, in chronic gout and rheumatism, and in some skin diseases.

CODE (*codex*, a book: *Lat.*), a collection or system of laws. The collection of laws and constitutions made by order of the Emperor Justinian is termed a *code* by way of eminence.——The *Code Napoleon*, or *civil code* of France, drawn up during the government of Napoleon, effected great changes in the laws of France.

COD'ICIL (*codicillus*, a *dim.* of *codex*, a book: *Lat.*), a supplement to a will, containing anything which the testator wishes to add, or any explanation, alteration, or revocation of what his will contains.

COEFFI'CIENTS, in Algebra, such numbers, or given quantities, as are put before letters, or unknown quantities, as multipliers: thus, in $3a$, bx, and cxy, 3 is the coefficient of a, b of x, and c of xy.

CŒ'LIAC (*koilia*, the belly: *Gr.*), an epithet for what pertains to the belly, or the intestinal canal. Thus, the *cœliac artery* is that artery which issues from the aorta just below the diaphragm; the *cœliac vein* is a vein of the *intestinum rectum*; and *cœliac passion* is a flux or diarrhœa of undigested food.

CŒ'NA (*Lat.*), the principal meal among the Greeks and Romans. The time of the *cœna*, or supper, was the ninth hour, answering to three o'clock in the afternoon with us; and it usually consisted of three courses. A libation was made both before and after it; and the evening was concluded with much festivity.

COF'FEE TREE, an evergreen shrub, growing in Arabia, the West Indies, and Ceylon. It is the *Coffea Arabica* of botanists, nat. ord. *Cinchonaceæ*. It is seldom more than sixteen or eighteen feet high: the flowers are of a pure white, and the berries red when ripe. The use of coffee is said to have been introduced into England in 1652. What is called Mocha coffee, from Arabia Felix, is accounted the best; but that of Java, Bourbon, and the West Indies, is what we usually obtain, and constitutes an important article of commerce.

COF'FER (*coffre: Fr.*), a chest or trunk. ——In Architecture, a square depression or sinking in each interval between the modillions of the Corinthian cornice.——In Fortification, a trench cut in the bottom of a dry ditch.——In Mineralogy, a trough in which tin ore is broken to pieces.

COF'FER-DAM, in Bridge-building, a water-tight case of piling, fixed in the bed of a river, for the purpose of rendering dry the place on which a pier is to be erected; and sometimes the enclosure is double, clay being rammed in between. When finished, the water is pumped out of it, and the pier is built up inside.

COF'FIN, in the Veterinary art, the whole hoof of a horse's foot above the coronet.

COGNA'TION (*cognatio*, relationship by birth: *Lat.*), in Civil Law, natural relationship, or that line of consanguinity which is derived through either males or females, descended from the same father; in opposition to *agnation*, which is derived through males only.

COG'NIZANCE (*connaissance: Fr.*; from *cognitus*, known: *Lat.*), in Law, the hearing of a thing judicially. Also, the acknowledgment of a fine.——COGNIZANCE OF PLEAS, a privilege granted by the king to a city or town, to hold pleas of all contracts, &c.

COGNO'MEN (*co-gnomen: Lat.*), the surname or family name among the Romans. Thus, in Publius Cornelius Scipio, Publius is the *prænomen*, Cornelius the *nomen*, and Scipio the *cognomen*.

COGNO'VIT (he has confessed: *Lat.*), in Law, a writing by which the defendant admits that the plaintiff's cause of action against him is just; and suffers judgment to be entered against him without trial. Cognovits must be witnessed by the defendant's attorney.

COHE'SION (*cohæreo*, I adhere to: *Lat.*), as distinguished from *adhesion*, in Natural Philosophy, is that species of attraction which, uniting the particles of homogeneous bodies, retains them in the same mass. It depends on the amount of cohesion, whether a body shall be in a solid, liquid, or gaseous state. The attraction of cohesion acts only at exceedingly small distances

COHOBA'TION, in Chemistry, the operation of repeatedly distilling the same liquor, or returning it back again upon the same substance, and redistilling it.

CO'HORT (*cohors: Lat.*), a military body among the Romans, consisting of the tenth of a legion, or from three to six hundred men. The *Prætorian cohort* was a body of picked troops who attended the general: it was first formed by Scipio Africanus. The *Prætorian cohorts* were established by Augustus, in imitation of the Prætorian cohort; and were intended to protect his person. They were originally 10,000 men, but Vitellius increased the number to 16,000.

COIF (*coiffe*, a hood: *Fr.*), the badge of serjeants-at-law, who are called serjeants of the coif, from the lawn coif they wear under their caps, when they are created serjeants.

COIN (*Fr.*), a piece of metal stamped with certain marks, and made current at a certain value. Strictly speaking, coin differs from money, as the species differs from the genus. Money is any matter, whether metal, paper, beads, shells, &c., which has currency as a medium in commerce. Coin is a particular species always made of metal, and formed by a process called coining. The British *coinage* of gold and silver is wholly made at an establishment called the Mint, near the Tower of London. [See MINT.]

COINDICA'TION (*co*, along with; and *indicatio*, a pointing out: *Lat.*), in Medicine, a sign or symptom, which, with other signs, assists to show the nature of the disease, and the proper remedy.

COIR, a fibrous material, formed from the husk of cocoa-nuts. It is used for making ropes, matting, &c.

COL'CHICUM (*Lat.*; from *Colchis*, in Armenia, where it is said to have abounded), *Meadow Saffron*, a herbaceous plant, which grows in various parts of Europe. It belongs to the nat. ord. *Melanthaceæ*. Preparations of it are used as a remedy for the gout.

COL'COTHAR (*Arab.*), called also *Crocus Martis*, an impure brownish-red oxide of iron, which remains after the distillation of the acid from sulphate of iron, and is used in polishing glass and metals. The best sort of polishing powder, called *jeweller's red rouge*, or plate powder, is the precipitated oxide of iron.

COLD (*Sax.*). Great degrees of cold are produced by mixing together substances which dissolve rapidly. The reason of this will appear when it is recollected that in the conversion of solid bodies to fluids, caloric is always absorbed. Mixtures to produce artificial cold are generally made by mingling salt with snow, or with diluted acid and powdered ice. Ice has now become so much in request, either as a luxury or as a remedy, that various machines have been constructed for making it. [See ICE-MAKING MACHINES.]

COLEOP'TERA (*koleos*, a sheath; and *pteron*, a wing: *Gr.*), in Entomology, the order of BEETLES.

COL'IC (*kōlikos*, suffering in the colon: *Gr.*, from the part to which the pain is referred), an appellation given indiscriminately to almost all pains in the abdomen; but it is chiefly known as that disease which is characterized by a spasmodic sensation in the intestines, bilious vomiting, and obstinate costiveness.——PAINTERS' COLIC, a very painful and dangerous disease, arising from the absorption of lead into the system. Without proper attention it ends in emaciation, paralysis, and death.

COLISE'UM, an elliptical amphitheatre, at Rome, built by Vespasian. This unrivalled monument of ancient grandeur was 1612 feet in circumference, contained eighty arcades, and would hold 100,000 spectators. It was decorated with statues representing all the provinces of the empire; and in the middle stood that of Rome, holding a golden apple in her hand. Down to the thirteenth century, it remained almost uninjured; afterwards Pope Paul II. took all the stones from it, which were used for the construction of the palace of St. Mark; and in later times some other palaces were erected from its fragments. But Benedict XVI. caused a cross to be erected in the centre of the arena, where Roman Catholic worship is occasionally performed; and, at present, care is taken not to injure its venerable ruins. The great object of this magnificent building was to exhibit the brutal spectacles of the gladiators contending with wild beasts, &c. On the triumph of Trajan over the Dacians, 11,000 animals were killed in the amphitheatres at Rome; and 1000 gladiators fought during 123 days. The gladiators at first were malefactors who contended for victory and life, or captives and slaves, who were made to fight for their freedom; but after a time many lived by it as a profession; and these exhibitions continued, with modifications, for above 500 years.

COLLAP'SE (*collapsio*, from *collabor*, I shrink together: *Lat.*), to close by falling together, as the fine canals or vessels of the body *collapse* in old age, or as a balloon collapses when the gas escapes from it.——In Medicine, a sudden and great depression of its energy and strength.

COL'LAR (*collare*, from *collum*, the neck: *Lat.*), in Roman Antiquity, a chain put round the neck of slaves who had run away.——In a modern sense, it denotes an ornament for the neck, consisting of a chain of gold, frequently containing ciphers or other devices with a badge hanging in front, and worn by the knights of several military orders.

COLLAT'ERAL (*com*, along with; and *lateralis*, belonging to the side: *Lat.*), in Genealogy, a term applied to kindred with reference to other kindred, when they are younger children, or have descended from younger children of the same common ancestor; used in opposition to *lineal* descendants.——COLLATERAL SECURITY, in Law, security for the performance of covenants or the payment of money, given in addition to the principal security.

COLLA'TION (*collatio*, a bringing together: *Lat.*), in the Canon Law, the presentation to a benefice, by a bishop, who has it in his own gift or patronage. When the patron of a church is not a bishop, he presents his clerk for admission, and the bishop institutes him; but *collation* includes both presentation and institution.——COLLATION, in Law, the comparison of a copy with its original, to ascertain its conformity; or the report of the officer who made the comparison. Hence, a *collator* is one who compares copies or manuscripts. And by *collating*, among printers, is meant examining the whole number of sheets belonging to a book, to see if they are all gathered properly.

COL'LECT (*collectus*, from *colligo*, I collect: *Lat.*), a short comprehensive prayer, such as those appointed to be repeated before the epistles and gospels in the public service of the Church of England.

COLLECTA'NEA (*collectaneus*, gathered together; from the same: *Lat.*), in Literature, notes, observations, or any matter collected from a variety of works.

COLLEC'TIVE (*collectivus*, gathered together; from the same: *Lat.*), in Grammar, an epithet for any noun which comprehends many persons or things; as a *multitude*, a *company*, a *congregation*, an *army*, &c.

COL'LEGE (*collegium*, from *collega*, a companion: *Lat.*), in its usual, though somewhat limited sense, a public place endowed with certain revenues, where the several departments of learning are taught, and where the students reside, under a regular discipline. The schools in cathedrals and monasteries were confined chiefly to the teaching of grammar, and there were only one or two masters employed for that purpose: but in colleges, professors are appointed to teach all the branches of science. ——In the more extended signification of the word, the ancient Romans had colleges, which were a species of corporate body, as that of the *augurs*; and others whose members had no bond of union but that of a common occupation, as the *Collegia opificium* (colleges of workmen). And, in this country, many corporate bodies are termed colleges, which have little or no reference to education; thus the College of Physicians, the College of Heralds, &c.——In the Academical sense, a college is a society established for scholastic purposes, endowed with revenues, and subject to a code of laws. When one body imparts instruction in all the branches of knowledge, it is both a college and a university: thus, Trinity College, Dublin. On the other hand, a number of colleges, united under the same discipline, constitute a university. In such a case, while each college is governed by its own superiors, there are powers which are wielded by the university at large. As the Scotch universities have not a body of fellows and scholars receiving stipends, they are not in the strict sense colleges. When universities were first instituted, the students who came to them for instruction lodged where they pleased, and had no common bond of union, except that of study. Boarding houses were then established; and being ultimately endowed by munificent persons for the benefit of the students who were receiving instruction at the university, they became colleges. These consist of a head under some name, as *provost*, of a body termed *fellows*, who—as these institutions originally had reference to supplying the church with ministers—were not allowed to marry, and, lastly, of graduates, named scholars. Afterwards, members who did not share the benefit of the foundation, were allowed to reside within them, and were subjected to their rulers. Every student is under the care of some *tutor*, who is generally one of the resident fellows, to whom he is assigned in charge. The university confers degrees, &c., but each college prepares its students to receive them; and every member of the university must now belong to some college. Individual colleges sometimes impart instruction in every branch of knowledge—some of those, for example, belonging to the University of Paris. But even there the most important are devoted to special subjects; as that of the Sorbonne, to theology, &c. The oldest colleges in Oxford and Cambridge are supposed to have been founded about the middle of the 13th century.

COLLE'GIATE CHURCHES, those that, without being cathedrals, have, with the exception of the episcopacy, the dignitaries usually attached to such. Westminster Abbey is formally styled 'the Collegiate Church of St Peter's.'

COLLIMA'TION, LINE OF, in a telescope that which passes through the tube, and cuts both the focus of the eye-glass and the centre of the object-glass.

COLLIQ'UATIVE (*colliquesco*, I become liquid: *Lat.*), an epithet indicating a morbid discharge of the animal fluids; as a *colliquative* fever, which is accompanied with profuse sweating, &c.

COLLIS'ION (*collisio*, from *collido*, I dash one thing against another: *Lat.*), in Mechanics, the meeting or mutual striking of two or more bodies, one of which, at least, is in motion.

COLLO'DION (*kolla*, glue: *Gr.*), a solution in ether, containing a little alcohol, of xyloidin, a substance formed by treating starch, and other things of the same class, with nitric acid. On account of its adhesive properties it is employed in pharmacy, but its chief use is in coating plates of glass for photographic images. [See PHOTOGRAPHY.]

COLLU'SION (*collusio*, from *colludo*, I act in fraudulent union with: *Lat.*), in Law, an illegal compact between two or more persons.

COLLYR'IUM (*Lat.*; from *kollurion*: *Gr.*), in Medicine any fluid application for the eyes.

COLOBO'MA (*koloboo*, I shorten: *Gr.*), in Medicine, the growing together, or gluey adhesion, of the eyelids.

COL'OCYNTH, or COLOQUIN'TIDA (*kōlon*, the colon; and *kineo*, I move: *Gr.*), the *Bitter apple*. It is the fruit of a wild gourd (the *Citrullus Colocynthis* of botanists), the pulp of which is light, spongy, and white; and is remarkable for its intense bitterness. Coloquintida has been known in medicine from the earliest times as one of the most powerful cathartics: it is sent us from Syria, particularly from Aleppo.

COLOGNE-EARTH, a substance used in painting, of a deep brown colour, approaching amber. It is supposed to be a preparation of the remains of wood long buried in the earth.

CO'LON (*kōlon*, a member of anything: *Gr.*), in Anatomy, the greater or upper portion of the large intestine.——In Grammar, a point marked thus (:), and used to divide a sentence.

COLONEL (*Fr.*), the chief commander of a regiment, whether infantry or cavalry.

COLONNA'DE (*Fr.; from columna*, a column: *Lat.*), a range of pillars running along or quite round a building.

COL'ONY (*colonia*, from *colonus*, a husbandman: *Lat.*), a body of people removed from their mother-country to a distant region, where they form a settlement under the sanction of the home government.

COL'OPHON (something finished: *Lat.;* from *kolophōn*, the summit: *Gr.*), in Bibliography, the name given to the *postscript* in the last sheet of an early printed work, containing the printer's name, date, &c.

COL'OPHONITE (*kolophōnia*, resin: *Gr.*), in Mineralogy, a variety of garnet, of a reddish yellow or brown colour, occurring in small amorphous granular masses.

COLOPH'ONY (*kolophōnia: Gr.*, from a city of that name), black resin, or turpentine boiled in water and dried: or the residuum after the distillation of oil of turpentine.

COL'ORATURE (*coloratus*, variegated: *Lat.*), in Music, all kinds of variations, trills, &c., intended to heighten the effect of the melody, or show the skill of the vocalist.

COLOS'SUS (*kolossos: Gr.*), a statue of enormous or gigantic proportions. That to which this name has been specially applied was an Apollo in brass, upwards of 100 feet in height, erected at Rhodes, the workmanship of Chares, who devoted himself to it during twelve years. It was placed at the entrance of the harbour, with the right foot on the land at one side, and the left on that at the other; and is said to have stood nearly fourteen centuries before the period in which it fell by the shock of an earthquake. When the Saracens became possessed of Rhodes, they found it in a prostrate state, and sold it to a Jew, by whom 900 camels were laden with its materials. The largest colossus of modern times is that of S. Carlo Boromeo, on the Lago Maggiore. It is a hollow statue of bronze, nearly sixty feet in height.

COL'OUR (*color: Lat.*), in Physics, a property inherent in light, and not, as was formerly supposed, in the coloured substance. It arises from only a portion of the coloured rays, which form white light, being transmitted to the eye so as to produce sensation, the rest being absorbed or turned in a different direction by reflection or refraction. The principal colours are red, orange, yellow, green, blue, indigo, and violet. They are all reducible to *red*, *yellow*, and *blue*: and the others are formed by some combinations of these, as green by yellow and blue, orange by red and yellow, &c.; and all the colours admit of many shades of difference. White is not properly a colour, since a white body reflects the rays of light without separating them; nor black, since a black body, on the contrary, absorbs nearly all the rays. [See COMPLEMENTARY COLOURS.]——COLOURS, in Heraldry, the tinctures with which the field or any part of the escutcheon is distinguished: they are red, blue, black, green, and purple; which the heralds call *gules*, *azure*, *sable*, *vert*, and *purpure*. Tenne and tawny, or sanguine, are not so common. The yellow and white, called *or* and *argent*, are metals, not colours. The metals and colours are expressed in blazon by the names of precious stones, with reference to the arms of noblemen, and by those of planets or stars, with reference to the arms of royal personages.——COLOURS, in Military affairs, the banners, flags, ensigns, &c., of all kinds borne in the army or fleet.

COL'OURING, in Painting. The effect of a picture depends far more upon the way in which the colours are harmonized and contrasted than on the exact imitation of the real colours of objects. Painters use the word *hue* with reference to the peculiar quality of a colour, distinguishing it from another colour throughout all shades and variations, as green from purple. *Tint* signifies the degree of the intensity of hue from the greatest depth to the lightest wash. *Tone* means the degree of illumination or shade in which the hues and tints are seen. *Local* colour is the true colour of an object without regard to tone or tint. *Broken* colours are hues composed of several others, so as to make a mixture quite distinct from the prismatic red, blue, and yellow, and the typical browns, purples, and greens. Colouring, says Mrs. Jameson, is generally cold in Poussin, delicate in Guido, warm in Domenichino, glowing and golden in Titian, fervid and fiery in Giorgione, florid in Rubens, powerful in Rembrandt.

COLOUR TOP, a philosophical toy invented by Mr. John Gorham, for the purpose of showing the effect of mingling different colours. This is done by giving pieces of coloured paper a motion of rapid rotation.

COL'UBER (a snake: *Lat.*), in Zoology, a genus of snakes which includes the common or ringed snake of our island, *Coluber natrix*, a timid inoffensive animal.

COL'UMBINE (*columbinus*, dove-coloured: *Lat.*), the common name of plants belonging to the genus *Aquilegia*, nat. order *Ranunculaceæ*, a genus of plants of several species.——Also the chief female dancer in a pantomime.

COLUM'BIUM (from *Columbia* in America), the name of a very rare metal, sometimes called *Tantalum*, first discovered in a mineral from Massachusetts in North America. It has a grey colour. So far no use has been discovered for it.

COLUMEL'LA (the *dim.* of *columna*, a column: *Lat.*), in Botany, the central pillar in some capsules from which the valves separate when the fruit is ripe. In Conchology, the upright pillar in most univalve shells, round which the whorls twist.

COL'UMN (*columna: Lat.*), in Architecture, a cylindrical pillar, or long round body of wood, stone, or iron, which serves either for the support or ornament of a building. It consists of a capital, which is the top or head: a shaft, which is the cylindrical part; and a base, on which it rests. It differs from the *pilaster*, which is square. Columns are distinguished as to their form into the Tuscan, Doric, Ionic, Corinthian, and Composite. The Tuscan is characterized by being crude, simple, and massive; the Doric is next in strength and massiveness to the Tuscan; the Ionic is more slender than the Tuscan and Doric; the Corinthian is still more delicate in its form and proportions, and is enriched with ornaments; and the Composite is a species of the Corinthian. The proportions of a column are stated in terms of the radius of the bottom of the shaft, which radius is termed a module, and is divided into 30 equal parts called minutes. The Tuscan column has a total height of 14 modules, the capital and the base having each one module. The Doric column has a height of 16 modules, the base having one module, and the capital 32 minutes. The Ionic column has a height of 18 modules, the capital 21 minutes, and the base 30 minutes. The shaft may be plain or fluted: if the latter, it should have 20 or 24 flutings. This column is frequently used for porticoes. The Corinthian column has more delicacy and ornament than the others, the shaft being slender, and the capital rich. It is 20 modules in height, the base having one module and the capital 70 minutes. The shaft may be fluted. The capital is adorned with olive leaves. The Composite or Roman column has a height of 20 modules, the base having one module, and the capital 70 minutes. The shaft may be fluted.——The word COLUMN has also many other significations. Thus it means the division of a page, which may contain two or more *columns*; a large body of troops drawn up in order; any body of the same diameter as its base—thus, a *column* of water, air, or mercury.

COLUM'NA (a column: *Lat.*), in Anatomy, a term applied to different parts: thus the *columna nasi* is the lowest and fleshy portion of the nose, which forms a part of the septum; and the *columna oris* is the same with the uvula.

COLU'RES (*kolos*, clipped; and *oura*, a tail: *Gr.*), in Astronomy, two great circles supposed to intersect each other at right angles in the poles of the earth. They pass through the solstitial and equinoctial points of the ecliptic, and are hence called the *Solstitial* and *Equinoctial* colures. It is believed that this name was given to them on account of their lower parts being always cut off by the horizon.

CO'MA, or COMA-VIGIL (*kōma*, a lethargy: *Gr.*), a preternatural propensity to sleep, or lethargic drowsiness. It is a symptom which often attends acute and malignant fevers.——COMA SOMNOLENTUM, is when the patient continues in a profound sleep, and, if awaked, immediately relapses, without being able to keep his eyes open. ——COMA BERENI'CIS (*komē*, hair: *Gr.*), *Berenice's hair*, in Astronomy, a constellation of the northern hemisphere, composed of stars near the tail of Leo.——The word COMA also denotes the hairy appearance that surrounds a comet, when the earth is between it and the sun.

COMA'TULA (*comatus*, hairy: *Lat.*), a genus of marine radiate animals allied to the star fishes. In their young state they are attached by a jointed stalk to rocks, and they then resemble the PENTACRINUS. But when fully grown the stalk disappears, and a number of jointed legs, armed with claws, take its place. The animal consists of a central disk, in which is the mouth on the underside, and from which radiate five pairs of plumose arms, whence it has received the name of feather star. By the flapping of these arms it can move slowly through the water.

COMBINA'TION (*combinatio*, a joining two by two: *Lat.*), in its general and most popular sense, a league or association formed for good or bad purposes.——In Chemistry, the intimate union of two or more bodies, from which results a new compound differing in its properties from any of the constituents. Thus, an acid uniting with an alkali, forms a salt, and furnishes a good instance of combination.——COMBINATION, in Mathematics, the variation or alteration of any number of quantities, letters, sounds, or the like, in all the different manners possible.

COMBUS'TION (*combustio*, from *comburo*, I consume: *Lat.*), in Chemistry, a term which denotes the union of a supporter of combustion, which is generally the oxygen of the air, with a combustible substance, or its elements. When this combination is *energetic*, it is always accompanied by heat and light. In popular language, *combustion* is the effect of fire in apparently consuming anything and producing heat. It was formerly supposed that a body was annihilated either wholly or partially by combustion; but we now know that this mistake is due to the products of combustion being generally invisible. Of all bodies capable of being procured in large quantities, none throws off light so abundantly during its combination with oxygen as the elementary gas, hydrogen, when united to the elementary solid, carbon. This gas and solid may be combined in various proportions, and a combination of the same proportions will assume various external appearances, according to the varying conditions under which the union has taken place. The gas of our street lamps exhibits one form of the compound; the liquid oils that we burn in our lamps another form; and a third form of it is afforded by the solid fats which we obtain from a wide range of animal and vegetable substances.

COM'EDY (*kōmōdia*, from *kōmē*, a village: and *ōdē*, a song: *Gr.*), because the first comedies consisted of rustic dialogues), a dramatic representation of the light, humorous, and pleasant kind, particularly intended to ridicule the follies of men. Scaliger defines comedy to be a dramatic poem, representing the business of life, whose event is fortunate and style familiar. With us, comedy is distinguished from *farce*, as the former represents nature as she is, the latter distorts and overcharges her; but whether it be to recommed virtue, or to render folly ridiculous, the real intention and effect are amusement.

COM'ET (*komētēs*, from *komē*, hair: *Gr.*), in Astronomy, a nebulous star, accompanied with a train of light, and performing revolutions about the sun in an elliptical orbit, which has the sun in one of the foci. Several comets are suspected of describing parabolas and not ellipses, in which case they will never again visit our system. The head has usually a nucleus or denser part, surrounded by a faint light or nebulosity. Some comets have appeared without tails, whilst others have had several tails; that of 1744, for instance, had six, which spread out like a fan. These tails are frequently of extraordinary extent. The comet of 1680, one of the most celebrated of modern times, had a tail that was calculated at twenty millions of leagues immediately after its perihelion passage, and yet it was emitted in two days. It subsequently became more than twice as long. The matter of these tails must be of incalculable tenuity, and it is supposed that on account of the distance to which they are sent, much of it can never be reabsorbed. Even the heads of many comets are composed of matter of extreme thinness, for a star of the fifth magnitude was observed through the densest part of one without undergoing any diminution of lustre. 'The most unsubstantial clouds,' says Sir John Herschel, 'which float in the highest regions of our atmosphere, and seem at sunset to be drenched in light, and to glow throughout their whole depth as if an actual ignition without any shadow or dark side, must be looked upon as dense and massive bodies compared with the filmy and all but spiritual texture of a comet.'

COMETA'RIUM (*kometes*, a comet: *Gr.*) a machine constructed to represent the revolution of a comet about the sun.

COMETOG'RAPHY (*komētēs*, a comet; and *grapho*, I write: *Gr.*), a description of, or discourse upon, comets.

COM'FREY, the common name of *Symphytum officinale*, a wild herbaceous plant, nat. ord. *Boraginaceæ*, whose root abounds with a mucilaginous juice, which made it esteemed as an emollient.

COMITA'TIS CAUSA (on account of courtesy: *Lat.*). At the universities of Oxford and Cambridge, persons who are masters of arts, or bachelors, or doctors of civil law, medicine, or divinity, of one university, or of Dublin, may be admitted to the same degree at the other *comitatis causâ*.

COMI'TIA (*Lat.*: from *cum*, with; and *itus*, a going), in Roman Antiquity, an assembly of the people, either in the *Comitium*, or *Campus Martius*, for the election of magistrates, or consulting on the important affairs of the republic.

COM'MA (*komma*, a piece cut off: *Gr.*), in Grammar, a point or character marked thus (,), denoting the shortest pause in reading, and separating a sentence into divisions or members.——In Music, the smallest of all the subdivisions; being about the ninth part of a tone.

COMMANDANT' (*Fr.*), the commanding officer of a place, or of a body of forces.

COMMAN'DER (*commander*, to command: *Fr.*), the chief officer of an army, or one who has the command of a body of men. The Commander-in-Chief in the British army is he who has the supreme command over all the land forces in Great Britain. In the Naval service, the chief admiral in any port or station is so called.——The COMMANDER of a ship, in the Royal Navy, is an officer next in rank to a post-captain, and corresponds to a *major* in the army; he has the command of a ship of war under 18 guns, a sloop, &c.

COMMEN'CEMENT (a beginning: *Fr.*), an annual public assembly of the university of Cambridge; or the day on which degrees are publicly conferred.

COMMEN'DAM (*commendo*, I give in charge: *Lat.*), in Ecclesiastical Law, the trust or administration of the revenues of a benefice, formerly given to a layman to hold as a deposit for six months, in order to repair, &c.; or to an ecclesiastic to perform the pastoral duties till the benefice was provided with a regular incumbent. In England, the right of granting benefices *in commendam* was vested in the crown by a statute of Henry VIII. When a benefice was given *in commendam*, the profits ought not to have been received by the party to whom it was committed: the restriction on this point was, however, evaded, and it became a mode of enjoying pluralities. But no spiritual person can now hold two benefices, some few cases excepted; nor can a bishop hold any office, benefice, &c., in commendam.—— One who holds a living in commendam is called a *commendatory*. COMMENDATORY LETTERS, those sent from one bishop to another in behalf of any of the clergy, &c.

COMMEN'SURABLE (*com*, together with; and *mensurabilis*, measurable: *Lat.*), among Geometricians, an appellation given to such quantities as are measured by the same quantity; thus, a yard and a foot are commensurable, as both may be measured by inches.

COM'MENTARY (*commentarius*, from *commentor*, I meditate thoroughly: *Lat.*), an explanation of the obscure passages in an author; sometimes applied to an historical narrative, as the Commentaries of Cæsar.

COM'MERCE (*commercium*, from *commercor*, I traffic with: *Lat.*), in a general sense, the intercourse of nations for the purchase of each other's produce or manufactures, the superfluities of one being given for those of another, and then re-exchanged with other nations according to their several wants.

COMMISSA'RIAT (*commissaire*: *Fr.*; from *committo*, I entrust with: *Lat.*), the whole body of officers in the commissary's department.

COM'MISSARY (*Fr.*; same *deriv.*), in a general sense, one who is sent or delegated to execute some office or duty, as the representative of his superior.——In Military affairs, an officer who has the charge of furnishing provisions, clothing, &c., for an army.——In Ecclesiastical Law, an officer of the bishop who exercises spiritual jurisdiction in distant parts of the diocese.

COMMIS'SION (*commissio*, from *committo*, I give in charge: *Lat.*), in Law, the warrant, or letters-patent, by which one is authorized to exercise jurisdiction.——In Military affairs, the warrant or authority by which one holds any post in the army; in distinction from the inferior or non-commissioned officers.——In Commerce, the order by which anyone traffics or negotiates for another; also the percentage given to factors and agents for transacting the business of others.

COM'MISSURE (*commissura*, a joint: *Lat.*), in Anatomy, any suture or juncture, particularly the corners of the lips where they meet together, and also certain parts of the brain.

COMMIT'MENT (*committo*, I give in charge: *Lat.*), the sending a person to prison by warrant or order, either for a crime or contumacy.

COMMIT'TEE (same *deriv.*), certain persons elected or appointed, to whom any matter of business is referred, either by a legislative body, or by any corporation or society.——A Committee of Parliament signifies a certain number of members appointed by the house to proceed on some specific business. The whole house frequently resolves itself into a committee, in which case each member has a right to speak as often as he pleases. When the house is not in committee, each gives his opinion regularly, and is only allowed to speak once, unless to explain himself. *Standing committees* are such as continue during the existence of the parliament. *Select committees* are appointed to consider and report on particular subjects.

COMMOD'ITY (*commoditas*, advantage: *Lat.*), in Commerce, any merchandise in which a person deals.——Staple Commodities, such wares and merchandises as are the proper produce or manufacture of the country.

COM'MODORE, a captain in the British navy, who is invested with the temporary command of a detachment in some particular enterprise. In the North American navy, a commodore corresponds with our admiral.——The Commodore of a Convoy is the leading ship in a fleet of merchantmen, and carries a light in her top to conduct the other ships.

COM'MON (*communis: Lat.*), a tract of ground, or open space, the use of which is not appropriated to any individual, but belongs to the public, or to a number. The right which a person has to pasture his cattle on the land of another, to dig turf, catch fish, cut wood, or the like, is called *common* of pasture, of turbary, of piscary, and of estovers.

COMMON COUN'CIL, the council of a city or corporate town, empowered to make by-laws for the government of the citizens. The term is generally used in speaking of a court in the city of London, composed of the lord mayor, aldermen, and a certain number of citizens called common-councilmen. The city of London is divided into 24 wards; the chief magistrate of each ward has the title of alderman; the 24 aldermen, with the lord mayor, form the court of aldermen; and certain inhabitants, chosen out of each ward, for the purpose of assisting the aldermen with their advice in public affairs, form the court of *common council*.

COMMON LAW, the law that receives its binding force from immemorial usage, in distinction from the statute law.

COMMON-PLACE BOOK, one in which extracts from books and reflections are written.

COMMON-PLEAS', or COMMON BENCH, one of the superior courts at Westminster-hall. It was originally that branch of the *Aula Regia*, or King's bench, in which civil causes between subjects were tried, and, like that court, followed the person of the sovereign. But it was fixed by the charters, both of John and Henry III., that it should be held in a determined place. It has concurrent jurisdiction with the Queen's bench and Exchequer, the two other superior courts in personal actions and ejectments; but has no cognizance in criminal matters, nor in matters relating to the revenue. It has exclusive jurisdiction in such real actions as still exist, and over the forms of conveyance substituted for fines and recoveries; also in appeals from the decisions of the barristers appointed to revise the lists of parliamentary voters, as well as in cases under the railway and canal traffic act. It has one chief, styled Lord Chief Justice, and four puisne judges; and from their decisions, proceedings in error may be taken into the Exchequer Chamber.

COMMON PRAY'ER, the liturgy, or public form of prayer prescribed by the Church of England to be used in all churches and chapels, and which the clergy are enjoined to use, under a penalty.

COM'MONS (*communis*, common: *Lat.*), the lower house of Parliament, consisting of the representatives of cities, boroughs, and counties, chosen by those possessed of the property or qualification required by law. This body is called the *House of Commons*, and may be regarded as the basis of the British constitution. In the 15th year of King John, writs were issued to the sheriffs, commanding them to return four knights for each county 'ad loquendum cum rege de negotio regni' (to confer with the king concerning the affairs of the realm), at Oxford. And in the 48 Henry III. four knights, from every county but nine, were summoned to attend with the barons, by the rebellious Earl of Leicester. No subsequent writs, for the purpose of county elections, earlier than 18 Edward I., nor for borough elections earlier than the 23rd of the same reign, are in existence; but it is not unlikely that these examples were occasionally followed. Though each member is elected by a distinct body of people, he is, from the moment of his election, the representative not of those particular persons only, but of the kingdom at large; and is to consider himself not merely as the organ through which his constituents may speak, but as one who having been entrusted with a general charge, is to execute it to the best of his judgment. In performance of this great function, his liberty of speech is bounded only by those rules of decency of which the house itself is the judge; and while, on the one hand, he is free to propose what laws he pleases, on the other, he is exposed, as a private man, to the operation of the laws he makes. The acceptance of any office of profit from the Crown, by a member, vacates his seat. And there are two places of no profit, the acceptance of which is considered to have this effect:—the stewardship of the *Chiltern Hundreds*, and the stewardship of the *Manor of East Hendred*. Officers of the army and navy receiving new commissions, and those, such as ambassadors, who obtain a foreign employment, are excepted from this law. A member becoming a bankrupt is incapable of sitting or voting for a year, unless within that time the commission is superseded, or the creditors paid; and if either of these does not take place within the year, the seat is lost. By a resolution dated 1667, and now strictly adhered to, any proposition for taxing the subject must be first examined by a committee of the whole house, and their opinions reported. And when a bill of supply has received the concurrence of the Lords, it is returned to the Commons, and by them presented to the throne. The House of Commons consists of 658 members, 500 for England, 53 for Scotland, and 105 for Ireland. Though many small boroughs were disfranchised by the Reform Bill, the elective franchise was given to several places of rising importance; and a variety of alterations took place, by adding to the number of representatives of counties, &c., so that the total number of members remains the same. No one can vote on the election of a knight of the shire except he be seized of a freehold estate of inheritance of 40*s.* a year value, or of a freehold estate for life of 10*l.* annual value, or of a freehold estate for life of less value when he actually occupies the premises, and in some other cases, or of an estate other than freehold tenure of inheritance, or for life of the annual value of 10*l.*, or of a chattel interest of a certain value and duration in land. No one can vote in the election of a member for a city or borough unless he shall be the occupant of some building which, with or without land, has the yearly value of 10*l.*

COM'MONWEALTH, a free state or body politic.

COM'MUNISM. [See **Socialism.**]

COMMU'NITY (*communitas*, from *communis*, shared by several: *Lat.*), a society of people living in the same place, under the same laws and regulations, and who have common rights and privileges. History shows that the establishment of communities has been one of the greatest advances in human improvement; and they have been, in different ages, the cradle and the support of freedom.

COMMUTA'TION (*commutatio*, from *commuto*, I alter: *Lat.*), in Law, the change of a penalty or punishment from a greater to a less; as when death is commuted for transportation or imprisonment.

COM'PANY (*compagnie*: *Fr.*), in a commercial sense, a society of persons joined together for trading purposes. When companies do not trade upon a joint stock, but are obliged to admit any person properly qualified, upon paying a certain fine, and agreeing to submit to the regulations of the company, each member trading upon his own stock and at his own risk, they are called *regulated companies*; when they trade upon a joint stock, each member sharing in the common profit or loss, in proportion to his share in the stock, they are called *joint-stock companies*. These may be ordinary partnerships, in which each member is liable for the whole debts of the firm; or they may be companies with limited liability, registered under the Joint-Stock Companies' Act, 1862, which contains many provisions regulating these companies.——In the City of London are many associations, relics of old trading companies, of which twelve are known as the Great Livery Companies. Some of these are wealthy bodies, with fine halls, where splendid banquets are occasionally given. Before any person can hold office in the Corporation, he must be a member of some one of these companies. ——**Company**, in Military affairs, a small body of foot, consisting, in the guards and artillery, of 120 men; but in other infantry regiments, of 100, commanded by a captain, who has under him a lieutenant and ensign. A company, in the infantry, corresponds to a *troop* in the cavalry.——Also, the whole crew of a ship, including the officers.

COMPAR'ATIVE ANAT'OMY, is so called because in it the organization of all the members of the animal kingdom are studied with reference to each other. The objects in view are to trace the modifications and disappearance of different organs, in the descending series; to determine the relative degrees of complexity in the structure of different animals, and the points of resemblance which different species manifest to each other, in the totality of their organization; and to trace the history of the development of the embryo. The ultimate aim of comparative anatomy and physiology is to ascertain the laws of vital phenomena.

COMPART'MENT (*compartiment*: *Fr.*; from *compartior*, I divide: *Lat.*), in Architecture, a proportionable division in a building; or some device marked in an ornamental part of the building.——**Compartments**, in Heraldry, are partitions and quarterings of the escutcheon, when the arms of several families are borne in one and the same coat, in consequence of marriages, &c.

COM'PASS, or the **Mariner's Compass** (*compas*: *Fr.*), an instrument used by mariners to point out the course at sea. It consists of a magnetic needle, freely suspended, in connection with a circular card, the circumference of which is divided into thirty-two equal parts. This is inclosed in a box with a glass top by way of protection from the elements, allowance being made for the 'variation' of the needle: the true direction of north and south is thus ascertained. Since iron ships have come into use, it has been necessary to have recourse to various contrivances to neutralize the effect of the attraction upon the needle of the iron of the vessel.——*A pair of compasses* is an instrument used in describing circles, measuring figures, &c.; and consists of two pointed legs or branches, made of iron, steel, brass, &c., united at the top by a joint, on which they move. There are also compasses of three legs, cylindrical, spherical compasses, &c.

COMPENSA'TION PEN'DULUM (*compensatio*, the rendering of an equivalent; from *compenso*, I weigh one thing against another: *Lat.*). The efficacy which a pendulum has in regulating a clock depends upon its being of the same length at all times—if it becomes longer, its vibrations are slower, and *vice versâ*. But the effect of increased temperature is to lengthen it, and of diminished temperature to shorten it; and, as the temperature scarcely ever remains for any space of time the same, the rate of vibrations must vary, unless some means are devised to remedy this defect. The mercurial and the gridiron pendulums are the best contrivances that have been devised for the purpose. The *mercurial pendulum* consists of a rod, at the lower extremity of which is a cylindrical vessel partially filled with mercury. When the rod expands, the centre of gravity of the mercury descends—this lengthens the pendulum: but when by the very same increase of temperature the mercury expands, its centre of gravity is raised—this practically shortens the pendulum; and thus by proper management the two effects neutralize each other: the centre of gravity remains stationary, and the length of the pendulum is not altered. The *gridiron pendulum* corrects itself on the same principle: a portion of its rod consists of parallel bars of different metals, so arranged that, while one set raise the bob by expanding upwards, the others lower it by expanding downwards. The *compensation balance* used to regulate chronometers is constructed also on the same principle. While one portion tends to make it vibrate slowly, the same change of temperature causes the other portion to produce an opposite effect.

COM'PLEMENT (*compleo*, I fill up: *Lat.*), what is required to fill up some quantity. Thus, the *complement of an angle* is what it wants of 90°. Hence, in Astronomy, the complement is the distance of a star from the zenith, or what it wants of being 90 above the horizon. The complement of *a number* is what it wants of 1, 10, 100, &c.; that is, what it wants to make unity with one or more ciphers.

COMPLEMEN'TARY COL'OURS. Every prismatic colour is capable of being converted into white light by the addition to it of all the other prismatic colours. The latter colours are called complementary. Take blue, for instance; the complementary colour is that arising from a mixture of red and yellow. A mixture of yellow and blue, making green, is the complementary colour of red. M. Chevreul has prepared a chromatic table, by which the complementary colour of any of the 13,480 colours, which he has distinctly classed, can be ascertained. It is of great importance to artists, house decorators, and dealers in coloured goods, to know at once the exact colour, shade, and tint, which will produce the greatest effect when placed beside another colour.

COM'PLEX TERMS, and COM'PLEX IDEAS (*complexus*, folded together: *Lat.*), in Logic, are such as are compounded of several simple ones.

COMPLEX'ION (*complexio*, a combination, from same: *Lat.*), among Physicians, the temperament, habitude, and natural disposition of the body; but, in general use, the word means the colour of the skin.

COMPO'SING (*compono*, I place together: *Lat.*), that branch of the art of printing which consists in taking the types or letters from the cases, and arranging them in such an order as to fit them for the press. The instrument in which they are adjusted to the length of the lines is called a *composing-stick*.

COMPOS'ITÆ, (*compositus*, compounded, *Lat.*), a very large nat. order of plants, having numerous small flowers, called florets, collected into dense heads upon a disk or common receptacle, which is surrounded by an involucre or external calyx, composed of leaves or scales. The anthers are syngenesious, that is, are joined together, round the forked pistil. Frequently the florets of the middle part of the head are smaller than, and have a colour different from, those of the margin, then called the ray. The common daisy may be taken as an example. The calyx closely adheres to the fruit, and its upper part forms a ring of hairs or feathers, by means of which the ripe seed is carried away by the wind. No large trees belong to this order, which is made up of more than 8,000 species of herbaceous or shrubby plants, distributed all over the world. Many beautiful garden flowers are placed amongst the Compositæ—for example, the dahlia, aster, chrysanthemum, zinnia, sun-flower, and gazania. Some species yield bitters and tonics, such as wormwood and chamomile Tansy, arnica, elecampane, centaury, colt's-foot, and taraxacum, have more or less celebrity medicinally. The artichoke, endive, succory, lettuce, common artichoke, and Jerusalem artichoke, afford aliment to man. This order is divided into three sub-orders:—1. *Tubulifloræ*, in which the hermaphrodite florets are tubular: the asters and the daisy may be taken as examples. 2. *Labiatifloræ*, in which the hermaphrodite florets, or at least the unisexual ones, are divided into two lips; no British wild-flower falls into this sub-order. 3. *Ligulifloræ*, in which the corollas are slit or strap shaped; the dandelion, chicory, and sow-thistle are examples.

COM'POSITE NUMBERS (same *deriv.*), numbers which can be measured exactly by a number exceeding unity, as 6 by 2 or 3; so that 4 is the lowest composite number. Composite numbers between themselves, are those which have a common measure besides unity; thus 12 and 15, both of which are measured by 3.

COM'POSITE ORDER (same *deriv.*), in Architecture, the last of the five orders of columns, so called because its capital is *composed* out of those of other columns. It is also called the Roman or Italic order, from having been invented by the Romans. The angular volute of the Ionic capital was added to the proportions and enrichments of the Corinthian order. The base measures the same as in the Ionic order. The height of the column is 20 modules, that of the entablature 5 modules, and the capital has 70 minutes in height. The shaft may be either plain, or enriched with 20 or 24 flutings.

COMPOSI'TION (*compositio*, from *compono*, I place together: *Lat.*), in a general sense, the putting together and uniting of several things, so as to form of the whole one mass or compound.——COMPOSITION OF IDEAS, an act of the mind, by which it unites several simple ideas into one conception or complex idea.——In Literature, the act of inventing or combining ideas, furnishing them with words, arranging them in order, and committing them to writing.——In Logic, a method of reasoning, by which we unite together the qualities of anything, one after another, until we have distinguished it from everything else. Thus, 'man is an *animal*: he is a *hot-blooded* animal: he is a hot-blooded *viviparous* animal: he is a hot-blooded viviparous *rational* animal.' Composition, or *synthesis*, is exactly the opposite of *analysis*: one puts together, the other takes in pieces.——In Music, the art or act of forming tunes, to be performed either vocally or instrumentally.——In Painting, the putting together the several parts of a picture, so as to set off the whole to the best advantage.——In Commerce, an agreement entered into between an insolvent debtor and his creditor, by which the latter accepts a part of the debt in compensation for the whole.——In Chemistry, the combination of different substances, from which results a compound substance, differing in properties from any of its component parts. Thus water is a compound of hydrogen and oxygen, which are invisible gases.——COMPOSITION OF FORCES: when two forces simultaneously act upon the same body, so as to set it in motion, it will obey neither of the forces taken separately, but will move along the diagonal of a parallelogram, the two adjacent sides of which will be represented by the two forces. And thus, centripetal force, which tends to draw the earth towards the sun, combined with the force of projection, which is at right angles to it, causes the earth to revolve in its orbit.

COM'POST (*compositus*, compounded; from *compono*, I place together: *Lat.*), in Husbandry, several sorts of soils or earths, and other matters, mixed together, in order to make a compound suitable for fertilizing land.

COM'POUND (*compono*, I place together: *Lat.*), a term in Botany, variously applied. Thus, a compound *flower* consists of several distinct florets, upon a common receptacle, surrounded by a common involucre; a compound *stem* is one that divides into branches: a compound *leaf* consists of several leaflets on a common petiole: a compound *umbel* is one which has all its rays or peduncles bearing small umbels at the top.——COMPOUND INTEREST, in Computation, is interest upon interest; when the interest of a sum is added to the principal, and then itself bears interest.——COMPOUND QUANTITIES, in Algebra, are such as are joined by the signs + and − (*plus* and *minus*), and expressed by more letters than one, or by the same letters unequally repeated: thus, $a+b-c$, and $ab-b$, are compound quantities.——COMPOUND, a word employed by Anglo-Indians to signify the enclosure within which their houses, offices, and outbuildings stand. Some derive the word from the Portuguese *campainha*, but it may originate from the Malay *campong*, a village.

COMPRES'SIBIL'ITY (*compressibilis*, from *comprimo*, I squeeze together: *Lat.*), in Physics, that property in a solid or fluid of yielding to the pressure of another body or force, so as to be brought into a smaller compass. All bodies may be compressed, since all have pores; but liquids resist compression with enormous force.

CON, in Language, a Latin inseparable preposition or prefix, joined to other words. *Con* and *cum* have the same signification, except that *cum* is used separately, and *con* in composition.——In the phrase *pro* and *con* (*pro* and *contra*), for and against, *con* denotes the negative side of a question.

CONCATENA'TION (*concatenatio*, from *concateno*, I link together: *Lat.*), a term chiefly used in speaking of the mutual dependence of second causes upon each other.

CON'CAVE GLASSES (*concavus*, hollow: *Lat.*), in Optics, such as are ground hollow: they are usually spherical, though they may be of any other figure. A concave lens renders rays of light divergent, or less convergent. Hence it is used with *short sight*, which arises from the rays being brought to a focus, by the crystalline lens of the eye, too soon—that is, before they reach the retina.

CONCA'VO-CON'CAVE (same *deriv.*), hollow or concave on both surfaces.

CONCA'VO-CON'VEX (*concavus*, hollow; and *convexus*, arched: *Lat.*), concave on one side, and convex on the other.

CONCEN'TRATE (*con*, together with; and *centrum*, a centre: *Lat.*), to bring nearer to each other; as, to concentrate particles of salt by evaporating the water that holds them in solution; or to concentrate rays of light into a focus.

CONCEP'TACLE (*conceptaculum*, a receptacle: *Lat.*), in Botany, the cases containing the reproductive organs of plants, which, like ferns, have them at the back of the leaves. Also, a pericarp of one valve, opening longitudinally on one side, and having the seeds loose in it.

CONCEP'TION (same *deriv.*), in Logic, the simple apprehension or perception which we have of anything, without proceeding to affirm or deny anything about it. An act of the mind, by which we combine individuals together, through some character common to them all. Thus, all kinds of triangles resemble each other, in having three sides.

CONCER'TO (harmony: *Ital.*), in Music, a piece composed specifically for a particular instrument, which is, however, at times accompanied by others.——CONCERTO-GROSSI, the grand chorus of a concert, or those places where all the several parts perform or play together.

CON'CHA (*konchē*, a shell: *Gr.*), in Anatomy, the larger cavity of the external ear, situated before the *meatus auditorius*, or passage into the internal ear.

CONCHIF'ERA (*konchē*, a shell; and *phero*, I bear: *Gr.*), a class of molluscs, living in bivalve shells. They are divided into two sections, those with and those without siphonal tubes for respiration. The cockle is an example of the first, the oyster and scallop of the second section.

CON'CHOID (*konchē*, a shell; and *eidos*, form: *Gr.*), in Geometry, the name of a curve invented by Nichomedes, for the solution of two celebrated geometrical problems, 'the duplication of the cube,' and 'the trisection of an angle.' Sir Isaac Newton observes that he prefers it before other curves, or even the conic sections, in the construction of cubic and biquadratic equations, on account of its simplicity.

CONCHOID'AL (same *deriv.*), in Mineralogy, a term applied to the fracture when there is a convex elevation and a concave depression, like the valve of a shell-fish.

CONCHOL'OGY (*konchē*, a shell; and *logos*, a discourse: *Gr.*), is to be considered as a branch of the science of Malacology, or the study of the Mollusca, one of the great subdivisions of the animal kingdom. Conchology has reference only to the structure and shape of the shells with which the bodies of many mollusca, but not all, are protected. The study of the animals belongs to the malacologist. Carbonate of lime is the basis of shell, with a small quantity of animal matter. It is secreted by the mantle of the animal, and added layer by layer to that which has been already formed. Shells vary in texture, some being porcellanous, others nacreous or pearly, whilst fibrous, horny, and glassy structures may be seen in others. In some shells there are two layers, the outer one composed of solid prismatic cells, sometimes resembling minute crystals placed side by side, and the inner one a nacreous layer, which, in certain large shells, yields the mother of pearl of commerce. The lustre which is peculiar to mother of pearl has been found to arise from the undulations of an extremely thin membrane, which alternates with layers of carbonate of lime. In a few cases the shell is internal; in the great majority it is external. Of the shell-bearing mollusca, three-fourths have only one shell, that is, are univalve. Another large section have two shells, and are therefore termed bivalves. A few have more pieces, and the chitons, which are very unlike other shell-bearing mollusca, have as many as eight. Shells are usually covered with a skin, epidermis, or periostracum, sometimes very thin, at others thick; whilst occasionally it is covered with hair. As to the **UNIVALVES**, the shells are usually spiral, but sometimes conical, like the limpet's, or tubular. The cavity is always a single chamber, except amongst the nautili, when it is *camerated*, that is, divided into several chambers, and the mouth is frequently closed when the animal has withdrawn into its shell, by a horny or calcareous plate, called the *operculum*. The upper part of the shell is the *spire*, and the point of this the *apex*. The whorls twist round a central axis, or *columella*, which is sometimes open or hollow, when the shell is said to be perforated, the hollow itself being termed the *umbilicus*. The mouth of the shell is termed the *aperture*, and this is often produced into a canal below, whilst the margin, with its outer and inner, or columellar lips, is styled the *peristome*. In some shells, the apex is broken off, and then the shell is styled *decollated*. BIVALVES are either *equivalve*, when the two valves are of the same size and shape, or *inequivalve*, the latter being the case when one of the valves adheres to a foreign substance. Most bivalves are *inequilateral*, that is, one side is shorter than the other side. The *beak*, or umbo, near the hinge, is the apex or point from which the valve begins to grow. The *umbones* are either straight, curved, or spiral; and sometimes one valve is spiral and the other flat. The surface of the valves is often marked with ridges which radiate from the beaks to the margin; or with concentric ridges, which represent the stages of growth. In front of the beaks there is an oval space, called the *lunule*. The valves are fastened together by an elastic ligament, which causes them to open when the *adductor* muscles inside the shell relax. The hinge is furnished with teeth, which differ in shape and number, and afford characters for distinguishing genera. The teeth on one side fit into pits on the other. The teeth placed immediately under the umbo are called hinge or cardinal teeth: those to the side are termed lateral. Looking at the interior of the valves, there is usually to be seen either a single rounded depression (when the shell is termed *monomyary*), or two such depressions, when it is termed *dimyary*. These are the sites of the attachments of the adductor muscles. There is also to be seen a line, which more or less follows the direction of the margin of the shell. This is the *pallial* line, and is produced by the margin of the mantle. When the animal possesses retractile siphons, this pallial line usually makes a bend inwards, which bend is termed the *pallial sinus*. In describing a shell, it must be understood that the anterior or front side is that to which the beaks turn, whilst the ligament is on the posterior side. When the shell is placed with the hinge downwards, the beaks being turned towards the observer, and the ligament therefore away from him, the valve on his left hand is the left valve, and the other the right valve.

CONCHOM'ETER (*konchē*, a shell; and *metron*, a measure: *Gr.*), an instrument for measuring shells.

CON'CLAVE (*conclavium*, literally shut up with one key: from *con*, together with; and *clavis*, a key: *Lat.*), the *place* in which the cardinals of the Romish church meet for the election of a pope: also the *assembly* of cardinals. The latter are locked up in separate apartments, and meet once a day in the chapel of the pontifical palace in which they are assembled, where their votes, given on a slip of paper, are examined. This continues until two-thirds of the votes are in favour of one person. [See ADORATION.] The ambassadors of France, Austria, and Spain, have a right, on the part of their respective courts, to put in a veto against the election of one cardinal.

CONCOC'TION (*concoctio*, from *concoquo*, I digest: *Lat.*), in Medicine, the process by which food is turned into *chyle*, or otherwise prepared to nourish the body.

CON'CORD (*concordia*, from *concors*, harmonious: *Lat.*), in Music, the union of two or more sounds pleasing to the ear. The words concord and harmony are, in fact, the same thing, though custom has applied them somewhat differently.——In Grammar, that part of syntax which treats of the agreement of words in a sentence.——In Law, an agreement between the parties in a fine, made by leave of the court.

CONCOR'DANCE (*concordo*, I harmonize with: *Lat.*), a dictionary of the Bible, in which the leading words used in scripture are arranged alphabetically, and reference is made to the various places in which they occur; that the student may determine the meaning of any passage, by collating it with another. The first Concordance was compiled in 1262. The best English Concordance is that of *Cruden*, published in 1737.

CONCOR'DAT (*concordo*, I agree with: *Lat.*), a treaty or public act of agreement between the pope and any prince, relative to ecclesiastical matters.

CON'CRETE (*concretus*, grown together: *Lat.*). In Logic, a *concrete term* expresses the notion derived from the view taken of any object, with reference to, or as in conjunction with, that which furnished the notion:—thus, *foolish*, or *fool*. When the notion is expressed without any such reference, it is an *abstract term*:—thus, *folly*.——A builder's term for a mixture of mortar and gravel, frequently employed on laying the foundation of a building.

CONCRE'TIONS (*concretio*, from *concresco*, I grow along with: *Lat.*), MORBID, in animal economy, hard substances that occasionally make their appearance in different parts of the body, as well in the solids as in those cavities destined to contain fluids: in the former, they are denominated *ossifications*; in the latter, *calculi*.

CONCUS'SION OF THE BRAIN (*concutio*, I shake: *Lat.*), in Surgery, an injury sustained by the brain, in consequence of sudden and violent pressure upon it. The effect is generally termed a *stunning*. It must be watched with great care; since the patient may seem to recover from the insensibility, &c., while dangerous inflammation is going on.

CONDENSA'TION (*condensatio*, from *condenso*, I press close together: *Lat.*), the act by which a body is rendered more dense, compact, and heavy. Hence condensation stands opposed to *rarefaction*. The term is generally applied to the conversion of vapour into a fluid.

CONDEN'SER (*condenso*, I press close together: *Lat.*), a pneumatic machine by which a volume of air may be reduced into a much smaller space. It is like an air pump, except that the valves are reversed, opening *inwards* instead of *outwards*; and is used to force a large quantity of air into a given space.—Also, that part of a steam engine to which the steam passes from the cylinder, and where it is reduced to the liquid state by cold water.

CONDI'TION (*conditio*: *Lat.*), in Law, a restraint annexed to a thing, so that by non-performance, the party shall receive loss, and by the performance, advantage. It is most generally used to signify a term, on which a grant is made. Conditions are *precedent* when anything is obtained by performance of them: *subsequent*, when they are not to be performed until after acquisition. If the breach of a condition can be compensated for, the party breaking it will generally be relieved from the consequences in equity.——CONDITIONAL PROPOSITION, in Logic, that which asserts the dependence of one categorical proposition on another. Thus, 'if the child falls, it will be hurt.' The proposition from which the other results is the *antecedent*: the result is the *consequent*.——CONDITIONAL SYLLOGISM, a syllogism, in which the reasoning depends on a conditional proposition. It is of two kinds, constructive and destructive. 'If A is equal to B, C is equal to D, but A is equal to B, therefore C is equal to D,' is *constructive*. 'If A is equal to B, C is equal to D, but A is not equal to B, therefore C is not equal to D,' is *destructive*.

CON'DOR, a very large kind of vulture, (the *Sarcoramphus gryphus* of ornithologists), the size of which, however, was greatly exaggerated by the earlier writers. It is about four feet in length, and the expanded wings measure about nine feet. The condor selects its breeding place at a height of more than 10,000 feet on the Andes. It feeds chiefly on dead carcases; but two will occasionally unite in overpowering and bearing away even large animals.

CONDOTTIE'RI (*Ital.*). These were men who, in the middle ages, raised corps of soldiers at their own expense, and then entered the service of some prince or government. Such soldiers of fortune were turbulent and rapacious, and frequently robbed their employers. An Englishman, Sir John Hawkwood, who died at Florence in 1393, was one of the last.

CONDUC'TOR (*Lat.*, from *conduco*, I lead), in Electrical experiments, a body capable of transmitting the electric fluid. It is called also a *non-electric*; for, unless insulated, it will not exhibit electrical excitement, the electricity being carried off along it as fast as it is communicated to or excited upon it. The metals are the best conductors: resinous substances are very bad ones. Bodies incapable of transmitting electricity are called *non-conductors*; and, because electricity may be communicated to or excited upon them, without artificial insulation, they are termed *electrics*. There is no body a perfect conductor, or a perfect non-conductor. The non-conducting power depends very much on the extent of non-conducting surface.——LIGHTNING CONDUCTOR, a pointed metallic rod fixed to the upper parts of buildings to secure them from the effects of lightning. It is connected with the earth, or, what is better, the nearest water, by a good conductor, which is sufficiently thick not to be melted in transmitting the electricity; and which where attached to the wall, is insulated by non-conductors, so that the electricity may not be diverted to the building, instead of passing harmlessly away.

CON'DUIT (*Fr.*), a subterraneous or concealed aqueduct. The ancient Romans excelled in them, and formed the lower parts, through which the water ran, with a cement of such an excellent quality, that it has become as hard as the stone itself which it was employed to join.——CONDUITS, in modern times, are generally pipes of wood, iron, or pottery, for conveying the water from the main spring, or reservoirs, to the different places where it is required.

CONDU'PLICATE (*conduplico*, I double together: *Lat.*), in Botany, a leaf is said to be conduplicate when it is folded laterally in the bud, like an oak leaf. The term is also applied to the embryo in a section of cruciferous plants, where the cotyledons are bent and the radicle is enclosed between their folds.

CON'DYLE (*kondulos*, a knuckle: *Gr.*), in Surgery, a rounded protuberance on the end of a bone; a knuckle.

CON'DYLOID (*kondulos*, a knuckle; and *eidos*, form: *Gr.*), in Anatomy, the CONDYLOID PROCESS, or Condyle, is the posterior of the two protuberances which are placed at the upper side of the back of the under jaw. By this the jaw is articulated to the glenoid cavity of the temporal bone. The anterior of the protuberances is called the coronoid process.

CONE (*konos*: *Gr.*), in Geometry, a solid figure having a circle for its base, and its top terminating in a point or vertex, like a sugar-loaf. A *right* cone has its axis perpendicular to its base, and its sides equal. It is supposed to be formed by the revolution of a right-angled plane triangle about one of its perpendicular sides. Any other cone is *oblique*. To find the curve surface of a cone, multiply half the product of the circumference of the base by the slant side. If the area of the base be added to this, the sum is the whole surface. The solidity of a cone is ascertained by multiplying one-third of the product of its base by its altitude. The *frustum of a cone* is that part which remains after cutting off the upper portion by a plane parallel to the base. To ascertain the solidity of such a frustum add the squares of the diameters of the two ends to the product of the two diameters, and multiply the sum by the height and by ·2618.——CONE, in Botany, the fruit of several trees forming the order of *Coniferæ*. It is composed of woody scales, variously shaped, each having a seed at the base.——In Conchology, a univalve shell, some specimens of which bring very large prices, on account of their beauty and rarity.——CONE OF RAYS, in Optics, the aggregate of the rays which proceed from a luminous point, or from a single point of a luminous object.

CONFEC'TION (*confectio*, a composing: *Lat.*), a sweetmeat or anything prepared with sugar. It also signifies a liquid or soft electuary, of which there are various sorts

CONFED'ERACY (*confœderatio*, an agreement: *Lat.*), in Law, a combination of two or more persons to do some damage or injury to another, or to commit some unlawful act.——In Politics, the alliance of independent states, for some common object.

CONFERVA'CEÆ, a large division of Algæ, principally microscopical plants, which abound wherever there is water or damp air. They are composed of articulated threads, and are usually of a green colour. What has been called 'meteoric paper' consists of a matted sheet of some species formed on the surface of a pool which afterwards dries up. Closely allied plants sometimes occur in the sea, in such abundance that they discolour it. These are of a red colour, and sailors have given the name of sea-sawdust to them. The Red sea is supposed to acquire its name from the tinge communicated to it by such plants. The word *Conferva* comes from *confervere*, to boil, from the bubbles given off by the plants.

CONFES'SION (*confessio*, from *confiteor*, I acknowledge: *Lat.*), in a Legal sense, the acknowledgment of something prejudicial to the person making the declaration.——In Theology, a public declaration of one's faith, or the faith of a public body. Also a part of the Liturgy, in which an acknowledgment of guilt is made by the whole congregation. Among the Jews, it was a custom, on the annual feast of expiation, for the high-priest to make confession of sins to God in the name of the whole people.——AURICULAR CONFESSION, a private confession or acknowledgment of sins, made by each individual in the Romish and Greek churches to the priest. [See AURICULAR CONFESSION.]

CONFESSION OF FAITH, a formulary, detailing the opinions held by a religious community. The Apostles', Athanasian, and Nicene creeds, are the most ancient of such formularies. In addition to these, Roman Catholics refer to the decrees and catechism of the Council of Trent, and the creed of Pius IV., as of primary authority, to the rule of faith of Verronius, and the exposition of Bossuet, &c., as of secondary. The symbol of Mogila is the most authentic exposition of the doctrines of the Greek Church. The 39 Articles, the 3 articles of the 36th canon, the Book of Common Prayer, and the Homilies, are authorized statements of the doctrines of the Church of England. The confession of Augsburg, the articles of Smalcald, Luther's great and little catechisms, and the 'form of concord,' detail the doctrines of the Lutheran church. The confession of the Westminster assembly is the formula of the Scottish church, last drawn up.

CONFES'SOR (*Lat.*, from *confiteor*, I acknowledge), in Church History, one who has proclaimed his faith in difficult and trying circumstances, without his zeal having been tested to the extent of martyrdom.——In the Roman Catholic church, a priest, who hears confessions, and is empowered to grant absolution to those who confess.

The person whose confession he hears is called his penitent; and the seat, or cell, in which he sits to hear confessions is called the *confessional*.

CONFIGURA′TION (*configuratio*, from *configuro*, I fashion after: *Lat.*), in Astrology, the aspects of the planets at a certain time. The astrologers pretended that the stars, in a given configuration, aided or opposed each other in their influence on the destinies of individuals.

CONFIRMA′TION (*confirmatio*, from *confirmo*, I strengthen: *Lat.*), the act or ceremony in the Christian church of the laying on of hands, by which baptized persons are confirmed in their baptismal vows. The ceremony is performed by the bishop; and the antiquity of it is, by all ancient writers, carried as high as the apostles, upon whose example and practice it is founded. In the Romish church it is considered a sacrament. ——CONFIRMATION, in Law, an assurance of title, by the conveyance of an estate or right *in esse*, from one person to another, by which a possession is made perfect, &c. ——CONFIRMATION, in Rhetoric, the third part of an oration, in which the orator undertakes to prove the truth of the proposition advanced in his narration.

CONFISCA′TION (*confiscatio*, from *confisco*, I seize for the public treasury: *Lat.*), in Law, the condemnation and adjudication of goods or effects to the public treasury.

CON′FLUENT (*confluens*, flowing into: *Lat.*), in Botany, a term for parts that have grown together, so that the line of junction is not visible.——In Anatomy, two bones are said to be confluent, when, having been originally separate, they have become blended together.——In Medical Science, running together, and spreading over a large surface of the body, as the *confluent* small-pox.

CONFORM′ABLE, in Geology, a term applied to a stratum that lies upon another parallel wise. If a stratum lies upon the edges of the strata below, it is said to be unconformable. Unconformity shows that the lower strata had been disturbed, and probably denuded, before the upper stratum had been deposited.

CONFORMA′TION (*conformatio*, from *conformo*, I put together: *Lat.*), the particular texture or structure of a body, or disposition of the parts which compose it. ——MAL-CONFORMATION, or *Malformation*, in Anatomy, denotes some defect in the first rudiments, by which a person is born either crooked, or with some part of the body unduly proportioned, &c.

CONFOR′MIST (*conformis*, similar: *Lat.*), in Ecclesiastical concerns, one that conforms to the Established Church; the seceders or dissenters from which are called *Non-conformists*.

CONFU′CIUS, DOCTRINES OF. These relate to morals and politics, and are the foundation of the ethics and system of government of the Chinese, who have built innumerable temples to him, where they do him service. The philosopher's real name was Koong-foo-tse, which has been Latinised into its present form by Europeans. The date of his birth is uncertain, some placing it four and a half centuries, others three and a half centuries before our era. His writings, which form nine works, have become the sacred books of the Chinese. They inculcate the duty of entire submission of children to parents. As a ruler stands in the relation of a father to his subjects, the doctrine of submission has been extended from families to the nation, and hence the memory of Confucius has always been revered by the emperors. He laid down the excellent rule that we ought to treat others as we would have them to treat us. That he leaned towards predestination, and the prediction of events, is not wonderful. He thought that the human body is composed of two principles, one of which, at the period of their separation, descends into the earth, the other is invisible, and ascends into the air. The spiritual part of the good man is permitted to visit its former abode on earth, or rather the hall or temple which it is the custom of the Chinese to erect, and wherein they perform sacred rites to the memory of their ancestors. He seems not to have conceived of a Deity with a personal being or form. He maintained that out of nothing there cannot possibly be produced anything; that material bodies must have existed from all eternity; that the cause or principle of things must have had a co-existence with the things themselves; that therefore this cause is also eternal, infinite, indestructible, without limits, omnipotent and omnipresent. Since the time of Confucius, the Buddhist religion has entered China, and brought with it idols and images, objects always needed to fix the attention and excite the devotion of the mass of the people.

CON′GE (*conger*, to take leave of: *Fr.*), in Architecture, the small curvature at each end of the shaft, termed also the *apophyge* (*apofugo*, I fly away: *Gr.*). When the congé is in the form of a *quarter round*, or *echinus*, it is called a *swelling congé;* but when in the form of a *cavetto*, a *hollow congé*.

CONGE′ D'ELIRE (*Fr.*), in Ecclesiastical affairs, the king's permission to a dean and chapter, in the time of a vacancy, to choose a bishop. It is a mere matter of form, for the person named in the writ must be chosen.

CONGELA′TION (*congelatio*, a freezing: *Lat.*), such a change produced by cold in a fluid body, that it quits its liquid state and becomes a solid.

CON′GER (*Lat.*), a voracious marine eel, the *Conger vulgaris* of naturalists. It has been taken on the Cornish coast, more than ten feet long, and weighing 130 lbs.

CONGE′RIES (*Lat.*), a collection of several particles or bodies united into one mass or aggregate.

CONGES′TION (*congero*, I accumulate: *Lat.*), in Medicine, an unnatural accumulation of blood in the capillary vessels, or any part of the sanguiniferous system. Congestion of the brain, liver, or lungs, is often the effect of fevers, though usually consequent on a previous morbid state of these organs.

CONGLOM′ERATE (*conglomero*, I heap together: *Lat.*), in Botany, an epithet for flowers growing on a branching peduncle or foot-stalk, upon short pedicles closely compacted together.——In Mineralogy, a sort of pudding-stone composed of pebbles of quartz, flint, silicious slate, &c., cemented together.——CONGLOMERATE GLAND, in Anatomy, a gland composed of many smaller glands, whose excretory ducts unite in a common one, as the salivary glands.

CONGREGA'TIONALISTS (*congregatio*, an association: *Lat.*), in Church History, a sect of Protestants who reject all church government, except that of a single congregation, which, they maintain, has the right to choose its own pastor and govern itself. They have been called *Brownists*, from their founder: and, latterly, *Independents*. They believe in the Trinity, predestination, total depravity, particular redemption, effectual grace, and final perseverance.

CON'GRESS (*congressio*, from *congredio*, I meet: *Lat.*), an assembly of envoys, commissioners, deputies, &c., from different courts, who meet to concert measures for their common good, or to adjust their mutual concerns. Having exchanged their credentials, the envoys of the different powers carry on their negotiations directly with each other, or by the intervention of a mediator, either in a common hall, or at their own residences, by turns, or, if there is a mediator, in his residence. These negotiations are continued, either by writing or by verbal communication, until the commissioners can agree upon a treaty, or until one of the powers dissolves the congress by recalling its minister.——CONGRESS OF THE UNITED STATES OF AMERICA. The assembly of senators and representatives of the several states of North America, forming the legislature of the United States, is designated, in the constitution of the general government by this title. It consists of a senate and a house of representatives, each constituting a distinct and independent branch.— The *house of representatives* is chosen every two years, by the people of the several states; and the voters and electors are required to have the same qualifications as are requisite for choosing the members of the most numerous branch of the legislature of the state in which they vote. Each state, however small its population, is entitled to at least one representative; but upon the whole population there cannot be more than one for every 30,000 persons, and the number of representatives apportioned to each state is altered every ten years. No person can be a representative who has not attained the age of twenty-five years, and been seven years a citizen of the United States, and who is not, when elected, an inhabitant of that state in which he has been chosen. No other qualifications are required.—The *senate* is composed of two senators from each state, who are chosen by the legislature of the state for six years; and are divided into three classes, so that one-third of them is, or may be, changed by a new election every second year. No person can be a senator who is not thirty years of age, and has not been nine years a citizen of the United States, and is not, when elected, an inhabitant of the state for which he is chosen. The times, places, and manner of holding elections for senators and representatives are appointed by the state legislatures. Each house determines the rules of its own proceedings, and has power to punish its members for disorderly conduct. Neither house, during the session of congress, can, without the consent of the other, adjourn more than three days, nor to any other place than that in which the two houses shall be sitting. The senators and representatives are entitled to receive a compensation, provided by law, for their services, from the treasury. They are also privileged from arrests, except in cases of treason, felony, or breaches of the peace, during their attendance at the session of their respective houses, and in going to and returning from it.

CON'GREVE ROCK'ET, so named from its inventor, Sir W. Congreve, a formidable weapon of destruction, consisting of a tubular case of copper or iron, filled with combustibles, which is impelled against the hostile ranks of an army, or the walls of a fortress. Congreve rockets were first used in the attack on Boulogne in 1806. *Carcass rockets*, as those for bombardment are called, are armed with strong iron conical heads, pierced with holes, and containing a substance as hard and solid as iron itself, which, when once inflamed, is inextinguishable, and scatters its burning particles in every direction. When this substance is consumed, the ball explodes like a grenade. The rocket is projected horizontally, and whizzes loudly as it flies through the air Congreve rockets were at first considered a most important invention, but experience has shown that in the field they are much less efficient than the common artillery, and in sieges do less injury than red-hot shot and bombs.

CON'IC SEC'TIONS, in Geometry, such curved lines as are produced by the intersection of a plane and a cone. The different positions of an intersecting plane give rise to five different figures or sections, viz. the *triangle*, formed by a plane passing through the vertex; the *parabola*, by a plane passing through one side, and parallel to a plane touching the other; the *hyperbola*, by a plane passing through one side, but not parallel with a plane touching the opposite side; the *circle*, by a plane passing through both sides and cutting off a right cone containing the vertex; and the *ellipse*, by a plane passing through both sides obliquely. The parabola, hyperbola, and ellipse, are the only curves which are peculiarly conic sections.

CONIF'ERÆ (*conus*, a cone; and *fero*, I bear: *Lat.*), in Botany, a natural order of trees and shrubs which are found in almost every part of the globe. They are most important to mankind for their resins, among which are turpentine, pitch, Canada balsam, &c.; and for their timber, under the names of fir, pine, deal, cedar, &c. The fruit usually forms what is termed a cone, a more or less ovoid mass of scales, at the base of each of which are one or two seeds. The ovule has no covering, but receives the fertilising pollen through the foramen, without the intervention of a stigma. Hence they have been placed in a class called Gymnogens (*gumnos*, naked: *Gr.*). In the genera of Pinus, Abies, Larix, and Cedrus, the leaves are long and slender, whence the Germans term the species needle-trees. But in other genera the leaves are broad. Some of the loftiest trees in the world belong to this order; the Wellingtonia of California, and the Douglas and Lambert Pines of North America, are more than 300 feet high. The beautiful Norfolk Island Pine, the **Huon** Pine of Tasmania, and the **Cowrie** Pine of New Zealand, are also lofty trees. On the other hand, there are some Dacrydia in New Zealand no larger than mosses. To this order belong the various species of **Cedar**, **Juniper**, **Cypress**, **Larch**, **Pine**, and **Fir**. The great bulk of the vegetable remains found fossilised in the state of coal consists apparently of extinct coniferous trees.

CONI'UM (*kōneion*, from *kōnao*, I whirl about: *Gr.*, on account of its intoxicating effects), in Botany, a genus of plants, nat. ord. *Umbelliferæ*, including the common Hemlock, *C. maculatum*, a poisonous plant, from which an alkaloid, *conia*, or *conine*, used in medicine, is obtained.

CON'JUGAL RIGHTS (*conjugalis*, belonging to marriage: *Lat.*). The restitution of conjugal rights is a species of matrimonial suit, which may be brought either by the wife or husband against the party who is living in a state of separation.

CON'JUGATE (*conjugo*, I join together: *Lat.*). **Conjugate Axis**, in Geometry, that which crosses another axis.——**Conjugate Diameter**, the shortest axis of an ellipsis.——**Conjugate Hyperbolas**, hyperbolas having the same axis, but in contrary order.

CONJUGA'TION (*conjugatio*, a combining: *Lat.*), in Anatomy, is applied to a pair of nerves, arising together, and serving the same operation, sensation, or motion.——**Conjugation**, in Grammar, the distribution of the several inflections or variations of a verb, in their different voices, moods, tenses, numbers, and persons.

CONJUNC'TION (*conjunctio*, from *conjungo*, I join together: *Lat.*), in Astronomy, the meeting of two or more stars or planets in the same point of the heavens. It is either true or apparent. *True conjunction* is when a right line, drawn from the centre of the earth through the centre of one of the bodies, would pass through that of the other. *Apparent conjunction* is when a line from the centre of the earth would not pass through the centres of both bodies. The moon is in conjunction with the sun when they meet in the same point of the ecliptic, which happens every month; and eclipses of the sun are always occasioned by the conjunction of the sun and moon, in or near the nodes of the ecliptic.—— **Conjunction**, in Grammar, an indeclinable word, or particle, which serves to join words and sentences together.

CON'NATE (*connatus*, born at the same time: *Lat.*), in Botany, an epithet for leaves, which are united at their bases, as in the garden honeysuckle.——In Anatomy, the term *connate* signifies that the ossification of the common fibrous or cartilaginous bases of two bones proceeds from one point or centre, and so converts such bases into one bone.

CONNI'VENT (*conniveo*, I wink: *Lat.*), in Botany, a term applied to the divisions of a calyx when they arch inwards.——**Connivent Valves**, in Anatomy, a term applied to the valvular folds of the lining membrane of canals, which are so disposed as to retard, while at the same time they permit (*connive at*), the passage of the contents of such canals.

CONNOISSEU'R (*Fr.*, from *connattre*, to know), a critical judge or master of any art, particularly of painting, sculpture, and the belles lettres.

CO'NOID (*konos*, a cone; and *eidos*, form; *Gr.*), in Geometry, a solid formed by the revolution of a conic section about its axis. — In Anatomy, a gland found in the third ventricle of the brain, called the pineal gland from its resemblance to a cone or pine-apple.

CON'QUEST (*conquête*: *Fr.*), the right over property or territory acquired in war. It presupposes a just war, and is generally admitted as a part of the law of nations. Conquest may respect either persons or things: it may apply to a whole nation, or to a single town or province; and it may be temporary or permanent. Where persons are not found in arms, but are included as inhabitants of a town or province which has surrendered, they are treated generally as subjects. The original allegiance to their own government is suspended, and they come under an implied obligation to the conqueror, to submit to his orders, and to demean themselves, for the time, as faithful subjects. Under such circumstances, the conqueror generally leaves them in possession of their property, and punishes them only for rebellious or traitorous conduct. It is not usual, in modern times, to change the fundamental laws of a conquered country; but the sovereign power of the conqueror so to do is conceded by the law of nations.

CONSANGUIN'ITY (*consanguinitas*: from *consanguineus*, related by blood: *Lat.*), the relation which subsists between persons who are sprung from the same stock or common ancestor, in distinction from affinity, or relation by marriage. It terminates in the sixth or seventh degree, except in the succession to the crown, in which case it is continued to infinity.

CON'SCRIPT (*Lat.*, from *conscribo*, I write together), in Roman Antiquity, an appellation given to the senators of Rome. The number of senators was increased to 300 when the *Luceres* were incorporated with the Roman people, as a *third* tribe. Sulla increased their number to 500 or 600; Julius Cæsar to 900; and it afterwards became 1000, but was subsequently reduced to 600. ——**Conscript**, in the French armies, an enrolled soldier or recruit.

CONSCRIP'TION (*conscriptio*, from same), the enlisting those inhabitants of a country who are capable of bearing arms, by a compulsory levy, at the pleasure of the government. The term is derived from the military constitution of ancient Rome. Under the consulship, all persons capable of bearing arms were obliged, under penalty of losing their fortune and liberty, to assemble in the Campus Martius, or near the capitol, where the consuls, seated in their curule chairs, made the levy, by the assistance of the legionary tribunes. The consuls ordered such as they pleased to be called out of each tribe, and every one was obliged to answer to his name, after which as many were chosen as were wanted.——France, in the beginning of the revolution, declared it the duty and honour of all citizens to serve in the army of their country. Every French citizen was born a soldier, and obliged to serve in the army from sixteen to forty years of age; from forty to sixty he belonged to the national guard. Every year the young men of the military age were assembled, and distributed in the different military divisions: and it was decided by lot who, among the able-bodied men of suitable age, should take arms. Thus it was that those prodigious masses were so quickly raised, and sent to the field of slaughter.

CONSECRA'TION (*consecratio*, from *consecro*, I dedicate: *Lat.*), the act of devoting and dedicating anything to the service and worship of God.——CONSECRATION was also a religious rite among the Romans, by which they set any person or thing apart for sacred purposes, as their high-priests; or made it sacred, or a fit object of divine worship, as the emperors, their wives, or children, who were in this manner enrolled among their gods. This was sometimes called *apotheosis*, but on medals it is distinguished by the word *consecratio*, with an altar, or some other sacred symbol.

CONSEC'TARY (*consectarius*, that which follows logically: *Lat.*), in Geometry, some consequent truth obtained from a demonstration.

CON'SEQUENCE (*consequentia*, from *consequens*, coming in order: *Lat.*), that which follows as an inference of truth and reason, from admitted premises or arguments.

CONSERVA'TOR (a defender, from *conservo*, I preserve: *Lat.*), an officer appointed for the security and preservation of the privileges of some cities, corporations, and communities, or for the protection of some places. The ancient office of *conservator of the peace* is now performed by all judges and magistrates, but particularly by *justices of the peace*.

CONSER'VATORY (same *deriv.*), a term sometimes used for a greenhouse. It is, properly, a large glazed building for exotics, in which the plants are planted in beds and borders, and not in tubs or pots, as in the common greenhouse.——In various parts of Italy and France there are musical schools called *conservatories*, which are expressly intended for the scientific cultivation of musical talent, and through which many first-rate composers, as well as vocalists, have attained their proficiency.

CON'SERVE (*conservo*, I preserve: *Lat.*), in Pharmacy, a form of medicine contrived to save the flowers, herbs, roots, fruits, or simples, as nearly as possible in their natural fresh state.

CONSIDERA'TION (*consideratio: Lat.*), in Law, the material cause or ground of a contract, without which the party contracting would not be bound. A consideration is either express or implied: *express*, when the thing to be given or done is specified; *implied*, when no specific consideration is agreed upon, but justice requires it, and the law implies it: as when a man labours for another, without stipulating for wages, the law infers that he shall receive a reasonable *consideration*. Also, a consideration is either *valuable*, that is, for money, or an equivalent, or of *natural affection*, certain degrees of relationship being a consideration for a gift.

CONSI'GNMENT OF GOODS (*consignatio*, a document: *Lat.*), in Commerce, the delivering or making them over to another: thus, goods are said to be consigned to a factor when they are sent to him for sale, &c. He who consigns the goods is called the *consignor*, and the person to whom they are sent is called the *consignee*.

CONSISTO'RIUM (*Lat.*, from *consisto*, I abide), in Antiquity, a council-house, or place of audience.

CONSIS'TORY COURT, the place in which a court is held by the bishop or his chancellor.

CON'SOLE (*Fr.*), in Architecture, a species of bracket; or an ornament cut upon the key of an arch, which has a projection. Sometimes it serves to support cornices, figures, busts, and vases. Consoles are also called *Ancones*.

CONSOLIDA'TION (*consolidatio*, from *consolido*, I make firm: *Lat.*), in the Civil Law, the uniting the possession or profit of land with the property, and *vice versâ*. In the Ecclesiastical Law, it is the uniting two benefices into one by assent of the ordinary, patron, and incumbent.——CONSOLIDATION, in Surgery, the action of uniting broken bones, or the lips of a wound, by means of applications.

CON'SOLS, funds formed by the *consolidation* (of which word it is an abbreviation) of different annuities, portions of the public debt of Great Britain, which had been severally formed. [See FUNDS.]

CON'SONANT (*consonans*, from *consono*, I sound at the same time: *Lat.*), a letter so named because it requires to be sounded in connection with a vowel. Some consonants have no sound without being united with a vowel, and others have a very imperfect sound: hence some are called *mutes*, and others *semi-vowels*.

CONSONAN'TE (harmonious: *Ital.*), in Music, an epithet for all agreeable intervals.

CONSPIR'ACY (*conspiratio*, from *conspiro*, I plot with: *Lat.*), a combination of men for an evil purpose, or an agreement between them to commit some crime in concert.——In Law, it signifies an illegal compact to do something injurious to another.

CON'STABLE (*comes stabuli*, count of the stable: *Lat.*), a civil officer, anciently of great dignity; as the Lord High Constable of England, and also the constables or keepers of castles, &c. Constables of the

Tower, Dover Castle, and a few other places, are still appointed by the crown. It is now the title of an officer under the magistrates, for the preservation of the peace, whose duty principally consists in seizing and securing persons guilty of tumultuary offences. There are both high constables and petty constables; the former are chosen at the court-leets of the hundred over which they preside, or, in default of that, by the justices of the quarter sessions, and are removable by the same authority that appoints them. The duties of a high constable, as far as concerns the preservation of the peace, are now nominal. The petty constables were formerly chosen by the jury of the court-leet, or, if no court was held, they were appointed by two justices of the peace. At present, when any are appointed, they are chosen by the justices at petty sessions.——SPECIAL CONSTABLES are householders, or others, sworn in to act for a limited time, if the ordinary officers are not considered sufficient, by two justices of the peace, to whom information has been given on oath that a riot is expected, &c.——The LORD HIGH CONSTABLE of England had the care of the common peace, in deeds of arms, and matters of war. His power was so great and so improperly used, that it was abridged by Richard II., and was afterwards forfeited in the person of Edward Stafford, Duke of Buckingham, in 1521. This office is now filled up only for some solemn occasion, such as a coronation. The first Duke of Wellington was Lord High Constable at the coronations of George IV., William IV., and Victoria.

CONSTELLA'TION (*constellatio: Lat.*), an assemblage or system of several stars, expressed or represented under the name and figure of some animal or other object, as a bear, a ship, and the like; whence are derived those appellations which are employed in describing the stars. The division of the heavens into constellations is very ancient, probably coeval with astronomy itself. Modern astronomers divide the whole starry firmament into three parts, viz.: 1. The constellations in the zodiac; 2. the constellations north of the zodiac; and 3. the constellations south of the zodiac. 'The constellations' says Sir John Herschel, 'seem to have been almost purposely named and delineated to cause as much confusion and inconvenience as possible. Innumerable snakes twine through long and contorted areas of the heavens where no memory can follow them; bears, lions, and fishes, large and small, northern and southern, confuse all nomenclature. A better system of constellations might have been a material help as an artificial memory.' [See STARS.]

CONSTIT'UENT (*constituo*, I appoint: *Lat.*), in Politics, one who by his vote constitutes or elects a member of parliament. ——CONSTITUENTS, in Physics, the elementary or essential parts of any substance.

CONSTITU'TION (*constitutio*, from same: *Lat.*), in Politics, the collective body of the fundamental laws of a state, either contained in written documents or established by custom. Constitutions are either democratic, aristocratic, or of a mixed character. They are—1. *Democratic*, when the fundamental law guarantees to every citizen equal rights, protection, and participation, direct or indirect, in the government: such as the constitutions of the United States of America, and of some cantons of Switzerland. 2. *Aristocratic*, when the constitution establishes privileged classes, as the nobility and clergy, and entrusts the government entirely to them, or allows them a very disproportionate share of it: such a constitution was that of Venice. 3. *Of a mixed character*, when both the people and the aristocracy form integral and essential portions of the government; as in some monarchical constitutions, which recognize the existence of a sovereign and nobility, whose power is modified by other branches of the state, and is of a more or less popular cast. Of this kind is the BRITISH CONSTITUTION. It assigns the making of laws to the sovereign and the Houses of Lords and Commons, the sovereign being at the same time the executive power and personal representative of the nation: the House of Lords being a court of appeal from the courts of law, and the House of Commons the originator of all taxes and financial grants for the use of the executive. The constitution of Great Britain is a constitution of *principles*, not of *articles*; and however frequently it may have been violated by tyrants, monarchical, aristocratical, or democratical, the people have always found it expedient to restore the original, and from time to time they have been successful in improving it.——By the word CONSTITUTION is also meant a particular law, ordinance, or regulation, made by the authority of any superior; as the *constitutions* of Justinian and his successors, the *constitutions* of Clarendon, &c.——CONSTITUTION, in Medicine, the temperament of the whole body, arising from the quality and proportion of the parts. In this sense we speak of a robust or feeble constitution, a cold, phlegmatic, or sanguine constitution, &c.

CONSTRIC'TOR (*constringo*, I draw together: *Lat.*), in Anatomy an appellation given to several muscles on account of their contracting or closing some of the orifices of the body; as the *constrictor labiorum*, a muscle which constitutes the very substance of the lips and draws them together; or the *constrictor nasi*, a muscle arising above the *dentes incisores* of the upper jaw, and terminating in the *alæ* of the nose.

CONSTRUC'TION, in a general sense, the manner of putting together the parts of a building, or of a machine, &c.——In Grammar, *syntax*, or the proper arrangement of words in a sentence. Also, the manner of explaining the arrangement of words, or of understanding their purport.

CONSUBSTAN'TIAL (*consubstantialis: Lat.*), in Theology, an epithet signifying of the *same substance*: thus, in the articles of the Church of England, Christ is declared *consubstantial*, or of one substance with the Father.

CONSUBSTANTIA'TION (*con*, along with; and *substantia*, a substance: *Lat.*), a tenet of the Lutheran church, the members of which maintain that after consecration of the sacramental elements, the body and blood of Christ are substantially present, *together with* the substance of the bread and wine. It is termed also *Impanation*, and differs from *transubstantiation*, in which bread and wine are supposed to be *changed into* the body and blood of Christ, nothing but their appearances remaining, a dogma of the Roman Catholic church.

CON'SUL (*Lat.*), the title of the two chief magistrates of Rome, whose power was, in a certain degree, absolute, but who were chosen only for one year. The authority of the two consuls was equal; yet the Valerian law gave the right of priority to the elder, and the Julian law to him who had the greater number of children; and this one was generally called *Consul major*, or *prior*. In the first ages of the republic they were elected from patrician families: but in the year of Rome 388, the people obtained the privilege of electing one of the consuls from their own body, and sometimes both were plebeians.——In French History, the consuls were those to whom, after the dissolution of the Directory in 1799, the provisional government was intrusted. Buonaparte, Cambacérès, and Lebrun were elected as *first*, *second*, and *third* consul respectively, with different degrees of authority, for ten years; but the influence of the first becoming gradually augmented, the transition to imperial dignity became easy to him: indeed, he had only nominally shared his authority with his colleagues.——In modern usage, the name *Consul* is given to an officer appointed to reside in a foreign country, to protect the interests of trade, and to aid his government in any commercial transactions with that country.

CONSULTA'TION (*consultatio*, from *consulto*, I deliberate: *Lat.*), a meeting for deliberation: thus, of *council*, for the purpose of considering the best way of carrying on a suit; of *physicians*, to determine the nature of the patient's disease, and the course to be pursued regarding it.

CONSUMP'TION (*consumptio*, from *consumo*, I waste away: *Lat.*), in Medicine, a word of very extensive signification, implying all disorders that bring decay or waste upon the constitution. But it is more particularly applied to the disease called *Phthisis pulmonalis*, a disorder seated in the lungs, attended with hectic fever, cough, &c. Hence the word *consumptive* is used to denote the incipient state of that disease, or a constitution predisposed to it.

CONTA'GION (*contagio*, from *contingo*, I touch: *Lat.*), that subtle matter which proceeds from a diseased person and communicates the malady to another: as in cases of small-pox, malignant fevers, &c., which are often communicated without contact.

CON'TEXT (*contextus*, connected with: *Lat.*), the parts of a discourse which precede or follow the sentence quoted; the sense of a dubious passage is often illustrated by the *context*.

CON'TINENT (*contineo*, I hold together *Lat.*), in Geography, a great extent of land, not disjoined or interrupted by a sea; or a connected tract of land of great extent, as the Eastern or Western continent.——CONTINENTAL POWERS, those whose territories are situated on the continent of Europe.

CONTINEN'TAL SYS'TEM, a term given to a plan devised by Napoleon to exclude this country from all intercourse with the continent of Europe; to prevent the importation of British manufactures and commerce; and thus to compel the English government to make peace upon the terms prescribed by him. The history of Napoleon's continental system begins with the decree of Berlin of Nov. 21, 1806, by which the British islands were declared to be in a state of blockade: all commerce, intercourse, and correspondence with them were prohibited; every Englishman found in France, or in any country occupied by French troops, was declared a prisoner of war; all property belonging to Englishmen was declared fair prize; and all trade in English goods was entirely prohibited. Great Britain immediately directed reprisals against the Berlin decree, prohibiting all neutral vessels from sailing from one port to another belonging to France or one of her allies, &c. This was met by counter-reprisals, and for a long time a fierce and most annoying system was carried on for the annihilation of British commerce, the effects of which are still felt from the rival products and manufactures on the continent, to which the system gave rise.

CONTOR'TED (*contortus*, twisted: *Lat.*), a term applied to twisted roots, like those of bistort; and to the æstivation of some petals, when one side of each overlaps the adjacent side of another.

CONTOR'TION (*contortio*: *Lat.*), in Medicine, a twisting or wresting of a limb or member of the body out of its natural situation; partial dislocation.

CONTOUR' (*contorno*: *Ital.*), in Painting, Sculpture, &c., the outline, or that line which defines or bounds a figure.

CONTOURNE' (turned away: *Fr.*), in Heraldry, an epithet for a beast standing or running with his face to the sinister side.

CON'TRABAND (*contra*, against; and *bando*, an edict: *Ital.*), in Commerce, is a term applied to such goods as are prohibited to be imported or exported, either by the laws of a particular state, by special treaties, or by the law of nations. Contraband of war means such articles as can in any way aid in carrying on the contest.——By the ancient law of Europe, a ship conveying any contraband article was liable to confiscation as well as the article. But in the modern practice of the courts of admiralty of this and other countries, a milder rule has been adopted, and the carriage of contraband articles is attended only with the loss of freight and expenses, unless when the ship belongs to the owner of the contraband cargo, or when the simple misconduct of conveying such a cargo has been connected with other aggravating circumstances.

CON'TRA-BASSO (*Ital.*), the largest kind of violin, termed a *double bass.*

CON'TRACT (*contractus*, from *contraho*, I draw together: *Lat.*), a covenant or agreement between two or more persons, with a lawful consideration or cause which binds the parties to a performance. Each party to a contract must be of sound mind at the time it was made, and, unless for necessaries, of age; and, if a woman, generally speaking she must be unmarried. The considerations are either future marriage, since performed; or money, or something capable of being estimated in money; or some act or omission of an act, undoubtedly advantageous to the party in whose favour it was done or omitted: the act contracted for must not be unlawful. The agreement must be obtained neither by fraud nor compulsion; and it is sometimes vitiated by fraudulent acts committed subsequently to it. When it relates to an interest in land of three years' duration or more, or to goods of 10*l.* value or upwards, there must be earnest, or delivery, or a memorandum in writing, signed by the parties or their agents. When it is an agreement as surety, or upon marriage, as a consideration, it must be in writing, the want of the latter being, however, supplied in equity by partial performance.

CONTRAC'TILE FORCE (same *deriv.*), that property or power inherent in certain elastic bodies, on account of which, after having been extended, they reduce themselves again to their former dimensions, if permitted to do so.

CONTRAC'TION (*contractio*, from same), in a general sense, the diminishing the extent or dimensions of a body.——In Surgery, the shrinking up of the muscles or arteries.——In Grammar, the reducing two syllables into one by the omission of a letter or syllable.

CONTRA-INDICA'TION (*contra*, in opposition to; and *indicatio*, a pointing out: *Lat.*), in Medicine, an indication from some peculiar symptom or fact, that forbids the method of cure which the general tenor of the disease requires.

CON'TRAST (*contraste: Fr.*), in Painting, the due placing of the different parts and details of a figure, that they may be suitably opposed to each other.

CONTRAVALLA'TION (*contra*, over against; and *vallum*, a rampart: *Lat.*), LINE OF, in Fortification, a trench guarded with a parapet, thrown round a place by the besiegers, to defend themselves against the sallies of the garrison.

CONTRE (against: *Fr.*), in Heraldry, an epithet given to several bearings, on account of their cutting the shield contrary and opposite ways: thus we say *contre-bend*, *contre-chevron*, *contre-pale*, &c.

CONTRIBU'TION (*contributio*, from *contribuo*, I contribute: *Lat.*), in a general sense, the act of giving to a common stock. In a Military sense, money, &c., demanded from a country which is in the power of an enemy, under various pretences, and for various purposes, usually for the support of the army.

CONTROL'LER (*contrôleur: Fr.*), or COMPTROLLER, an overseer or officer appointed to control or verify the accounts of other officers. There is a comptroller of the household in the royal establishment, who carries a white staff, and has the charge of checking and examining all the expenses of the household.

CON'TUMACY (*contumacia*, stubbornness: *Lat.*), in Law, a refusal to appear in court when legally summoned, or other disobedience to its rules and orders.

CO'NUS (*kōnos*, a cone: *Gr.*), an extensive genus of univalve molluscs, having very thick shells, rolled up in the form of a cone. They are found chiefly in the southern and tropical seas. Many of them afford shells of great beauty, which sometimes bring very large prices. As much as 50*l.* has been given for a single specimen of *Conus gloria maris.*

CONVALES'CENCE (*convalescentia*, from *convalesco*, I grow strong: *Lat.*), the insensible recovery of health and strength after disease.

CONVALLA'RIA (from Lilium *Convallium*, the lily of the valley: *Lat.*), in Botany, a genus of plants belonging to the nat. ord. *Liliaceæ*, and including the lily of the valley.

CONVEN'TICLE (*conventiculum*, the *dim.* of *conventus*, an assembly: *Lat.*), a private assembly or meeting for the exercise of religion. The word was at first an appellation of reproach for the religious assemblies of Wickliffe, in the reigns of Edward III. and Richard II., and is now usually applied to a meeting of dissenters from the established church.

CONVEN'TION (*conventio*, a meeting: *Lat.*), in Law, an extraordinary assembly of the estates of the realm.——In Military affairs, an agreement entered into between two bodies of troops opposed to each other; or an agreement previous to a definite treaty.——NATIONAL CONVENTION, the name of the assembly by which the government of France was conducted during a period of the revolution.

CONVER'GING (*con*, together with; and *vergo*, I incline: *Lat.*), tending to one point.——CONVERGING LINES, in Geometry, lines which continually approximate.——CONVERGING RAYS, in Optics, those rays that proceed from different points of an object, and incline towards one another until they meet.——CONVERGING SERIES, in Mathematics, that in which the magnitude of the several terms gradually diminishes.

CON'VERSE (*conversus*, turned round: *Lat.*), a proposition in which the terms have been transposed. Thus, 'some boasters are cowards,' and 'some cowards are boasters,' are converse propositions.

CONVER'SION (*conversio*, a change: *Lat.*), in Logic, conversion takes place in a proposition when its terms are transposed.——CONVERSION OF EQUATIONS, in Algebra, the reducing of a fractional equation into an integral one.——CONVERSION OF A PROPOSITION, in Logic, is a changing of the subject into the place of the predicate, and still retaining the quality of the proposition.

CON'VEX (*convexus: Lat.*), rising or

swelling on the exterior surface: thus, a *convex* lens or mirror, which bulges at the middle.

CONVEY'ANCE (*conveho*, I carry: *Lat.*), in Law, a deed or instrument by which lands, &c., are conveyed or made over to another.

CONVEY'ANCER (same *deriv.*), one who professes to draw deeds, mortgages, and conveyances of estates.

CON'VICT (*convaincre*, to convict: *Fr.*), in Law, a person found guilty of a crime alleged against him, either by the verdict of a jury, or some other legal decision.

CONVIC'TION (same *deriv.*), the act of proving an accused person guilty of an offence charged against him, before a legal tribunal.

CONVOCA'TION (*convocatio*, from *convoco*, I call together: *Lat.*), an assembly of the clergy of England, whose powers at present are little more than nominal. In 1665, the clergy gave up the privilege of taxing themselves, on condition of being allowed to vote at elections of members of parliament; and since that time, convocation has seldom been allowed to do any business. Its province is supposed to be the enactment of canon law, subject to the licence of the king, and the examination and censuring of all heretical and schismatical books and persons; but from its judicial proceedings lies an appeal to the king in chancery, or his delegates. It is held during the session of parliament, and consists of an upper and a lower house: in the upper sit the bishops, and in the lower the inferior clergy, who are represented by their proctors, and all the deans and archdeacons. It is prorogued from time to time.

CONVOLU'TE (*convolutus*, from *convolvo*, I roll together: *Lat.*), in Botany, that which is rolled upon itself.

CONVOL'VULUS (*Lat.*, from same), in Botany, a genus of plants of the nat. ord. *Convolvulaceæ*, including the Bindweed of our hedges, and several handsome climbing plants cultivated in gardens.

CON'VOY (*convoi*: *Fr.*), ships of war which accompany merchantmen in time of war, to protect them from the attacks of the enemy. ——By land, any body of troops which accompany provisions, ammunition, or other property, for protection.

CONVUL'SION (*convulsio*, from *convello*, I rend: *Lat.*), in Medicine, a writhing and agitation of the limbs, and involuntary action of the muscles in general. Sometimes the whole body is attacked, in which case the mind is affected. The fits are often preceded by dizziness, double or disturbed vision, and coldness; and are followed by great languor. Their cause is not fully understood; but they are supposed to be due to some change in the brain, spinal marrow, or nerves.

COOT, in Ornithology, a British water-bird, belonging to the genus *Fulica*, amongst the *Grallatores*. The long toes have membranes at the sides, forming rounded lobes. The plumage is black, with a white line across the wing. It is closely allied to the moor hen.

COPA'IBA or COPI'VI, BALSAM OF, a liquid resinous juice, employed medicinally, flowing from incisions made in the stems of several South American trees, belonging to the genus *Copaifera*, nat. ord. *Leguminosæ*.

COPAL', improperly called gum-copal, is a resin, the concrete juice of various trees growing in tropical countries. Brazilian copal is obtained from some leguminous trees of genus *Hymenæa*. Copal greatly resembles amber in appearance: it is hard, transparent, and odoriferous, and makes an excellent varnish.

COPAR'CENERS. [See PARCENERS.]

COPER'NICAN SYSTEM, that system of the universe which was anciently taught by Aristarchus of Samos, in the first half of the third century B.C., and afterwards revived by Copernicus, a Polish astronomer. According to it, the sun is supposed to be placed in the centre, and all the other bodies to revolve round it in a particular order; which theory is now universally adopted, under the name of the solar system.

CO'PING (*cop*, the head: *Sax.*), in Masonry, the covering on the top of a wall. It is usually of stone, and projecting, to carry off the rain.

COP'PER (*cuprum*, corrupted from *Cyprium*; from the island of Cyprus, whence it was originally brought: *Lat.*), a metal known from the most remote antiquity, and, before iron was in use, employed as an alloy, for swords, domestic utensils, &c. It is of a pale red colour; its specific gravity is 8·6; it requires a temperature of about 2000° Fahr. for fusion. It is usually found as an ore; the most common being some form of pyrites, a compound of the sulphurets of copper and iron. It is not unfrequently obtained native in small and slender fibres, and sometimes in little globular and irregular masses. Next to gold, silver, and platina, it is the most ductile and malleable of the metals: it is more elastic than any metal except steel, and is the most sonorous of all the metals. Copper in sheets is much used for covering the bottoms of ships, for boilers and other utensils; mixed with tin, it forms bell-metal and bronze; with zinc, it forms brass, pinchbeck, &c. Great Britain has numerous copper mines, in Cornwall, Devonshire, Wales, &c., but particularly in the first. Though known long before, the Cornish copper mines were not wrought with much spirit till the last century. From 1726 to 1735, the Cornwall and Devon mines produced, on an average, about 6480 tons per year of *copper ore*; during the ten years, from 1776 to 1785, they produced, on an average, 30,413 tons; from 1796 to 1805, 56,403 tons; and the quantity now amounts to 162,000, worth nearly 1,000,000*l.* sterling! In 1768, the famous mines in the Paris mountain, near Amlwch, in Anglesea, were discovered. The supplies of ore furnished by them were for a long time abundant beyond all precedent; but, for many years past, their productiveness has been declining, and they now yield comparatively little copper. At present, the entire annual produce of the copper mines of England, Wales, Scotland, and Ireland, may be estimated at about 15,000 tons of copper. Large quantities of copper are brought to us from Australia. The Burra Burra mines, near Adelaide, are the most productive in the world. Swansea is the great copper port, and there are large smelting works there.

COP'PER-PLATE, a plate of copper, on which figures are engraved; also, the impression taken from that plate. Copper-plate printing is performed by means of what is called a rolling-press. The engraved plate is covered with ink, made of oil and Frankfort black, then cleanly wiped on the smooth parts, and laid on wet soft paper; and, on being passed between two cylinders with great force, the impression of the engraved part is perfectly transferred to the paper.

COP'PERAS, commonly called *green vitriol*, is sulphate of iron, a salt of a peculiar astringent taste, and of various colours, though most usually green. If sulphuric acid be diluted with water, and poured upon iron, much effervescence will be perceptible; the metal will be dissolved, and the solution, when evaporated, will yield sulphate of iron, or common copperas. It is made on a large scale by exposing iron pyrites, which is a bisulphuret of iron, to the action of the atmosphere, from which it absorbs oxygen, and thereby produces the sulphate which is dissolved out by water. Copperas is the basis of many dyes; it gives, with logwood, a fine black.

COP'PICE, or COPSE (*coupeaux*, from *couper*, to cut: *Fr.*), a wood of small growth, cut at certain times for fuel, &c.

COPRO'LITES (*kopros*, dung; *lithos*, stone: *Gr.*), the fossil dung of extinct animals. They are ground along with fossil bones, and employed as manure by farmers.

COP'TIC, the language of the Copts, or anything pertaining to that people, a sect of Christians, descendants of the ancient Egyptians, who derive their name from *Coptos*, in Egypt.

COP'ULA (a tie: *Lat.*), the word or words that connect the terms of a proposition. It may be affirmative, as: 'truth *is* our aim;' or negative, as: 'pain *is not* to be desired.'

COP'ULATIVE PROPOSI'TIONS (same *deriv.*), in Logic, those in which the subject and predicate are so linked together, by copulative conjunctions, that they may be all severally affirmed or denied one of another. Thus, 'Science *and* literature enlighten the mind, *and* greatly increase our intellectual enjoyments.'

COP'Y(*copie*: *Fr.*), in Law, the transcript of any original writing, as the copy of a patent, charter, deed, &c. A common deed cannot be proved by a copy or counterpart, where the original may be procured. But if the deed be enrolled, an attested copy may be given in evidence.——COPY is also used for the imitation of an original production, more particularly in painting and other branches of art.——COPY, among Printers, denotes the manuscript or original of a book, given to be printed.

COP'YHOLD, a tenure of landed property, by which the tenant holds his land by copy of court-roll of the manor, at the will of the lord, or rather, according to the custom of the manor of which such estate is parcel. The lands of a copyholder, though substantially his own, are, nominally, a part of the lord's demesne.

COP'YRIGHT, the exclusive right of printing and publishing copies of any literary performance, vested either in the author, or in those to whom he may have assigned it. By a recent enactment, the copyright of every volume, part, or division of a volume, pamphlet, sheet of letter-press, sheet of music, map, chart, or plan, separately published, in the lifetime of its owner, shall endure for his natural life, and seven years longer; or, if the seven years shall expire before the end of forty-two years from the first publication, shall endure for forty-two years. When the work is posthumous, it shall endure for forty-two years from the first publication, and shall belong to the owner of the manuscript. No action regarding copyright can be commenced without previous registration of the work at Stationers' Hall. Under some recent statutes, a copyright may be secured by registration in certain articles of ornamental and useful designs, for periods varying from nine months to three years. The designs must be new, and drawings of them, or patterns, must be lodged in a special government office.

CO'QUILLA NUT, the hard covering of the kernel of a Brazilian palm, *Attalea funifera*. It is used for making umbrella handles, and other similar articles.

COR'ACLE (*Welsh*), a small boat, used by the fishermen of Wales, constructed of wicker, and covered with leather. It has descended from the times of the ancient Britons to the present day.

COR'ACOID (*korax*, a crow; and *eidos*, form: *Gr.*), in Anatomy, a small sharp process of the scapula, shaped like a crow's beak.

COR'AL (*korallion*: *Gr.*), a substance which is usually branched, formed by marine zoophytes, soft-bodied tentacled animals, bearing much resemblance to sea-anemones. There is a great number of species of coral, varying greatly in shape, texture, and colour. Some are stony and inflexible; others of a horny structure, and flexible. [See ANTIPATHES.] Some of the latter have their branches coated with carbonate of lime [see GORGONIA]; others are naked. Of the stony species, some are very porous, others so compact and hard that they will take a good polish, and of this nature is the coral of commerce, which is wrought into ornaments of many forms. The Brain-stone, one of these stony corals, is rounded and destitute of branches. In many corals, the zoophytes, which secrete the hard substance we term coral, reside in hollows or cells scattered over the whole surface. In others, they live in cups at the ends of the branches. The exact mode in which the coral is produced is not known. To return to the coral of commerce, the 'fishery' is carried on extensively in the Mediterranean. The coral is attached to submarine rocks, by the base of the main stem. For this kind of fishing, eight men, who are excellent divers, equip a felucca, or a small boat, commonly called a coralline; carrying with them a large wooden cross, with strong, equal, and long arms, each bearing a stout bag-net. They attach a strong rope to the middle of the cross, and let it down horizontally into the sea, having loaded its centre with a weight sufficient to sink it. The diver follows the cross, pushes one arm of it after another into the hollows of the rocks, so as to entangle the coral in the nets; after which his comrades in the boat pull up the cross and its accompaniments. Coral is usually of a fine red: but it is sometimes flesh-coloured, yellow, or white.

COR'AL ISLANDS, and REEFS. In the Pacific and Indian oceans there is an immense number of islands which owe their existence wholly or in great part to coral zoophytes, which have also formed extensive reefs, that is, sub-marine walls of the same calcareous material. Many fishes browse upon corals, and a great number of worms and shell-fish bore into the stony mass. Thus, in process of time, much fine mud is formed, which sinks to the bottom of the sea, and there constitutes beds, which would bear great resemblance to chalk if elevated into land. These structures have been classed as:—1. *Atolls*, or Lagoon islands, circular walls of coral enclosing a piece of quiet water. [See ATOLL.] 2. *Barrier reefs*, which extend in a linear direction near land. A reef of this kind, 1200 miles long, stands twenty or thirty miles from the north-east coast of Australia, and stretches almost across Torres Straits. Off New Caledonia is another reef 400 miles long. 3. *Shore or Fringing reefs*, which form a ribbon or fringe round the shore of an island. It has been ascertained that the animals which form these masses of coral cannot work below a depth of thirty fathoms, nor above the surface of the water. They belong to the families of Madreporidæ, Astræidæ, and Oculinidæ, and are quite different from the coral of commerce. It is generally believed that the different appearances presented by coral islands and reefs are connected with extensive subterranean movements of the earth's crust, and Mr. Darwin's theory, which has met with the acceptance of scientific men, is that atolls have their foundation on land that has slowly subsided, and part of which was once above the level of the sea; that barrier reefs prove that the land is also sinking; whilst fringing reefs testify that the land is either rising or stationary. In many of the Sandwich islands, old reefs are to be seen at a considerable height above the sea, and these afford examples of fringing reefs.

COR'AL TREE, the English name of some leguminous trees and shrubs, belonging to the genus *Erythrina*. They are natives of India, Africa, and America, and have handsome scarlet flowers.

CORAL'LIFORM (*corallium*, coral; and *forma*, a form: *Lat.*), forked, crooked, and irregular, like coral.

COR'ALLINES (*corallium*, coral: *Lat.*), small marine plants which grow on the shore near low water mark. They have many jointed branches, and their tissues are so charged with carbonate of lime that they were long thought to be of animal origin. The lime may be removed by means of weak acid, leaving the vegetable matter behind. *Corallina* and *Jania* are the two best known genera.——CORALLINE is also a small boat used in the coral fisheries.

COR'BEIL (*corbeille*, a basket: *Fr.*), in Fortification, a basket which is filled with earth, and set upon a parapet, to shelter men from the fire of besiegers.

COR'BEL (same *deriv.*), in Architecture, a short piece of timber in a wall, jutting out six or eight inches, in the manner of a shoulder-piece, and sometimes placed for strength under the semi-girder of a platform. It is often in the form of a basket, or some other ornament.——Also the carved bosses, or projecting stones, frequently seen in Gothic churches at the spring of the arches.——CORBEL TABLE, a projecting battlement, parapet, or cornice, resting on corbels.

COR'CULUM, or COR'CULE (a *dim.* of *cor*, the heart: *Lat.*), in Botany, a name for the embryo of the seed.

COR'DAGE, every description of ropes and lines used on shipboard; but more particularly that employed in the running rigging of a ship.

COR'DATE (*cor*, the heart: *Lat.*), a term used by naturalists for heart-shaped. Thus, in Botany, a *cordate leaf* means one which has a pair of rounded lobes at the base, with the stalk inserted between them, the other end of the leaf being acute.

CORDELIE'R (*corde*, a rope: *Fr.*), in Church History, a grey friar, or monk of the order of St. Francis. The Cordeliers wear a white girdle, which is a rope tied with three knots, and called the *cord of St. Francis*.

CORDELIE'RS. This word, as we have just seen, originally signified an order of Franciscan monks; but it was afterwards applied to a society of Jacobins which existed in France from 1792 to 1794, and were so called from their place of meeting. They were distinguished by the violence of their speeches and conduct, and contributed not a little to the execrable crimes which disgraced the French name and nation during the early periods of revolutionary anarchy.

CORDILLE'RA (*Span.*), a chain of mountains, applied to the range of the Andes.

COR'DON (a string: *Fr.*), in Fortification, a row of stones projecting from the rampart, at the basis of the parapet. The word cordon is also used to denote a line or series of military posts. Cordon signifies likewise a riband; as, the *cordon bleu*, the badge of the French order of the Holy Ghost.

COR'DOVAN, leather made of goatskin, and named from Cordova in Spain.

CORIA'CEOUS (*corium*, a hide: *Lat.*), stiff, like leather; a botanic term for leaves, capsules, &c., when of that texture.

CORIAN'DER (*koris*, a bug: *Gr.*), the *Coriandrum sativum* of Linnæus, an annual plant, belonging to the order of *Umbelliferæ*, the seed of which, when dry, is an agreeable aromatic, but, when fresh, has the smell of a bug: whence its name. It is one of the ingredients of *curry powder*.

CORIA'RIA (*corium*, a hide: *Lat.*, from its use in tanning), in Botany, a genus of shrubby plants, nat. ord. *Coriariaceæ*. The Toot poison of New Zealand is extracted from one species. The same and other species yield a black dye.

CORIN'THIAN, pertaining to Corinth, a celebrated city of Greece.——CORINTHIAN ORDER, in Architecture, the noblest and richest of the five orders. The capital of the column is adorned with two rows of leaves, between which arise little stalks, or caulicoles, forming sixteen volutes. [See COLUMN.]

CO'RIUM (*Lat.*), in Anatomy, the innermost layer of the skin in mammals, termed also the *cutis vera*. [See SKIN.]

CORK (*kork*: *Germ.*), the outer covering (*epiphlœum*) of the bark of the *Quercus Suber*, a tree which grows abundantly in Spain, Italy, and France. It is obtained by making an incision down the whole height of the trunk, and, at each extremity of this, another round the girth. The tree is supplied with this coat so abundantly that it not only continues to flourish uninjured by the act of barking, but, in its natural state, regularly sheds the old, and acquires a new covering. Cork is light, porous, nearly impervious to most liquors, and elastic; qualities which render it superior to all other substances for stoppers of bottles, in the manufacture of which it is principally used. It is also employed for buoys to float nets, in the construction of life-boats, the making of waterproof shoes, and in various other ways. The uses of cork were well known to the ancients, and were nearly the same as those to which it is applied by us.

CORM (*kormos*, a stump: *Gr.*), in Botany, an underground stem in the nature of a solid bulb, such as the gladiolus and tulip have.

COR'MORANT (*cormoran*: *Fr.*; from *corvus marinus*, a sea crow: *Lat.*), an exceedingly voracious genus (*Phalacrocorax*) of palmipede birds, found in every climate. They are excellent divers, but are very awkward on land, on account of their legs being placed far back. They fly, however, with great rapidity. They build on the highest cliffs hanging over the sea, and feed on fish, among which they make great havoc. Some of the species have been trained for fishing, particularly in China. There are two British species: the great Cormorant, and the Shag or Green Cormorant.

CORN (*korn*: *Germ.*), farinaceous seed, as that of wheat, rye, barley, oats, and maize. In short, it comprehends all the kinds of grain which constitute the food of men and horses.——CORN, in Surgery, an excrescence, or hard tubercle, like a flat wart, growing in the feet, especially upon the joints of the toes. Corns are usually produced by the pressure of tight or narrow-toed shoes, especially if a person is obliged to stand or walk much, and may be cured by removingthe pressure.

COR'NEA (*cornu*, horn: *Lat.*), in Anatomy, the transparent membrane in the forepart of the eye, through which the rays of light pass.

COR'NET (*cornette*, a *dim.* of *corne*, a horn: *Fr.*), an instrument very similar to a trumpet, which is used in the army.——CORNET (*cornetta*, a small flag: *Ital.*), the lowest commissioned officer in a troop of cavalry, answering to an ensign in a troop of foot. He bears the colours. His rank, or commission, is called a *cornetcy*.

CORN-FLAG, in Botany, the wild Gladiolus, nat. ord. *Iridaceæ*.

COR'NICE (*corniche*: *Fr.*; from *corona*, a crown: *Lat.*), in Architecture, the uppermost member of the entablature; or any moulded projection that crowns or finishes the part to which it is affixed; as, the cornice of a room, a door, &c.

CORNIC'ULATE (*corniculum*, a little horn: *Lat.*), in Botany, bearing a little spur or horn.

COR'NU AMMO'NIS (the horn of *Ammon*), a fossil shell, belonging to the genus *Ammonites*, bearing some resemblance in shape to a ram's horn.

CORNUCO'PIA (*cornu*, a horn; and *copia*, abundance: *Lat.*), or HORN OF PLENTY, the source whence, according to the ancient poets, every production of the earth was poured out abundantly: a gift from Jupiter to his nurse, the goat Amalthea. In elucidation of this fable, it has been said that in Libya, a part of ancient Africa, there was a small and fertile territory, somewhat resembling a bullock's horn in shape, which Ammon bestowed on his daughter Amalthea, the nurse of Jupiter. Upon medals, the cornucopia is given to all deities, genii, and heroes, to mark the felicity and abundance procured through the goodness of the former, or the care and valour of the latter.

COR'NUS (the cornel tree: *Lat.*), a genus of shrubs and trees, nat. ord. *Cornaceæ*, to which the dogwood, a well-known British shrub, belongs.

COROL'LA, or COR'OL (*corolla*, a garland: *Lat.*), in Botany, one of the whorls of leaves which surround the organs of fructification. There are usually two such whorls, the outer being the calyx, the inner the corolla, and this is frequently gaily coloured. Sometimes the calyx and corolla are undistinguishable, as in the lily and iris, in which case perianth is the term used. Each leaf of the corolla is called a petal; and, according as there is one, two, or three of these petals, the corolla is said to be *monopetalous*, *dipetalous*, *tripetalous*, &c. [See BOTANY.]

COR'OLLARY (*corollarium*, a deduction; literally, a wreath of flowers: *Lat.*), a conclusion, or consequence drawn from premises, or from what is advanced or demonstrated.

CORO'NA (a crown: *Lat.*), in Architecture, a large flat member of a cornice, very frequently called the *drip*, or *Larmier*. It is situated between the cymatium and the bed moulding, and its use is to carry off the water, drop by drop.——In Botany, the series of processes in the throat of the flowers of Narcissus and other allied plants. They are considered to be sterile stamens. ——In Optics, a halo, or luminous circle, round the sun or moon.——In Zoology, the exposed part of a tooth, which projects beyond the alveolus or gum.

CORONA'LIS SUTU'RA (the coronal suture: *Lat.*), in Anatomy, the first suture of the skull, which reaches transversely from one temple to the other, and joins the *os frontis* to the *ossa parietalia*.

COR'ONARY (*coronarius*, pertaining to a crown: *Lat.*), in Anatomy, the vessels, &c., which spread round certain viscera, bones, &c. Thus, CORONARY VESSELS are those which furnish the substance of the heart with blood.——CORONARY ARTERIES, two arteries springing out of the *aorta*, before it leaves the *pericardium*.——CORONARY VEIN, a vein diffused over the exterior surface of the heart. It is formed of several branches arising from all parts of that organ, and terminates in the *vena cava*, whither it conveys the blood brought by the coronary arteries.

CORONA'TION (*corona*, a crown: *Lat.*), the public and solemn ceremony of crowning, or investing a prince with the insignia of royalty, in acknowledgment of his right to govern the kingdom; at which time the prince swears reciprocally to the people to observe the laws, customs, and privileges of the kingdom, and to act in all things conformably to them. The form of the coronation oath of a British monarch is as follows: 'I solemnly promise and swear to govern the people of this United Kingdom of Great Britain and Ireland, and the dominions thereto belonging, according to the statutes in parliament agreed on, and the laws and customs of the same; to the utmost of my power to maintain the laws of God, the true profession of the gospel, and the Protestant reformed religion established by the law; to preserve unto the bishops and the clergy of this realm, and the churches committed to their charge, all such rights and privileges as by law do or shall appertain unto them or any of them.' After this, the king or queen, laying his or her hand upon the holy Gospels, says, 'The things which I have before promised, I will perform and keep; so help me God.' Our sovereigns, from Harold down to Queen Victoria, have been crowned at Westminster. The actual imposition of the crown, by the Archbishop of Canterbury, whilst the sovereign is seated in the ancient wooden chair preserved in the abbey, has of late years taken place within the sacrarium in front of the altar before St. Edward's Chapel. After being crowned, the sovereign receives the homage of the officers of state and nobility.

COR'ONER (same *deriv.*, because an officer of the crown), the officer presiding over a jury convened to inquire into the cause of sudden deaths. The lord chief justice of the Queen's Bench is the chief coroner for the whole kingdom. Coroners are elected by the freeholders of counties, and hold their appointments for life.

COR'ONET (a *dim.*, from *corona*, a crown: *Lat.*), in Heraldry, a small crown worn by the nobility. The coronet of a duke is adorned with eight strawberry leaves; that of a marquis has four strawberry leaves alternating with four pearls; that of an earl has eight strawberry leaves, alternating with eight pearls, raised on points; that of a viscount has sixteen pearls; and that of a baron only six pearls. The last does not appear to have worn a coronet earlier than the reign of Charles II.——CORONET, or CORONET BONE, in Farriery, the second of the consolidated phalanges of the horse's foot; the upper part of his hoof.

CORO'NOID PROCESS, in Anatomy. [See CONDYLOID.]

COR'PORAL (*caporal*: *Fr.*; from *capo*, a head: *Ital.*), the lowest non-commissioned officer in a company of foot, who commands one of the divisions, places and replaces sentinels, &c.; at drill, he has charge of a *squad*; in the ranks he does the duties of a private, but his pay is a little higher.——CORPORAL, in Law, an epithet for anything that belongs to the body, as *corporal punishment*, or a *corporal oath*—so called because the party taking it is obliged to lay his hand on the Bible.

CORPORA'TION (*corpus*, a body: *Lat.*), a body politic or corporate, so called because the persons or members are joined into one body, and authorized by law to transact business as an individual. Corporations are either sole or aggregate. *Sole corporations* consist of a single person: such is the parson, in respect to his benefice. *Corporations aggregate* consist of more than one, and are kept up by a continued succession of members. Corporations are also either *ecclesiastical* or *lay*. Parsons, bishops, chapters, &c., constitute the former. The latter are either *civil* or *eleemosynary*. Among the first are trading companies, &c.; among the second, hospitals, colleges, &c. The chief incident of a corporation is the power of taking land by succession. Corporations are established either by prescription, letters patent, charter, or act of parliament; but most commonly by patent or charter. The municipal corporations of boroughs were established by an act of parliament, 5 & 6 Wm. IV. cap. 76 (1835).

CORPS (*Fr.*), a body of troops, any division of an army; as, a *corps de reserve*, the troops in reserve; *corps de bataille*, the whole line of battle, &c.

COR'PUS (a body: *Lat.*), in Anatomy, a name given to several substances or parts of the human body. In legal phraseology, the corpus of a fund is the capital exclusive of interest.

COR'PUS CHRIS'TI DAY (*corpus Christi*, the body of Christ: *Lat.*), a festival instituted by the Church of Rome in honour of the sacrament of the Lord's Supper, in which it maintains that Christ is *corporeally* present.

CORPUS'CULAR PHILOS'OPHY (*corpusculum*, an atom: *Lat.*), that philosophy which endeavours to account for the phenomena of nature, by the motion, figure, rest, position, &c., of the minute particles of matter.

COR'PUSCULE (*corpusculum*, a *dim.* of *corpus*, the body: *Lat.*), a minute particle or physical atom.

CORREL'ATIVE (*con*, together and *relatus*, relative: *Lat.*), an epithet denoting the having a reciprocal relation, so that the existence of one in a certain state depends on the existence of another; as, father and son ; light and darkness ; motion and rest. 'Every right supposes a correlative obligation, but every obligation does not create a right correlative to it.'

COR'RIDOR (*corridoro : Ital.*), in Architecture, a gallery or long passage round a building, leading to several chambers at a distance from each other.——In Fortification, the covered way lying round the whole compass of the fortifications of a place.

CORROB'ORANT (*corroboro*, I strengthen : *Lat.*), of a strengthening nature ; as a *corroborant* medicine.

CORRO'SION (*corrodo*, I gnaw in pieces : *Lat.*), the action of eating or wearing away by slow degrees, as when acids act on metals, &c.

CORRO'SIVE SUB'LIMATE (same *deriv.*), *bichloride of mercury* ; an extremely acrid and poisonous preparation. White of egg is useful in preventing its poisonous effects.

COR'RUGATOR (*corrugo*, I wrinkle : *Lat.*), a muscle which contracts the skin of the forehead into wrinkles.

COR'SAIR (*corsaro : Ital.*), a name commonly given to the piratical cruising vessels of Barbary, which, from the beginning of the 16th century to a recent period, infested the Mediterranean.

CORS'ELET (*Fr.*), in Natural History, that part of the underside of crustaceans and insects which is between the insertion of the legs.——Also, a small cuirass.

CORTE'GE (*Fr.*), a word signifying the train or retinue that accompanies a person of distinction.

COR'TES, the two constitutional houses of peers and deputies in Spain and Portugal, answering to the houses of lords and commons in Great Britain.

COR'TEX (*Lat.*), the outer bark of a plant.

COR'TICAL (same *deriv.*), consisting of bark or rind ; belonging to the external covering, as the *cortical* part of the brain.

CORUN'DUM (*Ind.*), a mineral of the sapphire kind, which is found in the East Indies. It is composed of nearly pure alumina.

CORUSCA'TION (*coruscatio*, a flashing : from *corusco*, I glitter : *Lat.*), a sudden flash of light.

CORVET'TE (*Fr.*), a vessel of war carrying less than twenty guns.

COR'VIDÆ (*corvus*, a crow : *Lat.*), a family of birds belonging to the order of *Passeres*, including the crow, raven, jay, nutcracker, and many other birds.

CORVUS, in Antiquity, a military engine, invented by the Romans at the time of their wars in Sicily, when they first engaged the Carthaginian fleet. It consisted of a strong platform of boards at the prow, movable as on a spindle, and thrown over the side of an enemy's vessel when grappled, the object being to enable the Romans to board the Carthaginian ships.

CORYBAN'TES (*Korubantes : Gr.*), in Antiquity, priests of the goddess Cybele, celebrated for their wild and extravagant attitudes in dancing, &c.

COR'YMB (*korumbē*, a cluster of berries : *Gr.*), in Botany, a species of inflorescence in which the lower flower stalks are produced, so as to rise nearly to the same height as the upper and middle flowers, and thus they are all brought almost to the same level. The umbel differs from the corymb by having all the flower stalks radiating from the same point.

CORYPHÆ'NA (*korus*, a helmet; and *phaino*, I show : *Gr.*), in Ichthyology, a genus of acanthopterygious fishes, so called from the head being like a helmet. It includes the dolphin, the *Coryphæna Hippurus*.

CORYPHÆ'US (*koruphaios*, from *koruphē*, the summit : *Gr.*), the leader of a chorus.

COSE'CANT (*abbrev.* for *complement-secant*), in Geometry, the secant of an arc which is the complement of another, or what it wants of ninety degrees.

CO'SINE (*abbrev.* for *complement-sine*), in Geometry, the sine of an arc which is the complement of another. [See COSECANT.]

COSMET'IC (*kosmeo*, I adorn : *Gr.*), any preparation that renders the skin soft and white, or helps to beautify and improve the complexion.

COS'MICAL (*kosmikos*, from *kosmos*, the world : *Gr.*), relating to the whole system of the world. In ancient Astronomy, the word was used to denote a particular position of a planet or star, at its rising or setting, with respect to the sun. A planet is said to rise or set *cosmically* when it rises or sets at the same instant with that luminary. *Cosmical* is opposed to *acronycal*, which means that the planet rises when the sun sets, and *vice versâ*. The cosmical and acronycal rising of a planet or star are invisible on account of the sun's rays.

COSMOG'ONY (*kosmogonia* : from *kosmos*, the world ; and *gonos*, birth : *Gr.*), in Physics, the theory of the formation of the world.

COSMOG'RAPHY (*kosmographia* : from *kosmos*, the world ; and *grapho*, I write : *Gr.*), a description of the world or universe : or the mode of describing the several parts of the visible world.

COS'MOLABE (*kosmos*, the world ; and *labē*, a taking : *Gr.*), an ancient instrument, very similar to the astrolabe, for measuring distances in the heavens or on the earth.

COSMOL'OGY (*kosmos*, the world ; and *logos*, a discourse : *Gr.*), a treatise relating to the structure and parts of creation, the elements of bodies, the laws of motion, and the order and course of nature.

COSMOP'OLITE (*kosmos*, the world ; and *politēs*, a citizen : *Gr.*), a citizen of the world ; one who makes himself at home everywhere.

COS'SACKS (armed warriors : *Tart.*), the tribes who inhabit the southern and eastern parts of Russia, Poland, the Ukraine, &c., paying no taxes, but performing instead the duty of soldiers. They form a kind of military democracy, and have proved highly serviceable, as irregular cavalry, in the Russian campaigns. Their principal weapon is a lance from ten to twelve feet in length ; they have also a sabre, a gun, and a pair of pistols, and sometimes a bow and arrows. Their lances, in riding, are carried upright by means of a strap fastened to the foot, the arm, or the pommel of the saddle. Those who use bows carry a quiver over the shoulder. Though little adapted for regular movements, they are very serviceable in attacking baggage or magazines, and in the pursuit of troops scattered in flight. They fight principally in small bodies, that attack the enemy on all sides, but mostly on the flanks and in the rear, rushing upon them at full speed, with a shout, and with levelled lances.

COST-BOOK SYSTEM of carrying on a mining adventure. In this system, the mine is vested in one or more persons in trust for the other shareholders as well as for themselves, and an agent who is termed the purser is appointed to manage the mine. It is his duty to enter in the 'cost-book' the names of the shareholders, the minutes of their meetings, the expenses and receipts, and the transfers of shares. Meetings of the shareholders are frequently convened, and those present consider the accounts and the purser's report, make calls, declare dividends, give directions as to the working of the mine, and exercise a general control over the adventure, the majority deciding any question in difference. Any shareholder may withdraw from the undertaking on giving notice to the purser and settling his accounts. The purser will then strike his name out of the book, and enter the name of the person to whom he has sold his share; the transfer is thus completed. There is seldom any deed of settlement. The advantage of the system consists in the frequency of the general meetings, and the controlling superintendence exercised by the shareholders over the officers and the proceedings in the mine. The accounts being regularly discharged, the partners are acquainted with the extent of their several liabilities.

COS'TUME (*Fr.*), in Painting and the fine arts generally, the observance of that rule by which an artist is required to make any person or thing sustain its proper character; the scene, dress, arms, manners, &c., all corresponding.

COTAN'GENT (*abbrev.* for *complement-tangent*), in Geometry, the tangent of an arc which is the complement of another. [See COSECANT.]

CO'TERIE (*Old Fr.*; from *quot*, how many: *Lat.*), a knot of persons forming a particular circle. At first, the term, according to some, was purely commercial, and signified an association in which each member furnished his *quota*, or part, and bore his share in the profit and loss.

COTHUR'NUS (*Lat.*; from *kothornos*: *Gr.*), in Antiquity, a kind of high-laced shoe, such as Diana and her nymphs are represented as wearing. It rose above the middle of the leg, and was used by horsemen, hunters, and men in authority; also by heroes in tragedy; in which case, to give them height, it had a sole of cork, of considerable thickness.

COT'TON (*coton*: *Fr.*), a soft, downy substance, consisting of fine hairs growing round the seeds of plants belonging to the genus *Gossypium*, nat. ord. *Malvaceæ*, several species of which, some herbaceous, some shrubby, grow in warm climates. Its chemical characters are those of *lignin*, and it is peculiarly susceptible of combination with certain metallic oxides or bases. The chief distinction between cottons in the pod is that of *black-seeded* and *green-seeded*. The former part with the hairs very readily to a pair of rollers, or the human arm; while the latter require to be *ginned*, by powerful machinery. The filaments vary in length, flexibility, tenacity, and thickness, in different cottons; whence the great difference in their value. It appears that the manufacture of cotton has been carried on in Hindostan from the remotest antiquity; and there it is still continued, by hand labour, in all its primitive simplicity. In England, however, during the last half-century it has become of immense importance. It has been remarked that the rapid growth and prodigious magnitude of the cotton manufacture of Great Britain are, beyond all question, the most extraordinary phenomena in the history of industry. Our command of the finest wool naturally attracted our attention to the woollen manufacture, and paved the way for that superiority in it which we have long since attained; but when we undertook the cotton manufacture, we had comparatively few facilities for its prosecution, and had to struggle with the greatest difficulties. The raw material was produced at an immense distance from our shores; and in Hindostan and China the inhabitants had arrived at such perfection in the arts of spinning and weaving, that the lightness and the delicacy of their finest cloths emulated the web of the gossamer, and seemed to set rivalry at defiance. Such, however, has been the influence of the wonderful discoveries and inventions of Hargraves, Arkwright, Crompton, Cartwright, and others, that we have overcome all these difficulties—that neither the extreme cheapness of labour in Hindostan, nor the excellence to which the natives had attained, has enabled them to withstand the competition of those who buy their cotton, and who, after bringing it 5000 miles to be manufactured, carry back the goods to them.—The following account of a pound of cotton may not be uninteresting to our readers. There was sent to London, from Paisley, a small piece of muslin, about one pound weight: the wool came from the East Indies to London; from London it went to Lancashire, where it was manufactured into yarn; from Manchester it was sent to Paisley, where it was woven; it was next sent to Ayrshire, where it was tamboured; it was then conveyed to Dumbarton, where it was hand-sewed, and again returned to Paisley, whence it was sent to Glasgow and finished, and thence to London. It may be reckoned that it took about three years to bring this article to market, from the time when it was packed in India till it arrived complete in the merchant's warehouse in London; it must have been conveyed 5000 miles by sea, and nearly 1000 by land, and have contributed to reward the labour of nearly 150 persons, whose services were necessary in the carriage and manufacture of this small quantity of cotton, and by which the value has been advanced more than 2000 per cent. In 1860 there came to England the following supplies of cotton: United States, 2,581,000 bales; Brazil, 103,000 bales; Egypt, 109,000 bales; West Indies, 1000 bales; East Indies, 563,000 bales; total, 3,357,000 bales. After that year, as is well known, the quantity of cotton imported from America greatly decreased in consequence of the civil war. When the cotton manufacture was at its height, upwards of 500,000 persons were actually employed in it, of whom 400,000 were in Lancashire. If to this number we add the engineers, mechanics, and workers in metal and wood, the shopkeepers and other tradespeople supported by them, altogether about 250,000 persons, and then take into consideration the women, children, and old relatives of the preceding, 250,000 people more, we shall arrive at a total of a million of persons who were dependent upon the cotton manufacture, and of these four-fifths were resident in Lancashire. In 1862 the value of the cotton goods exported was 42,141,089*l.*, and the value of exported cotton yarn was 9,870,875*l.*——COTTON GIN, a machine to separate the seeds from cotton. ——COTTON MILL, a mill or building with machinery for carding, roving, and spinning cotton, by means of either water or steam.

COT'TON-GRASS, the common name of the species of *Eriophorum* (*erion*, wool; and *phero*, I bear: *Gr.*), a genus of perennial plants, nat. ord. *Cyperaceæ*. The fruit is clothed with cotton-like fibres, of which paper and candle-wicks have been made.

CO'TYLA (*kotulē*, a cavity: *Gr.*), in Anatomy, any deep cavity in a bone, in which another bone is articulated; but the word is generally used to express the *acetabulum*, or cavity which receives the head of the thigh-bone.

COTYLE'DON (*kotulēdōn*, any cup-shaped cavity: *Gr.*), in Botany, the seed-lobe attached to the embryo. It nourishes the plumula and radicle during their first development, before they are able to subsist on organizable matter, absorbed from the earth. The two cotyledons of exogenous plants usually burst through the integuments, and show themselves above ground in the shape of temporary leaves, which have a different form from the subsequent leaves of the plant. Where the seed-lobes are fleshy, as in the bean, they often remain below the surface of the ground. A plant called Welwitschia has been lately found in South Africa, which never has any other leaves than its two cotyledonous leaves: in this respect it has no parallel in the vegetable kingdom. The seed-lobe of monocotyledonous plants never takes the shape of a leaf. [See DICOTYLEDONOUS.]

COUCH (*couche*, a layer: *Fr.*), in Painting, a term used for each lay or coating of colour, either in oil or water, upon the canvas, wall, or other matter to be painted. Gilders use the term *couch*, for gold or silver leaf laid on metals in gilding or silvering.

COUCH'-GRASS (*coucher*, to lie down: *Fr.*, because it creeps along), the *Triticum repens* of botanists, a grass which spreads very fast in arable land, and chokes everything else.

COUCH'ANT (lying down: *Fr.*), in Heraldry, lying down, but with the head raised; which distinguishes the posture of *couchant* from *dormant*, or asleep.——*Levant* and *couchant*, in Law, rising up and lying down, applied to beasts, and indicating that they have been at least one night on the land.

COUCH'ING (*coucher*, to put lying down: *Fr.*), one of the modes of operating in cases of cataract, by which the opaque crystalline lens is removed out of the axis of vision.

COUGH, a convulsive motion of the diaphragm, muscles of the larynx, thorax, &c.; expelling the air that was drawn into the lungs by inspiration, and carrying along with it the phlegm or irritating matter which causes the effort of the muscles. It is generally, if not always, symptomatic of other diseases. When it does not disappear within a short period it cannot be neglected with impunity.

COUN'CIL (*consilium*, literally a sitting together: *Lat.*), in Ecclesiastical History, an assembly of prelates and other spiritual persons for the regulation of ecclesiastical matters. It is either *national* or *œcumenical*:—in the latter, the whole body of the clergy throughout the world is supposed to be represented. Roman Catholics hold the decision of a general council infallible; and a large number of them believe it superior to the pope. But, since this doctrine has been asserted by councils, not only *theoretically*, but *practically* in the deposition of popes, the latter have been very unwilling to convene them; nor has there been one since the Council of Trent: and before making the *immaculate conception* an article of faith, the present pope merely demanded the opinions of the Roman Catholic prelates by letter. Protestants attach great importance to the first four general councils, viz. those of Nice, Constantinople I., Ephesus, and Chalcedon; but they altogether deny their infallibility.——COUNCIL, in National affairs, an assembly of persons who meet for the purpose of concerting measures of state. In England, the PRIVY COUNCIL is that in which the privy councillors meet to deliberate on affairs of state. When a council is composed only of cabinet ministers, it is called a *Cabinet Council*.——COUNCIL OF WAR, an assembly of the principal officers of a fleet or army, called by the admiral or general to concert measures for requisite operations.

COUNT (*comes*, a companion: *Lat.*), a title of foreign noiblity, equivalent to earl with us. It is very ancient, having been in existence since the time of Augustus; but in most of the continental states it has degenerated very much, and in some—for example, the papal—it may be bought very cheaply.——In Law, a particular charge in an indictment, or narration in pleading, setting forth the cause of complaint. There may be different *counts* in the same declaration.

COUN'TER-APPROACH'ES (*contre*: *Fr.*; from *contra*, against: *Lat.*), in Fortification, lines and trenches made by the besieged, in order to attack the works of the besiegers, or to hinder their approaches.

COUN'TERDRAWING, in Painting, copying a design or painting by means of lines drawn on oiled paper or other transparent substance.

COUN'TERGUARD, in Fortification, a small rampart or work raised before the point of a bastion, consisting of two long faces parallel to the faces of the bastion, making a salient angle to preserve the bastion.

COUN'TERMARK, a mark put upon goods that have been marked before. It is also used for the several marks put upon goods belonging to several persons, to show that they must not be opened but in the presence of all the owners, or their agents. —— In Numismatics, a stamp frequently seen on ancient coins, often obliterating a large part of the impression. Some consider it intended to augment the value; others, to signify it was taken from an enemy.——The mark of the Goldsmiths' Company, affixed to an article of gold or silver plate after assay, to show the metal to be of a certain fineness.

COUN'TERMINE, in Military affairs, a well and gallery sunk in the earth, and running underground: it is intended to prevent the effect of the enemy's mine; or, in other words, is a mine made by the besieged, in order to blow up the mine of the besiegers.

COUN'TERPALED, in Heraldry, is when the escutcheon is divided into twelve pales parted *per fesse:* the two colours are counterchanged, so that the upper and lower are of different colours.

COUN'TERPART, the corresponding part or duplicate. Also the part which fits another: as, the key of a cipher.——In Law, when the parts of an indenture are interchangeably executed by the several parties, that executed by the grantors is termed the *original*, and the rest are *counterparts*. If each part is signed by all parties, they are *duplicate originals*. A deed made by one party is not indented, but *polled*, or shaved quite even: and is, therefore, styled a *deed poll*, or single deed.——In Music, the part to be applied to another; thus, the bass is the counterpart to the treble.

COUNTERPAS'SANT, in Heraldry, is when two lions in a coat of arms are represented as going contrary ways.

COUN'TERPOINT, in Music, the science of harmony, including the art of combining and modulating consonant sounds, or of disposing several parts in such a manner as to make an agreeable whole.

COUN'TERPROOF, an engraving taken from another fresh printed, which, by being passed through a rolling press, gives an inverted copy of the former.

COUNTER-REVOLU'TION, a revolution opposed to a former one, and restoring a former state of things.

COUN'TERSCARP, in Fortification, that side of the ditch which is next the country; but it often signifies the whole covered way, with its parapet and glacis.

COUNTER-SECU'RITY, security given to one who has entered into a bond, or become surety for another.

COUN'TERSIGN, a military watchword; or a private signal given to soldiers on guard, with orders to let no one pass unless he first gives that word.——Also, to sign, as secretary, or other subordinate officer, any writing signed by a principal or superior, to attest the authenticity of his signature.

COUNTER-TEN'OR, in Music, one of the middle parts, between the treble and the tenor.

COUN'TY (*comté*, the territory of a count: *Fr.*), originally the district or territory of a count or earl: one of the ancient divisions of England, which, by the Saxons, were called *shires*, a term not applied to such counties as were anciently kingdoms, such as Kent, Essex, &c. England is divided into forty counties or shires, Wales into twelve, Scotland into thirty-three, and Ireland into thirty-two. Each county has its sheriff and its court, with other officers, employed in the administration of justice and the execution of the laws. The lord-lieutenant of a county has the command of its militia.——COUNTY CORPORATE, a title given to several cities, or ancient boroughs, on which certain kings of England have bestowed peculiar privileges; annexing territory, land, or jurisdiction, and making them counties within themselves, with their own sheriffs and other officers; but all causes of action arising, and offences committed, in a county corporate, may be tried in the next adjoining county at large.——COUNTY PALATINE, a county distinguished by particular privileges, and named from *palatium*, the palace, because the owner had originally royal powers in the administration of justice. The counties palatine in England are Lancaster, Chester, and Durham.

COUP (a blow: *Fr.*), a term used in several expressions. Thus, COUP DE GRACE, the finishing blow.——COUP DE MAIN, a sudden unpremeditated attack.——COUP D'ŒIL, the first glance of the eye, with which it surveys any object.——COUP DE SOLEIL, a disorder produced by the action of a hot sun.

COUPE'D or **COUPE'** (*coupé*, cut: *Fr.*), in Heraldry, is used to express the head or any limb of an animal, cut off smooth from the trunk: distinguishing it from that which is called *erased*, or forcibly torn off.——COUPED is also used to signify such crosses, bends, bars, chevrons, &c., as do not touch the sides of the escutcheon, but are, as it were, cut off from them.

COUP'LE-CLOSE, in Heraldry, an ordinary, so termed from its enclosing the chevron by couples, being always borne in pairs, one on each side a chevron.

COUP'LET, the division of a poem, containing two verses or two rhymes.

COU'RANT (running: *Fr.*), in Heraldry, an epithet for any beast represented in a running attitude.

COURAN'TO (*corrente*, running: *Ital.*), a piece of music in triple time: also a kind of dance.

COURSE (*Fr.*), in its general sense, a motion forward, either in a direct or curving line. Applied to the arts and sciences, it denotes a methodical series.——COURSE, in Navigation, that point of the compass on which a ship steers.——COURSE, in Masonry, a continued range of bricks or stones of the same height.——COURSE OF EXCHANGE, in Commerce, is the current price or rate at which the coin of one country is exchanged for that of another; which, as it depends upon the balance of trade and the political relations which subsist between the two countries, is always fluctuating.——COURSES, in a ship, the large square sails.

COURS'ING, the act or sport of pursuing any beast of chase, as the hare, &c., with greyhounds.

COURT-BAR'ON was a court incident to every manor. There was one, also, in every hundred and county. It has long fallen into disuse, except in manors of ancient demesne, the lord of which was once the king, and manors containing land of copyhold or customary tenure.

COURT-LEET' (*leod*, the common people: *Sax.*), a court of record held once a year, in a particular hundred, lordship, or manor, before the steward of the leet. The business of the court-leet is now done at quarter sessions, except in certain manors, where it has been held from time immemorial.

COURT-MAR'TIAL, a court consisting of military officers, for the trial of the military offences of officers and soldiers.——A NAVAL COURT-MARTIAL is a similar court for those constituting the navy.

COURT'-ROLL, a roll containing an account of the number, &c., of lands which depend on the jurisdiction of the manor, &c.

COUR'TESY, TENURE BY (*courtoisie: Fr.*), in Law, is where a man marries a woman seised of an estate of inheritance, and has by her issue born alive, which was capable of inheriting her estate: in this case, on the death of his wife, he holds the lands for his life, as tenant by courtesy.

COUR'TESY TITLES. The children of noblemen in this country have no right by law to any title whatever, but courtesy has allowed them to assume rank according to the rank of their parents. Thus the eldest son of a duke bears a marquisate by courtesy, the eldest son of a marquis an earldom by courtesy, whilst the younger sons and daughters of both bear the title of lord and lady prefixed to their Christian and surnames. The eldest son of an earl has a viscounty by courtesy, the younger sons are styled honourable, and the daughters lady. All the sons and daughters of viscounts and barons are styled honourable. Although in the ordinary intercourse of society the titles above designated are accorded, in all legal documents the gentlemen are styled esquires, with a reference to the courtesy title: thus, John Brown, Esquire, commonly called Marquis of W.; or James Taylor, Esquire, commonly called Lord James Taylor. The courtesy titles of eldest sons are usually those of the second title of the father. It may, however, happen, that a duke has no marquisate, but only an earldom, in which case the eldest son takes that title, and yet ranks just the same as if he had assumed a marquisate. And so on with respect to lower grades of the peerage. When the daughters of peers marry a man of rank inferior to their own, they by courtesy retain their titles; but if a woman who has no title marries a man who has merely a courtesy title, and is left a widow, she loses the title she had assumed during her husband's life, in case she marries again. This, however, is not the case with respect to the widow of a man who has a title in his own right. If she marries again, she by courtesy retains her title.

COV'ENANT (*convenio*, I agree with: *Lat.*), in Law, an engagement, in writing, under seal, to do or omit a direct act. There are many kinds of covenant.

COW'ITCH, or **COW'AGE**, an Indian plant, the *Mucuna pruricus* of botanists, nat. ord. *Leguminosæ*, the pods of which are covered with microscopic hairs, that are employed as a mechanical anthelmintic. They are very troublesome if accidentally brought into contact with the skin.

COW'POX, the vaccine disease, produced by transferring morbific matter from the udder of a cow to the human body. It was proposed by Dr. Jenner, in 1798, as a substitute for and preventative of small-pox. Small bluish vesicles, surrounded by inflammation, elevated at the edge, and depressed at the centre, and containing a limpid fluid, occasionally appear on the teats of the cow, the animal being, at the same time, somewhat indisposed. This disease, transferred to the hands of the milkers, was found, in many cases, to preserve from small-pox. A disease of the horse's head, called *grease*, communicated to the hands of farriers, seems to have produced the same effect. The matter from the cow is, however, the most certain; and that which it produces in one human subject may be successfully transferred to another; though it is probable that it loses its efficacy by being transmitted too many times. In doubtful cases, the vaccination should be repeated; its repetition, even though unnecessary, can be attended with little inconvenience.

COW'RIE, or **KAW'RIE PINE**, a lofty coniferous tree, a native of New Zealand, named by botanists *Dammara australis*. It yields a hard brittle resin, like copal, and its timber is excellent.

COWRY, the popular name of several species of marine univalve shells, belonging to the genus *Cypræa*. One species, the *C. moneta*, or money-cowry, is used in place of coin on the west coast of Africa, and many tons weight are annually imported into this country from the Pacific and eastern seas, for the purpose of being sent to Africa. There are many species of this genus, some of which are beautifully marked and coloured. Savages, in various parts, adorn their persons or indicate their rank with cowries.

COW TREE, a name applied to distinct species of trees growing in tropical countries, on account of their yielding a milk-like innoxious fluid. One of these, the Massaranduba, found on the Amazons, grows to the dimensions of a forest tree. Milk can be drawn from its logs after they have been allowed to stand for many days in the hot sun. 'The timber (says Mr. A. R. Wallace) is very hard, fine grained, and durable, and is valuable for works which are much exposed to the weather. The fruit is eatable, and very good, the size of a small apple, and full of a rich and juicy pulp. The milk, which exudes in abundance when the bark is cut, has the consistence of thick cream, and, but for a very slight peculiar taste, could scarcely be distinguished from the genuine product of the cow. It is also used for glue, and is said to be as durable as that made use of by carpenters. As the milk hardens by exposure to the air, it becomes a very tough, slightly elastic, substance, much resembling gutta percha.'

CRAB (*crabba: Sax.*), the popular name for the species of a considerable group of invertebrate animals, whose bodies are covered by a calcareous crust, with ten articulated limbs. They belong to the *Decapoda brachyura*, or ten-legged short-tailed crustacea; and include a great number of species, differing in size, colour, and habits. The large and small edible crabs of our coasts may be taken as examples. Their sight is very acute, and their masticatory apparatus is exceedingly complicated. Some of them are exclusively aquatic, and remain on the sands or rocks, at great depths in the sea; others inhabit excavations formed in the soft coral reefs or bars on certain coasts; some spend their life altogether on shore, in burrows or dens; others live on rocky beaches, basking in the sun, and only retiring into the sea when alarmed; while some species are completely terrestrial, inhabiting holes upon the highest hills and mountains of the West Indies. The most remarkable are the crabs which are found in the less densely peopled or uninhabited West Indian islands. When the season for spawning arrives, they proceed to the sea in a body of many millions, a journey which employs them some weeks. Having deposited their eggs in the sand, they return, travelling only by night, and arrive emaciated and exhausted.

CRACKLE CHI'NA is a ware much prized by collectors, the surface of which is everywhere marked by cracks which give the vessel the appearance of being composed of small pieces cemented together.

CRAMP (*krampe: Ger.*), a convulsive contraction of a muscular part of the body, with pain.

CRAN'BERRY, the fruit of the *Oxycoccus palustris*, nat. ord. *Vacciniaceæ*, a creeping plant, growing only on peat bogs or swampy land, and bearing small bright red berries, which have a pleasant acid flavour, and are much used in tarts.

CRANE (*cran: Sax.*), a migratory bird of the family *Gruidæ*, which is an occasional visitor to England. It is the *Grus cinerea* of naturalists, and it soars high in the air, and performs journeys of immense extent; has blackish or black wing-feathers, with an ash-coloured body. The *Grus gigantea*, or Siberian crane, is of great size, being four feet six inches in height: the male and female watch the nest alternately during incubation.——**CRANE**, a machine for raising great weights, consisting of an arm, or piece of timber, projecting from a post, either horizontally or at some angle, and furnished with a pulley. It is also made of iron, on the principle of the wheel and pinion; by which it is rendered very commodious, and capable of raising immense weights.

CRA'NE-LINES, in a ship, are lines going from the upper end of the spritsail-topmast to the middle of the forestays. They serve to keep the spritsail-topmast upright and steady in its place, and to strengthen it.

CRA'NE'S-BILL, the popular name of the wild species of the genus *Geranium*, these plants having their seed vessel in the shape of a crane's beak.

CRANIOL'OGY (*kranion*, the skull; and *logos*, a discourse: *Gr.*), that branch of science which is concerned with the structure and uses of the skull in various animals, particularly in relation to their characters and intellectual powers. One who is versed in this science is termed a *craniologist*.

CRANIOM'ETER (*kranion*, the skull; and *metron*, a measure: *Gr.*), an instrument for measuring the skulls of animals. The art of measuring them, for the purpose of discovering their specific differences, is called *craniometry*.

CRANIOS'COPY (*kranion*, the skull; and *skopeo*, I examine: *Gr.*), the science of discovering, by the eminences produced by the brain on the cranium, the particular parts in which reside the organs that influence certain passions or faculties.

CRA'NIUM (*kranion: Gr.*), the skull; the assemblage of bones which enclose the brain. They consist of the frontal bone forming the forehead; the two parietal bones occupying the sides and roof of the skull; the two temporal bones forming the walls at the temples; and the occipital bone situate at the posterior and inferior part. These bones are joined together by means of interlocking serratures called **SUTURES**. The fore part of the skull is termed the sinciput, the hinder part the occiput, and the top, the vertex. Wedged in between the bones at the base of the skull are the two bones termed ethmoid and sphenoid, which may be considered as common to the cranium and the face. No cranium of an adult man has been found with a less capacity than 62 cubic inches: whilst the contents of the largest gorilla skull hitherto measured did not exceed 84½ cubic inches.

CRANK, a bend in an axle upon which the piston of a steam-engine acts, and thus a back and forward motion is converted into a circular motion. A ship is said to be *crank-sided* when she can bear but little sail, for fear of oversetting: and when a ship cannot be brought on the ground without danger, she is said to be *crank* by the ground.

CRAPE (*crêpe: Fr.*), a light transparent stuff, resembling gauze. It is made of raw silk, gummed and twisted in the mill, and is much used in mourning.

CRA'GIS (*krasis* a mixing *Lat.*), the healthy constitution of the blood in an animal body.

CRASSAMEN'TUM (sediment: *Lat.*), in Physic, the thick red or fibrous part of the blood, as distinguished from the serum, or aqueous part.

CRATCH'ES (*crach*, the itch: *Wel.*), in Farriery, a swelling on the pastern, under the fetlock, and sometimes under the hoof of a horse.

CRA'TER (*kratēr: Gr.*), the cup-shaped hollow of a volcano from which matter is ejected.——In Antiquity, a very large wine-cup, or goblet, out of which the ancients poured their libations at feasts.

CRAY'FISH, or CRAW'FISH (*écrevisse: Fr.*), a freshwater crustacean of the genus *Astacus*, which differs but little in appearance from the lobster. Crayfish are found everywhere, and very abundantly in England. Their flesh is wholesome and nutritious.

CRAY'ON (*Fr.*), a general name for all coloured mineral substances, used in designing or painting in pastil; whether they have been beaten and reduced to a paste, or are used in their primitive consistence, after sawing or cutting them into long narrow slips.

CREAM (*crême: Fr*), the oily part of milk, which rises to the surface, and forms a distinct layer. By agitation the solid butter is separated from the fluid oil.——Cream of Lime, a mixture of lime and water, used in gas-works for purifying the gas, which is transmitted through it; carbonic acid and sulphuretted hydrogen being absorbed by it.——Cream of Tartar, common white tartar freed from its impurities: the crystallized bitartrate of potash.

CREDEN'DA (*Lat.*), in Theology, things to be believed; articles of faith: distinguished from *agenda*, or practical duties.

CREDEN'TIAL LET'TERS (*credo*, I have confidence in: *Lat.*), the instrument, in the form of a letter, from one monarch to another, which constitutes the evidence of the title of a minister at a foreign court to the power which he exercises.

CRE'DIT (same *deriv.*), in Political Economy, the lending of money, or what is equivalent to it. He who lends *gives* credit, and he who borrows *obtains* it. A person who buys goods which are to be paid for at a future time, or who discounts a bill, obtains the command of so much capital belonging to another. There is no creation of wealth by these transactions.——Credit, in Bookkeeping, the side of an account in which payment is entered, opposed to *debit*.——Public Credit, the trust or confidence placed in a state by those who lend money to it.——Letters of Credit, letters given by merchants to persons who are to draw money from their correspondents.

CREED (*credo*, I believe: *Lat.*), a summary of belief; the principal articles of religious faith.

CREEK (*crecca: Sax.*), that part of a haven, or small channel, running from the sea, where goods are landed. In North America the tributaries to a river are called creeks.

CREMO'NA, an appellation for the superior sort of violins, which were made at Cremona, in Italy, during the 17th and 18th centuries, by the family of the *Amati*. Also a name erroneously given to a reed stop of the organ, originally intended to imitate the *krumhorn*, an ancient wind instrument.

CRE'NATE (*créneler*, to indent: *Fr.*), in Botany, an epithet for leaves, the edges of which are furnished with small rounded projections or teeth, inclining towards neither the point nor the base. When the edge of a leaf is cut into very minute notches, the word *crenulate* is used.

CRE'OLE, an epithet given in Spanish America to the American born children of European parents.

CRE'OSOTE or KRE'OSOTE (*kreas*, flesh; and *sozo*, I preserve: *Gr.*), one of the substances obtained by the distillation of tar. It is a colourless, oily liquid, of high refractive and dispersive power, with a penetrating odour. It is slightly heavier than water. It is a compound of carbon, oxygen, and hydrogen. It possesses great antiseptic power; a piece of meat steeped in it will never putrefy. It is used as a preservative for timber which has to be placed in the ground.

CREPITA'TION (*crepito*, I crackle: *Lat.*), the crackling noise made by some salts during the process of calcination.

CREPUS'CULUM, or CREPUS'CLE (*crepusculum*, a *dim.* of *creper*, dusky: *Lat.*), the twilight, which begins in the morning when the sun has arrived within 18° of the horizon, and ends in the evening when the sun is 18° below the horizon. It is due to the refraction of the sun's rays by the atmosphere.

CRESCEN'DO (*Ital.*), a term in Music, used to show that there is to be a gradual swelling of the notes over which it is placed.

CRES'CENT (*cresco*, I increase: *Lat.*), the increasing or new moon, which shows a curving rim of light, terminating in points or horns.——The Turkish standard, on which a crescent is depicted; and, figuratively, the Turkish power, or empire of the crescent. This emblem was used to indicate sovereignty, even in the time of the early Roman emperors, and continued to be employed by the Greek emperors. The Turks adopted it because, meeting it wherever they turned, they considered it a good omen.——In Heraldry, it is an honourable ordinary, often used as a mark of distinction for the second sons of families, or those descended from them. When the horns are turned towards the *chief*, or upper part of the shield, it is called *crescent;* when to the right, *increscent;* and when to the left, *decrescent*.

CRESCEN'TIA, in Botany, a genus of tropical trees belonging to the nat. ord. *Crescentiaceæ*. The *Crescentia cujete*, a tree inhabiting tropical America, bears a large gourd-like fruit called Calabash, the pulp of which is eaten, and the hard shell employed in place of bottles.

CRESS (*kresse: Germ.*), the name of several species of plants, of which the most useful are water-cress (*Nasturtium offici-*

nale), and common cress (*Lepidium sativum*), both belonging to the nat. ord. *Cruciferæ*.

CREST (*crista: Lat.*), the plume of feathers, or other object, on the top of the ancient helmet. The crest is considered a greater criterion of nobility than the armour generally, and therefore forms an important subject in heraldry.

CRE'TA (chalk: *Lat.*), in Pharmacy, the name of chalk, carbonate of lime.

CRETA'CEOUS (*cretaceus*, like chalk: *Lat.*), partaking of the qualities of, or abounding in chalk.——In Geology, a group of secondary strata, divided into Upper and Lower, or Neocomian. The former is again divided into the Maestricht beds, which are wanting in England; the Upper White Chalk, which contains layers of flint, and is exemplified in the North and South Downs; the Lower White Chalk, the Upper Green Sand, and the Gault. The Neocomian division embraces the Lower Green Sand and the Wealden series.

CRE'TINISM (*crétinisme: Fr.*), a peculiar endemic disease, common in some parts of Switzerland, and in some other mountain districts. It makes a close approach to rickets in its general symptoms, but is distinguished by the tendency to that peculiar enlargement of the thyroid gland, called by the French goitre, and by us Derbyshire-neck, and by the mental imbecility which accompanies it. The individuals affected with this disease are called *crétins*.

CREUX (a hollow: *Fr.*), a term used in Sculpture, where the lines and figures are cut below the surface of the substances engraved; thus it stands opposed to *rilievo*, implying the prominence of the lines and figures, which appear above the surface.

CRE'VASSE (*Fr.*), a deep cleft in a glacier. When covered over with snow it is very dangerous to travellers on the ice, who, to prevent mishap, usually proceed in single file, and tie themselves together by a rope passed round the waist of each.

CRIB'RIFORM (*cribrum*, a sieve; and *forma*, a form: *Lat.*), in Anatomy, a term applied to the laminæ of the ethmoid bone, through which the fibres of the olfactory nerve pass to the nose.

CRIBRO'SUM OS (the bone having the appearance of a sieve: *Lat.*), called also *os ethmoides*, in Anatomy, a bone situated internally in the fore part of the basis of the skull.

CRICK'ET (*cryce*, a stick: *Sax.*), an active, manly game, which is played with bats and a ball, and is almost peculiar to this country. The number of the party on each side is eleven, who alternately take the innings, and alternately the bowling and fielding. ——CRICKET, the popular name of some saltatorial orthopterous insects, which are divided by naturalists amongst different genera, and placed in the neighbourhood of the locusts and grasshoppers. The chirp of the house-cricket (*Acheta domestica*), and the field cricket (*A. campestris*), is made by rubbing one of the wing-cases over the other. The mole-cricket (*Gryllotalpa vulgaris*) has very strong fore-legs, with which it burrows in the ground.

CRICOI'DES (*krikos*, a ring; and *eidos*, form: *Gr.*), in Anatomy, a cartilage of the larynx, called also the *annular cartilage*.

CRIME (*crimen: Lat.*). In the general sense of the word, crimes are understood to be offences against society or morals, as far as they are amenable to the laws. To this we may add, in order more clearly to distinguish between words often considered synonymous, that actions contrary to the precepts of religion are called *sins*; actions contrary to the principles of morality are called *vices*; and actions contrary to the laws of the state are called *crimes*.

CRIN'GLE, or **CRIN'KLE** (*krinkelen*, to run in flexures: *Dut.*), in Marine language, a hole in the bolt-rope of a sail, to receive the ends of the ropes by which the sail is drawn up to its yard, or to extend the leech by the bowline bridles. *Iron cringles*, or *hanks*, are open rings running on the stays, to which the heads of the staysails are made fast.

CRI'SIS (*Gr.*, from *krino*, I judge), in Medicine, is a sudden change, either for the better or the worse, indicative of recovery or death. In its more general sense, it denotes that stage of a disorder at which some judgment may be formed of its termination. At the approach of a crisis, the disease appears to assume a more violent character. If the change is for the better, the violent symptoms cease with a copious perspiration, or some other discharge from the system. After a salutary crisis, the patient feels himself relieved, and the dangerous symptoms cease.——By a CRISIS is also meant the point of time when an affair is arrived at its height, and must soon terminate or suffer a material change.

CRISP (*crispus*, curled: *Lat.*), in Botany, an epithet for a leaf folded over and over at the edges, which are always serrated, dentated, or lacerated.

CRIS'TATE or **CRIS'TATED** (*cristatus*, tufted: *Lat.*), a botanical epithet for having an appendage like a tuft or crest; as applied to some anthers and flowers.

CRITE'RION (*kritērion*, from *kritēs*, a decider: *Gr.*), a standard measure or test.

CRIT'IC (*kritēs*, a judge: *Gr.*), a person who, with the requisite ability, estimates the value of works of art, whether of literature or in the Fine Arts, and points out their merits and faults, with reference to established principles.

CRO'CEOUS (*krokeos*, from *krokos*, saffron: *Gr.*), resembling saffron.

CROC'ODILE (*krokodeilos: Gr.*), the popular name of some hideous fourfooted reptiles, belonging to the genus *Crocodilus*, which are distinguished from the alligators by having webbed feet. The common crocodile (*C. vulgaris*) has the sides and body covered with bony armour, which, on the upper part of the body, is strong enough to resist a musket-ball. It sometimes grows to the length of twenty feet. It inhabits the large rivers in Africa, and lays its eggs in the sand to be hatched by the sun.

CRO'CUS (*krokos*, saffron: *Gr.*), in Chemistry, an old term, signifying a metal calcined to a red or deep yellow colour.——In Botany, a genus of plants with pretty flowers, belonging to the nat. ord. *Iridaceæ*.

CROIS'ES (crusaders: *Fr.*), in English Antiquity, pilgrims bound for the Holy Land, or such as had been there; so called from a badge they wore in imitation of a cross. The knights of St. John of Jerusalem, created for the defence and protection of pilgrims, were particularly called *croises;* and so were all those of the English nobility and gentry, who, in the reigns of Henry II., Richard I., Henry III., and Edward I., were *cruce signati*, that is, devoted to the recovery of Palestine.

CROM'LECH (*crwmlech: Wel.;* from *carem luach*, a devoted stone: *Heb.*), in British Antiquity, large broad flat stones raised upon other stones set up to support them. They are common in Wales, Devonshire, and Cornwall, and are thought to be remains of altars.

CROSS, in Antiquity, an instrument of torture, consisting of two pieces of timber crossing each other, one part being vertical and the other horizontal, or both oblique. This punishment was only inflicted on malefactors and slaves, and was thence called *servile supplicium*. The most usual method was to nail the criminal's hands and feet to this gibbet, in an erect posture; though there are instances of criminals so nailed with their head downward.——CROSS, the symbol of the Christian religion; and hence, figuratively, the religion itself.——Also, a monument with a cross upon it, to excite devotion, such as were anciently set up in market-places.——In Theology, the doctrine of Christ's sufferings, and of the atonement.——A Latin cross has one arm longer than the others; a Greek cross has equal arms.——CROSS, in Heraldry, an ordinary formed by lines drawn palewise and fessewise; and, if bounded by the escutcheon, enclosing one-fifth of the shield, or one-third if charged. A cross gules, one bar being vertical, the other horizontal, is called the *cross of St. George*. The *cross of St. Andrew* has both bars oblique. The extremities of a plain cross are 'couped,' that is, do not reach the circumference of the escutcheon. There are other crosses also which do not reach the circumference: thus, a *cross crosslet*, termed a Jerusalem cross when between four plain crosses: it is crossed on each arm. A *cross fleury* has three points at each end. A *Maltese cross* has arms increasing in breadth towards the ends, which terminate with double points. A *cross fitchy* has the lower limb pointed. A *patriarchal cross* is plain, and has two horizontal bars, the upper shorter. A *cross moline* terminates in representations of the millrind: it is the difference of the eighth son of a family.

CROSS-BAR-SHOT, a bullet with an iron bar passing through it, and standing out a few inches on each side; used in naval actions for cutting the enemy's rigging.

CROSS'-BILL, the common name of birds allied to the finches, and belonging to the genus *Loxia*. They are distinguished by having the mandibles crossing each other at the point. Buffon called this curious structure an error and defect of nature, and a useless deformity, but it has been found to enable them easily to obtain their usual food, the seeds of pine trees. The common cross-bill rarely breeds in England.

CROSS'-BOW, a missive weapon formerly much used, which was strung and set in a shaft of wood, with a trigger, &c.

CROSS'-EXAMINATION, in Law, a close and rigid examination of a witness by the counsel of the adverse party, after he has been examined in chief by the counsel of the party producing him.

CROSS'-STAFF, an instrument to take the altitude of the sun or stars.

CROSS'-STONE, a mineral of a greyish-white colour, called also *harmostone*, occurring in double and single crystals.

CROSS'-TREES, pieces of timber in a ship, supported by the cheeks and trestle-trees, at the upper ends of the lower masts, to sustain what is above, and to extend the top-gallant shrouds.

CROSS'LET (*croisette: Fr.*), in Heraldry, a little or diminutive cross: the shield is frequently seen covered with crosslets. Also, fesses, and other honourable ordinaries, are charged or accompanied with crosslets.

CROT'CHET (*crochet: Fr.*), in Music, half a minim.——In Printing, this mark [ ], to separate what is not a necessary part of the sentence.

CRO'TON OIL, one of the most valuable of the late additions to the materia medica, is expressed from the seeds of the *Croton tiglium*, an East Indian plant, belonging to the nat. ord. *Euphorbiaceæ*. It is so strongly purgative, that one drop is a full dose, and half a drop will sometimes produce a powerful effect.

CROUP (*Fr.*), in Medicine, the disease called *Cynanche trachealis*, an affection of the throat, accompanied by a peculiar shrillness of voice, wheezing, difficult respiration, &c. It most usually attacks young children, who are suddenly seized with a difficulty of breathing and other symptoms. Exposure to cold seems to be the general cause of the disease, and it is consequently more prevalent in winter and spring than in summer.

CROUPA'DE, in the Manège, a leap in which the horse pulls up his hind legs, as if he drew them up to his belly.

CROUT, KROUT, or SOUR-CROUT (*sauer*, sour; and *kraut*, an herb: *Germ.*), cabbage chopped fine and pickled. It is made by placing chopped cabbage in layers in a barrel, with salt and carraway seeds sprinkled between the layers; then pressing it down, and suffering it to remain till it has undergone fermentation. It is considered an efficacious preservative from the scurvy, and is used at sea, particularly in the Russian navy.

CROW (*craye: Sax.*), or Carrion Crow, the *Corvus corone* of naturalists, a well-known bird belonging to the *Corvidæ*. It is a carrion feeder, and is distinguished from the raven by its beak, voice, and habits, and from the rook by having the basal third of its beak covered with feathers. The Hooded Crow (*C. cornix*) has the plumage of the back and under-surface of the body coloured grey.

CROW'-BAR, in Mechanics, an iron lever, with a claw at one end, and a sharp point at the other; used for raising and moving weights.

CROW'-FOOT, a complication of small cords, spreading out from a long block; used on board ships for suspending the awnings, or keeping the topsails from striking against the tops.

CROW'S'-BILL, in Surgery, a kind of forceps for extracting bullets and other things from wounds.

CROW'S'-FEET, or CALTROPS, in the art of War, an iron instrument with four points, which was formerly thrown upon breaches, or in passes where the enemy's cavalry were expected, for the purpose of injuring the feet of the horses, and throwing them down.

CROWN (*krone: Germ.*), an ornamental badge of regal power, worn on the head by sovereign princes. Among the various crowns and wreaths peculiar to the Greeks and Romans were the following:—The *Corona aurea*, a golden crown, the reward of remarkable bravery. *Corona vallaris*, or *castrensis*, given to him who first entered the camp of an enemy. *Corona civica*, a garland of oak-leaves, one of the highest military rewards: it was given to him who saved the life of a citizen. *Corona convivialis*, the wreath worn at feasts. *Corona muralis*, given by the general to the soldier who first scaled the enemy's wall. *Corona navalis*, given to him who first boarded an enemy's vessel: it was next in rank to the civic crown. *Corona nuptialis*, a crown or wreath worn by brides. *Corona obsidionalis*, a reward given to him who delivered a besieged town or a blockaded army. It was one of the highest military honours, and very seldom obtained. *Corona triumphalis*, a wreath of laurel which was given by the army to the *imperator*, who wore it on his head at the celebration of his triumph.——The Imperial Crown of Great Britain is kept at the Tower of London, where the public is admitted to see it. The following description of it was written by Professor Tennant:—'It was made by Messrs. Rundell and Bridge, in the year 1838, with jewels taken from old crowns, and others. It consists of diamonds, pearls, rubies, sapphires, and emeralds, set in silver and gold; it has a crimson velvet cap, with ermine border, and is lined with white silk. Its gross weight is 39 oz. 5 dwts. troy. The lower part of the band, above the ermine border, consists of a row of 129 pearls, and the upper part of the band of a row of 112 pearls, between which, in front of the crown, is a large sapphire (partly drilled), purchased for the crown by George IV. At the back is a sapphire of smaller size, and six other sapphires (three on each side), between which are eight diamonds. Above and below the seven sapphires are fourteen diamonds, and around the eight emeralds, 128 diamonds. Between the emeralds and sapphires are sixteen trefoil ornaments, containing 160 diamonds. Above the band are eight sapphires, surmounted by eight diamonds, between which are eight festoons, consisting of 148 diamonds. In front of the crown, and in the centre of a diamond Maltese cross, is the famous ruby, said to have been given to Edward, Prince of Wales, son of Edward III., called the Black Prince, by Don Pedro, king of Castile, after the battle of Najera, near Vittoria, A.D. 1367. This ruby was worn in the helmet of Henry V., at the battle of Agincourt, A.D. 1415. It is pierced quite through, after the eastern custom, the upper part of the piercing being filled up by a small ruby. Around this ruby, to form the cross, are 75 brilliant diamonds. Three other Maltese crosses, forming the two sides and back of the crown, have emerald centres, and contain respectively 132, 124, and 130 brilliant diamonds. Between the four Maltese crosses are four ornaments in the form of a French fleur-de-lis, with four rubies in the centres, and surrounded by rose diamonds, containing respectively 85, 86, 86, and 87 rose diamonds. From the Maltese crosses issue four Imperial arches, composed of oak-leaves and acorns, the leaves containing 728 rose, table, and brilliant diamonds, 32 pearls forming the acorns, set in cups containing 54 rose diamonds and one table diamond. The total number of diamonds in the arches and acorns is 108 brilliants, 116 table, and 559 rose diamonds. From the upper part of the arches are suspended four large pendant pear-shaped pearls, with rose diamond caps, containing twelve rose diamonds, and stems containing 24 very small rose diamonds. Above the arch stands the mound, containing in the lower hemisphere 304 brilliants, and in the upper 244 brilliants; the zone and arc being composed of 33 rose diamonds. The cross on the summit has a rose cut sapphire in the centre, surrounded by four large brilliants, and 108 smaller brilliants. Summary of jewels comprised in the crown:—1 large ruby, irregularly polished, 1 large broad-spread sapphire, 16 sapphires, 11 emeralds, 4 rubies, 1,363 brilliant diamonds, 1,273 rose diamonds, 147 table diamonds, 4 drop-shaped pearls, 273 pearls.'——In Architecture, the uppermost member of a cornice.—Among jewellers, the upper work of the rose diamond.——An English silver coin of the value of five shillings.

CROWN'-GLASS. [See GLASS.]

CROWN-IMPE'RIAL, the popular name of some species of *Fritillaria*, nat. ord. *Liliaceæ*.

CROWN-IMPERIAL-SHELL, a beautiful species of *Voluta*, the head of which is surrounded with a series of sharp-pointed tubercles, so as to resemble an open crown: it has also two broad and very beautiful zones running round it.

CROWN'-OFFICE, an office belonging to the court of Queen's Bench, in which the attorney-general exhibits informations for crimes and misdemeanors.

CROWN'-POST, in Building, a post which stands upright in the middle between two principal rafters.

CROWN'-WHEEL, in common watches, the wheel which drives the escapement wheel, or that which acts on the pallets. [See WHEEL.]

CROWN'-WORK, in Fortification, an outwork running into the field, consisting of two demi-bastions at the extremes, and an entire bastion in the middle, with curtains. It is designed to gain some advantageous post, and cover the other works.

CRU'CIAL (*crux*, a cross: *Lat.*), in Surgery, an epithet for transverse, or in the form of a cross; as, a *crucial* incision. *Crucial instances*, a phrase of Bacon, signifying phenomena brought forward to decide between two apparent causes. Chemical tests are generally crucial instances or experiments. 'A well-chosen and strongly-marked crucial instance,' says Sir John Herschel, 'is sometimes of the highest importance, when two theories, which run parallel with each other in their explanation of great classes of phenomena, at length come to be placed at issue on a single fact.'

CRU'CIBLE (*creuset*, from *creuser*, to hollow: *Fr.*), a vessel or melting-pot used in chemical operations, and frequently made of clay, and so tempered and baked as to endure great heat. Silver, platina, and iron crucibles are occasionally used. For melting gold and silver, crucibles are made in great part of plumbago.

CRU'CIFERÆ (*crux*, a cross; and *fero*, I bear: *Lat.*), a large nat. ord. of plants, so named from the four petals which are arranged crosswise. There are six stamens, of which four are longer than the others (upon which character Linnæus founded the class *Tetradynamia*). The fruit is a kind of pod; called a siliqua or silicula, according as it is long and narrow, or broad and short. The shapes of these pods is curiously varied. To this order belong, amongst garden flowers, the stock, wall flower, rocket, honesty, and candy tuft. Here are placed a number of food-plants; cabbage (with its garden varieties, cauliflower, broccoli, and savoys), turnip, mustard, cress, sea-kale, horse-radish, water-cress, and radish.

CRU'CIFORM (*crucis*, of a cross; and *forma*, a form: *Lat.*), an epithet for anything having four arms or rays disposed in the form of a cross.

CRU'DITY (*cruditas*, from *crudus*, raw: *Lat.*), among Physicians, is applied to undigested substances in the stomach, to humours in the body which are imperfectly formed, &c.

CRU'ISER (*croiseur: Fr.*), a small armed vessel that sails to and fro in quest of the enemy, to protect the commerce of its own nation, or for plunder.

CRU'OR (gore: *Lat.*), the *crassamentum*, or clot of the blood which consists of fibrin and red corpuscles.

CRU'RAL (*crus*, the leg: *Lat.*), in Anatomy, an epithet given to the artery which conveys the blood to the legs, and to the vein by which this blood returns towards the heart.

CRUSA'DES (*croisade: Fr.;* from *crux*, a cross: *Lat.*), the name by which the wars or military expeditions were distinguished, that were carried on by the Christian nations of the West, from the end of the eleventh to the end of the thirteenth century, for the conquest of Palestine. They were called crusades, because all the warriors fought under the banner of the *cross*, and wore that emblem on their clothes. The pope considered the invasion of Asia as the means of promoting Christianity amongst the infidels, and of winning whole nations to the bosom of the church; monarchs expected victory and increase of dominion; and their subjects were easily persuaded to engage in the glorious cause! Yet army after army was destroyed; and though some brilliant victories served to exhibit the soldiers of Christendom as heroes of a valorous age, and the holy city of Jerusalem was more than once under their dominion, the Christian empire on the continent of Asia was eventually overthrown, and the dominion of the Mamelukes and Sultans established. But by means of these joint enterprises, the European nations became more connected with each other; feudal tyranny was weakened; a commercial intercourse took place throughout Europe, which greatly augmented the wealth of the cities; the human mind expanded; and a number of arts and sciences, till then unknown by the western nations, were introduced. These advantages were accompanied, undoubtedly, by great evils. There have been six crusades. The first, in 1096, was excited by Peter the hermit, and encouraged by Urban II. It was commanded by Godfrey of Boulogne, and Jerusalem was taken. In the second, which took place in 1142, Conrad III. of Germany, and Louis VII. of France, were leaders, but were unsuccessful. The third, in 1189, was occasioned by the Saracens taking Jerusalem: Frederick II. of Germany, Philip Augustus of France, and Richard Cœur de Lion of England were leaders: the only successful exploit was the taking of Acre. The fourth was conducted by Andrew, king of Hungary, in 1217. The fifth, by Frederick II. of Germany, who for a short time recovered possession of Jerusalem. The sixth was led by St. Louis, king of France, against Egypt, but was unsuccessful.—The wars carried on against the *Albigenses* and others who dissented from the Roman Catholic church, have sometimes been called crusades.

CRUSTA'CEA or **CRUSTA'CEANS** (*crusta*, a shell: *Lat.*), an extensive class of the sub-kingdom *Articulata*, including the crab, lobster, and prawn. The class takes its name from the crust in which the animals are encased; an integument strengthened with carbonate of lime. The body is divided into several segments, to some of which articulated limbs are attached. There are three principal divisions of the body, head, thorax, and abdomen. The thorax is covered by a large shield called the carapace. The abdomen is sometimes small, and soldered to the under side of the thorax; at others it is elongated, and an important agent of locomotion, as in the lobster, when it is furnished with swimming plates at the end. There are usually two pairs of antennæ, one pair being considered by some naturalists the organs of hearing, the other of smell. The great majority of crustaceans are aquatic, some living in freshwater, but the greatest number in the sea, and their blood is aerated by means of gills. All the species lay eggs, which the female usually carries about with her until the time for hatching arrives. They periodically cast their cases as they grow in size, a new case having been prepared beneath the old one, and this is at first a mere soft skin, but it soon becomes as hard as the preceding integument. The forms of these animals are very curiously varied, now one and now another part being transformed or suppressed. They consequently afford very interesting studies to those naturalists who are fond of tracing morphological changes.

CRY'OLITE (*cruos*, frost; *lithos*, a stone: *Gr.*), in Mineralogy, is a substance of a white or yellowish grey colour, occurring in masses of a foliated structure. It is a double fluoride of aluminum and sodium, and there are large deposits of it in Greenland. It is employed as a raw material in the manufacture of aluminate of soda, which is available instead of caustic soda in the saponification of fatty matters. Other useful chemical products are also obtained from the mineral.

CRYOPH'ORUS (*kruos*, frost; and *phero*, I bear: *Gr.*), an instrument invented by Dr. Wollaston for freezing water by its own evaporation.

CRYPT (*kruptê*, a vault—literally a secret place: *Gr.*), a subterranean chapel or oratory, or a vault under a church for the interment of bodies.

CRYPTOG'RAPHY (*krupto*, I conceal; and *graphê*, a writing: *Gr.*), the art of writing in cipher, or secret characters.

CRYPTOL'OGY (*krupto*, I conceal; and *logos*, a discourse: *Gr.*), secret or enigmatical language.

CRYS'TAL (*krustallos*: *Gr.*), in Chemistry and Mineralogy, an inorganic body, which has assumed the form of a regular solid, terminated by a certain number of plane and smooth surfaces. Crystals may be formed in various ways. Some are formed by the evaporation of a fluid holding crystalline substances in solution; or by the passage of a body from the fluid to the solid state, as in the case of most metals; or they may be deposited by the vapour of a volatilized body.——CRYSTAL GLASS, a substance more perfect in its manufacture than common glass. It is frequently cut; and vases, lustres, and other ornaments are made of it.——ICELAND CRYSTAL, a variety of calcareous spar, or crystallized carbonate of lime, brought from Iceland, which is remarkable for its *double refraction.*

CRYS'TALLINE (*krustallinos*, from last: *Gr.*), transparent and pure, resembling crystal.——CRYSTALLINE HEAVENS, in ancient Astronomy, two spheres imagined between the primum mobile and the firmament in the Ptolemaic system.——CRYSTALLINE HUMOUR (of the eye), a colourless transparent, firm substance, adapted like a glass lens, to converge rays of light; it is situated behind the iris, in the vitreous humour of the eye.

CRYS'TALLITE (*krustallos*, a crystal; and *lithos*, a stone: *Gr.*), in Mineralogy, a name given to whinstone, cooled slowly after fusion.

CRYSTALLIZA'TION (*krustallos*, a crystal: *Gr.*), the act or process of forming crystals.

CRYSTALLOG'RAPHY (*krustallos*, a crystal; and *grapho*, I write: *Gr.*), that branch of science which treats of the forms of crystals. The forms assumed by crystallized bodies are very numerous. Of the single substance carbonate of lime some hundreds of forms of crystals have been described and drawn, some of them having more than a hundred facets. A great number of forms, however, are derived from one principal type, and this is one of the polyhedra of geometry, either the cube, the tetrahedron, or the regular octahedron. The tetrahedron is a solid with four faces, forming equilateral triangles, and this is the form assumed by copper pyrites and the diamond The cube has six equal square faces; alum and common salt, and fluor spar afford instances of cubic crystals. The regular octahedron is a solid with eight faces forming equilateral triangles which may be considered as two pyramids placed base to base; alum, copper pyrites, and fluor-spar, exhibit this form. The rhombic dodecahedron is a solid with twelve rhombic faces. It may be regarded as two right hexahedral pyramids. Galena, protoxide of copper, and fluor-spar afford examples of this form. These forms, with their modifications, compose the cubical system. Another system is founded on the Rhomboid, or Rhombohedron, a solid with its faces forming six lozenges, or rhombic figures, each with two acute and two obtuse angles. Nitrate of soda, carbonate of lime, and many other minerals, have crystals of this form. The modifications are infinite, the form passing into the regular hexagon with six sides and six edges, the hexagonal prism with rhombohedral ends, the hexagonal prism with six-sided pyramids at the ends, &c. A third type of crystallization is the right prism with square bases, a solid of equal thickness at the two ends, which are parallel and alike, the four other sides being equal parallelograms. Sulphate of magnesia and sulphate of zinc offer examples of this form, which also is susceptible of numerous modifications, e.g. the end edges may be cut away, but still leaving a square median base (Apophyllite, Mesotype); or a regular octagonal right prism with square bases (Ido crase); or a double octahedral pyramid (oxide of tin), &c. A fourth system is that of the right rectangular prism, a solid with square bases, which are larger than the other sides, and every face parallel and equal to the opposite one. Of this form, Cryolite, Peridote, and Stilbite afford instances. There are, again, a large number of modifications. The fifth type is the right prism, with oblique-angled parallelograms for the bases; Sulphate of Lime, Borate of Soda, and White Felspar affording instances. Without stopping to notice the numerous secondary forms, we pass to the sixth type, an oblique prism with rectangular bases. There are certain irregular forms of crystals which must be briefly noticed. Sometimes, instead of all the angles of a regular solid being truncated, as would be the case in arriving at a regular secondary form, only some are truncated, and these give what are called hemiforms, or defective crystals. Again, two individual crystals are sometimes so united that one is turned a half-revolution with reference to the other. These are termed hemi-trope, or twin crystals. There is another class of crystals named pseudo-morphous, which have been formed by one body filling up a mould made by another belonging to a different type. To measure the angles of crystals, an instrument called a Goniometer is made use of. Crystallography cannot be studied without having models of the principal forms of crystals, and without some knowledge of geometry.

CTENOID (*ktenoeides*, comb-like : *Gr.*), in Ichthyology, a term applied to those fish-scales which are composed of horny or unenamelled bony material with spines at the exposed edge; such as those of the sole, red mullet, and perch.

CU'BATURE (*kubos*, a cube: *Gr.*), in Geometry, the finding exactly the solid or cubic contents of a body.

CUBE (same *deriv.*), in Geometry, a regular solid body, consisting of six square and equal sides, and containing equal angles. The solidity of any cube is found by multiplying the superficial area of one of the sides by the height, or multiplying together three factors, each equal to the common dimension. Thus, the solid contents of a cube, any one of whose surfaces is three feet long, will be 3×3×3, or 27 cubic feet. The product of two of the factors is the *area* of one of its sides. The cube is one of the five regular or Platonic bodies, which, being placed beside each other, fill up the space about a point.——CUBIC NUMBER, in Arithmetic, that which is produced by the multiplication of a square number by its root: thus, 64 is a cube number, and arises by multiplying 16, the square of 4, by the root 4.——CUBE ROOT, the common factor of a cube number: thus, 3 is the cube root of 27.——DOUBLE CUBE; this consists of two cubes placed side by side. Large halls are sometimes built of this shape.

CU'BEBS, the fruit of various species of *Cubeba*, plants belonging to the order of peppers. It is employed in medicine, its virtues depending upon a principle called cubebine, analogous to piperine.

CU'BIC or **CU'BICAL** (*kubikos*, from *kubos*, a cube: *Gr.*), having the form of a cube, or that may be contained within a cube. Thus, a *cubic* foot of water is the water that may be contained within six equal surfaces, each a foot square.

CU'BIT (*cubitus: Lat.*), an ancient measure, equal to the length of a man's arm from the elbow to the tip of the middle finger. Among different nations the length of the cubit differed. The English was 18 inches, the Roman rather less, and the cubit of the Scriptures is supposed to have been 22 inches.

CUBITÆ'US (same *deriv.*), in Anatomy, an epithet for two muscles of the wrist, one of which, called the *externus*, serves to extend the wrist; and the other, the *internus*, to bend it.

CU'BITUS (the elbow : *Lat.*), in Anatomy, the fore arm, reaching from the elbow to the wrist. It is composed of two bones, called *ulna* and *radius*, united by ligaments. The situation of the ulna is interior, its length is greater than that of the radius, and it has a capability of both flexion and extension. The epithet *cubital* is used; as, the *cubital* nerve, artery, or muscle.

CUCK'OO-SPITTLE, a white froth or spume, very common on many plants in the spring, which forms the nidus of the young of the *Aphrophora spumaria*; an insect belonging to the *Cercopidæ* (a family of the homopterous order), and popularly called the Frog-hopper.

CU'CULUS (*Lat.*), in Ornithology, a genus of birds, including our common cuckoo (*Cuculus canorus*), placed in the order of *Scansores*, or climbers. Our cuckoo lays its eggs in the nests of other birds, chiefly in those of the hedge-sparrow, from which the young cuckoos turn out the young sparrows. The cuckoo arrives in Britain about the middle of April, and departs in the first week of July. To this shortness of the period of residence, joined with the numerous progeny which nature has destined it to yield, ornithologists attribute the motive for this singular arrangement in the economy of nature; for by means of it, cuckoo's eggs are laid in an abundance that could not be effected if the bird were to sit herself.

CU'CUMBER (*cucumis: Lat.*). [See CUCURBITACEÆ.]

CUCUR'BIT (*cucurbita*, a gourd : *Lat.*), a chemical vessel shaped somewhat like a gourd. It is used in distillation, and, with its head and cover, constitutes the alembic.

CUCURBITA'CEÆ, a natural order of herbaceous plants, chiefly natives of hot climates, which have unisexual flowers and a climbing habit. An acrid, bitter, purgative principle, abounds in many plants of this order. The only member of it found in Britain is the Wild Bryony (*Bryonia dioica*) of our hedges, which contains a poisonous principle called Bryonine. To this order belong the cucumbers, melons, common gourds and bottle gourds, the bitter apple (*Citrullus*), which yields colocynth, the vegetable marrow, and the chou-chou (*Sechium*), which, in warm countries, bears a fruit that is cooked for the table.

CUD, the food which ruminating animals chew over again; from whence, *to chew the cud* signifies to ponder, think, or ruminate upon a thing.

CUD'DY, in large ships, a place lying between the captain's cabin and the quarter-deck under the poop. It is divided into partitions for the master and other officers. Also, a sort of cabin or cook-room, in the fore-part or near the stern of a lighter or barge of burden.

CUE (*queue*, a tail : *Fr.*), the last words of a speech, which a player, who is to answer, catches and regards as an intimation to begin. Also, a hint given to him of what and when he is to speak.

CUI BONO? A Latin phrase frequently quoted, and usually misapplied. The Roman lawyer Crassus put the question when several persons were suspected of having committed a crime. He asked, 'To whom was it a gain?' since he who would derive a benefit from its commission was more likely to be the guilty person than he who would derive no benefit. He did not ask *what good* has come of the act (as seems to be generally thought from the use made of the quotation at the present time), for, first, the Latin words will not bear such a construction, and, second, Crassus assumed that good had been done to some one, and the enquiry naturally arose, *cui?* to whom?

CUIRASS' (*cuirasse*, from *cuir*, leather: *Fr.*), a piece of defensive armour, made of iron plate, well hardened, and covering the body from the neck to the girdle.——CUIRASSIERS, heavy cavalry armed with a cuirass. In former times cuirasses were very common, but appear to have been disused in England about the reign of Charles II. Napoleon again introduced them; and they have been revived among the European cavalry.

CUL'DEES, in Church History, a religious order, whose origin is attributed to St. Columba, an Irish monk of the 6th century. Being remarkable for the religious exercises of preaching and praying, they were called, by way of eminence, *Cultores Dei*, corrupted to *Culdees*.

CUL DE LAMP, in Architecture, a term used for several decorations in vaults and ceilings.

CU'LEX (a gnat: *Lat.*), in Entomology, a genus of dipterous insects, including the common gnat, *C. ciliaris*.

CULM (*culmus*, a stalk: *Lat.*), in Botany, the stalk or stem of corn or grasses, usually jointed and hollow.—— Also, a provincial term for *anthracite* in various forms.

CULMIF'EROUS (*culmus*, a stalk; and *fero*, I bear: *Lat.*), in Botany, an epithet for such plants as have a smooth jointed stalk, usually hollow, and at each joint wrapped about with single, narrow, sharp-pointed leaves, and seeds contained in chaffy husks; as wheat, rye, barley, &c.

CULMINA'TION (*culmen*, the top of anything: *Lat.*), in Astronomy, the passing of any heavenly body over the meridian, or its greatest altitude for the day. Hence *culmination* is used, metaphorically, for the condition of any person arrived at the most brilliant or important point of his career.

CUL'PRIT (*culpa*, a fault: *Lat.*), in Law, a word applied in court to one who is indicted for a criminal offence.

CUL'VERIN (*coulevrine: Fr.*), a long slender piece of ordnance, serving to carry an 18 lb. ball to a great distance. It was formerly called a hawk.

CUL'VERTAILED (*culvre*, a pigeon: *Sax.*), in Shipbuilding, the fastening one timber into another by a dovetailed joint.

CUM'MIN-SEED (*cuminum: Lat.;* from *kuminon: Gr.*), a long slender seed, of a rough texture, unctuous when bruised, of a strong smell and a pungent taste. It forms an ingredient in curry powder, and is employed in veterinary practice. It is produced by an umbelliferous plant the *Cuminum cyminum* of botanists. Some of the Roman poets allude to its power of producing paleness and languor.

CU'MULUS (a heap: *Lat.*), a large cloud, flat at the base, and rounded in its upper parts.——CIRRO-CUMULUS, small well-defined masses of rounded cloud closely packed with a horizontal arrangement.——CUMULO-STRATUS, a blending of the cirro-stratus with the cumulus.——CUMULO-CIRRO-STRATUS, the raincloud, or *Nimbus*, a horizontal sheet, with the cirrus above, and the cumulus entering it laterally and from below.

CUNE'IFORM (*cuneus*, a wedge; and *forma*, form: *Lat.*), an appellation given to whatever resembles a wedge; as, in Botany, a *cuneiform* leaf. CUNEIFORM LETTERS, those found on old Babylonian and Persian monuments. They are sometimes called arrow-headed characters, and are the simplest and most ancient letters of which we have any knowledge. Specimens of this form of writing are to be seen in the British Museum, on the ancient sculptures of Assyria.

CU'NEUS (*Lat.*), the wedge, in Mechanics.——CUNEUS, in Antiquity, a company of infantry, drawn up in the form of a wedge, the better to break through the enemy's ranks. Also, the seats and benches on which the spectators sat in a theatre, which were narrow next the stage and broad behind.

CUP'BEARER, an officer of the king's household, who was formerly an attendant at a feast.

CU'PEL (because of the shape of a *cup*), a shallow chemical vessel, made generally of bone ash, in which assay-masters try precious metals. When these are changed by fire into a fluid, it absorbs their scoria, the dross formed by the oxidation of their baser constituents.

CU'POLA (*Ital.*), or DOME, in Architecture, a roof or vault, rising in a circular form. [See DOME.]

CUP'PING, in Surgery, the operation of using the *cupping-glass*, a small cup-shaped glass, whence the name. Being applied to some part of the body, the air within it is rarefied; which causes the flesh to protrude into it, on account of the external pressure. On removing the glass, a circular red mark is left, from the propulsion of the blood into the small vessels. This is termed *dry cupping*. It is, however, generally accompanied by a number of incisions produced by an instrument called a *scarificator*. A large quantity of blood may be drawn, by again applying the cupping-glass. When skilfully performed, it is neither a painful nor a dangerous operation.

CU'PREOUS: (*cupreus: Lat.*), resembling copper, or partaking of its qualities.

CUPRES'SUS (the cypress: *Lat.*), in Botany, a genus of coniferous trees, comprehending the various species of CYPRESS, which see.

CUPRIF'EROUS (*cuprum*, copper; and *fero*, I bear: *Lat.*), producing or affording copper; as *cupriferous* silver.

CU'RATE (*curo*, I take care of: *Lat.*), an officiating, but unbeneficed clergyman, who performs the duty of a church, and receives a salary from the incumbent of the living, &c.

CURA'TOR (*Lat.*), in Civil Law, a person regularly appointed to manage the affairs of minors, or persons mad, deaf, dumb, &c. There are also curators for the estate of debtors, and of persons dying without heirs. In learned institutions, the curator takes charge of libraries, collections of natural history, &c.——Among the Romans the title was given to various officers, who were superintendents of different departments of the public service.

CURCULION'IDÆ (*curculio*, a weevil: *Lat.*), in Entomology, a large family of coleopterous insects, including the destructive weevils.

CURCU'MA (*curcum: Arab.*), in Botany, a genus of herbaceous plants, nat. ord., *Zingiberaceæ*, including *Curcuma longa*, the Turmeric plant, and *C. angustifolia*, the East India or arrow root.

CUR'FEW (*couvrir*, to cover: and *feu*, fire: *Fr.*), a law introduced from Normandy into England by William the Conqueror. It ordained that all fire and lights should be extinguished on the ringing of a bell, at eight o'clock, or some other fixed hour of the evening.

CU'RIA (*Lat.*), in Roman Antiquity, a certain division or portion of a tribe. It was the current tradition that Romulus divided the people into thirty *curiæ*, or wards, ten in a tribe; that each might perform the ceremonies of the feast and sacrifices in the temple, or holy place, appointed for the purpose. The priest of the curia was called *curio*. The tribe resembled a Scottish clan, in which the bond of union is supposed to be common blood, though there is no consanguinity between many of the component families.——CURIA, in Law signifies generally a court.

CUR'LEW (*corlieu: Fr.*), a grallatorial bird, which belongs to the *Scolopacidæ*, or snipe family. It lives near waters and marshes, and feeds on worms; and is found in most parts of Europe. The English curlew goes to the sea-side in autumn and winter, and subsists there on marine insects, small crabs, &c.

CUR'RANT (from *Corinth*, in Greece: now *Coranto*), the fruit of well-known shrubs belonging to the genus *Ribes*, nat. ord. *Grossulariaceæ*.——Also, a small kind of dried grape, imported from the Levant.

CUR'RENCY (*curro*, I run: *Lat.*), in Commerce, the coin and bank-notes or other paper-money issued by authority, and which are continually passing current.

CUR'RYING (*corroyer*, to curry: *Fr.*; from *corium*, a skin: *Lat.*), the art of dressing skins after they are tanned, for the purposes of the shoemaker, coach and harness maker, &c., by giving them the necessary smoothness, lustre, colour, and softness. The person working at or carrying on this business is called a *currier*.

CUR'SITOR (*cursito*, I run to and fro: *Lat.*), a clerk belonging to the court of chancery whose business is to make out original writs.

CUR'TAIN (*cortina: Ital.*), in a general sense, a cloth hanging round a bed, or at a window, &c., which may be contracted, spread, or drawn aside at pleasure. Also, a cloth hanging used in theatres, to conceal the stage from the spectators.——CURTAIN, in Fortification, that part of the rampart which is between the flanks of two bastions. It is bordered with a parapet, behind which the soldiers stand to fire on the covered way and into the moat.

CURTA'TION (*curto*, I shorten: *Lat.*), in Astronomy, the interval between a planet's distance from the sun and the curtate distance. The *curtate distance* is the distance of a planet from the sun, reduced to the plane of the ecliptic.

CU'RULE CHAIR (*curulis*, belonging to a chariot: from *currus*, a chariot: *Lat.*), in Roman Antiquity, a chair or stool, adorned with ivory, in which the chief magistrates of Rome had a right to sit. The curule magistrates were the consuls, prætors, curule ædiles, and censors. After the fall of the republic it was assigned to the emperors, and to their statues, in their absence. This chair was often placed in a kind of chariot, whence it had its name.

CUR'VATURE (*curvatura*, a bending: *Lat.*), the peculiar bending or flexure of a line, by which it becomes a curve having certain properties.

CUR'VET (*courbette*, from *courber*, to bend: *Fr.*), in Horsemanship, a particular leap of a horse, when he raises both his fore-legs at once, and, as his fore-legs are falling, both his hind-legs, so that all his feet are off the ground at once.

CUSP (*cuspis*, the point of a spear: *Lat.*), in Astronomy, a term for the horns of the moon.——In Geometry, the point or corner formed by the meeting and termination of two parts of a curve.

CUS'PIDATE or CUS'PIDATED (same *deriv.*), a term in Botany for a leaf, &c., having a sharp end, like the point of a spear.

CUS'TARD-APPLE, the fruit of some species of *Annona*, growing in the West Indies. It is of the size of a tennis-ball, of a green colour, and contains a delicious white pulp of the consistence of custard. One species has the name of sweet sop, another of sour sop.

CUS'TOMARY FREE'HOLD (same *deriv.*), in Law, a superior kind of *copyhold*; the tenant holding, as it is expressed, by copy of court-roll, or roll telling the lands, &c., under the jurisdiction of the manor, &c., by the custom of the manor, but not at the will of the lord.

CUS'TOMS (same *deriv.*), in Political Economy, the duties, toll, tribute, or tariff, payable to the state upon merchandise exported and imported.

CUS'TOS ROTULO'RUM (keeper of the rolls: *Lat.*), the keeper of the rolls and records of a county. He is usually a nobleman, and always a justice of the peace, of the quorum, in the county where he is appointed.——CUSTOS BREVIUM (keeper of the briefs: *Lat.*), the principal clerk belonging to the Common Pleas.——CUSTOS OCULI (keeper of the eye: *Lat.*), in Surgery, an instrument for preserving the eye in some operations.

CUTA'NEOUS (*cutis*, the skin: *Lat.*), an epithet for whatever belongs to or affects the skin: as, a *cutaneous* eruption, &c.

CU'TICLE (*cuticula*, the external skin, a *dim.* of *cutis*, the skin : *Lat.*), in Anatomy, the scarf-skin, a thin membrane closely lying upon the skin or *cutis*, to which it adheres very firmly.

CU'TIS (*Lat.*), in Anatomy, the *derma*, or inner skin, which lies under the cuticle; it is full of pores, nerves, fibres, lymphatic ducts, &c., and is called the *cutis vera*, or true skin, in distinction from the cuticle.

CUT'LAS (*coutelas*, from *couteau*, a knife : *Fr.*), a broad cutting sword, used by seamen in boarding, &c.

CUT'LERY (*coutellerie*, from *couteau*, a knife : *Fr.*), a term applied to all cutting instruments made of steel. Although, in a general sense, it comprises all those articles denominated edge-tools, it is more particularly confined to the manufacture of knives, scissors, razors, surgical instruments, and swords. Those articles which require the edge to possess great tenacity, at the same time that superior hardness is not required, are made from shear steel. The finer kinds of cutlery are made from steel which has been in a state of fusion, and which is termed cast steel, no other being susceptible of a fine polish and very keen edge. Razors are made of cast steel, the edge of a razor requiring the combined advantages of great hardness and tenacity. After the razor blade is formed, it is hardened by gradually raising it to a bright red heat, and plunging it into cold water. It is tempered by heating it afterwards till a brightened part appears of a straw colour. The manufacture of penknives is divided into three departments: — the first is the forging of the blades, the spring, and the iron scales; the second, the grinding and polishing of the blades; and the third, the handling, which consists in fitting up all the parts, and finishing the knife. The blades are made of the best cast steel, and hardened and tempered to about the same degree with that of razors. But the beauty and elegance of polished steel is displayed to great advantage in the manufacture of the finer kinds of scissors. Damascus was anciently famed for its razors, sabres, and swords — the latter especially, which possessed all the advantages of flexibility, elasticity, and hardness: while they presented a beautiful wavy appearance called the water. It is not known how this effect is produced; but it is well imitated in Europe by scooping hollows in the blade and filling them up; also by welding together a bundle of steel bars, cutting and rewelding them, &c. Various other cities and countries have also been famous at different periods for the manufacture of good cutlery: as Sheffield is at the present time, for admirable penknives and surgical instruments.

CUT'TER, a boat attached to a vessel of war, which is rowed with six oars, and is employed in carrying light stores, passengers, &c. Also, a vessel with one mast and a straight running bowsprit, which may be drawn in upon deck. The distinction between a cutter and any other vessel with one mast is, that, in the cutter, the jib has no stay to support it.

CUT'TLE-FISHES (*cutele : Ang. Sax.*), the popular name for certain molluscous animals belonging to the class *Cephalopoda*. There are two sections: 1. Those with eight arms, including the OCTOPUS or Poulpe; 2. those with ten arms, two of which are elongated, including the CALAMARIES or Squids, and the SEPIAS.

CUT'-WATER, the fore part of a ship's prow, which cuts the water.

CY'ANITE (*kuanos*, blue : *Gr.*), in Mineralogy, a ponderous crystallized stone, of a blue or greenish-grey colour. It is a silicate of alumina, with a trace of oxide of iron.

CYAN'OGEN (*kuanos*, blue ; and *gennao*, I produce : *Gr.*), in Chemistry, a bicarburet of nitrogen, a highly poisonous and irrespirable gas. Combined with hydrogen, it forms hydrocyanic or *prussic acid;* and, with the metals, &c., *cyanides*. Prussian blue is a combination of cyanogen and iron.

CYATH'IFORM (*cyathus*, a cup; and *forma*, a form : *Lat.*), in the form of a cup or drinking-glass, a little widened at the top.

CY'ATHUS (*Lat.; from kuathos: Gr.*), in Roman Antiquity, a liquid measure, containing one-twelfth of a *sextarius*, the latter being about equal to our pint.——Also, a cup which the Romans used to fill and drink from as many times as there were letters in the name of their patron or mistress.

CYC'LAMEN (*kuklaminos : Gr.*), in Botany, a genus of plants, nat. ord. *Primulaceæ*. The species have tuberous roots, which in Sicily are said to be eaten by the swine, whence the common name Sow bread. One species is wild in England, *C. europæum.*

CY'CLE (*kuklos*, a circle : *Gr.*), in Chronology, a certain period or series of numbers, which regularly proceed from the first to the last, and then return again to the first, and so circulate perpetually.——CYCLE OF THE SUN, or *solar cycle*, a period of 28 years, in which the same days of the week recur on the same days of the year, and the Sunday or Dominical letter recurs in the same order.——CYCLE OF THE MOON, or *lunar cycle*, a period of 19 years, in which the new and full moon recur on the same days of the month.——CYCLE OF INDICTION, a period of 15 years, in use among the Romans, commencing from the third year before Christ. This cycle has no connection with the celestial motions. It was said to have been instituted by Constantine: but it was used long before that emperor.

CY'CLOGRAPH (*kuklos*, a circle; and *grapho*, I write: *Gr.*), an instrument used for describing the arcs of circles.

CY'CLOID, or TROCHOID (*kuklos*, a circle, or *trochos*, a wheel; and *eidos*, form : *Gr.*), a geometrical curve, generated by a point in the circumference of a circle rolled along a line.——CYCLOIDAL, the space contained between the curve or crooked line and the subtense of the figure.——CYCLOID, a term applied to those fish scales which are composed of concentric layers of horny or bony material, not covered with enamel, and without a spinous edge, such as the scales of the salmon and trout.

CYCLOM'ETRY (*kuklos*, a circle : and

metreo, I measure: *Gr.*), a term sometimes used for the mensuration of circles.

CY'CLONE (*kuklos*, a circle: *Gr.*). This is a storm of great violence and enormous proportions, in which the atmosphere is driven with extraordinary velocity round a central point, which is more or less calm. This point does not, however, remain stationary, but moves onward in obedience to circumstances. The breadth of the wind's path is sometimes 1000 miles. Such storms frequently occur within the tropics (where they are known as typhoons), at the change of the monsoons in August, September, and October, when the NE. trade-wind suddenly veers round, and becomes the SW. monsoon. In the southern hemisphere, the direction of the wind in these storms is like that of the hands of a clock: in the northern hemisphere it moves in the opposite direction. A navigator, overtaken by a cyclone, ought to avail himself of the wind, to avoid the centre, the point of greatest danger, and make towards the edge.

CYCLOPÆ'DIA, or more correctly ENCYCLOPÆ'DIA (*en*, in; *kuklos*, a circle; and *paideia*, instruction: *Gr.*), the circle or compass of the arts and sciences; a common title for a book like the present work.

CYCLOP'IC (*kuklopikos*, relating to *Cyclops*: *Gr.*), savage and gigantic; pertaining to those monsters in fabulous history, who are represented as having assisted Vulcan in forging the thunderbolts of Jove.

CYG'NUS (*Lat.*; from *kuknos*: *Gr.*), in Ornithology, the *Swan*, a well-known water fowl.——CYGNUS, in Astronomy, a constellation of the northern hemisphere. It is in the milky way, and is shaped like a large cross. The principal star is of the second magnitude.

CYL'INDER (*kulindros*, from *kulindo*, I roll: *Gr.*), in Geometry, a solid body, supposed to be generated by the rotation of a parallelogram round one of its sides. This will produce a solid, shaped like a column with parallel sides. If a line from the centre of the upper surface, let fall perpendicularly on the lower, touches the centre of the latter, it is a *right* cylinder; otherwise it is *oblique*. The solid contents of a cylinder, whether right or oblique, is found by multiplying the area of the base by its altitude, and its convex surface is found by multiplying the circumference by the height. The area of the internal diameter of a cylinder, multiplied by its depth, will give the cubical capacity. The solidities of a cone, of a sphere, and of a cylinder formed by the revolution of a square on a line passing through and bisecting it—the circumferences of the bases of the cone and cylinder and the great circle of the sphere being equal—are as 1, 2, and 3. This ratio was first discovered by Archimedes.——CYLINDER, in Gunnery, the whole hollow length of a great gun; the *bore*.

CYLIN'DROID (*kulindros*, a cylinder; and *eidos*, form: *Gr.*), a solid body, approaching to the figure of a cylinder, but differing in some respects, as having the bases elliptical, but parallel and equal.

CY'MA, or CYMA'TIUM (*kuma*, a wave; *kumation*, a small wave: *Gr.*), in Architecture, a member or moulding of the cornice, the profile of which is waving, that is, concave at one part and convex at the other. When the concave part of the moulding projects beyond the convex part, the *cymatium* is denominated a *cyma recta*; but when the convex part forms the greatest projection, it is a *cyma reversa*.

CYM'BAL (*kumbalon*, from *kumbos*, a hollow vessel: *Gr.*), a musical instrument used by the ancients, hollow, and made of brass, supposed to be somewhat like a kettle-drum. The modern *cymbals* used in military bands consist of two concave metal plates, which being held one in each hand are struck together.

CYME (*cyma*: *Lat.*; from *kuma*: *Gr.*), a sprout, a species of inflorescence, in which the flowering stems divide in pairs with a flower springing from the fork.

CYNAN'CHE (*kunanchē*, a bad sore throat; literally, *dog-throttling*: from *kuōn*, a dog; and *ancho*, I strangle: *Gr.*), among Physicians, an inflammation of the larynx It is of several kinds, and comprehends the quinsy, croup, and malignant sore throat.

CYN'IC (*kunikos*, dog-like: *Gr.*), a man of a surly or snarling temper: a misanthrope. —— CYNICS, a sect of ancient philosophers who prided themselves upon their contempt of riches and state, arts, sciences, and amusements. The two most celebrated men of this sect were Antisthenes and Diogenes.

CYN'IPS, in Entomology, a genus of hymenopterous insects, which puncture with their ovipositor the surface of leaves, &c., and deposit with the egg a drop of irritating fluid which produces the different kinds of gall-nuts. The most beautiful gall-nut is the production of the *Cynips Folii-quercûs*, which, piercing the terminal bud of the tree, deposits its egg in the interior, and the juice of the tree exuding and drying round it in concentric portions, converts it from a healthy bud into a fine dark green gall, leafed like a rose-bud beginning to blow, about an inch in diameter, and held to the branch by a pedicle. When the insect is fully formed, it eats through the nut and flies off. The common gall-nut is produced by the *Cynips tinctoria*, upon the *Quercus infectoria*, an oak growing in the Levant. A very curious thing about this genus is, that the male has never yet been discovered, although innumerable nests of gall-flies have been examined.

CYNODON'TES (*kunodon*: from *kuōn*, a dog; and *odous*, a tooth: *Gr.*), in Anatomy, dog-teeth, of which there are two in each jaw, one on each side betwixt the fore-teeth and the grinders.

CYNOREX'IA (*kuōn*, a dog; and *orexis*, an appetite: *Gr.*), in Medicine, a canine appetite.

CYN'OSURE (*kuonosoura*: from *kuōn*, a dog; and *oura*, a tail: *Gr.*), in Astronomy, a name given to *Ursa minor*, or the Lesser Bear, a constellation by which the ancient Phœnicians were guided in their voyages; and hence an object attentively observed, whence the application of the word in our time, 'The cynosure of modern eyes.'——In Greek Mythology, *Cynosura* was the nurse of the infant Jupiter, on Mount Ida in Crete, and was afterwards changed by him into a constellation.

CY'PRESS, the name of several species of coniferous trees, belonging to the genus *Cupressus*. Of the common cypress (*C. sempervirens*) there are two varieties, the horizontal form, and the upright one. The latter is frequently planted in cemeteries in the south of Europe. The *C. lusitanica*, or Cedar of Goa, is an elegant tree, which has been brought from India to Europe. The *C. funebris*, or weeping cypress of the Chinese, is said to be the original of the tree that figures on 'willow pattern' china.

CYPRIN'IDÆ (*kuprinos*, the carp: *Gr.*), in Ichthyology, a family of malacopterous abdominal fishes, with small mouths and no teeth in the jaws, living in fresh water. In England we have several species. The carps and gold fish are placed in the genus *Cyprinus;* the carp, bream, and the white bream in the genus *Abramis;* the roach, dace, chub, rudd, and minnow, in the genus *Leuciscus;* and the barbel, gudgeon, tench, and loach, in the genera *Barbus*, *Gobio*, *Tinca*, and *Cobitis*, respectively.

CYRENA'ICS, a sect of ancient philosophers, so called from their founder Aristippus of Cyrene, a disciple of Socrates. The great principle of their doctrine was, that the supreme good of man in this life is pleasure.

CYST (*kūstis*, a bladder: *Gr.*), a bag which contains morbid matter in animal bodies. ——CYSTIC OXIDE, a peculiar substance supposed to be generated in the kidneys.

CYS'TIDES (same *deriv.*), in Medicine, encysted tumours, or such as have their substance included in a membrane.

CYSTI'TIS (same *deriv.*), in Medicine, inflammation of the bladder.

CYS'TOCELE (*kūstis*, a bladder; and *kēlē*, a hernia: *Gr.*), in Surgery, a hernia or rupture formed by the protrusion of the bladder.

CYSTOT'OMY (*kūstis*, a bladder; and *temno*, I cut: *Gr.*), the practice of opening encysted tumours for the discharge of morbid matter.

CYT'ISUS (*kutisos: Gr.*), a genus of leguminous trees and shrubs, with pea-like flowers, chiefly natives of the south of Europe. Our common laburnum is one of the species.

CYT'OBLASTEMA (*kūstis*, a bladder; and *blastema*, a sprout: *Gr.*), in Physiology, a liquid or semi-fluid substance, consisting of proteine, fatty matter, and salts, found inside cells, or without them. It is also called blastema or protoplasm, and it is supposed to be the formative matter of cells.

CZAR (*Cæsar*), the title assumed by the emperors of Russia. The first that bore the title of czar of Moscow was Ivan II. in 1579. The eldest son of the czar was called *Czarovicz*, or as we usually spell it, *Cesarewitch;* but this appellation was discontinued after the murder of Alexis, the son of Peter I., until revived by Paul I. in 1799, in favour of Constantine, his second son. The consort of the czar is termed *Czarina*.

D

D, the fourth letter in the Hebrew alphabet, and in those derived from it. It is a palato-dental having a kind of middle sound between the *t* and *th;* its sound being formed by a stronger impulse of the tongue against the upper part of the mouth, than is necessary in the pronunciation of the *t*. D, as a numeral, denotes 500; but it is more correct to write IO. As an abbreviation, it stands for *Doctor:* M.D. *Medicinæ Doctor*, Doctor of Medicine. And for *Divinitatis:* D.D. *Divinitatis Doctor*, Doctor of Divinity. For *Domini:* A.D. *Anno Domini*, in the year of our Lord. For *Dei: Dei gratiâ*, by the grace of God. For *Defensor:* F.D. *Fidei defensor*, Defender of the faith, &c.——By Roman writers, it is used for *Divus*, *Decius*, *Devotus*, *Diebus*, *Diis*, &c. Thus D.M., in Roman epitaphs, signified *Diis Manubus* (to the infernal gods); but, on other occasions, *Diis Magnis* (to the great gods).——As a sign, it is one of the Dominical or Sunday letters; and in Music, it is the nominal of the second note in the natural diatonic scale of C.

DAB, a small flat fish, the *Platessa limanda* of ichthyologists. Its surface is rougher than that of the flounder or plaice, and it is better than either as food. It is about eight or nine inches long.

DA CA'PO (from the beginning: *Ital.*) in Music, a phrase signifying that the first part of the tune is to be repeated from the beginning. It is also used as a call or acclamation to the musical performer at concerts, &c., to repeat the air or piece which has just been finished.

DACE, a river fish of the family of the *Cyprinidæ*, the *Leuciscus vulgaris* of ichthyologists; it resembles the roach in habits and appearance, but there are only nine in place of twelve rays in the dorsal fin, and the pectoral, ventral, and anal fins are nearly white.

DA'COIT (*dakhee: Hind.*, a robber). Dacoits are high class Rajpoots, originally from Guzerat, who form gangs for the purpose of robbery, but never commit murder. They were found throughout India, but by the exertions of the government their numbers have been greatly reduced.

DACRYGELO'SIS (*dakru*, a tear; and *gelōs*, laughter: *Gr.*), in Medicine, a species of insanity, in which the person laughs and weeps at the same time

DAC'TYL (*daktulos*, literally the finger. *Gr.*—like the finger, the dactyl has, as it were, one long and two short joints), a foot in Latin and Greek poetry, consisting of a long syllable followed by two short ones: as *dŏmĭnŭs, cārmĭnă.* When combined with spondees consisting of two long syllables, it forms the hexameter, a line of six feet.

DACTYL'IC (*daktulikos*, from *daktulos*, a dactyl: *Gr.*), an epithet for verses which end with a dactyle instead of a spondee.

DACTY'LIOMANCY (*daktulios*, a ring; and *manteia*, prophecy: *Gr.*), a kind of divination among the Greeks and Romans, which was performed by suspending a *ring* by a thread over a table, the edge of which was marked with the letters of the alphabet. As the ring, after its vibration ceased, happened to hang over certain letters, these joined together gave the answer.

DACTYLIOTHE'CA (*daktulios*, a ring; and *thēkē*, a repository: *Gr.*), a collection of engraved gems.

DAC'TYLIS (*daktulos*, a finger: *Gr.*, because it has long and slender spikes, like fingers), a genus of grasses, containing *Cocksfoot grass.*

DACTYLOL'OGY, or DACTYLON'OMY (*daktulos*, a finger; and *logos*, a discourse, or *nomos*, a law: *Gr.*), the art of communicating ideas or thoughts by the fingers; or the art of numbering on the fingers.

DAC'TYLOS (literally, a finger: *Gr.*), the shortest measure among the Greeks, being a *finger's breadth*, or about seven-tenths of an inch. It corresponded to the *digitus* of the Romans.

DA'DO (*Ital.*), the die, or that part in the middle of the pedestal of a column between its base and cornice. It is also the name of the lower part of a wall.

DÆMONOMA'NIA (*daimōn*, a demon; and *mania*, madness: *Gr.*), in the medical writings of the ancients, denoted a madness which was supposed to arise from demoniacal influence.

DAF'FODIL, the popular name of some of the species of Narcissus, nat. ord. *Amaryllidaceæ*. It is a corruption of the Greek word *asphodelos.*

DA'GON (*dag*, a fish: *Heb.*), an idol of the Philistines, of the human shape upwards, and resembling a fish downwards, with a finny tail.

DAGUER'REOTYPE (*Daguerre*, the inventor; and *tupos*, a sketch: *Gr.*), the name given to the process discovered by *Daguerre*, by which all images produced by the camera obscura are retained and fixed in a few moments, by the action of light upon metallic surfaces coated with a salt of silver. The ancient alchymists were aware that a substance washed first with a solution of a salt of silver, and then with a solution of common salt, would become black. Paper wetted in this way, and placed in the camera obscura, so as to receive the image on it, will soon exhibit a *negative* picture; that is, one in which the lights and shadows are *reversed.* Many persons, among others, Wedgewood and Sir H. Davy, attempted in vain to arrest the action of the light when the picture was produced; but ultimately its whole surface became black. At length Niepce and Daguerre discovered a means of effecting this, and were munificently rewarded by the French government. They used for the purpose a silvered copper plate, which, after having been rendered extremely clean, was exposed on its silvered side to the vapour of *iodine*, and then placed in the camera obscura. Having been removed from the latter, without the least appearance of change on its surface, it was exposed in a proper apparatus to the vapour of *mercury*, which caused the landscape, &c., to appear. It was then washed with a solution of *hyposulphite of soda*, to remove the undecomposed salt of silver, and therefore to prevent any further action of the light; and was finally washed with pure water, and carefully dried. The application of chloride of gold fixes the picture. [See PHOTOGRAPHY.]

DAH'LIA (from *Dahl*, a Swedish botanist), a genus of plants, belonging to the *Compositæ*. The species are natives of South America, but have become common in our gardens, and are highly ornamental in the autumn, when other flowers are scarce. The flowers by cultivation have been doubled, and made to assume a variety of colours. They are reproduced from the seed, or by the division of the roots. The roots furnish the Mexicans with a wholesome article of food, though the taste is by no means pleasant.

DA'IRY (*dey*, milk: *Old Eng.*), a building appropriated to the purpose of preserving and managing milk, making butter, cheese, &c. Temperature in a dairy is of the first importance; for if too much heat be admitted, the milk will quickly become sour; and if too cold an atmosphere prevails, neither butter nor cheese making can be carried on with any success. Dairy farms, in general, consist chiefly of meadow and pasture, with only a small portion of the land under tillage; but it has of late years been proved that stall-feeding, with green crops, is most important in the management of cows: for in this way they can be kept in milk through the whole winter season.

DA'IS (a canopy: *Fr.*), in Architecture, a raised platform at the end of a dining-hall, where the table for the principal guests stood; also a seat with a canopy over it.

DA'ISY (*dæges eage*, day's eye: *Sax.*), a well-known wild plant, the *Bellis perennis* of botanists, belonging to the *Compositæ*.

DAM'AGE FEAS'ANT (*dommage faisant*, doing mischief: *Fr.*), in Law, is when one person's beasts get into another's ground, without licence from the owner or occupier of the ground, and do damage, by feeding or otherwise, to the grass, corn, wood, &c., in which case the party injured may distrain or impound them; but at his peril if the accident have happened through his neglect. Possession without title empowers a tenant to distrain in such a case; but the cattle cannot be detained if the owner of the estate offer amends.

DAM'AGES (*dommage*, injury: *Fr.*; from *damnum*, a loss: *Lat.*), in Law, the estimated equivalent for an injury sustained; or that which is given or adjudged by a jury to the plaintiff in an action to repair his loss.

DAM'ASK (same *deriv.*), a textile fabric, with a pattern consisting of figures and flowers, originally from Damascus. Though at first it was made only of silk, other materials are now used, as, for example, in damask table-cloths.——**DAMASK-STEEL**, is a fine kind of steel, used in Damascus for sword-blades, so celebrated for their extraordinary temper.

DAMASKEEN'ING (same *deriv.*), the art of engraving on and inlaying iron or steel with gold or silver.

DAME (lady: *Fr.*), formerly a title of honour for a woman, and the title still given in legal documents to the wife of a baronet.

DAM'NIFY (*damnum*, loss; and *facio*, I cause: *Lat.*), in Law, to cause hurt or damage to; as, to *damnify* a man in his goods or estate.

DAM'PERS, in Music, certain parts in the internal construction of the pianoforte, which are covered with soft leather in order to deaden the vibration, and are acted on by a pedal.——Also, iron plates used to regulate the supply of air to steam furnaces, &c.

DAMPS (*dampf*, vapour: *Germ.*), noxious exhalations, frequently found in mines, coal-pits, wells, and other subterraneous places, and which are deleterious or fatal to animal life. These damps are usually carbonic acid gas, vulgarly called *choke-damp*, which instantly suffocates; or some inflammable gas, called *fire-damp*. The fire-damp, which prevails almost exclusively in coal-mines, is a mixture chiefly of light carburetted hydrogen and atmospheric air, which explodes with tremendous violence whenever it comes in contact with flame. The injuries which formerly occurred so frequently, both to the machinery and to the lives of the miners, arising from the fire-damp, are now greatly diminished by the use of Sir H. Davy's *safety-lamp*. It consists of a cylinder of wire gauze, so placed that air cannot pass to or from the flame, except through it, while it transmits sufficient light for the miners. The flame cannot pass out through the gauze, and therefore cannot set the explosive mixture of gases on fire; although the mixed gas can pass into the flame, and thus be consumed without inconvenience or danger. If the workmen were not so infatuated as to remove the gauze for the purpose of lighting their pipes, candles, &c., this admirable contrivance would, it is probable, totally prevent explosion, and the consequent fearful loss of life and destruction of property which occurs from time to time.

DAM'SEL (*damoiselle: Fr.*), a name anciently given to young ladies of noble or genteel extraction. The word is, however, now seldom used, except jocularly or in poetry. *Damoisel*, or *damoiseau*, the masculine of the same word, appears to have been applied to young men of rank; thus we read of *damsel* Pepin, *damsel* Louis le Gros, *damsel* Richard, prince of Wales. From the sons of kings this appellation first passed to those of great lords or barons, and afterwards to those of gentlemen who were not yet knights. Such is the change which language undergoes, that at the present day the word *damsel* is used only, and even rarely, when speaking of young unmarried women. It occurs frequently in the Scriptures and in poetry.

DANCET'TE (*danser*, to dance: *Fr.*), in Heraldry, is when the outline of any bordure or ordinary is very largely indented.

DAN'CING (same *deriv.*), has been practised by all nations, civilized and barbarous; being by some held in esteem, by others in contempt. It has also often been made an act of religion; thus, David danced before the ark, to honour God and express his excess of joy for its return into Sion; and among the pagans it made a part of the worship paid to the gods, it being usual to dance round the altars and statues. According to Scaliger, the early bishops of the Christian church, on account of their leading the dance in solemn festivals, were styled *præsules*, a name given by the ancients to the priests of Mars, because they were the *præsultatores* (chief dancers: *Lat.*), in the sacred rites of that deity; and this practice continued in the church until the 12th century.

DA'NEGELT (*Dänengeld*, Dane's money: *Germ.*), an annual tax formerly laid on the English nation for maintaining forces to oppose the Danes, or to furnish tribute to procure peace with them. It was first imposed as a continual yearly tax upon the whole nation under king Ethelred about 995. It was levied by William I. and II., but was remitted by Henry I., and finally abolished by Stephen on the day of his coronation.

DA'OURITE, a mineral, called also *rubellite*, of a reddish hue. It is a Tourmaline with a soda base.

DAPH'NE (the laurel: *Gr.*), in Botany a genus of shrubs, nat. ord. *Thymelaceæ*. *Daphne Mezereum* and *Daphne Laureola*, the *spurge laurel*, are British species.

DAPH'NINE (*daphnê*, laurel: *Gr.*), in Chemistry, the bitter principle of the laurel, discovered by Vauquelin. It consists of hard crystals which are of a greyish colour and transparent.

DA'RIC (*dareikos*, from *Darios*, Darius: *Gr.*), in Antiquity, a Persian gold coin, said to have been struck by Darius. It is scarce in collections. Existing specimens weigh about 128½ grains. Silver darics were also struck: specimens exist weighing from 224 to 230 grains.

DA'TA (things given: *Lat.*), among Mathematicians, a term used for such things and quantities as are given, known, or capable of being ascertained, in order to find therefrom other things that are unknown.

DATE (*datus*, given: *Lat.*), because letters, &c., were stated to be 'given' at such and such a time and place, that part of a writing or letter which expresses the day of the month and year.——**DATE**, in Law, is the description of the day, month, and year, with (sometimes) the year of the reign of the king, in which a deed or other writing was executed. An *ante-date* is a date prior to the real time when the instrument was signed. A *post-date* is that posterior to the real time.

DA'TE-TREE, the *Phœnix dactylifera*, a

species of palm which flourishes in North Africa and Western Asia, growing fifty, sixty, and sometimes one hundred feet high, distinguishing the landscape of those countries, and affording the inhabitants food, clothing, &c. The fruit grows in large clusters, is pulpy, firm, sweet, and esculent, and contains a hard kernel.

DATH'OLITE (*daio*, I kindle: and *lithos*, a stone; *Gr.*), in Mineralogy, a borosilicate of lime, found in Norway. It becomes opaque when heated.

DA'TIVE CASE (*dativus*, pertaining to giving: *Lat.*), in Grammar, that inflection of a noun which indicates participation in the action of the verb accompanying it.

DATU'RIA, in Chemistry, a vegetable alkaloid, the poisonous principle of the *Datura Stramonium*.

DAU'CUS (*daukos: Gr.*), in Botany, a genus of plants, nat. ord. *Umbelliferæ*, containing the well known carrot.

DAU'PHIN, the title borne by the eldest son of the king of France, down to 1830. It is said that in 1349, Humbert II., the last of the princes of Dauphiny, having no issue, gave his dominions to the crown of France, upon condition that the king's eldest son should be styled the *Dauphin*. These princes carried a dolphin on their shields.

DA'VID'S DAY (St.), the 1st of March, kept by the Welsh in honour of St. David, bishop of Minevy, in Wales, who, at the head of their forces, wearing leeks to distinguish them, obtained a signal victory over the Saxons. It is the custom of the Welsh to wear leeks in their hats on this day.

DA'VY'S LAMP. [See DAMPS.]

DAY (*dæg: Sax.*), according to the most natural and obvious sense of the word, signifies that part of the twenty-four hours when it is light; or the space of time between the rising and the setting of the sun—the time which elapses from its setting to its rising again being considered the night. In this sense it is termed *artificial* day. The word day is often taken in a larger sense, so as to include the night also, or to denote the time in which the earth makes a complete revolution with respect to the celestial bodies. Hence it expresses different intervals, according as the body with which the earth's rotation is compared is fixed or not. The *astronomical*, called also the *solar* and the *apparent* day, is the time which elapses between two consecutive returns of the same terrestrial meridian to the centre of the sun. Astronomical days are not equal, because the velocity of the earth in its orbit, and by consequence the apparent daily motion of the sun, are greater in winter than in summer; also, the obliquity of the ecliptic causes the sun's apparent daily motion in right ascension to be less at the equinoxes than at the tropics. The astronomical day begins at noon, and is counted on through *twenty-four* hours to the following noon. The *civil*, or *mean solar* day, is the time employed by the earth in revolving on its axis, as compared with the sun, supposed to move at a *mean rate* in its orbit. In this way of reckoning, the days are all of the same length; but the noon, or any given hour of the civil day, sometimes precedes and sometimes comes after the noon or corresponding hour of the astronomical day. Most nations begin the civil day at mean midnight. The Babylonians, Syrians, and Persians, like the modern Greeks and the natives of the Balearic isles, began their day at sunrise; the Jews, ancient Athenians, Chinese, and other orientals, at sun-setting; and the ancient Egyptians at noon. The *sidereal* day is the period which elapses between the times at which a star passes over the meridian on two successive days. The most ancient astronomical observations show that this interval has always remained of the same length. It is divided into twenty-four sidereal hours, which are subdivided into sidereal minutes and seconds. It is used universally by astronomers in their observatories, though its commencement is still determined by the apparent passage of the sun across the meridian.——DAYS OF GRACE, in Commerce, a customary number of days allowed for the payment of a bill after it becomes due. *Three* days of grace are allowed in Great Britain and America. In other countries the time allowed is much longer, but the merchants very rarely avail themselves of the time.

DAY'COAL, a name given by miners to the upper stratum of coal.

DAY'FLY, a species of the family of the *Ephemeridæ*, an insect so called from the shortness of its existence, because, after it has become a perfect fly, it lives only a few hours. Its larva, however, lives in the aquatic state two or three years.

DAY'-LILY, the popular name of a species of *Hemerocallis*; a plant so called because the beauty of its flower seldom lasts longer than one day.

DAZE (*dwas*, to overwhelm with light: *Sax.*), in Mineralogy, a kind of glittering stones found in tin and lead mines.

DE'ACON (*diakonos*, an attendant: *Gr.*), the lowest of the three orders of clergy (bishops, priests, and deacons) in the English church. The word is sometimes used in the New Testament for anyone that ministers in the service of God; in which sense bishops and presbyters are styled deacons. In the church of England, the form of ordaining a deacon declares that it is his office to assist in the distribution of the holy communion, in which, agreeably to the practice of the ancient church, he is confined to the administration of the wine to the communicants. He may not pronounce the absolution. He is not capable of any ecclesiastical promotion; yet he may be chaplain to a family, curate to a beneficed clergyman, or lecturer to a parish church.——In the Roman Catholic church, the deacon's office is to incense the officiating priest, to incense the choir, to put the mitre on the bishop's head at the pontifical mass, and to assist at the communion He is attended by the *sub-deacon*, who, according to the doctrine of that church, being in one of the holy orders, is bound to celibacy, &c.——In Presbyterian and Independent places of worship, the deacons distribute the bread and wine to the communicants. 2.—In Scotland, an overseer of the poor, or the master of an incorporated company, is styled a *deacon.*

DE'ACONESS (same *deriv.*), a female deacon in the primitive church. This office appears as ancient as the apostolic age; for St. Paul calls Phœbe a servant of the church of Cenchrea. One part of her office was to assist the minister at the baptizing of women, to undress them for immersion, and to dress them again, that the whole ceremony might be performed with all the decency becoming so sacred an action.

DEAD'-EYES, in Sea language, a kind of blocks with many holes in them, by which the shrouds are fastened to the chains.

DEAD LAN'GUAGE, a language which is no longer spoken, or in common use by a people, and is known only in writings; as the Hebrew, Greek, and Latin.

DEAD'-LIGHTS, strong wooden ports, made to fit the cabin windows, in which they are fixed to prevent the water from entering the ship in a storm.

DEAD'-POINTS, two positions in the revolution of an axle driven by reciprocating motion, in which the driving force is nil. To obviate the difficulty thus arising, the fly-wheel was invented.

DEAD-RECK'ONING, in Navigation, the calculation made of a ship's place, by observing the way she makes by the log, and allowing for currents, &c., no recourse being had to observation.

DEAD'-WATER, the eddy water closing in with a ship's stern as she passes through the water.

DEAD'-WORKS, the parts of a ship which are above the surface of the water when she is trimmed for a voyage.

DEAF'NESS, a defect in the power of hearing, which may arise:—1. From the disease or some impairment of the auditory nerve; 2. From a partial or complete destruction of the *membrana tympani*, the membrane which receives those vibrations of the air which constitute sound: this may be the result of disease or accident; 3 From disease of the ossicles; 4. From a collection of wax in the auditory canal, preventing the due transmission of the vibrations to the *membrana tympani;* 5. From an enlargement of the tonsils, when they press upon the eustachian tube, the canal which communicates with the middle ear [see EAR].

DEAL (*delan*, to divide: *Sax.*), fir-planks of different thicknesses, brought from the north of Europe, the produce of the spruce fir (*Abies excelsa*). When the pieces are 7 inches broad they are called *battens;* when 9 inches broad, *deals*; and when 11 inches broad, *planks* Some North American spruce firs are also applied to the same purpose, especially the black and white kinds, *Abies nigra*, and *A. alba.*

DEAN (*decanus: Lat.*), a dignitary of the church of England, next to a bishop, and head of the chapter in a cathedral or council. ——The DEAN AND CHAPTER form a corporate body, in which is vested the property of the cathedral, and the management of the estates belonging to it.

DEATH (*Sax.*), total and permanent cessation of all the vital functions, when the organs have not only ceased to act, but have lost the susceptibility of renewed action.——In Law, there is a natural death and a civil death: *natural*, where actual death takes place; *civil*, where a person is not actually dead, but adjudged so by law; as by banishment, abjuration of the realm, &c.

DEATH'-WATCH, a small beetle belonging to the timber-boring genus *Anobium*, is remarkable for striking with the fore part of its head against paper or some other material, and thus making a ticking noise, like the beat of a watch, which by ignorant and superstitious people is supposed to be a presage of death. It is of a greyish-brown colour, and about a quarter of an inch in length The ticking is merely the mode of call which the male insect makes for its mate The larva is very destructive to furniture, books, &c. An instance occurred of twenty-seven volumes in a public library having been perforated by the larva of an *Anobium*, in such a way that a string could be passed through the holes, and the volumes could then be all lifted together.

DEBA'CLE (a breaking up of ice: *Fr.*), a Geological term, to designate a violent rush of waters, which, overcoming all opposing barriers, carries with it stones, rocks, &c., and spreads them in all directions.

DEBEN'TURE (*debeo*, I owe: *Lat.*), a term used at the custom-house for a certificate signed by an officer of the customs, which entitles a merchant exporting goods to the receipt of a bounty, or a drawback of duties.——It is also an instrument, in use in some government departments, by which the government is charged to pay a creditor or his assigns the sum found due on auditing his accounts.——Also, an instrument by which a public company acknowledges the borrowing of a sum of money, and undertakes to repay the amount with interest.

DEB'IT (*debitum*, a debt: *Lat.*), a term used in Book-keeping to express the left-hand page of the ledger, to which all articles are carried that are charged to an account.

DEBOUCH' (*déboucher*, to clear a way: *Fr.*), in Military language, to issue or march out of a narrow place, or from defiles.

DE'BRIS (*Fr.*), ruins or rubbish: applied particularly to the fragments of rocks.——The word *débris* is also used by the French to express the remains or wreck of an army that has been routed

DEBT (*debitum: Lat.*), in Law, a species of contract, by which one party is bound to pay the other a certain sum of money. A debt of *record* is a sum which appears to be due by the evidence of a court of record; a debt by *special contract*, or *specialty*, is a sum which is acknowledged to be due, or becomes due by instruments under seal; and a debt by *simple contract* is either by parole, or a written obligation unsealed, as by a bill of exchange, a promissory note, &c.——NATIONAL DEBT, the engagement entered into by a government to repay at a future period money advanced by individuals for public service, and to pay the lenders an interest agreed upon.

DEC'ACHORD, or DECACHORD'ON (*dekachordos:* from *deka*, ten; and *chordē*, a musical string: *Gr.*), a musical instrument of ten strings.

DEC'AGON (*deka*, ten; and *gōnia*, an angle: *Gr.*), in Geometry, a plane figure with ten sides and ten angles.

DE'CAGRAMME (*deka*, ten: *Gr.;* and *gramme*), a French weight of ten grammes, equal to 154·34 grains troy.

DECAHE'DRON (*deka*, ten; and *hedra*, a base: *Gr.*), in Geometry, a figure or body having ten sides.

DE'CALITRE (*deka*, ten: *Gr.;* and *litre*), a French measure of capacity, containing ten litres, or 610·28 cubic inches: the litre being rather less than our imperial quart.

DEC'ALOGUE (*deka*, ten; and *logos*, a discourse: *Gr.*), the ten commandments or precepts delivered by God to Moses, at Mount Sinai, originally engraved on two tables of stone.

DECAM'ERON (*deka*, ten; and *hēmera*, a day: *Gr.*), a work in Italian prose, written by Giovanni Boccaccio, and first published about 1352. It consists of one hundred tales, supposed to have been related during ten days, in a villa in the country, by a party who had assembled there to escape the plague which raged at Florence in 1348. It was arranged that each of the party should relate a story daily for the entertainment of the others. The beautiful country around Florence is described, and the rambles and repasts of the recluses are recorded. 'These stories,' says Sismondi, 'which are varied with infinite art, as well in subject as in style, from the most pathetic and tender to the most sportive, and unfortunately the most licentious, exhibit a wonderful power of narration; and his description of the plague in Florence, which serves as an introduction to them, may be ranked with the most celebrated historical descriptions which have descended to us. The perfect truth of colouring; the exquisite choice of circumstances, calculated to produce the deepest impression, and which place before our eyes the most repulsive scenes without exciting disgust; and the emotion of the writer, which insensibly pervades every part, give to this picture that true eloquence of history, which in Thucydides animates the relation of the plague in Athens. With regard to the stories themselves, it would be difficult to convey an idea of them by extracts, and impossible to preserve in a translation the merits of their style. The merit of Boccaccio consists in the perfect purity of his language, in his elegance, his grace, and, above all, in that *naïveté*, which is the chief merit of narration, and the peculiar charm of the Italian tongue.

DEC'AMETRE (*deka*, ten: *Gr.;* and *mètre*), a French measure of length, consisting of ten mètres, or 393·7 inches.

DECAN'DRIA (*deka*, ten; and *anēr*, a male: *Gr.*), the tenth class of the Linnæan system of plants, containing plants with flowers having ten stamens.

DECARBONIZA'TION (of cast iron), a process resorted to in order to convert cast iron into steel and malleable iron, by removing a portion of the carbon it contains.

DEC'ASTICH (*deka*, ten; and *stichos*, a line: *Gr.*), a poem consisting of ten lines.

DEC'ASTYLE (*deka*, ten; and *stulos*, a column: *Gr.*), in Architecture, a building with ten columns in front.

DECEM'BER (*Lat.*, from *decem*, ten), the last month of the modern year. About the 21st of this month, the sun enters the tropic of Capricorn, and makes the winter solstice. It was so called from being the tenth month in the Roman year, which began with March.

DECEM'VIRI (*decem*, ten; and *viri*, men: *Lat.*), a body of men who, according to the Roman traditions, were elected by the patricians, A.U.C. 302, for the purpose of drawing up a body of laws, founded on the most approved institutions of Greece. They compiled a code, which they inscribed on ten tables, and stated that their labours were not yet complete. Next year, therefore, another body of ten, which probably included some of the patricians, was appointed with the same powers; and these added two more tables, altogether making the famous *twelve tables*, which were, from that time, the foundation of all Roman law. The second body of decemvirs attempted to prolong their period of office, committed some acts of violence, and altogether gave such dissatisfaction, that they were dissolved. The traditionary history of the decemviri is, however, very doubtful. There were other decemvirs, who were appointed for judicial and other purposes.

DECEN'NARY (*decem*, ten: *Lat.*), in Law, a tithing consisting of ten freeholders and their families. Ten of these decennaries constituted a *hundred*, the origin of which is ascribed to Alfred.

DECID'UOUS (*deciduus*, that falls off: *Lat.*), an epithet chiefly used in Botany; as, *deciduous leaves*, those which fall in autumn, in distinction from those of evergreens. The calyx or cup of a flower is also said to be *deciduous* when it falls off or decays along with the flower petals; while, on the contrary, it is called *permanent* when it remains after these are fallen.

DE'CIGRAMME (*decimus*, the tenth: *Lat.;* and *gramme*), a French weight of one-tenth of a gramme, equal to 1·5434 grs. troy.

DE'CILITRE (*decimus*, the tenth: *Lat.;* and *litre*), a French measure of capacity, equal to one-tenth of a litre.

DE'CIMAL ARITH'METIC (*decimus*, belonging to ten: *Lat.*), the ordinary system, in which *decimal numbers* are used. Decimal numbers are those whose values increase or decrease in a *tenfold* ratio.

DE'CIMAL COINAGE. A system in which the computation is made in parts of ten with coins to correspond, is manifestly attended with great convenience, and has been adopted in France and some other countries. Attachment to established usage, and the apprehension of ill effects arising from a change, have hitherto prevented the adoption of such a system with us; but when the benefits are more clearly perceived, the public will not hesitate about it. The advantage of a decimal system will be appreciable in every calculation. There will, moreover, be a great saving of time in the teaching of pecuniary arithmetic, and hence a decimal system would further education.

DE'CIMAL FRAC'TIONS, a method of expressing fractions of unity, in parts of 10, 100, 1000, &c. It is usual to express in writing the numerator only, putting a point before it on the left hand, thus:—·2 is equal to $\frac{2}{10}$, ·25 = $\frac{25}{100}$, ·575 = $\frac{575}{1000}$. Cyphers on the right hand of decimals make no alterations in their value: thus, ·20 is exactly the same as ·2 But cyphers on the left hand of decimals decrease their value, for ·5, ·05, ·005 are equal to $\frac{5}{10}$, $\frac{5}{100}$, and $\frac{5}{1000}$. All figures to the left of the point · express whole numbers; and a series of figures, some of which are to the left, and some to the right of a decimal point, form a mixed number, thus: 25·75 = 25$\frac{75}{100}$. In order to reduce a vulgar fraction to a decimal fraction of equal value, we annex cyphers to the numerator until it is equal to a greater sum than the denominator, then dividing it by the denominator, the quotient will be the decimal fraction required.

DECIMA'TION (*decimatio*, from *decimus*, the tenth: *Lat.*), a punishment inflicted by the Romans on such soldiers as quitted their post, or behaved badly in the field. The names of all the guilty were put into an urn or helmet, from which a tenth part only were drawn, whose lot it was to suffer death. Those who escaped received barley, instead of wheat, for food.

DE'CIMETRE (*decimus*, the tenth: *Lat.*; and *mètre*), a French measure of length, equal to the tenth part of a mètre, or to 3·937079 inches.

DECK (*decan*, to adorn: *Sax.*), the planked floor of a ship from stem to stern. Small vessels have only one deck; larger ships have two or three decks. Thus, speaking of the size of a large ship, we say, she is a *two-decker*, or a *three-decker*.

DECK'ED (same *deriv.*), in Heraldry, a term applied to an eagle, or other birds, when their feathers are trimmed at the edges with a small line of another colour.

DECLAMA'TION (*declamatio*: *Lat.*), the act of speaking to a public audience with energy and grace; it may be a discourse addressed either to the reason or to the passions. Among the Greeks, declamation was the art of speaking indifferently on all subjects and on all sides of a question. With us it is more especially applied to the speeches of students in colleges, practised for exercise in oratory. The term is, however, often used contemptuously, to denote a noisy harangue. The Romans employed the expression only in the sense of pleading at the bar.

DECLARA'TION (*declaratio*, an exposition: *Lat.*), in Law, that part of the process or pleadings in a common law court in which a statement of the plaintiff's complaint against the defendant is set forth.——DECLARATION OF WAR, a public proclamation made by a herald-at-arms to the subjects of a state, declaring them to be at war with some foreign power, and forbidding all and every one to aid or assist the common enemy at their peril.

DECLEN'SION (***declino***, I vary or inflect: *Lat.*), in Grammar, the inflection of cases to which nouns are subject. Also, the act of going through these inflections.

DECLINA'TION (*declinatio*, a bending aside: *Lat.*), in Astronomy, the distance of any star or point of the heavens from the equator, either north or south, and measured on the great circle, which passes through the centre of the star or point, and the poles. When the sun is in the equinoctial, he has no declination, and illuminates half the globe from pole to pole. As he increases in north declination, he gradually shines further over the north pole, and leaves the south pole in darkness; and *vice versâ*. The sun's greatest declination, north or south, is 23½ degrees.——DECLINATION OF THE COMPASS, the variation of the needle from the true meridian of a place. At most places on the earth's surface, the needle does not coincide, but forms an angle, with the geographical meridian. Lines on a map connecting places at which the needle is deflected to the same extent from the geographical meridian are called *isogonal* lines. Lines which connect places where the needle coincides with the geographical meridian are called lines of no declination.

DECOC'TION (*decoctio*, from *decoquo*, I boil down: *Lat.*), a medicinal liquor, made by extracting the soluble and efficacious part of many drugs, particularly of barks, woods, seeds, roots, &c., by boiling. It differs from *infusion*, which is merely pouring boiling water upon them.

DECOLLA'TION (*decollatio*, from *decollo*, I take off from the neck: *Lat.*), the act of beheading, a term used in the phrase 'decollation of St. John the Baptist.'

DECOM'POSITE (*de*, out of; and *compono*, I put together: *Lat.*), a botanical term applied to leaves of plants when the primary leaf is so divided that each part forms a compound leaf, and to flowers which contain within a common calyx several that are smaller.

DECOMPOSI'TION (*de*, equivalent to the English *un*; and *compono*, I put together: *Lat.*), in Chemistry, the act of separating the constituent parts of a substance. It differs from mechanical division, as the latter effects no change in the properties of the body divided, whereas the parts chemically decomposed have properties very different from those of the substance itself.

DECOY', in a general sense, any lure that deceives and misleads. Also a sea term for a stratagem employed by ships of war to draw any vessel of inferior force into an incautious pursuit, until she comes within gunshot. Decoying is also performed to elude the chase of a ship of superior force in a dark night; and this is done by committing to the sea a lighted cask of pitch, which will burn for a considerable time, and misguide the enemy As soon as the cask is lowered, the ship changes her course, and thus, if at any tolerable distance from the foe, escapes with facility.——DECOY, among sportsmen, a place for catching wild fowl.——DECOY-DUCK, a wild duck trained to decoy others into the decoy, or place where they may be caught.

DECREE' (*decretum: Lat.*), in Civil Law, the decision of the emperors on cases submitted to them.——In Law, the judgment of a court of equity on any bill preferred. A decree is *interlocutory* when made during the progress of a suit on some minor matter in dispute, and *final* when it goes to the whole matter in question. Decrees of the inferior judges may be appealed from to the Lords Justices, or to the Lord Chancellor, and from them to the House of Lords. A decree may also be appealed against in the House of Lords.

DEC'REMENTS (*decrementum*, a diminution: *Lat.*), in Physics, the small parts by which a variable and decreasing quantity becomes less and less.

DECREPITA'TION (*de*, much; and *crepito*, I crackle: *Lat.*), in Chemistry, a term applied to the crackling noise of salts when exposed to heat, by which they are quickly split. It takes place in those salts that have little water of crystallization, or some between their plates, &c., if, like nitre, they have no water of crystallization—the increased temperature converting that small quantity into vapour by which the crystals are suddenly burst. Common salt affords a good example of decrepitation, and when used as a flux should be previously decrepitated.

DECRESCEN'DO (*Ital.*), or DIMINUENDO, in Music, the term for gradually decreasing or weakening the sound; as opposed to *crescendo*.

DECRES'CENT (*decrescens*, decreasing: *Lat.*), in Heraldry, a term denoting the state of the moon when she declines from the full to her last quarter, and the horns are turned to the sinister side of the escutcheon.

DECRET' (*decretum*, a decree: *Lat.*), in Scottish Law, a term applied to various judgments and sentences.

DEC'RETAL (same *deriv.*), a decree of the pope which, until the 14th century, had the same authority in canon law as that of an emperor in the civil law. The *Decretals of Isidore*, framed with a view to extend the papal power, pretend to contain the decrees of popes who lived in the first three centuries; but they were forged in the ninth.

DECUM'BENT (*decumbens*, lying down: *Lat.*), in Botany, an epithet for anything which lies on the ground.

DECUM'BITURE (same *deriv.*), in Astrology, the scheme or aspect of the heavens, by which the prognostics of recovery or death were supposed to be discovered.

DECU'RION (*decurio*, from *decem*, ten: *Lat.*), in Roman Antiquity, the commander of a *decuria* of cavalry. The cavalry belonging to a legion were divided into ten *turmæ* or troops; and for each of these, three decurions were chosen. In each troop, the decurion first chosen commanded the whole troop, but without changing his appellation.

DECU'RIO'NES MUNICIPA'LES (municipal decurions: *Lat.*), a court of judges or councillors representing the Roman senate in the free towns and provinces.

DECUR'RENT (*decurrens*, running along: *Lat.*), an epithet for a leaf which adheres to the stem forming a wing along it.

DECUS'SATE (*decussatio*, the intersection of two lines: *Lat.*), in Botany, a term applied to leaves which are set in pairs along a branch, each pair being at right angles to the one below it.——In Rhetoric, a *decussated* period is one that consists of two rising and two falling clauses, placed in alternate opposition to each other.

DE'DALOUS (from *Dædalus*, the contriver of a famous labyrinth), a Botanical term applied to leaves of a delicate texture, whose margin is marked by various windings and turnings.

DEDICA'TION (*dedicatio*, from *dedico*, I consecrate: *Lat.*), the act of consecrating or solemnly devoting any person or thing to the service of God and the purposes of religion.——FEAST OF DEDICATION, an anniversary festival among the Jews, in memory of Judas Maccabæus, who repaired and dedicated anew the temple and altar, which had been plundered and profaned by Antiochus Epiphanes. It was observed on the twenty-fifth of Cisleu, and continued eight days.——In Literature, a complimentary address to some one, prefixed by an author to his work. This practice is ancient, but it has gone much out of fashion.

DEDUC'TIVE METHOD OF IN'QUIRY, the pursuit of laws into their consequences. [See INDUCTION.] 'The successful process of scientific inquiry,' says Sir John Herschel, 'demands continually the alternate use of both the inductive and the deductive method.'

DEDUC'TOR (*Lat.*), a client amongst the Romans, who called upon his patron at his lodgings in the morning, waited upon him from thence to the forum, and attended him upon all public occasions.

DEED (*dæd: Sax.*), in Law, a writing sealed and delivered by the parties. If made by only one party, it is a *deed-poll*; if by two or more, an *indenture*. The essential parts of a deed are the *date* and *names* of the parties: the *recitals*, in which the intention of the parties, and former transactions with reference to the same property, are recounted, and the operative part, which tells the *considerations* for which the deed is made; the *conveyance* by and to the several parties; the *description* of the tenements, their legal adjuncts; the *habendum*, beginning with 'to have and to hold,' expressing the quantity of estate conveyed; the *declaration of uses*, which limits or modifies the enjoyment to one or more parties, according to stipulations previously made; the declaration of trusts, if any; and lastly, the covenants for title, and such as may be required by the peculiar circumstances of the case. It must be signed and sealed by the grantor, and also by the grantee, if he has entered into any engagement or covenant. Witnesses usually attest the deed; but this is indispensable only where, a power having been given to be executed by the deed, the terms of the power require such attestation.

DEER. Animals of the deer kind constitute the tribe *Cervina* of naturalists, a division of the ruminating *Bovidæ*. The **ELK**, **REIN DEER**, **FALLOW DEER**, and the True Stags belong to the *Cervina*, the latter including the Common Stag or Red Deer, the **WAPITI** Deer, the spotted Axis Deer of India, the Rusa Stag and Muntjak of Java, the **ROEBUCK**, and some other species. The Red Deer (*Cervus elaphus*) is a native of Europe and the temperate parts of Asia. Its fur has a brown colour, and its horns are conical with numerous branches. It is no longer wild in England, where the hunting of it afforded so much sport to the nobility of the olden time, but in Scotland it still runs wild over the extensive moors, and many are brought down annually by the rifle of the deer-stalker. The sovereign keeps a pack of stag hounds, and until lately there was a master of the buck hounds, one of the great officers of the royal household. The fallow deer has taken its place in parks.

DE FAC'TO (in fact: *Lat.*), in Law, something actually in fact, or existing, in distinction from *de jure*, where a thing is only so in justice, but not in fact: thus a king *de facto* is a person that is in actual possession of a crown, and a king *de jure* is the person who has a just right to the crown, though he may not be in possession of it.

DEFAMA'TION (*defamatus*, dishonoured: *Lat.*), the malicious uttering of falsehood with a view to injure another's reputation. Defamatory words, signs, pictures, &c., written or printed and published, constitute a *libel*.

DEFAULT' (*défaut: Fr.*), in Law, the omission of any act which a party ought to do to entitle himself to a legal remedy or defence, such as non-appearance in court on a day assigned. If the plaintiff make default, he is nonsuited; if the defendant, judgment by default passes against him. Suffering judgment by default entitles the plaintiff to issue execution after the damages, if damages are in question, have been ascertained.——**DEFAULTER**, one who fails to account for money entrusted to his care.

DEFE'ASANCE (*défaire*, to rid oneself of: *Fr.*), in Law a collateral deed, made at the same time with a deed of conveyance, containing conditions by the performance of which the estate created by the deed of conveyance may be defeated. A *defeasance* on a bond, recognizance, or judgment recovered, is a condition which, when performed, renders the bond, &c., of no effect.

DEFECA'TION (*defæco*, I cleanse from dregs: *Lat.*), the act of separating from lees or dregs.

DEFEN'CE (*defendo*, I defend: *Lat.*), in Law, the reply which the defendant makes after the declaration is produced.——In Military affairs, any work that covers or defends the opposite posts, as flanks, parapets, &c.

DEFEN'DANT (same *deriv.*), in Law, the party that is summoned into court, and *defends*, denies, or opposes the demand or charge, and maintains his own right. It is applied whether the person defends, or admits the claim and suffers a default.

DEFI'LE (*défiler*, to advance in a line: from *fil*, a thread: *Fr.*), a narrow way or pass, through which a company of soldiers can march only in file.

DEFINI'TION (*definitio*, from *definio*, I limit: *Lat.*), the determining the nature of things by words; or a brief description of a thing by its properties. It is generally effected by adding to a generic word the essential and peculiar qualities or circumstances of the thing to be defined. But a strictly accurate definition cannot always be given; and the most simple things are generally the least capable of definition, from the difficulty of finding terms more simple and intelligible than the one to be defined.

DEFIN'ITIVE (*definitivus*, from same: *Lat.*), a term applied to whatever terminates a process, question, &c., in opposition to provisional and interlocutory.——In Grammar, a word used to define or limit the extent of the signification of an appellative or common noun.

DEFLAGRA'TION (*deflagratio*, from *deflagro*, I consume by fire: *Lat.*), rapid combustion, or the act of burning two or more substances together, as charcoal and nitre.

DEFLEX'ION (*deflexio*, from *deflecto*, I bend aside: *Lat.*), the bending anything out of its proper direction, as the turning a ship out of her due course by currents, or the bending of an iron bar by a weight.——**DEFLEXION OF THE RAYS OF LIGHT**, in Optics. When a luminous ray passes very near to an opaque body, it is *deflected* or bent from its rectilinear course. This phenomenon, first remarked by Grimaldi, was examined by Newton, who gave it the name of *diffraction*, which see.

DEFLORA'TUS (*defloreo*, I shed blossoms: *Lat.*), in Botany, an epithet for a flower which has discharged its pollen.

DEFLU'VIUM (a falling off: *Lat.*) in Botany, a disease in trees in which they lose their bark.——**DEFLUVIUM CAPILLORUM**, in Medicine, a preternatural falling off of the hair.

DEFLUX'ION (*defluxio*, from *defluo*, I flow down: *Lat.*), in Surgery, the falling or flowing of humours from a superior to an inferior part of the body; as a defluxion from the nose in catarrh.

DEFOLIA'TION (*de*, privative; and *foliatus*, having leaves: *Lat.*), the shedding of leaves, a term technically applied to the fall of leaves in the autumn.

DEFO'RCEMENT (*de*, from; and *forcement*, forcibly: *Fr.*), in Law, the holding of lands or tenements to which another person has a right. In Scotland it denotes the resisting an officer in the execution of the law.

DEGRADA'TION (*de*, privative; and *gradus*, a station: *Lat.*), in Ecclesiastical affairs, the depriving a person of his dignity and degree; as the degradation of a clergyman by depriving him of holy orders. In the Roman Catholic church it is done with many ceremonies, which are intended to strike the beholders with horror. The vestments of the person to be degraded are dragged off; the unction applied to his hands at his ordination is, as it were, scraped off, by a piece of rough iron. Pope Boniface required that there should be six bishops at the degradation of a priest.——In Military affairs, the depriving an officer of his commission.——In Painting, lessening and obscuring remote objects in a landscape, that they may appear as they would do to the eye of a distant observer.

DEGRA'DED (*dégrader*, to degrade : *Fr.*; from *gradus*, a step : *Lat.*), in Heraldry, an epithet in blazoning for a cross that has steps at each end.

DEGREE' (*degré : Fr.*). Every circle is supposed to be divided into three hundred and sixty parts called degrees, and each degree into sixty other parts called minutes; each of these minutes being again divided into sixty seconds, each second into as many thirds, each third into fourths, and so on.——DEGREE, in Universities, a distinction of rank, intended to denote a certain amount of proficiency in a faculty or a science. The first degree is that of *Bachelor of Arts*, the second that of *Master of Arts*. Honorary degrees are those of *Doctor of Divinity*, *Doctor of Laws*, &c. Physicians also receive the degree of *Doctor of Medicine*.——DEGREE, in Algebra, a term applied to equations to distinguish the highest power of the unknown quantity.——DEGREE, in Genealogy, an interval of relationship between persons more or less nearly allied.——The division, space, or interval, marked on a mathematical or other instrument, as on a thermometer or barometer.

DEGRE'E OF LAT'ITUDE, and LON'GITUDE. A distance on the meridian which will cause a difference of one degree in the altitude of the pole is a degree of *latitude*. A degree on the equator, or any great circle of the earth parallel to the equator, is a degree of *longitude*. To ascertain the length of a degree of latitude has been a problem of great interest from the earliest times. Its solution is rendered extremely difficult by the irregularities of the surface of the earth. The mean of the most careful measurements indicates the length of a degree of latitude at the equator to be 362,734 English feet, and at the pole 366,361 ; and a degree of longitude at the equator, 365,152.

DEHIS'CENCE (*dehisco*, I gape : *Lat.*), in Botany, a term given to the opening of the capsules of a plant.

DEIFICA'TION (*Deus*, God ; and *facio*, I make: *Lat.*), the act of enrolling among the heathen deities.

DE'I JUDI'CIUM (the judgment of God : *Lat.*), the old Saxon trial by ordeal, so called because it was supposed to be an appeal to God.

DEIPNOS'OPHIST (*deipnon*, a meal; and *sophistes*, a learned person : *Gr.*), one of an ancient sect of philosophers, who were famous for their learned conversation at meals.

DE'ISTS (*Deus*, God : *Lat.*), in the modern sense of the word, are those persons who acknowledge the existence of a Creator, but do not admit that he has made in words any revelation of his will to mankind.

DE'ITY (*Deus*, God : *Lat.*), the nature and essence of the Supreme Being; a term frequently used in a synonymous sense with God.——Also, a fabulous god or goddess; as Jupiter, Juno, Apollo, &c. The works of Pliny, Cicero, &c., clearly show us that enlightened pagans had not those gross ideas regarding the Deity which are indicated by the heathen mythology.

DELACRYMA'TION (*delacrymatio : Lat.*), a preternatural discharge of watery humours from the eyes.

DEL CRED'ERE (*credere*, to trust : *Ital.*), in Commerce, a term expressive of a guarantee given by factors, who for an additional premium warrant the solvency of the parties to whom they sell goods upon credit.

DEL'EGATE (*delego*, I commit to : *Lat.*), in the United States of America, a person elected or appointed to represent a state or district in the congress.

DELF, a kind of potter's ware, originally made at *Delft* in Holland ; it is covered with an enamel, or white glazing, in imitation of porcelain.

DELIQUES'CENCE (*deliquesco*, I melt away : *Lat.*), in Chemistry, spontaneous liquefaction in the air; a term applied to certain saline bodies that absorb moisture from the atmosphere.

DELIR'IUM (madness : *Lat.*), a state in which the ideas of a person are wild and irregular, or do not correspond with the truth, or with external objects. It may be defined symptomatic derangement, or that which is dependent on some other disease, in distinction from idiopathic derangement or *mania*.

DELIV'ERY (*delivrer*, to deliver : *Fr.*), a part of oratory, referring to the management of the voice.

DEL'LA ROB'BIA WARE, a species of earthenware, the foundation of which is terra cotta, upon which a metallic colour is fixed by the action of fire. The Egyptians were acquainted with the art ; it was revived in the 15th century by Luca della Robbia, an Italian. He began with white figures on a blue ground, afterwards he added more colouring, and then he introduced perspective.

DELPHIN'IDÆ (*delphin*, a dolphin : *Lat.*), a family of *Cetacea*, mammals living in the sea, characterized by the moderate size of the head, and the presence of teeth in both jaws. It includes not only the dolphin, porpoise, and narwhal, but also some animals usually called whales. [See DOLPHIN.]

DELPHIN'IUM (*delphin*, a dolphin : *Lat.*, from a fancied resemblance in the flower), in Botany, a genus of plants, nat. ord. *Ranunculaceæ*, including the common Larkspur.

DEL'TA (the Greek letter Δ), the large tract of land formed by the sediment brought down by a river, and deposited in a lake or quiet ocean. Deltas have been formed at the mouths of the Nile, the Ganges, the Mississippi, and many other great rivers.

DEL'TOID (*delta*, the Greek Δ ; and *eidos*, form : *Gr.*), in Anatomy, a thick triangular muscle of the arm, being one of the three elevators.——Also, a term for anything hav ing three angles, of which the terminal one is much further from the opposite side than the lateral ones.

DEMAIN' or **DEME'SNE** (*domaine: Fr.*; from *dominus*, a lord: *Lat.*), in Law, a manor-house, and the lands thereunto belonging. It denotes also all the parts of any manor not in the hands of freeholders; and is frequently used for those lands that the lord has in his own hands, to distinguish them from other land appertaining to the manor, and belonging to freeholders or copyholders.

DEMARCA'TION (*Fr.*), LINE OF, every line drawn for determining a border which is not to be passed.

DEM'I-CADENCE (*demi*, half: *Fr.*), in Music, an imperfect cadence, or one that falls on any other than the key note.

DEMI CUL'VERIN, a piece of ordnance, which carried a nine-pound shot.

DEM'I-GORGE, in Fortification, that part of the polygon which reaches from the curtain to the angle of the polygon.

DEM'I-QUAVER, the same as *semi-quaver*, which see.

DEM'I-SEMI'QUAVER, in Music, a note equal in length to half a semi-quaver.

DEM'I-VOLT (*demi*, half: *Fr.*; and *volta*, a turn: *Ital.*), one of the artificial motions of a horse, in which he raises his fore-legs in a particular manner.

DEMI'SE (*demissio: Lat.*), in Law, signifies a grant by lease of heritable property. It may be either for life or years. ——The death of a king, or of a queen regnant, is termed the demise of the crown, by which is implied a transfer of the royal authority or kingdom to a successor.

DEMOC'RACY (*dēmokratia*: from *dēmos*, the people: and *kratos*, power: *Gr.*), a form of government in which the supreme power is lodged in the hands of the people collectively, or in which the people exercise the powers of legislation.

DE'MON, or **DÆ'MON** (*daimōn*, a spirit: *Gr.*), a name used by the ancients for certain supernatural beings, in whose existence they believed. They were spirits or genii, who appeared to men, either to do them service or to hurt them. The Platonists distinguish between gods, demons, and heroes; the demons being those since called angels. Socrates and Tasso declared, in very distant ages, they were each attended by a demon or familiar. In Tasso, this pretension has been referred to a hypochondriacal state of mind: in Socrates, the matter has given rise to much speculation. From the manner, however, in which the philosopher is said to have described his *demon*, there seems good reason to believe that he spoke figuratively of his natural conscience or intellect: 'it directed him how to act in every important occasion of life, and restrained him from imprudence of conduct.'

DEMO'NIAC (*daimonikos*, possessed by a demon: *Gr.*), a human being whose volition and other mental faculties are supposed to be overpowered, restrained, or disturbed in their regular operation, by an evil spirit. ——In Church History, the term *Demoniacs* is applied to a branch of the Anabaptists, whose distinguishing tenet is, that at the end of the world the devil will be saved.

DEMONOC'RACY (*daimōn*, a demon; and *kratos*, power: *Gr.*), the power or government of demons.

DEMONOL'OGY (*daimōn*, a demon; and *logos*, a discourse: *Gr.*), a treatise on demons or evil spirits. The Greeks imputed madness sometimes to the agency of Furies, and sometimes to the influence of Diana or the moon. The Romans thought insanity was caused by Ceres or the Larvæ; and amongst the Jews, 'to have a devil' and 'to be mad' were synonymous terms. Everything, in short, which affected either the body or the mind in an extraordinary manner—every disagreeable phenomenon which they could not otherwise account for—was by the Jews supposed to be the work of a devil.

DEMONSTRA'TOR (*Lat.*, from same), in Anatomy, one who exhibits the parts when dissected.

DEMUL'CENTS (*demulceo*, I sooth, literally I caress with the hand: *Lat.*), any medicines which lessen acrimony, or the effects of stimulants on the solids, as gums and other mucilaginous substances.

DEMUR'RAGE (*demoror*, I delay: *Lat.*), in Commerce, an allowance made to the master of a ship by the merchants, for staying in a port longer than the time first appointed.

DEMUR'RER (same *deriv.*), a legal term. Where, on the face of the declaration in an action at law, or a bill filed in chancery, there does not appear sufficient in point of law to entitle the plaintiff to relief, the defendant puts in a demurrer. The effect of this is that the defendant obtains the judgment of the court, whether even, supposing all the allegations in the declaration or bill to be true, the plaintiff has any case against him. If the demurrer be *allowed*, the action or suit is at an end, unless the court permits the pleadings to be amended.

DEM'Y (*demi*, half: *Fr.*), in Heraldry, an epithet for any charge that is borne half: as a demy-lion, or half-lion.——DEMY, the name given by printers to paper when cut or folded into sheets 22 inches long by 17½ broad.——DEMIES, the scholars at Magdalen College, Oxford.

DENA'RIUS (*Lat.*; literally, containing ten), in Roman Antiquity, a silver coin, worth at first ten asses, but afterwards sixteen, when the weight of the ass was reduced to an ounce. In military pay, it was still considered as equal to ten asses. Originally the denarius was the eighty-fourth of a pound of silver, but it was subsequently the ninety-sixth. It is considered to have been worth eightpence-halfpenny English. The gold denarius was equivalent to twenty-five silver ones. Our copper penny has been called a denarius, and is therefore represented by *d.*——DENARIUS DEI, God's penny, or earnest-money given and received by the parties to contracts. It was so called, because in ancient times it was given to the church or to the poor.

DEN'DRACHATE (*dendron*, a tree; and *achatēs*, agate: *Gr.*), in Mineralogy, arborescent agate, or agate containing the figures of shrubs or parts of plants.

DEN'DRITE (*dendritēs*, pertaining to a tree. *Gr.*), a stone or mineral on which are the figures of shrubs or trees. Hence the epithets *dendritic* and *dendroid*.

DEN'DROID (*dendron*, a tree; and *eidos*, form: *Gr.*), a fossil which has some resemblance in form to the branch of a tree.

DENDROL'OGY (*dendron*, a tree, and *logos*, a discourse: *Gr.*), a discourse on, or the natural history of trees.

DENDROM'ETER (*dendron*, a tree; and *metron*, a measure: *Gr.*), an instrument to measure the height and diameter of trees

DEN'IZEN (*dinassdyn*, a man of the city; *Wel.*), an alien who is made a subject by royal letters-patent, holding a middle position between an alien and a natural-born subject. He may take lands by purchase or demise, but cannot enjoy offices of trust, &c., nor receive a grant of lands from the crown

DENOM'INA'TOR (*denomino*, I designate: *Lat.*), in Arithmetic, the number which expresses into how many parts an integer or integers have been divided so as to produce those quantities, some number of which is expressed by the numerator. Thus, in the fraction $\frac{5}{7}$, the integer is supposed to have been divided into seven equal parts, of which five have been taken.

DENOU'EMENT (literally the unknotting: *Fr.*), a word nearly anglicized, signifying the development or winding up of any event.

DEN'SITY (*densitas*: *Lat.*), closeness of constituent parts; that property in bodies by which they contain a certain quantity of matter under a certain bulk or magnitude. It is directly opposed to *rarity*. A body is said to have double and triple the density of another body, when, being equal in size, the quantity of matter in one is double or triple the quantity of matter in the other

DEN'SITY OF THE EARTH Many attempts have been made to ascertain the mean density of our globe, and several processes have been used for this purpose. 1 Maskelyne, in 1774, ascertained the effect of the mountain Schehallien, in Scotland, upon a plumb line, and thus compared the attraction of a known mass with the attraction of the earth. This method has been employed by others. 2. The time of oscillation of a pendulum has been observed at the summit, and at the foot of a mountain. The difference in the times being precisely ascertained, the attraction of the mountain is a matter for calculation. 3 By descending to a known depth into the earth, and comparing the time of oscillation of pendulums stationed there, and on the surface of the earth, data are afforded for calculating the earth's density, because, at the lower station, the attraction of the exterior shell of the earth is got rid of, and the mass of this exterior shell being estimated, a term of comparison is obtained. 4. By ascertaining the attraction of an object of known weight, a piece of lead for example, upon the balance of torsion, as was done in the 'Cavendish experiment.' The results obtained by these several methods have a considerable range, but the mean result is, that our globe has a weight 5½ times greater than a globe of water of the same size. Whence it would seem that the weight of the earth may be estimated at 5,842 trillions of tons.

DEN'TAGRA (*dens*, a tooth; and *ago*, I carry off: *Lat.*), a surgeon's instrument or forceps for extracting teeth.

DEN'TAL (*dens*, a tooth: *Lat.*), an articulation or letter formed by placing the end of the tongue against the upper teeth or nearer the roof of the mouth; as in *d* and *t*.

DENTA'LIUM (same *deriv.*), a genus of marine molluscs, having a tubular slightly curved shell, open at both ends, but much narrower at one end than at the other. It thus has the shape of an elephant's tusk, whence the name.

DEN'TATE (*dentatus*, toothed; from same: *Lat.*) in Natural History, a term usually applied to an edge which is cut into angular projections. *Denticulate* is a diminutive term.

DEN'TIFRICE (*dentifricium*; from *dens*, a tooth; and *frico*, I rub: *Lat.*), any powder or other substance used for cleaning the teeth.

DEN'TIL (*dens*, a tooth: *Lat.*), in Architecture, an ornament in cornices, bearing some resemblance to teeth; used particularly in the Corinthian, Ionic, Composite, and sometimes Doric orders.

DEN'TINE (*dens*, a tooth: *Lat.*), the substance of which the greater part of our teeth consists. It is what is frequently called the ivory of the tooth, and its minute structure is composed of a homogeneous basis surrounding numerous elongated channels, termed the ivory tubes. The dentine of the fangs is covered with the 'cement,' or bony portion; that of the exposed part of the tooth with enamel. [See TEETH]

DEN'TOID (*dens*, a tooth: *Lat.*; and *eidos*, form: *Gr*), having the form of teeth.

DENUDA'TION (*denudo*, I make naked: *Lat*), in Geology, the removal of solid matter from any part of the earth's crust by water in motion, such as rivers, and the waves of the sea. The sea acts upon the margin of the land with a broad horizontal movement, which has a tendency to eat away the land down to its own level. If the land is slowly rising, gentle slopes are found upon it; if it is stationary for a long period, vertical cliffs are produced. Rivers are continually carrying to the sea the weathered particles of rocks, and mud formed by the attrition against each other of stones that have fallen into their bed. The solid materials thus obtained are again spread out over the bottom of the ocean, and thus new strata are formed, which will at some future period be elevated above its level. The stratified deposits in the earth's crust are at once the monument and measure of the denudation which had previously taken place.

DEOB'STRUENT (*de*, privative: and *obstruens*, obstructing: *Lat.*), any medicine which removes obstructions and opens the natural passages for the fluids of the body.

DE'ODAND (*Deo dandum*, to be given to God: *Lat*), a personal chattel which was the immediate occasion of the death of a rational creature, and for that reason was formerly *given to God*, that is, forfeited to the king, to be applied to pious uses. In later times it was given absolutely to the sovereign; but now no chattel is forfeited, however instrumental it may have been in causing death.

DEO'DORIZERS (*de*, privative; and *odor*, a smell: *Lat.*), a term applied to a class of disinfectants especially characterized by their power of destroying fœtid effluvia: among these are chlorine and several of its compounds. A solution of permanganate of potash has lately come into use as a disinfectant. Some kinds of charcoal, and especially that obtained from peat, when mixed with excrement, not only destroy the odour, but form an excellent compost for agricultural purposes.

DEOX'IDATE or **DEOX'IDIZE**, in Chemistry, to deprive of oxygen, or reduce from the state of an oxide.

DEPART'MENT (*Fr.*, from *départir*, to divide), either a division of territory, as the *departments* of France, or a distinct class of official duties allotted to particular persons.

DEPAR'TURE (*départ*: *Fr.*), a nautical term, indicating the distance a ship has gone to the east or west of the meridian from which she set out.

DEPHLOGIS'TICATED AIR (*de*, privative; and *phlogiston*, an element imagined by the older chemists), a term applied by Dr. Priestley, when he first discovered it, to what is now called *oxygen gas*. It was denominated by Scheele, who also discovered it about the same period, *vital air*.

DEPLOY' (*deployer*, to spread: *Fr.*), the spreading of troops; a military term.

DEPO'NENT (*depono*, I lay down; *Lat.*), in Law, one who gives written testimony on oath.

DEPORTA'TION (*deportatio*, from *deporto*, I carry away: *Lat.*), a sort of banishment among the Romans, to some island or other place which was allotted to a criminal for his abode, with an obligation not to leave it on pain of death.

DEPOS'IT (*depositum*, a something intrusted: *Lat.*), among civilians, something that is committed to the custody of a person, to be kept without any reward, and to be returned on demand.

DEPOSI'TION (*depositio*, from *depono*, I lay down: *Lat.*), in Law, the testimony of a witness set down in writing, in answer to interrogations legally made.——DEPOSITION, the settlement of substances suspended in fluids; thus the *depositions* of alluvial matter.——DEPOSITION (*depono*, I take from: *Lat.*), the act of dethroning a king or divesting anyone in authority of his power and dignity.

DEP'OT (*Fr.*), a store or magazine for depositing goods or merchandise.——In Military affairs, a place where all sorts of stores and provisions are kept, and recruits are received and trained. The word is applied, also, to that portion of a regiment which remains at home when the rest is on foreign service.

DEPRES'SION (*depressio*, from *deprimo*, I sink down: *Lat.*), *of the sun, or a star*, in Astronomy, is its distance at any time below the horizon, measured by an arc of the vertical circle.——DEPRESSION OF THE POLE, a phenomenon which arises from the spherical figure of the earth; thus, when a person sails or travels towards the equator, he is said to depress the pole, because as many degrees as he approaches nearer the equator, so many degrees will the pole be nearer the horizon.——DEPRESSION OF AN EQUATION, in Algebra, the reducing an equation to lower degrees by dividing it by some common factor, as a biquadratic to a cubic equation, or a cubic to a quadratic.

DEPRES'SOR (*deprimo*, I press down: *Lat.*), in Anatomy, a name applied to several muscles, because they depress the parts to which they are attached.

DEPRIVA'TION (*de*, from; and *privatio*, a taking away: *Lat.*), the taking away from a clergyman his spiritual dignity by sentence of the proper authority.

DEPURA'TION (*Fr.*), the act of purifying or freeing fluids from heterogeneous matter. This is done either by decantation, when the feculent matter is deposited in the bottom of the vessel, by boiling and skimming, by filtration, or by clarification.

DEP'UTY (*député*: *Fr.*; from *deputo*, I cut off: *Lat.*), in a general sense, a person appointed or elected to act for another, or sent upon some business by a community.——In Law, a *deputy* is one who exercises an office in another's right; and the person whom he represents is answerable for his misconduct. By a *deputation* is generally understood the person or persons authorized and sent to transact business for others, either with a special commission and authority, or with general powers.

DER'ELICTS (*derelictus*, abandoned: *Lat.*), in Civil Law, such goods as are wilfully relinquished by the owner. It also signifies what is forsaken, or cast away by the sea: thus, lands which the sea has suddenly left are called *derelict lands*, and vessels forsaken at sea *derelict ships*.

DERIV'ATIVE (*derivativus*: *Lat.*), in Grammar, any word taking its origin from another, called its *primitive*; as *manhood*, from *man*, &c.

DERMATOL'OGY, or **DERMOL'OGY** (*derma*, a skin; and *logos*, a discourse: *Gr.*), a discourse or treatise on the skin.

DERMES'TES (*dermestēs*: from *derma*, a skin; and *esthio*, I eat: *Gr.*), in Entomology, a genus of coleopterous insects, whose larvæ devour skins, leather, furs, feathers, &c. They are exceedingly destructive in museums and furriers' shops.

DER'VISE or **DER'VIS** (poor: *Pers.*), a name given to various Mahometan priests or monks. Enthusiasts have, from time immemorial, existed in Persia, who, impelled by the convictions that poverty is the only passport to virtue, and that the self-imposed privations of this world will be commensurately rewarded in the next, have voluntarily renounced all the comforts and charities of life. Dervises are found in all Mohammedan countries. There are many sects, distinguished by the different forms and colours of their habit. Dancing is one of their religious ceremonies.

DESCEN'SION (*descensio*, a going down:

Lat.), in Astronomy, an arc of the equator which descends or sets with any sign or point in the zodiac. Descension is either *right* or *oblique*, according as it takes place in a right or oblique sphere.——The epithet *descending* is also in frequent use in Astronomy; as, *descending degrees*, *descending latitude*, &c. And by *descensional difference* is understood the difference between the right and oblique descensions of any planetary body.

DESCENT' (*descensus : Lat.*), in a general sense, is the tendency of a body from a higher to a lower place; thus, all bodies, unless prevented by a force superior to their gravity, descend towards the centre of the earth.——In Law, the title to inherit lands by reason of consanguinity, as well where the heir shall be an ancestor, or collateral relation, as where he shall be a child or other issue. Title to inherit land by descent accrues only when such land is not the subject of a settlement or devise. The principal rules of descent are :—1. That the estate shall lineally to the children of the person who last died entitled. 2. That male children shall take to the exclusion of female. 3 That the eldest male child shall inherit to the exclusion of the other male children; but where there are only female children, they shall all take equally. 4. That the lineal descendants *in infinitum* shall represent, that is, stand in the place of their ancestor, and have the same estate or share that he would have done if living. 5 That when there shall be a failure of lineal descendants, or issue, of the person last entitled (technically called the purchaser), the estate shall ascend and descend to the lineal ancestors, and to the collateral relations of the purchaser 6. That the nearest lineal ancestor shall take the estate in preference to all others: hence, a father will take before a brother, and collaterals only take through a lineal ancestor 7. Amongst collaterals, a relation of the half-blood shall inherit next after any relation in the same degree of the whole blood, and his issue where the common ancestor was a male, and next after the common ancestor where that ancestor was a female. 8 In lineal ascents, and in collateral inheritances, the male stock shall always be preferred to the female, unless the estate has descended from a female. Hence none of the maternal ancestors of the purchaser, nor any of their descendants, can inherit until all the paternal ancestors and their descendants have failed. In some localities, all sons inherit equally from their father, on account of the custom of *gavelkind*. By the custom of *borough English*, the youngest son is heir. Bastards or aliens cannot inherit. But, with certain restrictions, a natural-born subject may derive his title through alien ancestors.——DESCENT, a term in Heraldry, to express coming down; as, 'a lion in descent,' i. e. a lion with his heels upwards, as though in the act of leaping down from an eminence.

DES'ERT (*desertus: Lat.*), a large uninhabited tract of land, or extent of country, entirely barren. In this sense, some are sandy deserts, as those of Arabia, Libya, and Sahara: others are stony, as the desert of Pharan, in Arabia Petræa.

DESER'TER (*desertor : Lat.*), an officer, soldier, or seaman, who quits his post, &c., without leave or intention to return. The crime of desertion has at all times been held in the utmost contempt and abhorrence. Its punishment has ever been severe, and, in time of war, generally that of death.

DESHACHE' (*de*, from; and *hacher*, to hack : *Fr.*), in French Heraldry, a term for a beast whose limbs are separated from its body, but still remain on the escutcheon, and at only a small distance from their natural places.

DESIC'CANT or **DESIC'CATIVE** (*desicco*, I dry up : *Lat.*), any medicine or application that has the property of exhausting moisture from, or drying up, a sore.

DESIDERA'TUM (*Lat.*), a thing to be desired.

DESI'GN (*dessin : Fr.*), in a general sense, the plan, order, representation, or construction of a building, &c., by an outline or general view of it. The word *design*, in painting, is used for the first draft of a large work, which is to be executed and finished in a more elaborate manner.

DESIPIEN'TIA (*Lat.*), in Medicine, a defect of reason, or symptomatic frenzy.

DESMOL'OGY (*desmos*, a ligament; and *logos*, a discourse : *Gr.*), that branch of anatomy which treats of the ligaments and sinews.

DES'POTISM (*despotês*, a master : *Gr.*), a form of government in which the monarch rules by his sole and uncontrolled authority.

DESPOUILLE' (despoiled: *Fr.*), in Heraldry, the whole case, skin, or slough of a beast, with the head, feet, tail, &c., so that, being filled and stuffed, it looks like the entire animal.

DESPUMA'TION (*despumatio*, from *despumo*, I skim off: *Lat.*), a term for clarifying a liquor, by skimming off its froth or excrementitious matter.

DESQUAMA'TION (*desquamo*, I scale off : *Lat.*), in Anatomy, an exfoliation of bone; also the separation of the cuticle in small scales.

DESUDA'TION (*desudatio*, from *desudo*, I sweat much : *Lat.*), in Medicine, a profuse and inordinate sweating, succeeded by an eruption of pustules called *heat-pimples*.

DESULPHURA'TION, in Chemistry, the act or operation of depriving of sulphur.

DETACH'MENT (*Fr.*, from *détacher*, to separate), a body of troops selected or drawn out from several regiments or companies, on some special service or expedition. Also a number of ships, taken from a fleet, and sent on a separate service.

DETENTS' (*detineo*, I keep back : *Lat.*), in Clock-work, those stops which, by being lifted up or let down, lock or unlock the works of a clock in striking.

DETER'GENTS, or **DETER'SIVES** (*detergeo*, I clean out : *Lat.*), medicines which have the power to remove viscid humours, or cleanse sores.

DETERMINA'TION (*determinatio*, from *determino*, I prescribe : *Lat.*), in Physic, the tendency of a body in any particular direction : thus, a determination of blood to the head, liver, &c., is a more copious or rapid flow of blood to those parts.

DETERRA'TION (*de*, from; and *terra*, the earth: *Lat.*), the uncovering of anything buried or hidden in the earth.

DET'INUE (*detineo*, I detain: *Lat.*), in Law, a personal action of contract, that lies against a person who has goods or other things which he detains or refuses to deliver up.

DET'ONA'TING POW'DER. [See FULMINATING POWDER.]

DETONA'TION (*detono*, I thunder: *Lat.*), an explosion or sudden report made by the percussion and inflammation of certain combustible substances.

DETRI'TUS (rubbed down: *Lat.*), in Geology, the fragments removed by natural agencies from the surfaces of rocks.

DEU'TERO-CANON'ICAL (*deuteros*, second; and *kanonikos*, canonical: *Gr.*), in Theology, a term applied to certain books of Scripture which were added to the canon after the rest, either because they were not written till after the canon was compiled, or in consequence of some controversy in regard to their canonicity. A canon was drawn up in the time of Esdras, when some books were put upon it which were not on the canon made before the captivity: thus, Daniel. The apocryphal books, considered as canonical by the Roman Catholic church—Maccabees, for example—were not written until after the Jewish canon was settled.

DEUTERON'OMY (*deuteros*, the second; and *nomos*, law: *Gr.*), one of the sacred books of the Old Testament, or the fifth book of the Pentateuch.

DEUTOX'IDE (*deuteros*, the second: *Gr.*; and oxide), in Chemistry, a substance oxidized in the second degree.

DEVELOP'MENT. In order to become thoroughly acquainted with the nature of an organism, it is necessary to study its life-history, and to trace its development as it passes from the embryonic to the adult condition. Morphology, it has been said, teaches us what an animal is, physiology what it does, the study of development what it was, and how from what it was it came to be what it is. This study is also necessary for the determination of its homologies [see HOMOLOGY], because it is not always safe to infer homology in organs from a correspondence in structure and position. An examination of the organs in their simplest state, and in the stages they pass through, is required to determine the point with perfect certitude. A comparison of the forms of organized beings in past times with one another, and with those now existing, has led some naturalists to conceive that there has been a gradual passage from one form to another, that is, from beings of a lower to those of a higher grade; in other words, that the influence of external circumstances acting through a long lapse of ages upon beings possessing indefinite variability, has changed the earlier less complex forms of life into forms of greater complexity. It is a fact that existing beings of the highest type now pass during their lives from a structure of the greatest simplicity to one of the greatest complexity; and it has been thought that the study of fossil remains proves that the history of organic life, from its first appearance on the planet to the present day, has pursued an analogous course. This is the theory of progressive development.

DEVI'CE (*deviser*, to invent: *Fr.*), in Painting, an emblem or representation of anything, with a motto subjoined, or otherwise introduced.——In Heraldry, a name common to all figures, ciphers, characters, rebuses, mottoes, &c., which, by allusions to the names of persons, families, &c., denote their qualities, nobility, or the like. Badges, impresses, and devices were very commonly used in England from the reign of Edward I. to that of Elizabeth, when they began to be rare.

DEVI'SE (*deviser*, to will: *Fr.*), in Law, is the disposition of real estate by will; being distinguished from a gift of personal estate, which is termed a bequest. The person to whom a devise is made is called a *devisee*.

DEVO'NIAN, or *Old Red Sandstone System*, in Geology, a member of the Palæozoic series. It is divisible into an upper and a lower group. Parts of each are developed in Scotland and the south-west of England. In one of the beds in Scotland, belonging to the upper division, remains of the earliest reptile yet discovered have been found. The Devonian series is interposed between the Silurian and Carboniferous systems.

DEW (*thau*: *Germ.*), the moisture which rises into the atmosphere during the day, and is afterwards deposited on the earth in gentle drops during the night. The air, when heated during the day, is capable of holding a larger quantity of water in solution, as vapour, than when cooled during the night, the low temperature of which causes some of the water to separate. The separated particles uniting, form drops of dew. When the night is cloudy, the surfaces on which the dew would be deposited are not sufficiently cooled down for the purpose, since the clouds give back some of the heat which passed off by radiation.

DEW'-POINT, in Meteorology, that point of temperature at which, if the air is cooled down to it, dew will begin to be formed, the air containing just enough of the vapour of water to saturate it at that temperature.

DEX'TER (*dextra*, the right hand: *Lat.*), the right, or on the right hand or side; as, the *dexter point*, in Heraldry, by which is meant the right-hand side of the escutcheon.

DEX'TRINE, a soluble substance dealt in commercially as British gum, and used in the arts as a substitute for gum. It is obtained from potato starch, by boiling it with an acid. The substance called DIASTASE has also the property of converting starch into dextrine, and at a much lower temperature than that of boiling water. It is simply starch under a new form, having the same chemical composition. The name dextrine was given to it on account of its twisting the plane of polarisation towards the *right* hand.

DEY (*dai*, a maternal uncle: *Turk.*), the title of the supreme governor in Tunis, and the other Barbary states.

DIABE'TES (*Gr.*, from *diabaino*, I stride), in Medicine, a morbid discharge of urine containing sugar.

DIACAUS'TIC CURVE (*diakaio*, I heat to excess: *Gr.*), in the higher Geometry, a curve which touches the rays from a luminous point after they have been refracted by passing through a curved medium.

DIACHRIS'TA (*diachristos*, anointed: *Gr.*), medicines applied to the fauces, palate, &c., for the abstersion of phlegm.

DIACH'YLON (*diachulos*, very juicy: *Gr.*), in Medicine, a plaister formed of the juices of several plants, and formerly very much esteemed. The word is at present used to express a plaister made by boiling hydrated oxide of lead with olive oil.

DIACOUS'TICS (*diakouo*, I hear through: *Gr.*), the refraction of sound, caused by its passing through media of different densities.

DIA'CRISIS (a deciding: *Gr.*), in Medicine, the act of distinguishing diseases from one another by their symptoms.

DIADEL'PHOUS (*dis*, twice: and *adelphos*, a brother: *Gr.*), in Botany, a term given to stamens when their filaments are united into two bundles, as is the case with many leguminous plants. Linnæus formed an order of such plants, and called it *Diadelphia*.

DI'ADEM (*diadēma*, from *diadeo*, I bind round: *Gr.*), anciently a head-band or fillet worn by kings, as a badge of royalty. It was made of silk, thread, or wool, and was put round the temples and forehead, the ends being tied behind, and let fall on the neck. In modern usage, the mark of royalty worn on the head.——DIADEM, in Heraldry, a term applied to certain circles or rims, serving to enclose the crowns of sovereign princes.

DI'ADROM (*diadromē*, a running across; *Gr.*), the time in which the vibration of a pendulum is performed.

DIÆ'RESIS (*diairesis*, a dividing: *Gr.*), in Surgery, an operation serving to divide and separate a part when its continuity is a hindrance to the cure.——DIÆRESIS, in Grammar, the division of one syllable into two, which is usually denoted by two dots over a letter, as in *aulaï* for *aulæ*. Such dots placed over contiguous vowels indicate that they are to be severally pronounced, and not blended into a diphthong.

DIAGNOS'TICS (*diagnostikos*, able to distinguish: *Gr.*), in Medicine, a term applied to those signs which indicate the state of a disease, its nature and cause, the symptoms by which it is known or distinguished from others. When the diagnostics are common to several diseases, they are called *adjunct*; when they always attend a particular disease, the word *pathognomonic* is used.——DIAGNOSTIC SIGNS, in Botany, the signs or characters by which one order is distinguished from others, one genus from others, &c.

DIAG'ONAL (*dia*, through, and *gōnia*, an angle: *Gr.*), in Geometry, a right line drawn across a quadrilateral figure from one angle to another; it is by some called the *diameter* of the figure.

DI'AGRAM (*diagramma*, from *diagrapho*, mark out by lines: *Gr.*), a geometrical delineation, used for the purpose of demonstrating the properties of any figure, as a square, triangle, &c.

DI'AL, or SUN'-DIAL (*dies*, the day, *Lat.*), an instrument for ascertaining the hour of the day by means of the shadow of the sun. It consists of a plane surface, on which lines are drawn in such a manner that the shadow of a wire, or the upper edge of another plane, erected perpendicularly on the former, may show the true time of the day. The projecting body which casts the shadow is called the *style*, or *gnomon*. It must be parallel to the earth's axis, and its plane, when it is a plate of metal instead of a thin rod, must be perpendicular to the terrestrial equator. The style may be made to throw a shadow on a horizontal or other plane; and the dial will be termed *horizontal*, *vertical*, or *inclined*, according to this circumstance. The horizontal dial is the most common: the vertical is the next generally used. The vertical may be turned towards the north, south, &c., and then the dial will be *north*, *south*, &c. If the dial were at right angles to the style, that is, parallel to the plane of the earth's equator, every 15° the shadow travelled round it would be equal to an hour of time, and the angles made by the *hour lines* with each other would be easily found, since they would all be equal. The angles formed by the hour lines of any other dial may, however, be determined without difficulty by means of a good terrestrial globe, or by calculation. In the *polar dial*, which faces due east or due west, and is in the plane of the meridian, the hour lines are parallel.

DI'ALECT (*dialektos*, from *dialego*, I use the language of a particular district: *Gr.*), the form or idiom of a language, peculiar to a province or any particular part of a country. The dialects of Greece are a subject of study to linguists, specimens of several of them having been preserved in the literature. The principal were the Attic, Ionic, Poetic, Æolic, and Doric, which were used either separately or intermixed.

DIALEC'TICS (*dialektikos*, skilled in argument: *Gr.*), that branch of logic which teaches the art of reasoning.

DIAL'LAGE (*diallagē*, an interchange: *Gr.*), a mineral of variable composition, consisting of silica, with lime, magnesia, and other bases. It is usually found of a lamellar or foliated structure. With felspar it forms diallage rock or gabbro.

DI'ALLING SPHERE, an instrument made of brass, with several semicircles sliding over each other upon a movable horizon; serving to show the nature of spherical triangles, and to give a correct method of drawing dials on all sorts of planes.

DIAL'OGISM (*dialogismos*, a conversation: *Gr.*), in Rhetoric, the soliloquy of persons deliberating with themselves. It is also, in a more extensive sense, taken for discourse in general, whether held by a person alone, or in company with others.

DI'ALOGUE (*dialogos*, from *dialegomai*, I converse with: *Gr.*), a verbal or written discourse between two or more persons.

DIAL'YSIS (*dialusis*, from *dialuo*, I part asunder: *Gr.*), a mark or character, consisting of two points, placed over one of two vowels, as *mosaic*, to separate the parts of the diphthong, and show that they must be sounded distinctly. [See DIÆRESIS.]——In Rhetoric, a figure of speech in which several words are placed together without the aid of a conjunction, as *veni, vidi, vici.*——In Medicine, a term denoting great relaxation or weakness of the limbs.——In Physics, it has been found that substances in a state of solution pass through a membrane with different degrees of rapidity according to their nature. Thus, if a mixture of a solution of gum arabic, and a solution of common salt, be placed upon a stretched sheet of parchment, the saline solution will pass through sooner than the gum. With reference to this property, Prof. Graham has divided all soluble substances into *colloids* (*colla*, glue: *Gr.*), and *haloids* (*hals*, salt: *Gr.*). This discovery has been turned to practical account in the separation of the constituents of mixtures of the two classes of substances.

DIAMAGNET'IC (*dia*, through: *Gr.*), an epithet applied to bodies which are repelled by the poles of a magnet, and which, when freely suspended between the poles of a magnetic, will arrange themselves, if of an elongated form, across the lines of force. *Paramagnetic* (*para*, with: *Gr.*) bodies are the reverse of these, and set themselves along, not across, the lines of magnetic force.

DIAM'ETER (*diametros*, from *diametreo*, I measure through: *Gr.*), in Geometry, a right line passing through the centre of a circle or other curvilinear figure, and terminated at each extremity by the circumference. It thus divides the circle into two equal parts, and is the greatest chord; hence we have a method of describing a semicircle upon any line, by assuming its middle point for the centre. The diameter of a circle is to the circumference as 1 to 3·1416, or as 7 to 22 nearly. The square of the diameter multiplied by ·7854 is the area. The cube of the diameter of a sphere multiplied by ·5236, gives the solid contents.

DI'AMOND (a corruption of *adamant*, from *adamas*: *a*, not; and *damao*, I subdue – on account of its hardness: *Gr.*), the most valuable and the hardest of gems. When pure, it is perfectly clear and pellucid, and is eminently distinguished from all other substances by its vivid splendour and the brightness of its reflections. Though found of different shapes, and sometimes tinged with several colours, yet it ever bears the same distinguishing characters. The largest diamond ever known is probably that of the rajah of Mattan, in the East Indies. It is of the purest water, weighs 367 carats, or, at the rate of 4 grains to the carat, upwards of 3 ounces troy. It is shaped like an egg. A governor of Batavia offered 150,000 dollars, two ships of war with their ammunition and guns, and a certain number of great guns, with powder and shot, for it. But the rajah refused to part with it at any price. The Mogul diamond, under the name of *Koh-i-noor* (mountain of light), is in the possession of the queen of England. Its history is supposed to reach back about 4000 years. It has been recently re-cut, and now weighs $186\frac{1}{16}$ carats. A diamond belonging to the emperor of Russia weighs 193 carats: it is of the size of a pigeon's egg. The Regent or Pitt diamond, in the possession of the French government, weighs 136 carats; and one belonging to the court of Portugal 120 carats. The value of a wrought diamond is found by ascertaining its weight in carats, doubling it, squaring the result, and multiplying what is obtained into 2*l.* Thus, if a diamond weighs 5 carats: twice 5 are ten, ten times 10 are 100, 100 times 2*l.* are 200*l.* This rule does not hold when the diamond becomes large, on account of the fewness of purchasers. A very trifling flaw greatly lowers the commercial value of a diamond. The places whence diamonds are brought are Borneo and Golconda, Bengal, and the Brazils. In the last-mentioned country the gem appears to have been originally found in the metamorphic quartzo-schistose rock, constituting the mountains of the Diamond district in southern Brazil. It, is, however, almost invariably obtained by washing from a loose gravel, formed by the disintegration of the metamorphic rock, or from a conglomerate chiefly composed of gravel set in a ferruginous cement. These gems consist of pure carbon, and, as the hardest tools make no impression on them, they are cut and ground by the powder of their own substance. In the experiments of modern chemists, the diamond has been reduced to carbonic acid by combustion with oxygen, and, like carbon, it is capable of changing iron into steel. Diamonds are valuable for many purposes. Their powder is the best for the lapidary and gem engraver, and more economical than any other material for cutting, engraving, and polishing hard stones. Glaziers use them, set in a steel socket, and attached to a small wooden handle, for cutting glass. It is very remarkable, that only the point of a natural crystal can be used; cut or split diamonds scratch, but the glass will not break along the scratch, as it does when a natural crystal is used. The diamond has also of late years become an article of great value to engravers, particularly in drawing or ruling lines, which are afterwards to be deepened by aqua fortis, for which steel points, called etching needles, were formerly used.——ROUGH DIAMOND, the stone as it comes from the mines.——ROSE DIAMOND, one which is quite flat underneath, with its upper part cut in numerous little faces, usually triangles, the uppermost of which terminate in a point.——TABLE DIAMOND, one which has a large square face at top, encompassed with four smaller.——BRILLIANT DIAMOND, one which is cut in faces both at top and bottom, and whose table or principal face is flat. In cutting diamonds the first step is to cement them at the ends of two pieces of wood, which are held in the hands and rubbed together. The dust thus produced is carefully preserved for the purpose of polishing. The diamond is then embedded in soft metal, and in this state is brought to bear at the proper angle upon a horizontal plate of soft iron, called a skieve.

set in rapid revolution, the plate having been first charged with diamond dust mixed with oil. Each facet is thus separately formed and polished.

DI'AMOND BEET'LE, a coleopterous insect, a member of the family *Curculionidæ*. The *elytra*, or wing cases, are very brilliant, and fragments are often mounted for examination by the microscope.

DIA'NA, TREE OF (*Dianæ arbor: Lat.*), a name given by the old chemists to the crystallized silver which forms when mercury is put into a solution of nitrate of silver.

DIAN'DRIA (*dis*, twice; and *anēr*, a male: *Gr.*), the second class of the Linnæan system of plants, containing those which have two stamens.

DIANŒ'A (*dianoia*, a thought: *Gr.*), in Rhetoric, a figure of speech, importing a serious consideration of the matter in hand.

DIAN'THUS (*dianthēs*, variegated; literally, flowering twice: *Gr.*), in Botany, a genus of plants, nat. ord. *Silenaceæ*, including the various species of pink and carnation.

DIAPA'SON (*Lat.*: from *dia*, through; and *pasōn*, all: *Gr.*—that is, through all the notes of the octave: a concord consisting of a note and its octave), in Music, an interval, which most authors who have written upon the theory of music use to express the octave of the Greeks. The diapason is the first and most perfect of the concords: if considered simply, it is but one harmonical interval; though, if considered diatonically, by tones and semitones, it contains seven degrees.——**Diapason**, the fundamental or standard scale by which musical instruments are made.——**Diapason Stop**, that which indicates the power of an organ, by the length of its longest pipe; as of 8, 16, or 32 feet.

DIAPEN'TE (*dia*, through; and *pente*, five: *Gr.*, a concord consisting of a note and its fifth), in Music, an ancient term signifying a fifth; an interval making the second of the concords.——In Medicine, a composition of five ingredients.

DI'APER (*d'Ypres: Fr.*, from being originally made at Ypres), a kind of figured linen cloth, much used for towels and napkins.

DIAPH'ANOUS (*diaphanēs*, from *diaphaino*, I let a thing be seen through: *Gr.*), an appellation given to all transparent bodies, or such as transmit the rays of light. It is synonymous with *translucent*, but differs from *transparent*, since it does not allow the *forms* of objects to be seen.

DIAPH'ORA (a difference: *Gr.*), in Rhetoric, a figure of speech, in which a word, when repeated, is taken in a different sense from that in which it was first used.

DIAPHORE'SIS (*Gr.*, from *diaphoreo*, I carry off), in Medicine, augmented perspiration.

DIAPHORE'TICS (*diaphorētikos*, from same: *Gr.*), medicines which promote perspiration.

DI'APHRAGM (*diaphragma*, literally a partition wall: *Gr.*), in Anatomy, a large muscular membrane or skin placed transversely in the trunk, and dividing the thorax or chest from the abdomen.

DIAPOR'ESIS (perplexity: *Gr.*), in Rhetoric, a figure expressive of the speaker's doubt or hesitation as to the manner in which he should proceed in his discourse, the subjects he has to treat of being all equally important.

DIARRHŒ'A (*diarrheo*, I flow through: *Gr.*), a disorder which consists in a frequent and copious evacuation from the intestines.

DIARTHRO'SIS (a separation: *Gr.*), in Anatomy, a kind of juncture of the bones, in which there is a perceptible motion.

DI'ARY (*dies*, a day: *Lat.*), a register of daily occurrences and observations; or an account of what passes in the course of a day.

DI'ASPORE (*diaspora*, a scattering: *Gr.*), a laminated mineral, consisting of alumina, water, and oxide of iron. A small fragment decrepitates when heated, and is dispersed in numerous particles; whence the name.

DI'ASTASE (*diastasis*, a separation: *Gr.*), a peculiar azotised substance, formed in barley and other grains during germination from the gluten or vegetable albuminous matter. This substance has the effect of converting starch into dextrine, and ultimately into grape sugar. It is precipitated from an infusion of bruised malt by alcohol. When malt is mashed with raw grain, its diastase changes the starch of the grain into sugar.

DIAS'TASIS (a separation: *Gr.*), a term used by ancient Physicians for a distension of the muscles, or separation of the bones.

DIASTE'MA (*diastēma*, an interval: *Gr.*), in Rhetoric, a modulation of the tones of the voice, by marking with precision the intervals between its elevation and depression.——In *Music*, a space or interval.

DIAS'TOLE (*Gr.*), among Physicians, a dilatation of the heart, auricles, and arteries, during the process of circulation: it is opposed to *systole*, a contraction of the same parts.——In Grammar, a figure of prosody, by which a syllable naturally short is made long.

DI'ASTYLE (*diastulos*: from *dia*, asunder; and *stulos*, a column: *Gr.*), an edifice in which three diameters of a column are allowed for the intercolumniations.

DIASYR'MUS (*diasurmos*, a mocking: *Gr.*), in Rhetoric, a kind of hyperbole, being an exaggeration of something low and ridiculous; ironical praise.

DIATES'SARON (*diatessarōn*: from *dia*, through; and *tessarōn*, four: *Gr.*: a concord consisting of a note and its fourth), in Music, a concord or harmonic interval, composed of a major tone, a minor tone, and one major semitone.——In Theology, the four gospels.

DIATHER'MANOUS (*dia*, through; *thermos*, hot: *Gr.*), a term applied to those substances which transmit radiant heat. Substances do this in different degrees, and some refuse to transmit any. Thus, glass, through which light passes readily, is opaque to heat; whilst rock-salt, through which light will not penetrate, permits heat to pass.

DIATOMA'CEÆ (*dia*, through; *tomos*, a section: *Gr.*), a large tribe of microscopic vegetables, growing in salt and fresh water, and usually parasitic upon other vegetables. They were formerly confused with animal infusoria, but are now universally considered vegetable organisms, notwithstanding the curious motions which some species exhibit. They form a division of the great order of Algæ. Some of the species are solitary, whilst others are grouped into lines and membranes. In consequence of the variety of their shapes, and of a large portion of each individual consisting of silex forming a hollow case bearing elegant patterns made by striæ, they have been sought after by microscopists, and they have been extensively studied. They retain their beautiful configuration even after boiling in strong acid, a process adopted in preparing them for inspection, in order to get rid of the vegetable matter. These silicious cases are found fossil in enormous quantities in various parts of the world.

DIATON'IC (*diatonos*: from *dia*, through; and *tonos*, a tone: *Gr.*), in Music, whatever proceeds by tones and semitones, both ascending and descending. Thus we say, a *diatonic* series; a *diatonic* interval; *diatonic* melody or harmony.

DI'CAST (*dikastēs*, from *dikē*, justice: *Gr.*), in Ancient Greece, an officer answering nearly to our juryman.

DICE (*dés*: *Fr.*), cubical pieces of bone or ivory with dots on their faces ranging from one to six. They are employed in various games, and are of great antiquity. One tradition says that they were invented by Palamedes, at the siege of Troy, for the amusement of the officers and soldiers.

DICHOT'OMOUS (*dichotomos*, divided equally into two: *Gr.*), in Botany, an epithet for a stem or branch that divides and redivides into two throughout.

DICHOT'OMY (*dichotomia*: from *dicha*, in two; and *temno*, I cut: *Gr.*), in Astronomy, that phase or appearance of the moon, when she is bisected, or shows just half her disk. In this situation the moon is said to be in her quadrature.

DICHRO'MATISM, or DICHRO'ISM (*dis*, double; and *chrōma*, a colour: *Gr.*), a property, in certain crystallized bodies, of exhibiting two distinct colours, according to the direction in which the light is transmitted through them. Dichromatism is also exhibited by certain liquid solutions. For instance, if a few drops of cochineal be mixed with water in a tall champagne glass, the upper part will be red, the lower of a lavender tint. Again, a strong solution of acetate of chromium is red, but if diluted with water it becomes green.

DICLI'NAL, or DICLI'NOUS (*dis*, twice; *kline*, a bed: *Gr.*), in Botany, an epithet for plants which have the stamens and pistils in distinct flowers.

DICOTYLE'DONOUS (*dis*, double: *Gr.*; and *cotyledon*), in Botany, an epithet applied to plants which have an embryo or germ with two seed-lobes or COTYLEDONS. Almost all exogenous plants are dicotyledonous, whilst endogenous plants are monocotyledonous, that is, with only a single seed-lobe attached to the embryo.

DICTA'TOR (*Lat.*, from *dicto*, I order), in Ancient Rome, a magistrate created in times of exigency and distress, and invested with very great power. He had authority to raise or disband troops, and to make war or peace, and that without the consent of either the senate or the people. The usual duration of his office was only for six months, during which time all the ordinary magistrates, except the tribunes of the people, acted under his authority. Whenever he appeared in public, he was attended by twenty-four lictors, or double the number allowed a consul. Extensive, however, as his power was, he was nevertheless under some restrictions: he could not, for instance, spend the public money arbitrarily, leave Italy, or enter the city on horseback. The choice of a dictator was not, as in the case of other magistrates, decided by the popular voice, but one of the consuls appointed him by command of the senate; and the dictator always nominated his *master of the horse*, unless that officer had been named by the senate. A dictator was also sometimes named for holding the *comitia* for the election of consuls, and for the celebration of public games, &c. For the space of four hundred years this office was regarded with veneration, till Sylla and Cæsar, by becoming perpetual dictators, converted it into an engine of tyranny, and rendered the very name odious.

DIC'TIONARY (*dictionarium*: *Mod. Lat.*; from *dictio*, a word or expression: *Lat.*), in its first and most obvious sense, signifies a vocabulary, or alphabetical arrangement of the words in a language, with their definitions. But, now that the various branches of science have become so much extended, the term is also applied to an alphabetical collection of the terms of any art or science, with such explanations or remarks as the writer may deem necessary for their elucidation.

DIDAC'TIC PO'ETRY (*didaktikos*, instructive, from *didasko*, I teach: *Gr.*), that species of metrical composition which has *instruction* for its primary object. But though its ostensible aim is to impart instruction in verse, it may and often does attain an animated and elevated character.

DIDAC'TYLOUS (*dis*, double; and *daktulos*, a finger: *Gr.*), in Zoology, an epithet for having two fingers or toes.

DIDECAHE'DRAL (*dis*, twice; *deka*, ten; and *hedra*, a base: *Gr.*), in Crystallography, having the form of a decahedral (or ten-sided) prism, with pentahedral (or five-sided) summits.

DIDODECAHE'DRAL (*dis*, twice; *dōdeka*, twelve; and *hedra*, a base: *Gr.*), in Crystallography, having the form of a dodecahedral (twelve-sided) prism, with hexahedral (six-sided) summits.

DIDYNA'MOUS (*dis*, double: and *dunamis*, power: *Gr.*), in Botany, an epithet for flowers which have two of their stamens longer than the other two, as amongst the *Labiatæ*. Linnæus formed such flowers into a class which he named *Didynamia*.

DIE (*dé*: *Fr.*), the stamp with which a piece of prepared metal is impressed in coining, &c. Coins are generally completed by one blow of the coining-press; and at the Royal Mint these presses are so contrived, as to strike, upon an average, sixty blows in a minute Medals are usually in very high relief, and the effect is produced by a succession of blows.

DI'ES (a day: *Lat.*). In Law, days are distinguished into *Dies juridici*, days on which the court sits for the administration of justice; *Dies non* (juridici), days on which no pleas are held in any court of justice; and *Dies datus*, a day, or time of respite, given by the court to the defendant in a cause.——Among the Romans, days were distinguished in a variety of ways; the most important of which were *Dies nefasti* or *Dies atri*, days devoted to religious purposes, on which it was unlawful to do any public business *Dies fasti*, similar to the *Dies juridici* of modern times; and *Dies feriati*, like our *Dies non juridici*, when the courts were shut.——DIES CANICULARES, in Astronomy, the *dog days*.——DIES CRITICI, in Medicine, days in which some diseases are supposed to arrive at a crisis

DIE'SIS (*Gr*: the least subdivision in music), that division of a tone less than a semitone; or an interval consisting of a less or imperfect semitone.

DI'ET (*diaita*, maintenance: *Gr*), food regulated by the rules of medicine The best way to preserve health is to live upon plain simple food, lightly seasoned, and in a quantity agreeable to the age, strength of the stomach, sex, and constitution. Generally, indeed, hunger shows the best time of eating, as thirst does of drinking; but if either be indulged to excess, our health and spirits will both suffer In summer, when the fluid parts quickly evaporate, the diet should be moist, cooling and easy of digestion, to repair the loss with the greater speed: but in winter, the stomach will admit of more solid and heating aliments. The golden rule, however, seems to be, to use moderation both in eating and drinking; and it is indisputable that early habits of self-command, in the regulation of the appetite, are of paramount importance to all who would enjoy good health, and attain a vigorous old age.——DIET (*Diät* · *Germ.*), in German politics, a convention of princes, electors, ecclesiastical dignitaries, and representatives of free cities, to deliberate on the affairs of the empire.

DIETET'ICS (*diaitētikos*, relating to diet: *Gr.*), the rules relating to diet framed with a view to healthy persons and to invalids.

DIEU ET SON ACTE (God and his act: *Fr.*), a maxim in old law, that the act of God shall not be a prejudice to any man.

DIEU ET MON DROIT (God and my right: *Fr.*), the motto of the royal arms of England, first assumed by king Richard I. to intimate that he did not hold his empire in vassalage to any mortal It was afterwards assumed by Edward III., and was continued without interruption to the time of William III., who used the motto *je maintiendray*, though the former was still retained upon the great seal. After him queen Anne adopted the motto *semper eadem*, which had been before used by queen Elizabeth; but since Anne's time, *Dieu et mon droit* has been the royal motto.

DIF'FERENCE (*differentia Lat.*), in Logic, an essential attribute belonging to any species that is not found in the genus; being the formal or distinguishing part of the essence of a species.——In Arithmetic, the remainder, when one number has been subtracted from another.——DIFFERENCES, in Heraldry, certain additions to a coat of arms, serving to distinguish one family from another, or a younger branch from the elder or principal branch. The eldest son bears a *label of three points*; the second, a *crescent*; the third, a *mullet*; the fourth, a *martlet*; the fifth, an *annulet*, or small ring; the sixth, a *fleur de lis*; the seventh, a *rose*; the eighth, a *cross moline*; the ninth, a *double quatrefoil*. The family of the second son repeat these differences on their own paternal mark of filiation:—thus, the second son's first son bears a crescent ensigned with a label; and so on of the rest. Females do not bear differences.

DIFFEREN'TIAL CAL'CULUS, a most important branch of the higher mathematics, invented by Leibnitz, and brought to perfection by James and John Bernoulli. The method of fluxions, which is the same as the calculus, except as to notation and the mode of explaining the principles, was discovered some years before by Newton. The object of the calculus is to find the ratios of the differences of variable magnitudes, on the supposition that these differences become infinitely small. Every magnitude which forms the subject of mathematical reasoning may be increased or diminished without limit. We may therefore always conceive a quantity to become so great as to exceed, or so small as to be less than, any assignable finite quantity of the same nature as itself. It is not necessary to attribute a physical existence to either of them The infinitely small quantities, which are considered in the differential calculus, are called *differentials* The differential of a variable quantity is 'the infinitely small difference between two successive states of the same variable;' and the object of the *calculus* is to find this for all possible cases.

DIF'FORM (*dis*, signifying separation; and *forma*, a form: *Lat.*), in Botany, an epithet for leaves or flowers which do not correspond in size or proportion: the opposite of *uniform*.

DIF'FRACTION OF LIGHT When a beam of light, admitted into a dark chamber, is received on a screen, and a small object is placed in its path, there will be seen a number of coloured fringes external to the shadow, and if the object be a narrow one, like a piece of thin wire, there will also be fringes of colour in the shadow, whilst the middle will be luminous, as if the object were perforated. This phenomenon is called diffraction, and it arises from the interference of the undulations of light, passing on opposite sides of the object which throws the shadow.

DIF'FUSION OF GASES. Two gases, not acting chemically on each other, will intermix, if allowed to do so, even against the action of gravity. Thus if a vessel be separated into two divisions by a partition of dry plaster of Paris, and one division filled with oxygen, the other with hydrogen, the heavier oxygen will penetrate upwards, and the lighter hydrogen downwards, through the porous partition, until the two are uniformly mixed. Hence we see how in the economy of nature the atmosphere is preserved in a uniform state, as regards the proportions of its constituent gases, and the accumulation of deleterious vapours in towns is prevented.

DI'GAMMA, an ancient letter of the Greeks which is thought to have been equivalent to our W. It was finally dropped from the alphabet. It has given rise to much learned dissertation.

DI'GEST (*digestus*, a distributing: *Lat.*), in Law Literature, a collection of judicial decisions arranged under distinct heads. The most celebrated *digest* was that made by order of the emperor Justinian, which was published A.D. 533. This was the spirit of several thousand volumes containing judicial decisions and the opinions of the most learned jurisconsults. It was divided into 50 books, and was termed *Digesta* or *Pandectæ*.

DIGES'TER (*digesteur: Fr.*), a strong metallic vessel, with a tight lid and a safety valve, for subjecting bodies to the action of high-pressure steam.

DIGES'TION (*digestio: Lat.*), that process by which the nutritive portion of food is elaborated and prepared to be converted into blood. This is effected in the stomach and the intestines. The stomach is lined with glands, one set of which secrete a solvent fluid called the gastric juice, and another set secrete an albuminous fluid. When the food has become reduced to a pulpy fluid called *chyme*, it is passed into the duodenum, the first portion of the small intestine, where the bile secreted by the liver and the pancreatic juice secreted by the pancreas are mingled with the aliment, and it there becomes completely elaborated, the nutritious being separated from the rejected portion. The milky liquid called *chyle* is the result, and this is carried into the blood by certain very minute vessels, called lymphatics or lacteals, which are numerously distributed in the walls of the intestine, and are in communication with the veins. The residue of the product of digestion is carried on to the great intestine, and is afterwards ejected. In the lower animals the process is much less complicated than amongst the vertebrata. In many it does not advance beyond the making of chyme, which is circulated through the body without further elaboration.——DIGESTION, in Chemistry, the exposing of bodies to the action of moderately warm water.

DIGES'TIVE (*digestio*, a digesting: *Lat.*), in Medicine, any preparation which increases the energy of the stomach, and aids digestion.——In Surgery, an application which ripens an ulcer or wound, or disposes it to suppurate.

DI'GIT (*digitus*, a finger: *Lat.*), in Astronomy, the twelfth part of the diameter of the sun or moon: a term used to express the quantity and magnitude of an eclipse. Thus, an eclipse is said to be of six digits when six of these parts are hid.——Also, a measure taken from the breadth of the finger, and thus indicating the humble means originally employed in measurements, &c. It is properly three-quarters of an inch.——DIGITS, or MONADES, in Arithmetic, any one of the nine numerals, 1, 2, 3, 4, 5, 6, 7, 8, 9.

DIGITA'LIS (*Lat.*, literally pertaining to the finger, from its five-parted leafy calyx), in Botany, a genus of plants, containing the common foxglove, *D. purpurea*, and belonging to the nat. ord. *Scrophulariaceæ*. In this and some other species, there is a principle which, in a concentrated form, is poisonous. An extract is much employed to lower the action of the heart.

DI'GITATE (*digitatus*, having fingers: *Lat.*), in Botany, an epithet used when a leaf branches into several distinct leaflets like fingers; or when a simple undivided petiole connects several leaflets at the end of it.

DI'GLYPH (*digluphos*: from *dis*, twice; and *glupho*, I hollow out: *Gr.*), in Architecture, a kind of imperfect triglyph, with *two* instead of *three* channels.

DIG'NITARY (*dignitas*, a dignity: *Lat.*), in the Canon Law, an ecclesiastic who holds a dignity which gives him some pre-eminence over mere priests and canons; as a bishop, dean, archdeacon, prebendary, &c.

DI'GRAPH (*dis*, double; and *graphē*, a letter: *Gr.*), a union of two vowels, of which one only is pronounced, as in *bread*. It is essentially different from a diphthong, which consists of two vowels also, but produces a sound which neither of the vowels has separately.

DIGRES'SION (*digressio*, a going aside: *Lat.*), in Rhetoric or Literary Composition, that passage or narration which deviates from the main subject, but which has some relation to it, or may be useful by way of illustration.

DIGYN'IA (*dis*, twice; and *gunē*, a female: *Gr.*), in Botany, an order in the Linnæan system, consisting of plants that have two pistils.

DIHEXAHE'DRAL (*dis*, twice; *hex*, six; and *hedra*, a base: *Gr.*), in Crystallography, having the form of a hexahedral (six-sided) prism with trihedral (three-sided) summits.

DIKE, or DYKE (*dique: Fr.*), a mound of earth, stones, or other materials, intended to prevent low land from being inundated by the sea, &c., as the dikes of Holland.——In Geology, sheets of igneous rock, which have usually a vertical or oblique position. They have originated from the filling up of a fissure by molten rock. When the rocks at each side have disappeared through denudation, the dike is seen to stand out like a wall; whence its name.

DILAPIDA'TION (*dilapidatio*, from *dilapido*, I demolish: *Lat.*), in Law, the ruin or damage which accrues to a house in consequence of neglect.

DILATA'TION (*dilatatio*, from *dilato*, I make wide: *Lat.*), in Surgery and Anatomy, the widening the orifice of a wound, or the distension of a vessel.

DILEM'MA (*dilemma:* from *dis*, twice; and *lambano*, I take: *Gr.*), in Logic, an argument which is usually defined as a complex kind of conditional syllogism. It has commonly two divisions, which places an opponent in such a position that he cannot escape from one of two difficulties, both fatal to his own side. If he avoids the rocks, he is drawn into the whirlpool. It is sometimes called a *syllogismus cornutus*, or horned syllogism, the adversary being gored by one or other horn. When Demosthenes argued against Æschines, 'If he joined in the public rejoicings he is inconsistent; if he did not he is unpatriotic; therefore he is either inconsistent or unpatriotic,' he urged a dilemma against his opponent.

DILETTAN'TE (*Ital.*), an amateur of the fine arts.

DILETTAN'TI SOCIETY, a society established in London in 1734, and still existing, for the purpose of promoting the study of the fine arts. It has chiefly devoted itself to ancient sculpture, and has been at the expense of bringing some specimens to this country, and of publishing several volumes of illustrations, inscriptions, and travels. The society meets at the Thatched House Tavern in St. James's Street, London, where there is a collection of portraits of several eminent members, and two conversation pieces by Sir Joshua Reynolds.

DILU'VIUM (a deluge: *Lat.*), an old geological term given to boulders and superficial accumulations of gravel, sand, and mud, which were formerly attributed to the deluge of Scripture. The phenomena in question are now considered to have been produced by the action of ice.

DIMEN'SION (*dimensio*, a measuring: *Lat.*), the measure or compass of a thing. A line has one dimension, namely, length; a superficies two, length and breadth; and a solid three, length, breadth, and thickness. The word is generally used in the plural, and then denotes the whole space occupied by a body, or its size and capacity; as the *dimensions* of a room, ship, &c.

DIMINUEN'DO (*Ital.*), a term in Music of the same meaning as *decrescendo*, which see.

DIMINU'TION (*diminutio*, a lessening: *Lat.*), in Architecture, a contraction of the upper part of a column, by which its diameter is made less than that of the lower part. It generally commences from one-third of the height of the column.——**Diminution**, in Rhetoric, the exaggerating what is said, by an expression that seems to diminish it.——In Music, the imitation of or reply to a subject, in notes of half the length or value of those of the subject itself.

DIMIN'UTIVE (*diminutus*, lessened: *Lat.*), in Grammar, a word which, by means of some termination, attaches littleness to the idea contained in the original word; as, *rivulet*, a small river; *mannikin*, a little man.

DIM'ISSORY (*dimissus*, sent away: *Lat.*), dismissing to another jurisdiction.——A **Letter Dimissory** is one given by a bishop to a candidate for holy orders, having a title in his diocese, directed to some other bishop, and giving leave for the bearer to be ordained by him.

DIM'ITY, a kind of white cotton cloth, ribbed or figured. It was originally imported from India, but is now manufactured in Lancashire and various other parts of Britain.

DIOC'ESAN (*dioikesis*, a government: *Gr.*), a bishop who has charge of a particular diocese.

DI'OCESE or **DI'OCESS** (same *deriv.*), the district or circuit of a bishop's jurisdiction. The word was first used in the fourth century, when the exterior polity of the church began to be formed upon the model of the Roman empire. England, in regard to its ecclesiastical state, is divided into two provinces, viz., Canterbury and York, and each province into subordinate dioceses; the province of Canterbury contains twenty-one dioceses, and that of York three. These are divided into archdeaconries, which are subdivided into rural deaneries and parishes.

DIOCTAHE'DRIA (*dis*, twice; *octō*, eight; and *hedra*, a base: *Gr.*), in Crystallography, crystals composed of two octangular pyramids, joined base to base, without any intermediate column.

DI'ODON (*dis*, twice; and *odous*, a tooth: *Gr.*), in Ichthyology, a genus of fishes, each of whose jaws is a single and continuous dental plate. Like the Tetrodons, they have the power of inflating their bodies with air until they become globular. Their skins are frequently set with spines. They are dangerous fishes to use as food.

DIŒ'CIOUS (*dis*, double; and *oikos*, a house: *Gr.*), a term applied by botanists to those species of plants which have the staminiferous flowers on one individual, and the pistilliferous flowers on another. *Monœcious* species (*monos*, single; and *oikos*, a house: *Gr.*), are those which have also unisexual or diclinous flowers, but they are found upon the same individual. Linnæus formed two orders, *Monœcia* and *Diœcia*, for the reception of such plants.

DIOME'DEA. [See Albatross.]

DIOP'SIDE (*diopsis*, a view through anything: *Gr.*), a rare mineral, of a pale green colour, occurring in prismatic crystals, and regarded as a variety of *Augite*.

DIOP'TRICS (*dioptron*, anything through which an object is seen: *Gr.*), that branch of Optics which has reference to the light which enters and passes through transparent bodies. The phenomena of refraction, including the changes of direction which rays of light undergo in passing through prisms and lenses, fall into the department of dioptrics; and many optical instruments, such as the telescope, the microscope, the spectroscope, and the stereoscope, have been constructed according to the laws discovered by the study of this branch of optics.

DIORA'MA (*diorao*, I see through: *Gr.*), a mode of painting invented by two French artists, Daguerre and Bouton. It produces a very high degree of optical delusion, by the application of two principles. First, the spectators and the picture are placed in two different rooms, and the picture is viewed through an aperture, the sides of which are continued towards the picture, so as to prevent any object in the picture-room, except the picture itself, being seen. The only light which enters the eye is from the picture, and the latter is illuminated by a method which allows the light thrown on it to be varied, as to intensity, tint, &c, according to every difference of circumstances. Secondly, certain parts of the picture are in transparency: this allows a stream of light to be thrown from behind, which, passing through the picture, produces an extraordinary brilliancy, and a relief of the objects which is exceedingly strong and deceptive.

DIOSCO'REA. [See YAM.]

DIOS'PYROS (*dios*, celestial; and *puros*, food: *Gr.*), in Botany, a genus of trees growing in Asia, Africa, and America, nat. ord, *Ebenaceæ*, and bearing a plum-like edible fruit.

DIP, the angle made by a magnetic needle, freely suspended at its middle, with the horizontal plane at any given place on the earth's surface.——DIP, in Geology, the inclination of a stratum of rock; its amount is measured by the angle it makes with the horizontal plane. *Strike* is the direction of the stratum at right angles to the dip. The ridge of a house roof represents the strike, whilst the sloping slates represent the dip.

DIPET'ALOUS (*dis*, double: and *petalon*, a leaf: *Gr.*), in Botany, an epithet for a corolla having two petals only.

DIPHTHE'RIA (*diphthera*, parchment: *Gr.*), a peculiar condition of the mucous membrane, when, instead of secreting pus, as in the case of ordinary inflammation, lymph is poured out in large quantities, and a thick false membrane is formed over the surface. The term has been commonly applied to the disease when it attacks the mucous membrane of the throat, but it is now extended to a similar condition of the membrane lining the eyelids (*diphtheria* of the *conjunctiva*). Diphtheria of the throat is often associated with very severe constitutional symptoms.

DIPH'THONG (*diphthongos*: from *dis*, double; and *phthongos*, a voice: *Gr.*), the union of two vowels pronounced in one syllable, as *noise*, *bound*, *joint*, &c. [See DIGRAPH.]

DIPH'YLLOUS (*dis*, double; and *phullon*, a leaf: *Gr.*), in Botany, an epithet for a calyx, &c., having two leaves.

DIP'LOE (*Gr.*, from *diploo*, I double), in Anatomy, the horny or spongy substance between the tables of the skull.

DIPLO'MA (*Gr.*, from same), a written document, conferring some power, privilege, or honour. Thus an instrument or licence, given by colleges, societies, &c. to a clergyman to exercise the ministerial function; or to a physician to practise his profession, after passing examination, or being admitted to a degree. Every kind of ancient charter, donation, bull, &c., is comprehended by writers on diplomatics under this name, from the charters of the Roman emperors having been inscribed on two tablets of copper joined together so as to fold like a book.

DIPLO'MACY (from last). In its most extended signification, it embraces the whole system of negotiation with foreign states, as founded on public law, positive engagements, or custom. It is carried on by and through ambassadors, envoys, or other representatives, each state having representatives at the seat of government of every other.——It was one part of the business of the congress assembled at Vienna in 1814, to regulate the degrees of rank to which the various *diplomatic agents* were entitled: viz, 1. Ambassadors. 2. Envoys extraordinary and ministers plenipotentiary. 3. Ministers resident. 4. *Chargés d'affaires*. 5. Secretaries of legation and *attachés*. Ministers at a court are denominated the *diplomatic* body.

DIPLOMAT'ICS (from same), the science of diplomas, or of ancient writing, literary and public documents, decrees, charters, &c., having for its object the deciphering of old writings and ascertaining their authenticity, &c.

DIPLO'PIA (*diplos*, double; and *opsis*, sight: *Gr.*), in Medicine, a disease in the eye, which causes the person to see an object double or treble.

DIP'NOUS (*dipnoos*, with two breathing apertures: from *dis*, double; and *pnoos*, a breath: *Gr.*), in Surgery, an epithet for wounds which have two orifices.

DIP'PING, among Miners, the interruption or breaking off of the veins of ore, an accident often attended with much trouble before the ore can again be discovered.

DIP'PING NEED'LE, an instrument intended to show the magnetic force of the earth. It consists of a magnetic needle, having an axis at right angles to its length, and passing through its centre of gravity. It is capable, therefore, of moving freely in a vertical direction. When the instrument is placed anywhere except on the magnetic meridian, on account of one of its poles being nearer to one of the magnetic poles, and therefore more strongly attracted, than the other, it *dips*, or points downwards towards that predominating pole, and when, by means of a variation compass, it is adjusted so that its motion coincides with the plane of the magnetic meridian, it shows the direction of the *magnetic force*; and the intersections of two or more directions, formed at different places, point out the position of the *magnetic pole*. The *angle of dip* at a given place is ascertained from a graduated circle, to which the needle acts as an index; and the *force* of the magnetic attraction may be ascertained by shifting a movable weight along the raised end until the needle becomes horizontal. In some cases, the needle is made to move freely, both in a horizontal and vertical direction; in which case, a separate variation compass is not required.

DIP'SACUS (*Lat.*; from *dipsakos*, the teasel: *Gr.*), in Botany, a genus including the *Dipsacus Fullonum*, or cultivated teasel, reared in great quantities in the west of England, and employed for raising the nap upon woollen cloths by means of crooked awns upon the heads. For this purpose, these are fixed on the circumference of a large broad wheel, which turns round while the cloth is held against them

DIP'TERA (*dipteros*, with two wings from *dis*, twice, and *pteron*, a wing Gr) in Entomology, an order of insects comprising an immense number of species, of which the house fly is an example As some of this order have no wings, it is distinguished by several peculiarities drawn from other sources Behind the wings is a pair of slender bodies termed *halteres*, or balancers, which are always in motion, and are generally present even when true wings are not developed In some species, as the blow fly, *the eggs are hatched within the body of* the parent, in others as the forest fly, the larva undergoes its metamorphosis in the parent s body, and the young are excluded as *pupæ*

DIP'TYCHA, or DIP'TYCH (*diptuchos*, twofold *Gr*), in Roman Antiquity, a public register of the names of the consuls and other magistrates —— Among the early Christians tablets, on one of which were written the names of the deceased, and on the other those of the living patriarchs, bishops, &c, or of those who had done any service to the church They consisted of two leaves, which folded like a book If the register consisted of more than tw leaves, it was a *poluptuchon* (manifold)

DIPUS (*dipous* two footed from *dis* twice, and *pous*, a foot *Gr*, on account of the disproportionate development of the hinder legs), in Zoology, a genus of rodents between the squirrels and rats, and greatly resembling the kangaroo in the enormous development of the hind legs and tail The Egyptian *Jerboa* has a body eight inches long, and was known to the ancients by that name It is found in various parts of Africa, and in the eastern provinces of Siberia. It lives in burrows, in which it reposes during the day, choosing the night for its excursions, and for obtaining its food

DIPY'RE (*dipuros*, twice put in the fire *Gr* — doubly acted on by fire), a mineral occurring in minute prisms, composed of silica, alumina, and lime Before the blow pipe it becomes phosphorescent, and then fuses

DIRÆ (ill-omened *Lat.*), in the Roman divination, any unusual accidents or uncommon appearances as sneezing, stumbling, strange voices apparitions, spilling salt or wine upon the table or upon one s clothes, meeting wolves, hares, foxes, &c

DIRECT' (*directus*, straight *Lat*) in Law, an epithet for the line of ascendants and descendants in genealogical succession —— Direct, in Astronomy, a term used when a planet moves forward in the zodiac according to the natural order and succession of the signs, in distinction from *retrograde* —— In Optics, a *direct ray* is one which is carried from a point of the invisible object directly to the eye, without being turned out of its rectilinear direction by any intervening body

DIREC'TION, LINE OF (*directio*, from *dirigo*, I send in a straight line *Lat*), in Mechanics, a line along which a given force tends to move a body on which it acts thus, the line of direction of gravity is towards the centre of the earth ——Angle of Direction, the angle comprehended between the lines of direction of two conspiring forces.——Direction Word, in Printing, the word which is sometimes put at the bottom of a page, and which begins the next page

DIREC'TOR (*dirigo*, I arrange *Lat*), a person appointed to transact the affairs of a public company, as, the *director* of a bank, assurance office, &c ——Director, in Surgery, a grooved probe to direct the edge of the knife or scissors in opening sinuses or fistulæ, &c, that by means of it the subjacent nerve and tendons may remain unhurt

DIREC'TORY (*directorius*, that points to some object *Lat*), a book containing an alphabetical list of the inhabitants of a town with their places of abode Also, a book containing directions for public worship or religious services ——In France, the term *directory* was given to five officers to whom the executive authority was committed in 1795 It had the appointment and removal of the ministers of state Its policy was at first moderate and conciliatory, but at last gave great dissatisfaction After existing four years, it was overthrown by the ascendency of Buonaparte

DIRGE (*dirige Lat*) a song or tune, intended to express grief, sorrow, and mourning It is a corruption of the word *dirige*, with which the Roman Catholic service for the dead commences

DIS a prefix or inseparable particle, which generally has the force of a privative and negative as *disarm, disallow, disoblige* In some cases, however, it denotes separation, as in *distribute, disconnect* The Greek word *dis* (twice) means that anything is doubled, the last letter being sometimes cut off

DISABIL'ITY (*dis*, a privative, and *habilitas* fitness *Lat*) in Law, an incapacity under which a person labours, and which prevents him from enjoying certain legal benefits Thus an alien cannot take lands an infant cannot make valid contracts, &c It is produced in four ways viz, by the act of God of the law of the person, or of his ancestors ——*Disability* differs from *inability* in denoting deprivation of ability whereas *inability* denotes destitution of ability, either by deprivation or otherwise

DISAFFOREST, to abolish forest laws and their oppressive privileges with respect to a particular district

DISAGGREGA'TION (*dis*, privative and *aggrego*, I gather together *Lat*), the act or operation of separating an aggregate body into its component parts

DISC, or DISK (*diskos Gr*), the body and face of the sun, the moon, or a planet as it appears to us on the earth, or the body and face of the earth, as it would appear to a spectator at the moon The fixed stars are destitute of any apparent disk, even when viewed by the best telescopes ——In Optics, the magnitude of the lens of a telescope, or the width of its aperture ——Disc, in Botany, the part inside the ray of a radiated compound flower, such as is seen in the marigold or daisy.

DISCHAR'GING ROD (*décharger*, to discharge: *Fr.*), an instrument used in electrical experiments. It generally consists of metal wire with balls at the end, a joint in the middle, and a glass handle.

DISCI'PLE (*discipulus*, from *disco*, I learn: *Lat.*), one who learns anything from another: thus the followers of any teacher, philosopher, &c., are called disciples. In the more common acceptation, among Christians, the disciples denote those who were the immediate followers and attendants on Christ, of whom there were seventy or seventy-two specially selected by him; but the word is also applied to all Christians, as they profess to learn and receive his doctrines and precepts. The words *disciple* and *apostle* are often synonymously used in the gospel history; but sometimes the apostles are distinguished from disciples, as persons chosen out of their number to be the principal ministers of religion.

DIS'CIPLINE (same *deriv.*), subjection to laws, rules, order, and regulations, either in a moral, ecclesiastical, or military sense. Also that chastisement or external mortification which some religious devotees inflict on themselves.

DISCLAIM'ER (*dis*, privative; and *clamo*, I cry out: *Lat.*), in Law, a denial by a tenant of his landlord's title; or the renunciation by an executor before he has proved a will of the executorship; also in equity, a plea by which the defendant renounces all claim to the subject of the demand made by the bill.——In Patent Law, the formal renunciation in writing of something claimed in the specification.

DIS'CORD (*discordia*, from *discors*, dissonant: *Lat.*), in Music, a union of sounds which the ear receives with dislike, whether they are produced together or in succession. A *discord* may, however, be happily introduced into a musical composition; in which case, it adds to the pleasure produced by the chord into which it is resolved, and for which the discordant note is a preparation.

DIS'COUNT, in Commerce, an allowance made on a bill or any other debt not yet become due, in consideration of immediate payment; or any deduction from the customary price of an article. The discounts at banking establishments are usually the amount of legal interest paid by the borrower, and deducted from the sum borrowed at the commencement of the credit. To discount a bill of exchange, signifies to pay it before it is due, deducting a certain part of the sum for the accommodation

DISCOV'ERY (*découvrir*, to discover: *Fr.*), in Law, the disclosing or revealing anything by a defendant in his answer to a bill filed against him in a court of equity.

DISCRE'TIVE (*discretus*, separated: *Lat.*), in Logic, an epithet applied to a proposition expressing some distinction, opposition, or variety, by means of *but*, *though*, *yet*, &c.; as, men change their dresses, *but* not their inclinations.

DIS'CUS (*Lat.*; from *diskos*: *Gr.*), in Antiquity, a quoit made of iron, and sometimes perforated in the middle. The players did not try to hit a mark, but to throw the quoit as far as they could.

DISCU'TIENT (*discutio*, I dispel: *Lat.*), a medicine or application which disperses any coagulated fluid, or tumour.

DISE'ASE, any state of a living body in which the natural functions of the organs are interrupted or disturbed, either by defective or preternatural action. A disease may affect the whole body, or a particular limb or part of the body; and such partial affection of the body is called a *local* or *topical* disease.

DISINFEC'TION (*dis*, privative; and *infectus*, tainted: *Lat.*), in Medicine, purification from infected matter.

DISINTEGRA'TION (*dis*, privative; and *integratio*, a making whole: *Lat.*), the act of separating *integrant* parts of a substance, as distinguished from decomposition or the separation of *constituent* parts. Geologists speak of the disintegration of rocks under atmospheric influences.

DISJUNC'TIVE (*disjungo*, I separate: *Lat.*), in Grammar, an epithet for conjunctions which unite sentences, but separate the sense, as *but*, *nor*, &c.——A DISJUNCTIVE PROPOSITION, in Logic, is one consisting of two or more categorical parts connected disjunctively, and therefore stated alternatively, as 'it was day or night.'——A DISJUNCTIVE SYLLOGISM is one in which the major proposition is disjunctive; as 'the earth moves in either a circle or an ellipsis; but it does not move in a circle, therefore it moves in an ellipsis.'

DISLOCA'TION (*dis*, privative; and *locatio*, a placing: *Lat.*), a displacement of one part with reference to another.

DISMEM'BERED (*démembrer*, to dismember: *Fr.*), in Heraldry, an epithet for birds that have neither feet nor legs; and also for lions and other animals whose members are separated

DISPATCH'ES (*dépêches*: *Fr.*), in Politics, a packet of letters sent by a public officer, on some affair of state or public business.

DISPENSA'TION (*dispensatio*: *Lat.*), in Ecclesiastical affairs, the granting of a licence, or the licence itself, to do what is forbidden by laws or canons, or to omit something which is commanded. Also, a system of principles and rites enjoined: as the *Mosaic dispensation*, that is, the Levitical law and rites.

DISPEN'SATORY (*dispensatorius*, relating to management: *Lat.*),.or PHARMACOPŒ'IA, an authorized volume containing directions for compounding medicines.

DISPER'MOUS (*dis*, twice; and *sperma*, a seed: *Gr.*), in Botany, an epithet for fruits which contain only two seeds.

DISPER'SION (*dispergo*, I scatter about: *Lat.*), in Optics, the separation of the different coloured rays, during refraction, arising from their different refrangibilities.——In Medicine, the removing of inflammation from a part, and restoring it to its healthy state.

DISPLAY'ED (*déployer*, to spread out: *Fr.*), in Heraldry, a term applied to the position of an eagle, or any other bird, when it is erect, with its wings expanded or spread out.

DISPOSI'TION (*dispositio: Lat.*), in Architecture an arrangement of the whole design: it differs from *distribution*, which relates to the arrangement of the internal parts.

DISPUTA'TION (*disputatio: Lat.*), in the schools, a contest, either by words or in writing, on some point of learning, for a degree, prise, or for an exercise. Also a verbal controversy respecting the truth of some fact, opinion, or argument; as when Paul *disputed* with the Jews in the synagogue.

DISQUISI'TION (*disquisitio*, an investigation: *Lat.*), an inquiry into the nature and properties of any problem, question, &c., with the intention of acquiring or imparting a correct knowledge regarding it.

DISRUP'TION (*disrumpo*, I break asunder: *Lat.*), in Geology, a term applied to the violent separation of rocks by an earthquake.

DISSEC'TION (*disseco*, I cut up: *Lat.*), the methodical opening of an organized body, for the purpose of examining its structure and uses. Le Gendre observes, that the dissection of a human body, even dead, was held a sacrilege till the time of Francis I.; and that he has seen a consultation held by the divines of Salamanca, at the request of Charles V., to settle the question whether or not it were lawful, in point of conscience, to dissect a human body for the purposes of anatomical science.

DISSE'ISIN or **DISSE'IZIN**, in Law, a wrongful putting out of him who is seised of the freehold in lands: it is either *single disseisin*, or *disseisin by force*, more properly called *deforcement*.

DISSEN'TER (*dissentio*, I think otherwise: *Lat.*), one who separates from the service and worship of any established church. In England, therefore, the word is particularly applied to those who do not conform to the rites and service of its church as by law established. The principles on which dissenters separate from the church of England are the right of private judgment, and liberty of conscience. They maintain that Christ, and he alone, is the head of the church, and that they bow to no authority, in matters of religion, but that which proceeds from him. In England the Presbyterians are dissenters, in Scotland the Episcopalians.

DISSE'PIMENT (*dissepimentum*, from *dissepio*, I hedge off: *Lat.*), in Botany, a partition or *septum* formed in ovaries, by the united sides of the carpels, whereby cells are formed.

DISSIPA'TION (*dissipatio*, a scattering: *Lat.*), in Physics, the insensible loss or waste of the minute parts of a body, which fly off. By means of it, the body is diminished, or consumed.

DISSOL'VENT (*dissolvo*, I dissolve: *Lat.*), or **SOLVENT**, in Chemistry, a *menstruum*, or anything which has the power of converting a solid substance into a fluid; thus, water is a *dissolvent* of salts.——In Medicine, any remedy supposed capable of dissolving calculi or other concretions in the body.

DIS'SONANCE (*dissonantia*, from *dissono*, I disagree in sound: *Lat.*), in Music, a false consonance: it is synonymous with *discord*, which see.

DIS'TANCE (*Fr.*; from *disto*, I am separated from: *Lat.*), **LINE OF**, in Perspective, a right line drawn from the eye to the principal point; the *point of distance* being a point in the horizontal line at a distance from the principal point equal to that of the eye from the same.——**DISTANCE**, as applied to the turf, is a length of 240 yards from the winning-post of a racecourse. Precisely at this spot is fixed a post corresponding with others, but having a gallery capable of holding three or four persons, which is called the *distance-post*. In this gallery, as well as in that of the winning-post, before the horses start each heat, a person is stationed holding a crimson flag; during the time the horses are running, each flag is suspended from the front of the gallery to which it belongs, and is inclined forward as a horse passes either post. If there happen to be any horse which has not come up to the distance-post before the first horse in that heat has reached the winning-post, such horse is said to be 'distanced,' and is thereby disqualified for running any more during that race.

DISTEM'PER, in the Veterinary art, a disease incident to dogs, horses, and other domestic animals.——In Painting, the use of colours mixed with size and water. On a small scale this is called *body-colour* painting. The old painters made use of white of egg, or the glutinous juice of the young branches of the fig tree.

DIS'TICH (*distichos*: from *dis*, double; and *stichos*, a verse: *Gr.*), a couplet or couple of verses in poetry making complete sense.

DISTILLA'TION (*dis*, apart; and *stillo*, I trickle: *Lat.*), the evaporation and subsequent condensation of liquids. Its discovery has been ascribed to the alchemists, though it was probably known to the Arabians in very early times. On the large scale, it is used for the production of ardent spirits in distilleries. There are two distinct processes in the operations of the distiller: the first is the formation of alcohol from sugar; the second, the separation of the alcohol from the fluid, &c., with which it is associated. In most cases, even the formation of sugar is a part of the distiller's business in this country, as the substance employed is either malt, or a mixture of raw grain and malt. The process consists in the infusion of the ground grain and malt, with constant agitation, in a certain quantity of water, at a proper temperature, in the *mash tun*. After some time the resulting *wort* is run off, fresh water is added, and the process is repeated until scarcely anything soluble remains. When the worts are collected, they are made to ferment, by the addition of good yeast; and when the fermentation is over, the *wash* is subjected to the action of heat: the spirit distils over and is condensed. To purify and strengthen it, by separating the water and *fusel oil*, it is distilled a second time. Sometimes it is purified by filtration through charcoal. The oil comes over most abundantly towards the end of the distillation, when the weak spirit which remains requires an elevation of temperature, which is also favourable to the evaporation of the oil. The process is not difficult to be explained. The diastase of the malt changes the starch of the raw grain into sugar; the fermentation changes the sugar into alcohol; the distillation separates the alcohol from the remaining fluid, on account of its boiling at a lower temperature: the second distillation removes still more of the water and oil, on account of the low temperature at which the comparatively strong solution of alcohol evaporates. The product of spirit from a given quantity of grain depends greatly on the skill and attention of the distiller. The spirit which comes over in the beginning of the first distillation is termed *first shot;* that which comes over last, *feint:* the spirit before the second distillation is called *low wines.* *Proof spirit* is a mixture of about equal parts, by weight, of absolute alcohol and water. Great improvements have been made in distillation: with some of the more perfect stills, a pure and strong spirit can be obtained by one distillation.——DESTRUCTIVE DISTILLATION, the production of gases, acids, &c., by subjecting organic substances to a heat which causes them to be decomposed. In this way *coal gas* is obtained from bituminous coal, and *pyroligneous acid* from wood.——FRACTIONAL DISTILLATION, distillation carried on at several different degrees of temperature, the product of each distillation, at a given degree, being kept separate from the others.

DISTINC'TION (*distinguo*, I make a difference: *Lat.*), in Argumentation, the admission of what is said by an adversary, to be true in one sense, but not in another. Thus, if it be asserted that 'age is venerable,' we may *distinguish*, by admitting this to be true of a *virtuous* old age, but denying it of one that is *corrupt*.

DIS'TOMA, a genus of intestinal worms. [See FLUKE.]

DISTRESS' (*distringo*, I strain hard: *Lat.*), in Law, the proceeding of entering upon land and houses, and seizing the movable property, growing crops, &c., with a view of selling the same for the purpose of satisfying some claim. Landlords have a right of distress for rent which has become due. A distress cannot be made after sunset, or before sunrise. Gates cannot be broken open, nor can the outer door of a dwelling-house or building be forced open in order to make a distress. The goods distrained cannot be sold until five days from the making of the distress have expired. Certain species of personal chattels are exempt from distress, particularly the utensils and instruments of a person's trade and profession—if in *actual use.* All distresses for rent must be made by day. But if the tenant fraudulently removes goods from the premises, the landlord may, within thirty days, seize such goods, wherever found, unless they are sold for a valuable consideration before the seizure. [See REPLEVIN.]

DISTRIBU'TION (*distributio: Lat.*), the act of dividing or separating; as, the distribution of property among children, or the distribution of plants into genera and species.——In Architecture, the dividing and disposing of the several parts of a building, according to some plan, or to the rules of the art.——In Medicine, the circulation of the chyle with the blood.——In Printing, the inverse of *composition.* It consists in throwing the types or letters, one by one, into those compartments of the cases to which they belong.——In Logic, a term is said to be distributed in a proposition when it is employed in its full extent, so as to comprise everything to which the term can be applied. Thus *man is weak,* where the term man is distributed, and weak undistributed, since there are other things weak besides man.——DISTRIBUTIVE JUSTICE, justice so administered by a judge as to give every man his due.——DISTRIBUTIVE, in Grammar, an epithet for words which serve to distribute things into their several orders, as *each, either, every,* &c.

DIS'TRICT (*districtus*, stretched out: *Lat.*), a word applicable to any portion of land or country, or to any part of a city or town, which is defined by law or agreement. A governor, a prefect, or a judge may have his *district,* or states and provinces may be divided into *districts* for public meetings, the exercise of elective rights, &c.——DISTRICT, in Law, that circuit or territory within which certain laws may be in force, or regarding which certain regulations, &c., may have been made.

DISTRIN'GAS (you are to distrain: *Lat.*), a writ in common law proceedings addressed to the sheriff, directing him to compel the appearance of a defendant, or to distrain the goods of a defendant.——In Chancery, a writ called a distringas issues to compel the appearance of a corporation aggregate. Also a writ to restrain the Bank of England from transferring stock or paying dividends.

DITHYRAM'BUS (*Dithurambos*, Bacchus: *Gr.*), a sort of hymn anciently sung in honour of Bacchus, full of excitement and poetical rage: any poem written with wildness. The *dithyrambic poetry* was very bold and irregular, for the poets not only took the liberty to coin new words for the purpose, but made double and compound words, which contributed very much to the wild magnificence of this kind of composition.

DI'TONE (*ditonos:* from *dis*, double; and *tonos*, a tone: *Gr.*), in Music, an interval comprehending two tones.

DITREM'ATOUS. [See MONOTREMATOUS.]

DITRIHED'RIA (*dis*, twice; *tris*, thrice; and *hedra*, a base: *Gr.*), in Mineralogy, a genus of crystals with six sides or planes; being formed of two trigonal pyramids joined base to base, without any intermediate column.

DIT'TANY OF CRETE, a species of marjoram used as a febrifuge, the *Origanum dictamnus* of botanists, a native of Candia.

DIT'TO (*detto*, said: *Ital.*), contracted into *Do.* in books of accounts, signifies 'the aforesaid.' It is used to avoid repetition.

DIURET'ICS (*diourētikos*, promoting a discharge of urine: *Gr.*), medicines which have the power to promote or increase the discharge of urine.

DIUR'NAL ARCH (*diurnus*, daily: *Lat.*), in Astronomy, the arch or number of degrees that the sun, moon, or stars describe between their rising and setting.——DIURNAL MOTION of a planet, so many degrees and minutes as any plane moves in twenty-four hours.

DIVAN' (an audience chamber: *Turk.*), a council-chamber or court, in which justice is administered in the eastern nations, particularly among the Turks. There are two sorts of divans: that of the grand seignior, called the council of state, which consists of seven of the principal officers of the empire; and that of the grand vizier, composed of six other viziers or councillors of state, with the chancellor, and secretaries of state, for the distribution of justice. — The word *divan*, in Turkey, also denotes a kind of stage, which is always found in the halls of the palaces, and in the apartments of private persons. It is covered with costly tapestry, and has a number of embroidered cushions leaning against the wall; the master of the house reclines on it when he receives visitors. From this, a kind of sofa has obtained the name of divan.

DIVAR'ICATE (*divarico*, I spread out: *Lat.*), in Botany, an epithet for a branch which spreads out wide, or forms an obtuse angle with the stem. It is also applied to peduncles and petioles.

DIVER'GENT (*di*, asunder; and *vergo*, I turn: *Lat.*), spreading out.——DIVERGING LINES, in Geometry, those which constantly recede from each other.——DIVERGENT RAYS, in Optics, those rays which spread out more and more as they recede from their source: opposed to *convergent*. Concave glasses render the rays divergent, and convex ones convergent.——DIVERGING SERIES, in Mathematics, a series the terms of which always become larger the further they are continued.

DIVER'SION (*diverto*, I turn a different way: *Lat.*), in Military tactics, an attack on an enemy, by making a movement towards a point that is weak and undefended, in order to draw his forces off from continuing operations in another quarter.

DIV'IDEND (*dividendum*, something to be divided: *Lat.*), the part or proportion of profits which the members of a society or public company receive at stated periods, according to the share they possess in the capital or common stock of the concern. The term is applied also to the annual interest paid by government on various public debts. In this sense, the order by which stockholders receive their interest is called a *dividend warrant*, and the portions of interest not called for are denominated *unclaimed dividends*. It also signifies the sum a creditor receives from a bankrupt's estate.——DIVIDEND, in Arithmetic, the number to be divided into equal parts by the *divisor*.

DIVI-DIVI, the Indian name of a leguminous tree, *Cæsalpinia coriaria*, growing in South America, the pods of which are very rich in astringent principles, and are employed in tanning leather.

DIVI'NA COMME'DIA LA the name by which Dante's great poem is known, although its author styled it only *La Commedia*, saying, that he called it a Comedy because, contrary to the fashion of tragedy, it begins with sorrow and ends with joy. It was not published entire until after Dante's death, which occurred in 1321. The poem, written in *terza rima*, is the story of a vision, and is divided into three books, the Inferno, the Purgatorio, and the Paradiso (Hell, Purgatory, and Heaven), whither he supposes himself in spirit to be successively transported. Much of the poem is allegorical, as he himself stated to his friends, telling them that it had many meanings. Dante was a sincere son of the church, but he has unsparingly attacked the papal court, and urged the necessity of reform. There are many passages of stern invective, and bitter indignation, directed against persons and cities; but there are not wanting instances of vivid description and tender beauty. His great excellence, however, is thought to consist in his mastery over the feelings, and his acquaintance with the workings of the heart of man. Many translations have been made into English, and almost all other European languages have their own versions. The Italian editions have been very numerous, and the disquisitions and commentaries upon it would fill a library of respectable size.

DIVINA'TION (*divinatio*: *Lat.*), the pretended art of discerning future events, or such as cannot be known by ordinary or natural means. The ancient philosophers divided divination into two kinds, natural and artificial. *Natural* divination was supposed to be effected by a kind of inspiration or divine afflatus; *artificial* divination by certain rites, or observances, which we have explained under their respective titles. All the ancient Asiatic tribes had modes of divination: the Egyptians and Greeks had their oracles; and, with the Romans, divination and witchcraft were brought into a kind of system, and constituted part of their religion. In truth, there has hardly been a nation discovered, which had advanced beyond the lowest barbarism, that did not practise some kinds of divination; and even in the ages in which reason has most prevailed over feeling, the belief in the power of discerning future events has been entertained. Even the wise Socrates was wont to assert that the science of divination was necessary for all persons who would govern successfully either cities or their own families.

DI'VING (*dippan*, to dive: *Sax.*), the art of descending under water to a considerable depth, and remaining there for a length of time, as occasion may require. The practice of diving is resorted to for the recovery of things that have been lost in the water. An apparatus is now very generally employed, in which the head of the diver is covered by a helmet of thin sheet copper, large enough to admit of its easy motion, and capable of containing from six to eight gallons of air. The helmet comes pretty far down on the breast and back, and has in front three eye-holes, covered with glass, and protected by brass wire. This helmet is united to a waterproof canvas jacket by means of rivets, so tightly that no water can be introduced to the body of the diver. The junction of the helmet and jacket is stuffed, so that it may clasp the shoulders of the diver firmly. A leather belt passes round the neck, to which are attached two weights, one before and the other behind, each about 40lbs., in order that the diver may descend with facility; but, to provide against any accident when he is at the bottom, the belt is secured with a buckle in front, which he can instantly unfasten; and thus, dropping the weights, he rises to the surface. The diver is supplied with fresh air by means of a flexible waterproof pipe, which enters the back of the helmet, and communicates with an air-pump at work above in the vessel from which the diver descends. From the back part of the helmet also there issues an eduction pipe, to allow the escape of the breathed air. In order that the diver may give notice to the attendants at the top, when he requires a hook, tackle, bucket, or any alteration in the supply of fresh air, he is furnished with a single line, which passes under his right arm He descends from the side of the vessel by means either of a rope or wooden ladder loaded at the lower end (but more frequently by the former). When he reaches the bottom, the rope is let down, till it becomes slack, to prevent the motion of the vessel from affecting him; and he carries a line in his hand, that he may, when necessary, return to the rope, if he lets it go. To make himself as comfortable as possible under water, he puts on two suits of flannel, over which he has a dress of waterproof cloth, which entirely covers his body, the only apertures being at the neck and wrists, and these are water-tight. The diver is thus enabled to remain several hours at a time under water, all the while perfectly dry, his motion being rendered quite steady by weights attached to his shoes.

DI'VING-BELL, a mechanical contrivance, by which persons may descend below the surface of the water and remain there for some time without inconvenience. It is most usually made in the form of a truncated cone, the smaller and upper end being closed and the larger open; and it is used for the recovery of property that is sunk in wrecks, &c. Of late years it has also been much employed to assist in laying the foundations of buildings under water. To illustrate the principle of this machine, take a glass tumbler and plunge it into water with the mouth downwards; you will find that very little water will rise into the tumbler, which will be evident if you place a piece of cork inside; for its upper side will be perfectly dry, the air which was in the tumbler having prevented the entrance of the water. But, as air is compressible, it cannot entirely exclude the water, which condenses it a little, by pressure. Modern improvements have rendered this apparatus perfect. The air pumped in not only supplies the divers, but empties the bell of water. It is made heavy enough to sink itself, and is so constructed that it cannot easily overset, even if it meet a sunken rock. Signals render communication between the divers and those above very simple and effective. By letting air through a stopcock into a water-tight compartment in the upper part, the bell becomes so light as to ascend, and by letting water into the same compartment, the bell is made sufficiently heavy to descend. The divers, therefore, have the machine completely under their own control.

DIVISIBIL'ITY (*divisibilis*, that may be divided: *Lat.*), that property by which the particles of matter in all bodies are capable of mechanical separation or disunion from one another. As it is evident that a body is extended, so it is no less evident that it is divisible; for, since no two particles of matter can exist in the same place, it follows that they are really distinct from each other, which is all that is meant by being divisible. In this sense, the least conceivable particle must still be divisible, since it will consist of parts which will be really distinct. Thus far, extension may be considered as divided into an unlimited number of parts, but with respect to the limits of the actual divisibility we are still in the dark. That matter may, even with the means at our disposal, be divided to a surprising extent, is easily proved by many simple experiments. A single grain of sulphate of copper, or blue vitriol, will communicate a fine azure tint to five gallons of water. In this case, the sulphate is attenuated at least ten million times. Odours are capable of yet wider diffusion: a single grain of musk is sufficient to perfume a room for twenty years.

DIVIS'ION (*divisio*: *Lat.*), the act of separating any entire bodies into parts.——DIVISION, in Arithmetic, one of the four fundamental rules, by which we find how often a less number, called the *divisor*, is contained in a greater, called the *dividend*, the number of times which the divisor is contained in the dividend being termed the *quotient*.——DIVISION, in Music, the dividing the interval of an octave into a number of less intervals. The fourth and fifth divide the octave perfectly, though differently: when the fifth is below, and serves as a bass to the fourth, the division is called *harmonical*, but when the fourth is below it is called *arithmetical*.——DIVISION, among Logicians, the unfolding of a complex idea, by enumerating the simple ideas of which it is composed.——In Rhetoric, the arrangement of a discourse under several heads.——DIVISION, part of an army, as a brigade, a squadron, or platoon.——A part of a fleet, or a select number of ships under a separate commander, and distinguished by a particular flag.

DIVIS'ION OF LA'BOUR, in Political Economy, an expression employed to designate that apportionment of occupations, by means of which an individual labourer is restricted to the repeated execution of the same operation, or at least of a small number of operations. Adam Smith said that the superiority of civilized nations over savages is entirely owing to this regulation; and he pointed out that the advantages attending it are:—1. That workmen do not lose time by quitting one kind of occupation for another, by having to change their places, positions, or implements. 2. That the mind and hand acquire a wonderful skill in performing simple and often-repeated operations. 3. That the division of labour leads to the discovery of contrivances for the abridgment of labour. It reduces each operation to a very simple, and often-repeated process; and it is this kind of labour which is most easily performed by implements or machinery.

DIVO'RCE (*divortium*, from *diverto*, I separate: *Lat.*), a separation, by law, of husband and wife. It is either a divorce *à vinculo matrimonii*, that is, a complete dissolution of the marriage bond, by which the parties become as entirely disconnected as those who have not been joined in wedlock; or a divorce *à mensâ et thoro* (from bed and board), by which the parties are legally separated, but not unmarried. Divorces are now obtained in the Court of Divorce, in consequence of adultery on the part of the wife, or of adultery, with cruelty or certain other serious offences, on the part of the husband, unless the petitioner has connived at or condoned the adultery, or been guilty of adultery also, or has too long delayed bringing the matter into court. A divorce *à mensâ et thoro* is now termed a *judicial separation*, and is obtained on account of cruelty on the part of the husband or wife, or adultery alone on the part of the husband: it gives the wife, as to property and in other respects, the condition of a *feme sole*. Damages may be obtained by the injured husband from the *co-respondent* or paramour; more or less of the fortune brought by the guilty wife may be allotted to the support of the children of the dissolved marriage; and whether the marriage is dissolved, or there is only a judicial separation, on petition of the wife, an order for alimony to her may be made. An appeal lies from this court to the House of Lords; but after the time limited for this purpose has expired, or the decree has been confirmed, the parties may marry as if the prior marriage had been dissolved by death.

DOBEREI'NER'S LAMP, a small instrument for obtaining instantaneous light, in which a jet of hydrogen gas is inflamed by coming into contact with spongy platinum.

DOCE'TÆ (*dokēsis*, an opinion: *Gr.*), a sect that looked upon all the acts and sufferings of Christ as having taken place only in appearance.

DOCIM'ASY, or the DOCIMAS'TIC ART (*dokimasia*, an examination, from *dokimazo*, I prove: *Gr.*), the art of assaying metals, or separating them from foreign matters, and determining the nature and quantity of metallic substance contained in any ore or mineral.

DOCK (*docke*: *Germ.*), an artificial basin for the reception of ships.——WET DOCKS are constructed with gates, which, when shut, keep the ship afloat at low water. They are used for loading or unloading vessels out of the influence of the tide.——DRY DOCKS, called also *graving* docks, are left dry by the sea, or are rendered so by pumping. They are used for building, repairing, and examining ships.

DOCK'ET (*etiquette*, a ticket: *Fr.*), in Law, an abridged entry of an instrument or proceeding on a small piece of paper or parchment.

DOCK'YARD, an arsenal, containing all sorts of naval stores and timber for shipbuilding. In England, the royal dockyards are at Chatham, Portsmouth, Plymouth, Deptford, Woolwich, and Sheerness, where many of Her Majesty's ships and vessels of war are generally moored during peace, and such as want repairing are taken into the docks and refitted.

DOC'TOR (a teacher: *Lat.*), a person who has passed all the degrees of a faculty, and is empowered to practise and teach it; or, according to modern usage, one who has received the highest degree in a faculty. The title of *doctor* originated at the same time with the establishment of universities, and is either conferred publicly with certain ceremonies, or by diploma. We have doctors of divinity (D.D.); of Medicine (M.D.); of Civil Law (D.C.L.); and of Laws (LL.D.); the two last being frequently honorary merely. In Germany there are doctors of Philosophy (Ph. D.).

DOC'TRINAIRES (*Fr.*), a party in the French chamber of deputies on the second restoration of the Bourbons, who would rank themselves neither among the friends of absolute power, nor among the defenders of the revolution. They opposed the ultra-royalists, and took a middle course, avowing themselves the supporters of a constitutional monarchy.

DOC'TRINE (*doctrina*: *Lat.*), a principle or position in any science, laid down as true by an instructor therein. Thus, the *doctrines* of the Gospel are the principles or truths taught by Christ and his apostles. But, as *any* tenet or opinion is a doctrine, doctrines may be either true or false.

DOC'UMENT (*documentum*, a proof: *Lat.*), any official or authoritative paper, containing written instructions or evidence.

DOD'DER (*todter*, the slayer: *Teut.*, because injurious to plants), the common name of some parasitical plants, belonging to the genus *Cuscuta*, nat. ord. *Cuscutaceæ*. The two British species attach themselves to hops, flax, nettles, &c.

DODEC'AGON (*dōdeka*, twelve; and *gōnia*, an angle: *Gr.*), a regular polygon of twelve sides. Its area is equal to the square of one of its sides multiplied by 11·196.

DO'DECAHE'DRON (*dōdeka*, twelve; and *hedra*, a base; *Gr.*), one of the five Platonic bodies, or regular solids. Its surface consists of twelve equal and regular pentagons, and is found by multiplying the square of the side of one of its pentagons by 20·64578, and its solid contents by multiplying the cube of one of the same sides by 7·66312.

DODECAN'DRIA (*dōdeka*, twelve; and *anēr*, a male: *Gr.*), the 11th class in the Linnæan system of Botany, comprehending those plants which have flowers with twelve stamens and upwards, as far as nineteen inclusive, as dyer's weed, purslane, houseleek, &c. The essential character is, that the stamens, however numerous, are inserted into the receptacle.

DO'DO, the popular name of an extinct bird, which formerly lived in the Mauritius, the *Didus ineptus* of naturalists. It was an unwieldy creature, with short wings and a strong beak, the upper mandible being curved. So scanty is the evidence of its former existence, that some naturalists have doubted whether such a bird as the Dodo ever lived. Its place amongst the birds has also been debated, but it would seem best classed with the ground pigeons.

DODO'NIAN, in Antiquity, an epithet given to Jupiter, because he was worshipped in a temple built in the forest of Dodona, where was the most celebrated, and, it is said, the most ancient oracle in Greece.

DOG (*dogghe: Dut.*), the *Canis familiaris*, an animal well known for his attachment to mankind. [See CANIS.]

DOG'BANE, the common name of plants belonging to the genus *Apocynum*, nat. ord. *Apocynaceæ*. The *A. androsæmifolium* is a perennial North American plant, the root of which is intensely bitter and nauseous, and is employed in the form of a powder for the same purposes as *ipecacuanha*.

DOG'-DAYS. [See CANIC'ULAR DAYS.]

DOG'-FISH, in Ichthyology, the popular name of several species of shark. Although dog-fishes rarely venture to attack mankind, they commit great ravages in the fisheries by their voracity. The flesh of all the species is hard, dry, and unpalatable, requiring to be well soaked before it is eaten; but a considerable quantity of oil is obtained from the liver. The rough skin of the *Scyllium Catulus*, or common dog-fish, is used by joiners and other artificers for polishing wood, &c.

DOG'-STAR, or SIRIUS, a star of the first magnitude in the constellation *Canis major* (the greater dog: *Lat.*). It is the brightest of all the fixed stars.

DOG'WOOD, a name applied, in England, to any of the shrubby species of *Cornus*, nat. ord. *Cornaceæ;* in the West Indies, to the *Piscidia Erythrina*, nat. ord. *Leguminosæ*. The former are mere ornamental shrubs; the latter yields a powerful narcotic. The *Cornus sanguinea*, or cornel-tree, is a common shrub in English hedges.

DOGE (*Fr.*), formerly the title of the chief magistrate in the republics of Venice and Genoa. The dignity was elective in both places. At Venice it continued to be for life; but at Genoa, from 1528 until the title of Doge was abolished in Italy by the French, in 1797, it was held only for two years. His power became, by degrees, very limited.

DOG'GER (*dogre: Fr.*), the name of a two-masted Dutch fishing vessel. In some of our old statutes we meet with *dogger-men*, denoting the fishermen whose vessels were of this description.

DOG'GREL, a kind of loose, irregular, burlesque poetry.

DOG'MA (*Gr.*, from *dokeo*, I think), a principle, maxim, or tenet, particularly with regard to matters of faith and philosophy; as, the *dogmas* of the church, the *dogmas* of Aristotle.

DOG'MATISTS (*dogmatistæ*, from *dogmatizo*, I lay down an opinion: *Gr.*), a sect of ancient physicians, of which Hippocrates was the first. They laid down definitions and divisions, reducing diseases to certain genera, and those genera to species, and furnishing remedies for them all; supposing principles, drawing conclusions, and applying those principles and conclusions to the particular diseases under consideration.

DOIT (*duyt: Dut.*), the ancient Scottish penny-piece, twelve of which were equal to a penny sterling. Two of them were equal to the *bodle*, six to the *baubee*, and eight to the *acheson*.

DOLA'BRIFORM (*dolabra*, an axe; and *forma*, a form: *Lat.*), hatchet-shaped. In Botany, applied to leaves which are cylindrical at the base, grow broader at the upper part, and are thick on one edge and very thin on the other.

DOLE, in our ancient customs, signified a part or portion of a meadow where several persons had shares. It now means a distribution or dealing of alms, or a liberal gift made to the people or to some charitable institution.

DOLICHOCEPH'ALIC (*dolichos*, long; *kephale*, the head, *Gr.*), a term applied by comparative anatomists to skulls of an elongated form, such as those of negroes; opposed to *brachycephalic*.

DO'LIUM (a very large jar: *Lat.*), a genus of molluscs inhabiting univalve shells, of a figure approaching to round, so as to seem distended, and, as it were, inflated. They are found in the Mediterranean and other seas.

DOL'LAR, a silver coin of the United States of America, of the value of about 4*s.* 3*d.* sterling; it contains 100 cents. In Prussia the *thaler* or dollar is worth about 3*s.* Bavaria, Hanover, Denmark, and Hamburg, have also *thalers* of different values. The English give the name dollar to the Spanish *piastre*, worth about 4*s.* 4*d.*

DOL'MAN, a kind of long cassock worn by the Turks, hanging down to the feet, with narrow sleeves buttoned at the wrist.

DOL'OMITE, a variety of magnesian carbonate of lime, so called from the French geologist Dolomieu. It belongs to the Permian division of the Palæozoic period. It occurs under considerably diversified aspects, constituting beds of very great extent, and abounding in the Apennines, the Tyrol, Switzerland, and Tuscany. It is of various shades of white; and both in Europe and America it is frequently employed as marble.

DOL'PHIN (*delphin: Lat.*), a name given both to a genus of acanthopterygious fishes and to members of the cetacean genus *Delphinus*. The former includes the *Coryphæna hippurus*, celebrated in poetry for its display of colours when dying. The *Delphini* are allied to the porpoises.

DOM (*dominus*, a lord: *Lat.*), a title given, in the middle ages, to the pope; but, more recently, to members of certain monastic orders—thus to the Benedictines.

DOME (*domus*, a house: *Lat.*), in Architecture, a spherical or other concave roof, over a circular or polygonal building. A *surbased* or *diminished dome* is segmented on its section. A *surmounted dome* is higher than the radius of its base. The most ancient dome at present existing is that of the Pantheon at Rome. The following are the diameters (in feet) of some of the most remarkable domes :—

	diam.	*height*
Pantheon, at Rome	142	143
Duomo, at Florence . . .	139	310
St. Peter's, at Rome . . .	139	330
St. Sophia, at Constantinople	115	201
Ancient Baths of Caracalla.	112	116
St. Paul's, London	112	215

DO'MESDAY or DOOMS'DAY BOOK (*dom*, lord ; and *deya*, a proclamation ; *Celt*), a book or record made by order of William the Conqueror, which now remains in the exchequer, and consists of two volumes, a large folio and a quarto ; the former contains a survey of all the lands in most of the counties in England, and the latter comprehends some counties that were not at first surveyed The 'Book of Domesday' was begun by five justices, assigned for that purpose in each county, in the year 1081, and finished in 1086. It was of such authority, that the Conqueror himself allowed some cases in which he was concerned to be determined by it. Camden calls it the tax-book of king William ; and it was further called *Magna Rolla*. There is likewise a third domesday book, made by command of the Conqueror, and also a fourth, which is an abridgment of the others

DOM'ICILE (see next), in Law, the place of permanent residence of a person. This has frequently to be considered with reference to the wills of persons dying in a foreign country, it being a maxim of our law that all personal property is to be considered as being in that country where its owner is domiciled, and consequently the laws of that country are those according to which it is to be distributed.

DOMICIL'IARY (*domicilium*, a residence : *Lat*), pertaining to an abode or residence. Hence, a *domiciliary visit* signifies a visit to a private dwelling, particularly for the purpose of searching it, under authority.

DOM'INANT (*dominans*, ruling over; *Lat.*). In Music, the *dominant* or sensible chord is that which is practised or the dominant or *fifth* of the key, and which introduces a perfect cadence. Every perfect major chord becomes a dominant chord as soon as the seventh minor is added to it.

DOMIN'ICAL LETTER (*dies dominica*, the Lord's day : *Lat.*), in Chronology, that letter of the alphabet which points out in the calendar the Sundays throughout the year. This mode of representing the days of the week in almanacs by placing a letter opposite to the day of the month, has fallen into disuse, the initial letters of the name of the day itself being used instead.

DOMIN'ICANS, called also *Predicants*, or *Preaching Friars*, an order of monks founded by Dominic, a native of Spain, in 1215. The establishment of this order was due to the apprehensions of the papacy, excited by the rise and spread of opinions hostile to its doctrines and authority; the secular and regular clergy of the time being little disposed to rouse themselves from their indolence and vices, to combat with their assailants. As soon as the Dominicans had fulfilled their first mission, by the destruction of the Albigensian heresy, as it was called, the order was permanently established by a bull of Honorius III. In France they were called *Jacobins*, because the first convent in Paris was in the *Rue St. Jacques*. The *military order of Christ* was originally composed of knights and noblemen, whose duty it was to wage war against heretics. After the death of the founder, this became the order of the penitence of St. Dominic, for both sexes. In course of time the Dominicans were superseded in the schools and courts by the Jesuits.

DOMIN'ION (*dominium : Lat.*), in the Civil Law, the power to use or dispose of a thing as we please. *Dominium plenum* is when the property is united with the possession. *Dominium nudum*, when there is the property without the possession. *Dominium* is again divided into that which is acquired by the law of nations, and that which is acquired by the civil law. The former can never be had without possession, the latter may. *Directum Dominium* is the right alone of dominion. *Dominium utile*, the profit accruing from it. Thus the wife retains the *dominium directum* of her jointure, and the *dominium utile* passes to her husband.——In a general sense, *Dominion* signifies either sovereign authority, or territory within the limits of the authority of a prince or state ; as, the British *dominions*.

DOM'INO (*Ital.*), a masquerade dress, worn by gentlemen and ladies, consisting of a long silk mantle, with a hood and wide sleeves. It was formerly a dress worn by priests in the winter, which, reaching no lower than the shoulders, served to protect the face and head from the weather.——DOMINOES, a game played by two or more persons, with twenty-eight pieces of ivory, called cards, and variously dotted on one side like dice.

DOM'INUS (*Lat*), in the Civil Law, one who possesses anything by right or purchase, gift, loan, legacy, inheritance, payment, contract, or sentence.——DOMINUS, in the feudal law, one who grants a part of his estate in fee to be enjoyed by another.

DON (*dominus*, a lord : *Lat.*), a title which in Spain is given to every one from the king to the poorest gentleman, but in Portugal is restricted to the royal family and the higher nobility. All the ladies in both countries are styled *Dona*.

DONA'TION (*donatio : Lat.*), in Law, the act or contract by which a person transfers to another either the property or the use of something, as a free gift. In order to be valid, it supposes a capacity both in the donor and donee, and requires consent, acceptance, and delivery.——The conferring of certain benefices on a clerk, by deed of gift alone, without presentation, institution, or induction ; but he cannot legally officiate until he obtains the bishop's licence.

DO'NATISTS, a sect of Christians in Africa, who took the name from their founder Donatus. They held that theirs was the only pure church, and that baptism and ordination, unless conferred by them, were invalid. The Donatists made themselves formidable, when swarms of fanatical peasants, inflamed by their doctrines, in 348, under the name of *Circumcelliones*, attacked the imperial army, and for thirteen years after desolated Mauritania with pillage and murder. Martyrdom was eagerly sought by them, and they voluntarily gave themselves up to be executed. This sect was finally extinguished when the country was conquered by the Saracens.

DO'NATIVE (*donatio*, a gift: *Lat.*), a church or chapel founded by the sovereign or by his permission, and intended to be merely the gift of the patron, subject to his visitation only, and not that of the ordinary; and, by the mere act of donation, vested in the clerk, who does not require the ordinary's leave to officiate. But if the patron once presents a clerk to the bishop, he loses his privilege.——DONATIVE, among the Romans, was properly a gift made to the soldiers, as *congiarium* was that made to the people.

DON'JON (a turret: *Fr.*), in Fortification, a strong tower or redoubt, into which the garrison of an ancient fortress might retreat in case of necessity, and capitulate with greater advantage.

DOOM PALM, a palm with fan-shaped leaves, which grows in Upper Egypt, and is remarkable for the way its branches grow, forking and reforking. The ripe fruit resembles gingerbread in flavour, and is eaten by the peasants. The nut is eaten by the Ethiopians before it is ripe. When ripe, it is so hard as to serve for the sockets of dirks.

DOR'IC, an epithet for anything belonging to the Dorians, an ancient people of Greece. The *Doric dialect* was broad and rough, yet there was something venerable and dignified in its antique style; for which reason it was often made use of in solemn odes, &c.——The DORIC ORDER of Architecture is the second of the five orders, being that between the Tuscan and Ionic. It is distinguished for simplicity and strength, and is used in the gates of cities and citadels, on the outside of churches, and in other situations where embellishment is unnecessary or inappropriate.——The DORIC MODE, in Music, was the first of the authentic measures of the ancients, and grave rather than gay.

DOR'MANT (*dormio*, I sleep: *Lat.*), an epithet expressive of a state of inaction or sleep, termed *hibernation*, from its taking place usually in winter. Hence *dormant* animals are such as remain several months in the year apparently lifeless, or, at least, in utter inactivity. The period of long sleep generally begins when the food of the animal grows scarce, and inactivity spreads over the vegetable kingdom; and instinct then impels it to seek a safe place for the period of rest. The bat hides itself in dark caves, or in walls of decayed buildings; the hedgehog envelopes itself in leaves, and generally conceals itself in fern brakes; and the marmot buries itself in the ground. A state of partial torpor takes place in the case of the common bear, the badger, and the racoon. During this period we observe in the animals, first a decrease of animal heat; and secondly, that they breathe much more slowly and uninterruptedly than at other times. The digestion also is much diminished; the stomach and intestines are usually empty; and even if the animals are awakened, they do not manifest symptoms of appetite, except in heated rooms. Snails also have a period of inaction, but whilst this takes place during winter in cold countries, it is during summer in warm.——DORMANT, in Heraldry, the posture of a lion, or any other beast, lying along in a sleeping attitude, with the head on the fore paws, by which it is distinguished from the *couchant*, where, though the beast be lying, yet he holds up his head.——DORMANT (or sleeping) PARTNER, one who takes no share in the active business of a partnership, but is entitled to a proportion of the profits, and subject to a share of the losses.

DOR'MER, or **DOR'MENT** (same *deriv.*), in Architecture, a window made in the roof of a building.

DOR'MOUSE (same *deriv.*), in Zoology, a rodent animal, the *Myoxus avellanarius* of naturalists. During the rigour of winter dormice retire to their bed of moss or dry leaves, made in a hollow tree or under shrubs, and, rolling themselves up, fall into a torpid or lethargic state, which lasts, with little interruption, throughout that cheerless season. Sometimes they experience a short revival, on a warm, sunny day, when they take a little food, and then relapse into their former condition.

DOR'NOCK, a kind of figured linen, of stout fabric, manufactured for coarse tablecloths. It derives its name from a town in Scotland, where it was first made.

DOR'SAL (*dorsum*, the back: *Lat.*), an epithet for what belongs or relates to the back, as the *dorsal fins* of fishes.

DORSIF'EROUS (*dorsum*, the back; and *fero*, I bear: *Lat.*), in Botany, a term applied to ferns which bear the spore cases on the back of the frond.

DOSE (*dosis*, a giving: *Gr.*), in Chemistry, the quantity of any substance which is added to any solution, &c., in order to produce any chemical effect.

DOS'SIL or **DOR'SEL** (*dorsum*, a back: *Lat.*), in Surgery, a pledget, or piece of lint made into a cylindrical form.

DOT'TEREL, a small grallatorial bird, the *Charadrius Morinellus*. It inhabits the northern parts of Asia and Europe, and is migratory, appearing on our moors and downs when going to, and again when returning from, the breeding-place.

DOU'BLE ENTEN'DRE (*Fr.*), any phrase which has a covert as well as an obvious meaning.

DOU'BLE STARS. [See STARS.]

DOUB'LET (*Fr.*), among Lapidaries, a counterfeit stone composed of two pieces of crystal, with a colour between them, so that they have the same appearance as if the whole substance were coloured.——Amongst Opticians, a lens composed of two glasses.

DOUB'LING (*doubler*, to double: *Fr.*) *a cape*, is to sail round or pass beyond it, so that the point of land shall separate the ship from her former situation.

DOUBLOO'N, a Spanish gold coin containing two pistoles, and of the value of 16*s.* 2*d.* sterling.

DOU'CINE (*Fr.*), in Architecture, a moulding, concave above and convex below, serving as a cymatium to a delicate cornice.

DOVE (*taube: Germ.*), the popular name of birds of the genus *Columba*, of which there are four British species, namely: the *ring-dove* (*Columba palumbus*), the largest of the pigeon tribe, so wild that it cannot be domesticated; the *stock-dove*, or common wild pigeon (*C. œnas*), which is migratory; the *rock-dove* (*C. livia*), which builds in high cliffs near the sea; and the *turtle-dove* (*C. turtur*), also migratory, a shy and retired bird, living in the woods.

DOV'ETAIL, in Carpentry, the manner of fastening boards together by letting one piece into another, in the form of a dove's tail spread, or a wedge reversed; it is the strongest of all jointings.

DOW'AGER (from *dower*), in Law, properly a widow who enjoys a dower: the term is applied particularly to the widows of princes and noblemen. The widow of a king is a *queen-dowager*.

DOW'ER (*douaire: Fr.*), in Law, the portion which a widow has of her husband's lands and tenements, to enjoy during her life.

DOWN (*dunn: Dan.*), the softest and most delicate feathers of birds, particularly of geese, ducks, and swans, growing on the neck and part of the breast. The *eider-duck* yields the best kind.——Also the fine feathery substance by which seeds are conveyed to a distance by the wind; as in the dandelion and thistle. This is called *pappus* by botanists, and consists of the upper part of the calyx, the lower part adhering to the fruit.

DOWNS (*düne*, a large open plain: *Germ.*), banks or elevations of sand, which the sea gathers and forms along its shore, and which serve it as a barrier. The term is also applied to tracts of naked land on which sheep usually graze. The North and South Downs are two ranges of chalk hills, of a smooth rounded outline, covered with short herbage in the south-east of England.——THE DOWNS is a celebrated roadstead on the coast of Kent, between the North and South Forelands, where both outward and homeward bound ships frequently make some stay, and squadrons of men-of-war rendezvous in time of war. It affords excellent anchorage, and is defended by the castles of Deal, Dover, and Sandwich, as well as by the Goodwin Sands.

DOW'RY (*douaire: Fr.*), the money or fortune which the wife brings her husband in marriage: it differs from *dower*.——DOWRY is also used, in a monastic sense, for a sum of money which is given with a female upon entering her in some religious order.

DOXOL'OGY (*doxologia:* from *doxa*, glory; and *logos*, a discourse: *Gr.*), in Christian worship, a hymn in praise of the Almighty. There is the greater and lesser doxology: the angelic hymn, 'Glory be to God on high,' &c., is the *greater* doxology; 'Glory be to the Father, and to the Son,' &c., the *less.*

DRACHM', or DRACH'ME' (*Gr.*), from *drassomai*, I grasp with the hand; and, therefore, literally, a handful), an ancient Greek coin of the value of ninepence three-farthings. It weighed 66·5 grains, and contained 65·4 grains pure silver. The drachma was originally, no doubt, a weight.——DRACHM is also a weight containing sixty grains, or the eighth part of an ounce. It is often written *dram.*

DRA'CO (*drakōn*, the dragon: *Gr.*), in Astronomy, a constellation in the northern hemisphere.

DRACON'IDÆ, a family of scaly reptiles found in India, distinguishable from the true lizards by having a broad membrane at each side of the body, supported by their six first false ribs. Thus a kind of wing is formed, by which, whilst leaping from branch to branch, the animal is assisted in its flight as by a parachute. But it has no power of rising in the air like a bat.

DRA'CO VO'LANS (a flying dragon: *Lat.*), a meteor in cold marshy countries, consisting of phosphuretted or carburetted hydrogen, which, under certain conditions, becomes luminous.

DRACUN'CULUS (a *dim.* of *draco*, a dragon: *Lat.*), in Botany, a species of *Arum*, a plant with a long stalk, spotted like the belly of a serpent.——DRACUNCULI, long slender worms, which breed in the muscular parts of the arms and legs. They are called *Guinea worms*, being common among the natives of Guinea. [See GUINEA WORM.]

DRAFT, in Commerce, a bill drawn by one person upon another, for a sum of money.——In Military affairs, the selecting or detaching of soldiers from an army or from a military post. Also, the act of *drawing* men to serve in the militia.

DRAG'OMAN (*targeman*, he has interpreted: *Arab.*), an interpreter in the East. The term is applied particularly to one whose office is to interpret for the European ambassadors at the Ottoman court.

DRAG'ON (*drakōn: Gr.*), a fabulous winged serpent, frequently mentioned in the romances of the middle ages.

DRAG'ON-FLY, the popular name of many species of neuropterous insects assigned by naturalists to several genera, *Libellula*, &c. Their elegant forms and bright colours render them beautiful objects on a sunny day. They deposit their eggs in water, and they continue in that element for the two years during which they remain in the larva and pupa state. According to Leuwenhoek there are more than 12,000 lenses in each eye of a dragon-fly.

DRAG'ONET, the *Callionymus Lyra*, an acanthopterygious fish with a slender body, coloured with yellow, blue, and white. It inhabits the Mediterranean and the German Ocean.

DRAGONNE'E (*Fr.*), in Heraldry, the term for a lion or other beast, whose upper half resembles a lion, &c., but the lower the hinder part of a dragon.

DRAG'ON'S-BLOOD, a resinous juice

obtained by incision from several plants found between the tropics, chiefly species of *Calamus*, plants belonging to the order of palms, and the Dragon's-blood Tree, *Dracæna Draco*, belonging to the order of *Liliaceæ*. It is opaque, of a deep reddish-brown colour, and brittle; and has a smooth and shining conchoidal fracture. Its taste is slightly astringent; and when burnt, it emits an odour somewhat like benzoin. It is employed chiefly for tingeing spirit and turpentine varnishes, for preparing gold lacquer, and for staining marble, to which it gives a red tinge. It was formerly in high repute as a medicine, but at present is very little used.

DRAG'ON'S HEAD, the *Dracocephalum*, a genus of plants with many species, most of them herbaceous.——DRAGON'S HEAD AND TAIL, the name given by astrologers to the points of the ecliptic plane crossed by the moon in its orbits, to the former of which they ascribe good fortune, and to the latter, bad.

DRAGOO'N (*dragon: Fr.*), a kind of light horseman, first employed in France. They were to fight either in or out of the line, in a body or singly, chiefly on horseback, but, if necessary, on foot also; but experience proving that they did not answer the end designed, they ceased to be used in infantry service, and now form a useful kind of cavalry, mounted on horses too heavy for the hussars and too light for the cuirassiers.

DRAM'A (literally a deed: *Gr*), the name of all compositions adapted for recitation and action on the stage, whether tragedy, comedy, opera, or farce, in which are displayed, for instruction and amusement, those passions, feelings, errors, and virtues of the human race, which are found in real life. The elements of the dramatic art are observed among all nations, and every people which has made progress in civilization has, at the same time, shown some taste for it. It is impossible to ascertain the exact period when theatrical amusements were first introduced into England; but they are mentioned as having existed very early by William Fitz-Stephen, a monk of Canterbury, in his *Descriptio nobilissimæ civitatis Lundoniæ*, written soon after the year 1170; and her success has been such, that she has produced the dramatic genius who has surpassed all ancient and modern writers in universality of conception and knowledge of human nature—our unrivalled Shakspere. In the beginning of the middle ages, when everything noble was buried under the deluge of barbarism, the dramatic art was lost, or existed only among the lower classes of the people, in plays improvised at certain festivals—for instance, at the carnival. These were attacked as heathenish, immoral, and indecent exhibitions; but the favour which they enjoyed among the people, and the spirit of the times, induced the clergy to encourage theatrical exhibitions founded on subjects from sacred history. These *Mysteries*, as they were at that time denominated, were followed by a species of the drama, styled *Moralities*, in which the senses, passions, affections, virtues, and vices were personified, and constituted the characters. As the moralities were contrived to entertain as well as instruct, some dawnings of poetry were soon exhibited, with occasional attempts at wit and humour, which naturally introduced *comedy*.

DRA'MATIS PERSO'NÆ (the characters in the play: *Lat.*), the characters represented in a drama.

DRA'PERY (*draperie: Fr.*), in Sculpture and Painting, the representation of the clothing of human figures; also hangings, tapestry, and curtains.

DRAS'TICS (*drastikos*, that which acts promptly: *Gr*), medicines which operate speedily and effectually.

DRAUGHT (*dragan*, to draw: *Sax.*), in Architecture, the delineation of any intended building, &c.——In Navigation, the depth of water necessary to float a vessel, or the depth to which a ship sinks when laden; as, a ship of ten feet draught.——DRAUGHTS, an amusing game played by two persons with twelve men on each side, on a chequered board like the chess-board.——DRAUGHT HOOKS, the iron hooks fixed on the cheeks of a cannon carriage, used in drawing the gun backwards and forwards.

DRAW'BACK, in Commerce, a term used to signify the remitting or paying back of the duties previously paid on a commodity, on its being exported, so that it may be sold in a foreign market on the same terms as if it had not been taxed at all. By this expedient, merchants are enabled to export commodities loaded at home with heavy duties, and to sell them abroad on the same terms as those brought from countries where they are not taxed.——In a popular sense, *drawback* signifies any loss of advantage or deduction from profit.

DRAW'ER, and DRAW'EE (*dragan*, to draw: *Sax.*), in Commerce, the *drawer* is he who draws a bill of exchange or an order for the payment of money; and the *drawee*, the person on whom it is drawn.

DRAW'ING (same *deriv.*), the art of representing the appearances of objects upon a flat surface, so as to exhibit their form and shadow, situation, distance, &c. [See PAINTING, PERSPECTIVE, &c.]

DREAM (*traum: Germ.*), a series of mental impressions occurring to a sleeping person, and which, therefore, are not under the command of reason. Dreams have been referred to various causes: among others, to direct impressions on the organs of sense during sleep; to the absence of a power to test the inaccurate conclusions drawn from one set of impressions by other impressions; to a disordered state of the digestive organs; to a less restrained action of the mental faculties; to the suspension of volition while the powers of sensation continue, &c. In health there is a less tendency to dream than in disease; in the earlier than in the later periods of life: and the very act of dreaming shows that the brain is not enjoying a complete state of rest. They have been frequently ascribed by the superstitious to supernatural agency, especially when there has been any coincidence between a dream and an external event.

DREDG'ING (*dragan*, to drag: *Sax.*), the process of catching oysters, by the removing or dragging mud with dredges, &c.——DREDGING-MACHINE, an engine used to take up mud or gravel from the bottom of rivers, docks, &c.

DRES'SINGS (*dresser*, to trim up: *Fr.*), in Architecture, mouldings round doors, windows, and the like.

DRIFT, a heap of any matter driven together; as, a drift of snow or sand.——DRIFT, in Mining, a passage cut under the earth, betwixt shaft and shaft, or turn and turn.——In Geology, a superficial deposit of fragments of rock frequently brought from a considerable distance, along with mud, sand, and clay.——DRIFT, in Navigation, the angle which the line of a ship's motion makes with the nearest meridian, when she drives with her side to the waves and is not governed by the helm.——DRIFT-SAIL, a sail used under water, veered out right ahead by sheets, as other sails are. It serves to keep the ship's head right upon the sea in a storm, and to hinder her driving too fast in a current.——A boat is also said to *drift*, or to go *adrift*, when it floats on the water without any one to row or steer it.

DRILL (*drillen*, to turn in a circle: *Ger.*), in Mechanics, a small instrument for making such holes as punches will not conveniently produce. Drills are of various sizes, and are used by smiths, turners, and machinists.——A dog-like baboon, the *Cynocephalus leucophæus* of naturalists. It is a native of Guinea.——TO DRILL, in a military sense, is to teach and train recruits to their duty by frequent exercise.——DRILLING, in Husbandry, a mode of putting seed into the ground by a machine called a *drill plough*, which makes channels in the ground and lets the seed into them, so that it comes up in rows, in which the plants are at regular distances from each other.

DROM'EDARY (*dromedarius: Lat.*; from *dromas: Gr.*) [See CAMEL.]

DRONE, the male of the honey-bee. It is larger than the working bee, but less than the queen bee. The drones make no honey: and, after living a few weeks, they are killed or driven from the hive.

DROP (*tropfen. Germ.*), a small portion of any fluid in a spherical form; as, a *drop* of water, a *drop* of laudanum, &c. In Pharmacy, 60 drops are equal to the quantity filling a teaspoon.——The part of a gallows which sustains a criminal before he is executed, and which suddenly *drops* after the rope is attached to his neck.——To *drop astern*, in seamen's language, is to slacken the velocity of a vessel to let another pass her.

DROP'SY (*hydrops: Lat.*; from *hudōr*, water: *Gr.*), in Medicine, an unnatural collection of watery humour, either throughout the whole body or in some part of it; as the cavity of the abdomen. It occurs most frequently in persons who are debilitated by disease. The dropsy takes different names, according to the part affected: as, *Ascites*, or dropsy of the abdomen; *Hydrocephalus*, dropsy of the brain or water in the head, &c.

DROS'ERA (*droseros: Gr.*), in Botany, a genus of herbaceous bog plants, nat. ord. *Droseraceæ*. They are of small size, and are found in various parts of the world, two species being natives of Britain. The leaves are furnished with glandulous hairs, which discharge a viscid juice. A drop of this is to be seen at the end of each hair during the hottest day. The hairs are irritable, and contract when touched.

DROSOM'ETER (*drosos*, dew; and *metron*, a measure: *Gr.*), an instrument for ascertaining the quantity of dew which falls. It consists of a balance, one end of which is furnished with a plate to receive the dew, the other containing a weight protected from it.

DROWN'ING (*druncnian*, to drown: *Sax.*). Death by drowning ensues from respiration having been stopped, and not from any water having got into the lungs, this being prevented by the glottis. If a man, unable to swim, falls into the water, he instinctively makes every exertion to escape from it; for a time he struggles, but at last becomes exhausted, and sinks. His agitation leads him to neglect obvious means of safety. The body, when the lungs are properly filled with air, is of less specific gravity than the water; and would, if the lungs were not exhausted by his struggles, easily float. Hence, if he were to lie quietly on his back, his mouth would be above water. The directions given by the London Humane Society for the treatment of persons in a state of suspended animation ought to be kept in every house, and known by every individual; and in all cases medical assistance should be immediately sent for. In the meantime, avoid all rough usage, and attend to the following *cautions* never hold the body up by the feet, nor roll it on casks; nor rub it with salts or spirits, nor inject tobacco-smoke or infusion of tobacco, but convey it carefully, with the head and shoulders supported in a raised position, to the nearest house; strip it and rub it dry; then wrap it in hot blankets, and place it in a warm bed, in a warm chamber, put bladders or bottles of hot water, or heated bricks, to the pit of the stomach and the soles of the feet, and foment the body with hot flannels; but if possible immerse it in a warm bath, as hot as the hand can bear without pain, as this is preferable to the other means of restoring warmth. Do not, however, suspend the use of the other means at the same time. These observations are recommended in the absence of a medical practitioner. The treatment recommended by the society is to be *persevered in* three or four hours; for it is a very erroneous opinion, that persons are irrecoverable because life does not soon make its appearance: though it must be confessed that, after an immersion of four or five minutes, the chances of recovery are very remote.

DRUG (*dreg: Sax.*), a general name for substances used in medicine, sold and frequently compounded by the druggists. It is also applied to dyeing materials.——In Commerce, any article lying on hand, or become unsaleable, is called a *drug*.

DRUG'GET (same *deriv.*, because light, as if dried up), a coarse woollen fabric, used for covering carpets, and sometimes as an article of clothing by females of the poorer classes.

DRU'IDS (*Druides* · *Lat.*), the priests of the ancient Britons and Gauls Cæsar is the first writer who tells us of the Druids They presided over religious observances and sacrifices, taught youth, decided controversies, chose a president by election, held a great meeting once a year, made great osier images, in which human beings were burned as sacrifices, had traditions about astronomy, the power of the gods, and the nature of things The younger Pliny added to this information that the mistletoe was a sacred plant with them, and that, clad in white robes, they cut it with a golden sickle, performing certain ceremonies The oak was their sacred tree, and they lived amongst groves of it. Hence he derives Druid from *drus*, the Greek for an oak Tacitus, in a famous passage, has described the invasion of Anglesea by Suetonius, when the Roman soldiers were met by Druids, who, with hands extended upwards, uttered awful prayers, and called down the vengeance of the gods When the island was conquered, the sacred groves were hewn down The connection of the Druids with altars and circles of stones, like Stonehenge, rests on nothing historical, for no ancient book contains anything to bring the two together. Notwithstanding the great number of volumes written about the Druids, very little is known about them beyond what is mentioned above, and in this age of investigation there are some who think that the whole subject is mythical, so obscure and indefinite is the information transmitted to us.

DRUM (*trummel* · *Germ*), a military musical instrument in the form of a cylinder, hollow within and covered at the ends with vellum, which is stretched or slackened at pleasure by means of small cords and sliding knots. It is beat upon with sticks Drums are sometimes made of brass, but commonly of wood. Kettle-drums are hollow hemispheres, and are used in pairs, one of them being tuned to the key note, and the other to the fifth of the key. There are several beats of the drum, as the *Chamade*, *Reveille*, *Retreat*, &c.——DRUM, in Architecture, the upper part of a cupola, usually below the dome; also the base of the Corinthian capital.——DRUM OF THE EAR, the hollow part of the ear, behind the membrane of the *tympanum*, which latter is a tense membrane closing the external passage of the ear, and receiving the vibrations of the air

DRUM'MOND'S LIGHT, the name given to the light produced by directing a stream of oxygen gas, passing through the flame of alcohol, upon a small ball of quick lime. It derives its name from its inventor.

DRUPE (*drupa*, an over ripe olive : *Lat*), in Botany, a succulent fruit, such as the cherry, plum, apricot, and date. The hard *endocarp*, forming the stone, and containing a single seed or kernel, is surrounded by the *mesocarp*, which is usually pulpy, but in the almond is of a rough texture. The *epicarp* forms the skin of the fruit. *Drupaceous* is an epithet applied to plants bearing drupes

DRUSE, in Mining, a cavity in a rock, having its interior surface studded with crystals or filled with water.

DRY'ADS (*Druas*, from *drus*, an oak : *Gr*), in the Heathen Mythology, deities or nymphs, which the ancients believed to inhabit groves and woods They differed from the *Hamadryads*, these latter being attached to some particular tree with which they were born, and with which they died; whereas the *Dryads* were goddesses of trees and woods in general

DRY-ROT, a minute fungus which grows in timber, decomposes its fibres, and produces rapid decay. *Dry-rot* is so called by architects in contradistinction only to the more usual circumstances of decay to which wood is liable Many methods have been proposed for rendering wood, and the various substances consisting of woody fibre, incapable of being affected by dry-rot the most effectual is the saturating them with a solution of corrosive sublimate

DU'AL (*dualis*, that contains two. *Lat*), a name given by Grammarians to a particular form of the nouns, to indicate that two of the things designated are referred to, the plural form referring to more than two The Greek language has a dual number

DU'ALISM (same *deriv*), the philosophical exposition of the nature of things by the adoption of two dissimilar primitive principles, not derived from each other It is the most striking feature in all the early Greek cosmogonies, and that which chiefly distinguishes them from the Oriental Among the ancients, the most eminent of those who maintained it were the Pythagoreans, and, among the moderns the followers of Descartes Those holding matter and spirit as distinct, in opposition to the materialists, are, in some sense, *dualists* ——In Theology, the Manichæan doctrine of two principles, the *good* and the *evil* Also, the high Calvinistic, which holds that all mankind are divided, by the arbitrary decree of God, into two classes, the *elect* and *reprobate*

DUC'AT (*ducato* *Ital*—because coined by dukes), a gold coin, coined in Austria, Denmark, Hamburg, Hanover, Prussia, Russia, and Sweden The values differ in the different states, ranging from 7*s* 6*d* to 9*s* 5*d*.

DU'CES TE'CUM (bring with thee *Lat*), in Law, a clause in a subpœna, commanding a person to bring with him to the trial of an action, books and papers which the party who issues the subpœna may think material to his purpose

DUCK'WEED or DUCK'S'-MEAT, the popular name of some plants growing in ditches and stagnant waters, and serving as food for ducks and geese. There are four species indigenous to Britain. They belong to the genus *Lemna*, nat. ord. *Pistiaceæ*.

DUCT (*ductus*, a leading : *Lat.*), in Medicine, any vessel or tube in the animal body by which the blood, chyle, lymph, &c., are carried from one part to another. Also, the vessels of plants in which the sap is conveyed.

DUCTIL'ITY (*ductilis*, capable of being drawn: *Lat.*), that property of metals which renders them capable of being extended by hammering, or of being drawn into wire without breaking. In general, ductility depends, to a greater or less extent, on temperature. Metals which, like zinc, are very ductile at one temperature, may be quite the contrary at another. The ductility of gold is very great: it may be reduced to a leaf only the 282,000th of an inch in thickness, and a particle of gold not exceeding the 500,000th of a grain in weight can be made distinctly visible to the naked eye. By drawing a compound wire, consisting of platinum covered externally with silver, and afterwards dissolving off the silver, Dr. Wollaston obtained a platinum wire only the 30,000th of an inch in diameter. When the diameter was only the 18,000th of an inch, it supported a weight of a grain and one-third.

DU'EL (*duellum*, a contest between two: *Lat.*), originally a combat between two persons, authorized by the law, for the discovery of the truth, but now a premeditated battle between two persons on some private quarrel, in which, if death ensue, both the principal and the seconds are guilty of murder.

DUEN'NA, the chief lady-in-waiting to the Queen of Spain. Also, an elderly woman, holding a middle rank between a governess and a companion, appointed to take charge of the younger ladies in Spanish families.

DUET, or DUET'TO (*Ital.*; from *duo*, two: *Lat.*), in Music, a song or piece for two performers.

DU'GONG, a cetaceous mammal, allied to the Manatee, and living in the Indian ocean, where it feeds on sea-weed. It is the *Halicore dugong* of naturalists.

DUKE (*dux*, a leader: *Lat.*), a sovereign prince in Germany, and the highest title of honour in England. His consort is called a *duchess*.——In England, among the Saxons, the commanders of armies, &c., were called dukes (*duces*), without any addition, till Edward III. made his son, the Black Prince, duke of Cornwall, after whom other dukes were made in the same manner, the title descending to their posterity. Duke, at present, is a mere title of dignity, without giving any domain, territory, or jurisdiction over the place from whence it is taken.

DULCAMA'RA (*dulcis*, sweet; and *amarus*, bitter: *Lat.*), the common *woody nightshade*. [See BITTER-SWEET.]

DUL'CIMER (*dulcis*, sweet: *Lat.*), a musical instrument, used by the Jews, but the nature of which is not known. Also, in more modern times, an instrument played by striking brass wires with small sticks.

DULOC'RACY (*doulokratia*: from *doulos*, a slave; and *kratos*, power: *Gr.*), a government in which slaves and the lowest order of the people have the power.

DULSE, the common name of an edible sea-weed, the *Rhodymenia palmata* of botanists.

DUMB'NESS (*stumm*, dumb: *Germ.*). The most general cause of this is the want of the sense of hearing. Sometimes, however, it arises from injury to the lingual nerves, or from general or local debility. The loss of hearing, though it happen in early life, after speech has once been attained, does not produce dumbness. Even the loss of the tongue does not altogether incapacitate from speaking. Great attention has been bestowed latterly on methods of instructing the dumb in the various arts and sciences, and even in languages, with great success; and such persons are now able not only to converse with facility by signs, but to devote themselves, as an amusement or means of support, to literature and science.

DUNES (*Ang. Sax.*), low hills of movable sand, very common in different parts of Great Britain, Ireland, and the Continent.——Fine sand, blown from the sea, accumulates when it meets with rocks, stumps of trees, or other obstacles. These hillocks, by the continual action of the same cause, are urged on, and their inroads often produce the most destructive effects. One department of France, the *Landes*, has been nearly overwhelmed by them. During violent hurricanes, their progress is so rapid, that they almost instantaneously cover entire villages, fields, and gardens. The best barriers against them are such trees and shrubs as are known to thrive in a barren soil: these both fix them and prevent any further encroachment of the sand.

DUN'NAGE, any loose or light material, such as wool, used as a bed in the stowage of heavy articles.

DUODE'CIMALS (*duodecimus*, the twelfth: *Lat.*), in Arithmetic, numbers proceeding from multiplications by twelve, in the same way as decimals proceed from multiplications by ten.——Also, a rule in Arithmetic, by which the contents of any surface or solid are found, by multiplying together its linear dimensions, expressed in feet, inches, and lines. It is much used by artificers, and is called likewise *cross-multiplication*.

DUODE'CIMO (*duodecim*, twelve: *Lat.*), abbreviated to 12*mo*, having or consisting of twelve leaves to a sheet; or a book in which a sheet is folded six times, so as to have twenty-four pages.

DUODE'NUM (*duodeni*, twelve each: *Lat.*), in Anatomy, the first of the small intestines in vertebrate animals, where the bile and the pancreatic juice are mixed with chyme. It received this name from the older anatomists, on account of their having remarked it to be, in some animals, of a length equal to about the breadth of *twelve fingers*: but this measure is generally inapplicable.

DU'PION (*doppio*, double: *Ital.*), a double cocoon, formed by two or more silkworms.

DU'PLE (*duplus*, double: *Lat.*), among mathematicians, an epithet applied to a ratio where the antecedent term is double the consequent: thus, the ratio of 8 to 4 is a duple ratio.——SUBDUPLE RATIO is just the reverse of the former, or as 1 to 2. Such is 4 to 8, or 6 to 12.

DU'PLICATE (*duplico*, I double: *Lat.*), a copy or transcript.——DUPLICATE PROPOR-

TION, or RATIO, is the proportion of the square of one number to the square of another.

DU'PLICATURE (same *deriv.*), in Anatomy, the fold of a membrane of a vessel.

DU'RA MA'TER (the hard mother: *Lat.*), in Anatomy, the membrane between the bones of the skull and the brain, and also dividing the latter into parts. The membranes of the brain were called *matres*, or mothers, by the older anatomists, because they supposed the other membranes to be derived from them.

DURAN'TE (*Lat.*), in Law, *during:* as *durante bene placito*, during pleasure; *durante minore ætate*, during minority; *durante vitâ*, during life.

DUR'BAR (*Ind.*), a court held by the governor-general, or by the native princes of India, on some state occasion.

DURESS' (*durities*, harshness: *Lat.*), in Law, restraint or compulsion; as where a person is wrongfully imprisoned, or deprived of his liberty contrary to law; or is threatened to be killed, wounded, or beaten, till he executes a deed or signs a writing intended to bind him. Any bond, deed, or other obligation, obtained under duress, will be void in law; and in an action brought on the execution of any such deed, the party may plead that it was obtained by duress.

DUTCH LIQ'UID (or chloride of hydrocarbon), a name for the mixture of chlorine and olefiant gas, which combine in equal measures even in the dark. It is a heavy oily liquid, with a sweetish taste.

DU'TY (*dû*, owed: *Fr.*), in Commerce, any tax or impost; a sum of money required by government to be paid on the importation, exportation, or consumption of goods.

DUUM'VIRI (*duo*, two; and *viri*, men: *Lat.*), in Roman Antiquity, a general appellation given to magistrates, commissioners, and officers, where two were joined together in the same function. The office, dignity, or government of two men thus associated, was called a *duumvirate.*——The *Duumviri capitales* were the judges in criminal causes. From their sentence it was lawful to appeal to the people, who alone had the power of condemning a citizen to death. The *Duumviri juri dicundo* were the highest magistrates in municipal towns. The *Duumviri perduellionis* were appointed to try those accused of *perduellio*, or treason. The *Duumviri municipales* were two magistrates in some cities of the empire, answering to the consuls at Rome; they were chosen out of the body of the *decuriones;* their office usually lasted five years, upon which account they were frequently termed *quinquennales magistratus.* The *Duumviri navales* were the commissaries of the fleet: the duty of their office consisted in issuing orders for the fitting of ships, and giving their commissions to the marine officers, &c. The *Duumviri sacri* were appointed for the purpose of building a temple when it was determined to erect one. The *Duumviri sacrorum* had the charge of the Sibylline books, afterwards committed to the *Decemviri.* The *Duumviri viis extra urbem purgandis* were officers who had charge of the streets outside the gates of Rome, &c.

DWARF (*dweoph: Sax.*), in general, an appellation given to things greatly inferior in size to that which is usual in their several kinds: thus, there are dwarfs of the human species, dwarf trees, &c. The Romans were so passionately fond of dwarfs, that they often used artificial methods to prevent the growth of boys designed for dwarfs, by enclosing them in boxes, or by the use of tight bandages.

DWARF'ING TREES. 'The art of dwarfing trees' (says Mr. Fortune), 'as commonly practised both in China and Japan, is, in reality, very simple. It is based upon one of the commonest principles of vegetable physiology. Anything which has a tendency to check or retard the flow of the sap in trees also prevents, to a certain extent, the formation of wood and leaves. This may be done by grafting, by confining the roots in a small space, by withholding water, by binding the branches, and in a hundred other ways, which all proceed upon the same principle. Stunted varieties are generally chosen, particularly if they have the side branches opposite or regular, for much depends upon this; a one-sided dwarf tree is of no value in the eyes of the Chinese or Japanese. The main stem is thus in most cases twisted in a zigzag form, which process checks the flow of the sap and at the same time encourages the production of side branches at those parts of the stem where they are most desired. The pots in which they are planted are narrow and shallow, so that they hold but a small quantity of soil compared with the wants of the plants, and no more water is given than is actually necessary to keep them alive. When new branches are in the act of formation they are tied down and twisted in various ways; the points of the leaders and strong growing ones are generally nipped off, and every means are taken to discourage the production of young shoots possessing any degree of vigour. Nature generally struggles against this treatment for a while, until her powers seem to be in a great measure exhausted, when she quietly yields to the power of Art. When plants from any cause become stunted or unhealthy, they almost invariably produce flowers and fruit. A bamboo, a fir, and a plum-tree, the last in full blossom, have been seen growing and thriving in a box only one inch square by three inches high.'

DY'EING (*deagan*, to colour: *Sax.*), the art of giving a lasting colour to silks, cloths, and other substances, by which their beauty is much improved, and their value enhanced. Dyeing, properly so called, is a chemical process; and, in order that it may succeed, it is necessary that the colouring matters should be dissolved in some fluid, and that their attraction to that fluid should be less than to the stuff. It is essential in dyeing to ascertain the affinities of the colouring substance: first, to the solvents; secondly, to those substances which modify its colour, increase its brilliancy, and strengthen its union with the stuff; thirdly, to the different agents which may change the colour, and principally to air and light In dyeing, the term *mordant* is applied to those matters which serve as intermedia between the colouring particles and the stuff to be dyed, either for the purpose of facilitating or of modifying their combination: by their means, also, colours are varied, brightened, and rendered more durable. The principal substances employed as mordants are aluminous salts, lime, metallic oxides, some astringent principles, and animal matters. Sometimes the mordant is printed on the cloth, and then, the whole cloth being dipped in the colouring matter and washed, the colour will be removed, except where the mordant has been placed. Sometimes the mordant is intended to resist the colour, in which case the colour will be removed in the washing wherever the mordant has touched, and there will be a white pattern on a coloured ground. Sometimes the mordant and pattern are printed on together, and rendered permanent by exposing the goods to steam. Sometimes the substance put on by the block destroys the colour after the cloth has been dyed uniformly throughout. The three simple colours used in dyeing are red, yellow, and blue; all other colours are compounded of these. The ancient Egyptians practised the art of dyeing with some degree of scientific precision; but the Tyrians were those who made it the staple of their commerce; and there is little doubt that purple, the symbol of royal and sacerdotal dignity, was a colour discovered in Tyre, and instrumental in raising that city to opulence and grandeur. The moderns have obtained from the New World several dye-drugs unknown to the ancients, such as cochineal, Brazil wood, logwood, annotto, &c.; but the vast superiority of our dyes over those of former times must be ascribed principally to the employment of pure alum and solution of tin as mordants—substances which give to our common dye-stuffs remarkable depth, durability, and lustre. One of the most important improvements in the art of dyeing is the recent discovery of the beautiful *aniline* colours obtained from coal tar.

DYNAM'ETER (*dunamis*, force; and *metron*, a measure: *Gr.*), an instrument for determining the magnifying power of telescopes.

DYNAM'ICS (*dunamikos*, powerful: *Gr.*), the doctrine of power; but, as this is known to us only by its effects, that is, by the motion it produces on the body upon which it acts, and it is measured by that motion, dynamics may be defined to be 'the science which treats of the motion of bodies.' It is often restricted to the motion of those which are at liberty to obey the impulse communicated to them; in which case, the motion of a stone falling freely to the ground, or of a heavenly body moving in its orbit, would belong to *dynamics*; but the motion of a body moving along an inclined plane, to *mechanics*. Dynamics, however, and statics, are often, and not incorrectly, considered as branches of the general science of *mechanics*. A knowledge of the principles of dynamics is due to the moderns, having had its commencement in the researches of Galileo: before his time, the forces which act on bodies were examined only in the cases in which equilibrium is produced.

DYNAMOM'ETER (*dunamis*, force; and *metron*, a measure: *Gr*), an instrument for measuring and recording the energy exerted by an effort

DY'NASTY (*dunasteia*, from *dunastes*, a chieftain: *Gr.*), a race or series of princes who have reigned successively in any kingdom; as the *dynasties* of Egypt and Persia.

DYS'CRASY (*duskrasia*: from *dus*, difficult; and *krasis*, a blending: *Gr.*), in Medicine, an ill habit or vitiated state of the humours.

DYS'ENTERY (*dusenteria*: from *dus*, difficult; and *enteron*, an intestine: *Gr.*), in Medicine, a disease in which blood, mucus, and other morbid matter, are evacuated, accompanied with griping of the bowels, &c.

DYS'ODILE (*dusōdēs*, stinking: *Gr*), a species of coal of a greenish or yellowish grey colour, in masses composed of thin layers. Its odour when burning is very fœtid.

DYS'OREXY (*dus*, bad; and *orexis*, a yearning after anything: *Gr.*), in Medicine, a bad or depraved appetite.

DYSPEP'SIA, or DYSPEP'SY (*dus*, bad; and *pepsis*, digestion: *Gr.*), in Medicine, difficulty of digestion. Hence those who are afflicted with indigestion are termed *dyspeptic* persons. The disorder of the digestive function is the most frequent and prevailing of the ailments that afflict man in the civilized state; all classes and all ages suffer from its attacks. The symptoms of dyspepsia are very different in different circumstances. The epicure loses his relish for the most refined dishes: becomes bloated, heavy, and probably apoplectic. The fashionable lady suffers from headaches, flatulence, occasional giddiness, and dimness of sight; she becomes indolent, whimsical, and full of fancies; or, as the old physicians would say, she has the *vapours*. The studious man finds his mind blunted, loses his appetite or does not enjoy his meals; sleeps badly, dreams much, and becomes capricious and dissatisfied with himself and everybody else: he is a *hypochondriac*. The humbler classes drink gin or rum for a stimulant, which soon becomes a necessity; and as its effect diminishes, the dose is increased, until at last they become tipplers, or perhaps confirmed drunkards The nature of the case must, in a great degree, suggest the remedy. It is one of the most painful diseases; but, with a little energy and perseverance, it is almost certain to be removed. When the man advanced in years does not find the energetic appetite of his youth, when the studious man does not possess the appetite derived from active employment, each merely discovers what nature herself points out—that he does not require so large a supply of food as he might in other circumstances; and if, by provocatives, he forces himself to eat what nature tells him he is unable to digest, he must take the consequences. Some kinds of food are naturally hard to be digested: some kinds are indigestible in certain circumstances, and by certain constitutions; but in the great majority of cases the evil arises, not so much from the *quality* as the *quantity* of what is taken. As to the use of bitters, or those other means of improving a weak stomach, their effect is but temporary; in most cases, the remedy will ultimately lose its effect, and in many it will produce evils as bad as, or worse than, those it is intended to remove. *Abstinence* is the great cure for dyspepsia; moderation and healthful exercise are its preventives.

DYSPHA'GIA (*dus*, difficult; and *phago*, I eat: *Gr.*), in Medicine, a difficulty of swallowing, which arises from paralysis, enlarged tonsils, &c.

DYS'PHONY (*dus*, difficult; and *phōnē*, a voice: *Gr*), in Medicine, a difficulty of speaking, occasioned by imperfection in the organs of speech.

DYSPNŒ'A (*dus*, difficult; and *pneo*, I breathe: *Gr.*), in Medicine, a difficulty of breathing.

DYS'URY (*dusouria*: from *dus*, difficult; and *ouron*, urine: *Gr.*), in Medicine, difficulty of voiding the urine, attended with pain and a sensation of heat.

E

E, the fifth letter in the Hebrew alphabet, and languages derived from it, is the second vowel, and has different pronunciations in most languages. The French have their *e* open, *e* masculine, and *e* feminine or mute. In English the letter has two sounds: long, as in *here, mere, me*; and short, as in *wet, kept*, &c. As a final letter it is generally quiescent; but it serves to lengthen the sound of the preceding vowel, as in *mane, cane, thine*, which without the final *e* would be pronounced *man, can, thin*. In many other words the final *e* is silent, as in *examine, definite*, &c. In sea charts, E. stands for *east*: thus, E. by N. *East* by *North*; E by S. *East* by *South*. As an abbreviation, it is put for *engineers*, as R E. *Royal Engineers*; for *empire*, as H R E. *Holy Roman Empire*; for *eminence* and *excellency*, as H E. *His Eminence* (a title of cardinals), or *His Excellency*, a title given to governors of colonies and to ambassadors; for *exempli*, as *e g. exempli gratia* (for instance), &c In Music, it is the third note or degree of the diatonic scale, corresponding with *mi* of the French and Italians. As a numeral, E stands for 250.

E'AGLE (*aigle*: *Fr*), the name of several rapacious birds of the family *Falconidæ*. The largest is the imperial eagle (*Thrasaëtus harpyia*), a native of Mexico, which measures three feet and a half from the tip of the bill to the end of the tail; and the next, the golden eagle (*Aquila chrysaëtos*), the largest of the European kinds, and a native of Britain, its length being three feet three inches. Most of the species are noble birds. The talons and bill of the eagle are strong and terrible; its vision is keen, and it can distinguish objects at a great distance. It lives to a great age. Among the ancients, the eagle was held sacred to Jupiter: it was placed on his sceptre, as the carrier of the lightning, and thus became expressive of superior dominion. In this sense it is used as the symbol of nations, princes, and armies. The eagle was first used as a military standard by the Persians. Among the Romans, it was either of gold, silver, or bronze, borne singly on the point of a staff; but from the time of Constantine, when the empire became divided into the eastern and western, it was represented with two heads. During the sway of Napoleon, the French took for their standard an eagle with folded wings.——EAGLE, in Heraldry, one of the most noble bearings, and which, according to the learned in that science, ought to be given to none but such as greatly excel in courage and magnanimity. It is assumed by sovereigns as the badge of empire. The eagle of Russia is *or*, with two heads displayed *sable*, each ducally crowned of the field; the whole imperially crowned, beaked, and membered, *gules*. The eagle of Austria is also displayed, with two heads; the Prussian eagle has but one. The Americans have selected the bald eagle of their continent, a selection made by Benjamin Franklin. The eagle is also the badge of several orders, as the Black Eagle and the Red Eagle of Prussia, the White Eagle of Poland, &c.——EAGLE, a gold coin of the United States, value 2*l*. 3*s*. 10*d*. sterling.

E'AGLE STONE, a term applied by the old pharmaceutists to globular clay ironstone. The specimens vary in size from a walnut to a man's head, are of a spherical or oval shape, have a rough surface, and are essentially composed of concentric layers. In the centre is generally a kernel or nucleus, sometimes movable, and always differing from the exterior in colour and density. The ancients gave them the name of eagle-stones, from an idea that the eagle carried them to her nest to facilitate the laying of her eggs.

E'AGLET, a diminutive of *eagle*, properly signifying a young eagle.——In Heraldry, when there are several eagles on the same escutcheon, they are termed *eaglets*.

E'AGLE-WOOD. [See ALOES-WOOD.]

EAR (*eare*: *Sax.*), the organ of hearing, consisting externally of a cartilaginous body, the *concha*, attached to each side of the head. This collects the undulations of the air constituting sound, and conveys them to the external auditory passage, at the bottom of which a membranous partition, the *tympanum*, stretches across a cavity containing four little bones, named *malleus*, *incus*, *stapes*, and *os orbiculare*. These are articulated together A bony partition, perforated by two small holes, one covered by a membrane, and the other closed by the *stapes*, separates the tympanic cavity from the internal ear or labyrinth, a cavity in the temporal bone. The labyrinth is chiefly composed of the three *semicircular canals*; and the *cochlea*, an organ resembling in shape the spiral shell of a snail. A limpid fluid fills these parts, and the nerves of hearing are suspended in it ——EAR, in Music, that internal sense by which we perceive and judge of harmony, and distinguish musical sounds.——EAR, among gardeners, a name given to the cotyledonous leaves which first appear from the seed, and usually differ in form from the subsequent perfect leaves.

EAR'ING, in seamen's language, a small rope employed to fasten the upper corner of a sail to its yard, &c

EAR'-MARK originally signified a cut in the ear by which a sheep could be recognized, but it has been extended to a mark on any object by which it may be identified

EARL (*eorl: Sax.*), a British title of nobility, between a marquis and a viscount; now the third degree of rank. William the Conqueror first made this title hereditary, giving it in fee to his nobles, and allotting them for the support of their state the third penny out of the sheriff's court, from all pleas of the shire whence they had their title. At present the title is accompanied by no territory, or private or judicial rights, but confers nobility, and an hereditary seat in the House of Lords. In official instruments, earls are styled by the sovereign 'trusty and well-beloved cousins,' an appellation as ancient as the reign of Henry IV For some time after the Norman conquest they were called *counts*, and their wives to the present day are styled *countesses*. The earl's coronet has no flowers raised above the circle, like that of a duke and a marquis, but only points, and a pearl on each of them

EARL MAR'SHAL OF ENGLAND, a great officer who had anciently several courts under his jurisdiction, and among them the *court of chivalry*, or *court of honour*. Under him is the herald's office, or college of arms. He is an earl *ex officio*. The first Earl Marshal on record was appointed in 1135. Since 1483 it has been in the Howard family, and has been made hereditary in the heirs male of the eighth Duke of Norfolk, whose descendant, the present duke, now holds it.

EARN'EST, in Commercial law, money advanced by the buyer of goods, to bind the seller to the performance of a verbal bargain.

EARTH, in Astronomy and Geography, one of the primary planets, the terraqueous globe which we inhabit. In remote antiquity, the earth was regarded as a flat, circular body, floating on the water; but the great distances which men were able to travel soon refuted this limited idea as an optical illusion, and the spherical form of the earth was consequently suspected. According to the Ptolemaic system, it was supposed to be immovable in the centre of the universe; but, according to that of Copernicus, it moves from west to east, so as to occasion the succession of day and night, and also annually round the sun, so as to cause the different seasons. By some of the ancients its form was supposed to be like that of an oblong cylinder; by others, like that of a drum; and by others it was supposed to be a plane surface. Succeeding ages have, however, demonstrated it to be nearly spherical; and among other reasons for this theory are the following:—1. All the appearances of the heavens, both on land and at sea, are the same as they would be if the earth were a globe. 2 In eclipses of the moon, which are caused by the shadow of the earth falling upon the moon, this shadow is always circular, and a body can be no other than a globe which, in all situations, casts a circular shadow. 3 Several navigators have sailed quite round the globe, steering their course directly south and west till they came to the Magellanic sea, and from thence to the north and west, till they returned to their port from the east; and all the phenomena which should naturally arise from the earth's rotundity happened to them. It is true, the surface of the earth is not an exact geometrical globe; but then the inequalities are so inconsiderable that the highest mountain bears no greater proportion to the bulk of the earth than a grain of dust does to a common globe. The figure of the earth was believed by mathematicians and geographers to be perfectly spherical, excepting the small inequalities in its surface, of mountains and valleys, until Sir Isaac Newton and Huygens demonstrated from the laws of hydrostatics, and the revolution of the earth about its axis, that its figure is not a true sphere, but an oblate spheroid flattened towards the poles Various measurements have since put this beyond all doubt. There are abundant proofs that the earth, since it has assumed its present form, has undergone many great revolutions. Shells and corals are found in the interior of continents, and on the summits of the highest mountains; which, therefore, must have been at some period beneath the sea. The remains of tropical animals and plants are found in high latitudes Mineral strata are twisted, dislocated, and broken asunder. As to the structure of the crust of the globe, see GEOLOGY. The earth's equatorial diameter is rather more than 7,925½ English miles; its polar, rather more than 7,899 miles; the polar compression is, therefore, not quite 26½ miles, and the proportion of one diameter to the other is as 299 to 298. Its mean radius is 3,956⅛ miles; its circumference, 25,000; its superficies, 198,944,200 square miles; and its solidity, 263,930,000,000 cubic miles. The mass of the earth, compared with that of the sun, is as 1 to 355,000; and its mean density is to that of water as 5½ to 1. The *interior* of the earth is almost entirely unknown to us, as the depth to which we have been able to penetrate is nothing in comparison with its diameter. The earth has a triple motion. There is a *diurnal motion* round its own axis, from west to east, in 24 hours, which occasions the per petual succession of days and nights. The time of the earth's revolution on its axis, called the *sidereal day,* is measured by the interval between two transits of the same fixed star over the meridian of any place; and astronomers have proved that this interval cannot have altered so much as three times the thousandth part of a second during the last 2000 years. There is an *annual motion* round the sun in a year, which produces the different seasons, and the lengthening and shortening of days. This motion is performed in an elliptical orbit, the excentricity of which, or the distance of the foci from the centre, is 0·01679 parts of the mean distance of the earth from the sun—that is, of 95 millions of miles. The motion of the earth in its orbit is not uniform, being most rapid at its *perihelion,* and slowest at its *aphelion.* Its average velocity is 68,040 miles an hour. The inequality of the earth's angular motion about the sun causes the *apparent solar day,* or the interval between the successive transits of the sun over the same meridian, to be unequal, and not to correspond with the length of the *mean solar day.* The third motion is caused as follows. The equator of the earth is inclined to the plane of its orbit, called the *plane of the ecliptic,* at an angle of 23° 27′ 56″: this inclination is termed the *obliquity of the ecliptic,* and causes the phenomena of the seasons. Since the earth's axis always preserves its parallelism (that is, points to the same star), the sun, at one season of the year, is 23° 27′ 56″ to the north of the equator, and at the opposite season the same distance to the south of it; but the straight line formed by the intersection of the planes of the equator and ecliptic has a slow motion westward, contrary to the order of the signs, and retreats at the rate of 50·1″ yearly, causing what is termed the *precession of the equinoxes,* or, more correctly, the *retrogression of the earth's nodes.* This is due to the disturbing action of the sun and moon on the redundant matter at the equator of the earth, by which its figure is rendered oblate; and this precession, jointly with the nutation of the earth's axis, causes a motion of its poles about the poles of the ecliptic. The sun appears to return to the equator before the completion of the sidereal year, by the amount of time which the sun, or rather the earth, requires to pass over 50·1″, that is, 20′ 19·9″. A complete tour of the ecliptic is performed in 25,868 years. The revolution of the seasons forms the *equinoctial* or *tropical year.* The discovery of the motion of the earth has become memorable in the history of the human mind, showing, as it does, a marked ability in man to resist the impressions produced by appearances, and to believe the contrary of that which had been believed and taught for many centuries. It was also a triumph over the assumption of an infallible authority. Galileo was imprisoned for holding the very doctrines now maintained universally by mankind; and he was obliged, under the threat of most terrible punishment, to recant, as heretical, his teachings regarding a system of the world, the correctness of which is now unquestionable. The invention of the telescope, by means of which the rotation of Jupiter was soon observed, but still more Newton's discovery of universal gravitation, and the nature of the celestial motions, led to the accurate knowledge regarding the solar system at which we have arrived.

EARTH-EAT'ING is a habit which individuals amongst some savage peoples possess, the morbid craving arising probably from the meagreness of their ordinary diet. Humboldt has described the habit as witnessed by him amongst the Otomacs of the Orinoco. On the upper parts of the Amazon it is by no means uncommon, not only amongst the Indians, but the negroes and whites.

EARTH'-NUT, a name given to various subterranean vegetable products. It is applied in England to the nut of the *Bunium flexuosum,* an umbelliferous plant; in China and the western coast of Africa, to the pods of the *Arachis hypogœa,* a leguminous plant; and, in other countries, to the small tubers of cyperaceous plants.

EARTH'ENWARE, or POTTERY. [See CHINA WARE.]

EARTH'ING, in Agriculture and Gardening, the covering of shrubs and plants, as vines, celery, &c., with earth.

EARTH'QUAKES are waves of elastic compression travelling through a portion of the crust of the globe, and originating in an impulse in the interior. 'That impulse (says Mr. Mallet) may be an explosive production or condensation of high pressure steam in heated cavities deep beneath the surface, or sudden increase or decrease of its tension, or sudden fracture or fall, or forcing up or down or against each other of great rocky masses, or if in near propinquity to active volcanoes, it may be any of their throbs or throes, or explosive ejections, or the recoil from these.' The rate of movement of the wave thus generated varies with the elasticity of the medium through which it is propagated, the rate being less at sea than on land, and less in loose strata than in compact rock. An earthquake wave has been found in some cases to travel at the rate of thirty miles a minute. When the impulse originates under the sea, a large volume of water is forced upwards, and a wave is propagated in all directions, which, when it reaches a shore, rushes upon it with violence, frequently causing great destruction. Very large tracts of ground are sometimes shaken. At the fearful earthquake which destroyed a great part of Lisbon in 1755, a portion of the earth's surface four times larger than Europe was shaken. In the Andes the earth has sometimes continued to tremble without interruption for many days together; and at other places there have been tremblings felt almost hourly for many successive months. Permanent alterations of the level of large tracts of ground, both elevations and depressions, have followed earthquakes. Noises very frequently but not always accompany earthquakes. The connection of earthquakes and volcanoes has been often noticed, so much so that the latter have been termed safety valves for the country in their neighbourhood. The immediate cause of earthquakes is still involved in great obscurity, and various theories have been proposed to embrace all the phenomena displayed. The destruction of life by earthquakes has often been very large. Although there is a strong tendency on such occasions to exaggerate the loss of life, it may well be that in the course of a few thousand years some millions of human beings have been destroyed

EARTHS (*erde: Ger*), in a popular sense, those solid bodies composing the mineral strata, which are incombustible, colourless, not convertible into metals by any ordinary methods of reduction, and, when reduced by scientific experiments, possessing generally but an evanescent metallic existence. But, to describe *earths* according to the rules of chemical science, we should say that they are tasteless, inodorous, uninflammable substances, usually occurring in intimate union with each other, with various acids, and with oxides of the common metals. Under these circumstances, they constitute by far the greatest part of the strata, gravel, and soil, forming the mountains, plains, and valleys of our globe Their number is ten. Five of them possess decided alkaline properties—*baryta*, *strontia*, *lime* (*calcia*), *magnesia*, and *lithia* Five of them are termed earths proper—*alumina*, *glucina*, *yttria*, *zirconia*, and *thorina*, these do not change the infusion of cabbage or tincture of litmus, do not readily neutralize acidity, and are insoluble in water. The earths were regarded as simple bodies until the brilliant researches of Sir H Davy proved them to be compounds of oxygen with peculiar bases

EAR'-TRUMPET, an instrument used by persons partially deaf, to strengthen the sensation of sound, by collecting and conducting it through a funnel-shaped tube to the seat of the sense of hearing

EAR'WIG, the common name of some orthopterous insects, of which the *Forficula auricularia* is the best known The English and French name, *perce-oreille*, is founded on a popular error that these insects enter the human ear, and there commit serious injury. These insects are remarkable for the forceps at the end of the abdomen, and for the singular structure of the wings, which, although little used, are of large size. They are of delicate texture, and fold up like a fan into a very small compass.

E'ASEL (*esel*, an ass *Ger.*), a wooden frame on which a painter sets the cloth, &c., to be painted.——**EASEL-PIECES**, such pieces as are painted on easels, in distinction from those painted on ceilings, &c.

E'ASEMENT (*aisement: Fr*), in Law, a privilege or convenience which one man has upon another man's land, such as a right of way.

E'ASING (*aisant: Fr.*), in sea language, the slackening a rope, &c ; thus, to ease the bowline or sheet, is to let them go slacker; to ease the helm, is to let the ship go more before the wind, or more larboard.

EAST (*Ost: Ger.*), one of the four cardinal points, being that point of the horizon where the sun appears to rise when in the equator. The word *east* is indefinitely used when we speak of countries which lie eastward of us, as Persia, India, China, &c. ——In Christian churches, which are generally built east and west, the chancel stands at the east end, with an emblematic reference to Christ, who is called the Son of Righteousness and the Day-spring.

E'ASTER (*ostern: Ger.*), a solemn festival observed among Christians, in commemoration of Christ's resurrection. The Greeks and Latins call it *pascha*, a Hebrew word, applied to the Jewish feast of the passover, to which the Christian festival of Easter corresponds. Thus, St. Paul says (1 Cor. v. 7), 'For even Christ our passover is sacrificed for us.' This feast was fixed by the council of Nice, in the year 325, to be held on the Sunday which falls upon or immediately after the full moon which happens next after the twenty-first of March; and as such it stands in the rubric of the church of England. The new moons of the ecclesiastical calendar, by which Easter is regulated, are determined arbitrarily, by the lunar cycle in the Julian calendar, and the table of epacts in the Gregorian The new moons of the calendar are generally one, two, or even three days later than the astronomical or *true* new moons And the 14th day of the moon is counted *full* moon, though the *opposition* more usually occurs on the 16th.

E'ASTER-OF'FERINGS, or **EASTER-DUES**, small sums of money sometimes paid to a parochial clergyman by the parishioners.

E'ASTERLING (*österlich*, eastern · *Ger.*). The silver penny was at first called by this name, from which *sterling*, as applied to English money, is supposed to have been derived The Baltic and German traders, who visited London in the middle ages, were called *Easterlings;* and their name may have been given to this coin, from some of their nation having been employed to coin it

EAST-IN'DIA COM'PANY,—'the Governor and Company of Merchants of London trading to the East Indies,'—the most celebrated commercial association either of ancient or modern times It was incorporated about the 42nd of Queen Elizabeth, A.D 1600, and empowered to trade to countries to the eastward of the Cape of Good Hope, exclusive of all other persons. A variety of causes had been long operating in favour of such an incorporation; and several very valuable East India ships which had been taken from the Portuguese and Spaniards by the English fleets, awakened a desire in our merchants to obtain a share in a traffic which promised such great advantages. At length, in 1593, an armament fitted out for the East Indies by Sir Walter Raleigh, and commanded by Sir John Borroughs, fell in, near the Azores, with the largest of all the Portuguese carracks, a ship of 1600 tons burden, carrying 700 men and 36 brass cannon; and, after an obstinate conflict, carried her into Dartmouth. She was the largest vessel that had been seen in England, and her cargo, consisting of gold, spices, calicoes, silks, pearls, drugs, porcelain, ivory

&c., excited the ardour of the English to engage in so lucrative a commerce. About the year 1698, application being made to parliament by private merchants, for laying this trade open, an act passed empowering every subject of England, upon raising a sum of money for the supply of the government, to trade to those parts. A great subscription was accordingly raised, and the subscribers were styled the New East-India Company; but the old establishment being in possession of all the forts on the coast of India, the new one found it its interest to unite with it; and both, trading with one joint stock, have ever since been known under one name, viz. *The United East-India Company*. Many and severe have been the contests between the advocates of a free trade to India and the friends of the 'incorporated company;' but at length the long-supported monopoly of that powerful body yielded to the act 3 and 4 Will. IV. c. 85, for continuing the charter till 1854, which, in fact, put a limit to the Company's commercial character, by enacting that its trade to China was to cease on the 22nd of April, 1834, and that the Company was, as soon as possible after that date, to dispose of its stocks on hand, and close its commercial business. All the real and personal property belonging to the Company on the 22nd of April, 1834, was vested in the crown, to be held or managed by the Company in trust for the same; subject to all claims, debts, contracts, &c., already existing or to be hereafter incurred by a competent authority. The Company's debts and liabilities were to be all charged on India; the dividend, which was to continue at 10½ per cent., was to be paid in England out of the revenues of India, but it might be redeemed any time after April 1874, or, should the Company be deprived of the government of India in 1854, any time after that event, on payment of 200*l.* for 100*l.* stock. The functions of the East-India Company became, therefore, wholly political, and even these functions have now ceased. The affairs of our Indian empire are now managed by a Secretary of State, assisted by fifteen councillors, and two under secretaries. The East-India Company's territories were immense: they were greater than those of either Russia or Austria, being inferior only to those of Great Britain and France. The revenue of India, which now exceeds the expenditure, is upwards of forty-five millions sterling.

EAU DE COLOGN'E (Cologne water: *Fr.*), an aromatic spirit, made originally at Cologne. It is chiefly used as a perfume; though numberless imaginary medicinal virtues have been ascribed to it. A good imitation of it may be made by mixing one pint of alcohol, one drachm each of the oils of bergamot, orange-peel, and rosemary, one drachm of bruised cardamom seeds, one pint of orange-flower water, and distilling one pint from a water bath.

EAU DE LUCE, a strong solution of ammonia, scented by adding a little mastic and oil of amber. It is considered, in India, an effective remedy against the bite of poisonous snakes.

EAVES (*eaux: Fr.*), the edges of the roof of a house, which overhang the wall, for the purpose of throwing the water to a distance from it.

E'AVES-DROPPER, one who skulks under the eaves of houses, for the purpose of listening to what passes within.

EBB (*ebbe: Ger.*), the retirement or reflux of the tide.

EB'ONY (*ebenos: Ger.*), a hard, heavy, durable black wood, which admits of a fine polish: obtained from various species of *Diospyros*, nat. ord. *Ebenaceæ*, trees which grow in India, Madagascar, Ceylon, and the Mauritius. It is wrought into toys, and used for mosaic and inlaid work. Ironwood belongs to the same genus.

EBOU'LEMENT (*Fr.*), in Fortification, the crumbling or falling away of a wall or rampart.

EBRAC'TEATE (*e*, privative; and *bractea*, a thin leaf: *Lat.*), in Botany, without a bractea or floral leaf.

EBULLI'TION (*ebullio*, I bubble up: *Lat.*), either the operation of boiling, or the effervescence which arises from the mixture of an acid with an alkaline liquor.

ECAU'DATE (*e*, privative; and *cauda*, a tail: *Lat.*), an epithet for anything which has no tail or spur.

EC'BASIS (*ekbasis*, an issue of a matter: *Gr.*), in Rhetoric, those parts of the proœmium in which the orator treats of things according to their events or consequences.

EC'BOLE (*ekbolē*, a going out: *Gr.*), in Rhetoric, a digression by which the orator introduces some other person speaking in his own words.

EC'CE HO'MO ('Behold the man!' *Lat.*), in Art, a picture or piece of sculpture, which represents Christ crowned with thorns The name was suggested by Pilate's exclamation, John xix. 5.

ECCEN'TRIC or EXCEN'TRIC (*ekkentros*: *ek*, away from; and *kentron*, the centre: *Gr.*), in Geometry, a term applied to circles and spheres which have not the same centre, and consequently are not concentric. ——In Ancient Astronomy, the *deferent* circle, in the circumference of which the centre of the *epicycle* of a planet is supposed to be carried forward in its orbit round the earth. It was excentric with regard to the earth; for though the orbit of a planet was believed to be a circle described about the earth, the latter was not placed in the centre of that circle.——EXCENTRIC ANOMALY, the arc of the excentric circle, between the perihelion of the orbit, and a straight line drawn through the centre of the planet, perpendicular to the major axis.——EXCENTRIC CIRCLE, in Ancient Astronomy, the circle that circumscribes the orbit of a planet.——An ECCENTRIC, in Machinery, is a circular disc, attached to a shaft in such a manner that its centre does not coincide with the axis of the shaft. It is of great use when a reciprocating motion is required to be given to a rod.

ECCENTRIC'ITY or EXCENTRIC'ITY (same *deriv.*), in Astronomy, the distance between the focus and centre of the elliptic orbit of a planet or satellite, the semi-axis major being considered as unity; or the ratio of the distance between the focus and centre to the semi-axis major.

ECCHYMO'SIS (*Gr.*), from *enchumo*, I pour in), in Medicine, an appearance of livid spots on the skin, occasioned by an extravasation of blood from a vein betwixt the flesh and the skin.

ECCLESIAS'TES (a preacher: *Gr.*), a canonical book of the Old Testament, the design of which is to show the vanity of all sublunary things. The majority of commentators believe this book to be the fruit of Solomon's repentance, after having experienced all the follies and pleasures of life.

ECCLESIAS'TIC (*ekklesiastikos*, belonging to the church; from *ekklesia*, the church: *Gr.*), a person in orders: one who is consecrated to the service of the church and the ministry of religion.

ECCLESIAS'TICUS (same *deriv.*), an apocryphal book of Scripture, considered by the Roman Catholic church as canonical. It is so called from its being read in the Jewish church as a book of piety and instruction, but not of infallible authority. Its author was a Jew, called Jesus the son of Sirach. The Greeks call it *the wisdom of the son of Sirach*. It exhibits but little regard for methodical arrangement, but it is highly poetical

ECCLE'SIOLOGY (*ecclesia*, and *logos*, a discourse: *Gr.*), that branch of knowledge which is concerned with the structure of churches, ancient and modern, their various parts and contents.

E'CHELON (a step: *Fr*), a term in military tactics borrowed from the French, signifying the position of an army with one division more advanced than another, somewhat like the steps of a ladder. A battalion, regiment, &c, marches *en échelon* if the divisions of which it is composed do not march in one line, but on parallel lines The divisions are not exactly behind each other, but each is to the right or left of the one preceding, so as to give the whole the appearance of a stairway This order is used if the commander wishes to bring one part of a mass into action, and to reserve the other.

ECHI'NATE or ECHI'NATED (*echinos*, a hedgehog: *Gr.*), a term applied to whatever is armed with large spines.——In Botany, an epithet for the seeds of plants that are rough and prickly; also for the pericarp of some plants

ECHI'NITES (same *deriv*), fossil *Echini*, and radiate animals of allied genera. They abound in the chalk.

ECHI'NODERMS (*echinos*, a hedgehog; *derma*, skin: *Gr.*), a class of radiate animals, including sea-urchins, star-fishes, and some worm-like animals in which the radiate structure is only slightly displayed.

ECH'INUS (a sea-urchin: *Lat.*; from *echinos*: *Gr.*), the name of a genus of sea-urchins or sea-eggs, belonging to the echinodermatous class. They have a subglobose shell, or test, composed of calcareous plates, some of which bear tubercles, forming the sockets on which the spines move; whilst others are perforated with small holes in rows through which fleshy cirri, the organs of locomotion, are thrust at the will of the animal. The vent is placed at the middle of the upper part, over against the mouth on the under side. The dental apparatus is large and remarkably elaborate. It was formerly styled Aristotle's lantern. Some species of Echinus form an article of human food on the shores of the Mediterranean.——In Architecture, the *quarter round*, a member or ornament near the bottom of the Ionic, Corinthian, and Composite capitals. It is the *ovolo*; but the name is properly applied only when it is carved with eggs and anchors.——ECHINUS, in Botany, a prickly head or top of a plant.

EC'HIUM (*echion*, from *echis*, a viper: *Gr.*), in Botany, a genus of plants belonging to the nat. ord. *Boraginaceæ*. The *Viper's bugloss*, a British wild plant, belongs to the genus.

EC'HO (*ēchō*, a returned sound: *Gr.*), a sound reflected from some hard surface to the ear. As the undulatory motion of the air, which constitutes sound, is propagated in all directions from the sounding body, it will frequently happen that the air, in performing its vibrations, will impinge against various objects, which will reflect it back, and so cause new vibrations the contrary way. Now, if the reflecting body is at such a distance, &c., as to cause the reflected sound to be both distinct from the original one, and so strong as to be appreciable by the ear, there will be what is called an echo The greater the distance of the reflecting body, the longer will be the time before the repetition is heard; and when the sound, in its progress, meets with objects at different distances, sufficient to produce an echo, it will be repeated several times successively, according to the different distances of these objects from the sounding body; which makes what is called a *repeated echo* Echoes are not, however, caused by a mere reflection of the sonorous particles of air, for then every hard substance would produce an echo; certain conditions are required.—The ear must be in the line of reflection, that the person from whom the sound proceeds may hear the echo If there are several reflecting surfaces, the sound may be brought back by their joint reflection. The reflecting body must not be too near, or the direct and reflected sounds cannot be distinguished: there may be *resonance* without echo. The least distance cannot be less than fifty feet; and about ten distinct sounds may be heard in a second; hence a person situated 512 feet from the reflecting body, will hear the sound one second after it is emitted, and it may repeat about ten syllables. The reflecting surface must be sufficiently extensive, or the echo will be too feeble. A certain concavity in the surface, though not necessary, is very advantageous, as it concentrates several rays of sound to one point Two persons may converse in whispers which will be heard by no one else, if each is placed in the focus of an elliptical building The reflection of sound is governed by the same laws as regulate the reflection of light.——ECHO, in Architecture, any vault or arch constructed so as to produce an artificial echo. These are generally of a parabolic or elliptic form: of this kind is the whispering-gallery in St. Paul's cathedral.——**ECHO**, in Poetry, a sort of verse which returns the sound of the last syllable, the elegance of which consists in giving a new sense to the last words.

ECHOM'ETER (*ēchō*, an echo; and *metron*, a measure: *Gr.*), among Musicians, a kind of scale or rule, serving to measure the duration and length of sounds, and to determine their intervals and ratios.

ECLAIRCISSE'MENT (*Fr.*), the clearing up of anything not before understood.

ECLAMP'SIS (*Gr.*, from *eklampo*, I shine forth), in Medical Science, scintillations or flashings of light in the eyes; a symptom of epilepsy.

ECLA'T (*Fr.*), a burst of applause; renown following some action or event.

ECLEC'TICS (*eklego*, I pick out: *Gr.*), those philosophers who, without attaching themselves to any particular school, select what appears to them the best and most rational from each.——Anciently, they were a sect of Greek philosophers who endeavoured to mould the doctrines of Pythagoras and Plato, and blend them with the theology of the Egyptians and the tenets of Zoroaster. They borrowed many of the principal dogmas of Christianity from the catechetic school of Alexandria; and, combining these with the mysticism of Pythagoras, the errors of Plato, and the superstitions of Egypt, they hoped to reconcile the Christians and Pagans to the same opinions.——In Art, the school of the Carracci is termed 'eclectic,' because they endeavoured to select the chief excellences of other schools and artists, the grandeur of the Florentine, the grace of the Roman school, the colouring of Titian, &c. 'The Carracci were the unapproached representatives of the eclectic school. In the attempt to combine the excellences, however great, of various minds, the chief recommendation of human productions, viz. the evidence of individual character, the moral physiognomy, which in its sincerity and passion atones for so many defects, is of necessity wanting.'—**EASTLAKE.**

ECLEGM' (*ekleigma*, an electuary; from *ek*, away; and *leicho*, I lick up: *Gr.*), a medicine made by the incorporation of oil with syrups.

ECLIP'SE (*ekleipsis*, literally a forsaking: *Gr.*), in Astronomy, an obscuration of the light of the sun, moon, or other luminary, by the interposition of another heavenly body between it and our sight. An eclipse of the *sun* is caused by the intervention of the moon, which totally or partially hides the sun's disc; an eclipse of the *moon* is occasioned by the shadow of the earth, which falls on it and obscures it, either wholly or in part. In endeavouring to understand the true nature of eclipses, the mind must figure to itself the body of the sun, irradiating the earth on one side of its globe, which, being a solid body, intercepts the rays, and therefore projects a long conical shadow from its opposite side: now, when the moon happens to come in a line with this shadow, it falls upon her, and she is eclipsed. An eclipse of the moon is *partial*, when only a part of its disc is within the shadow of the earth; it is *total*, when all its disc is within the shadow. As the moon is actually deprived of her light during an eclipse, every inhabitant upon the face of the earth, who sees the moon, sees the eclipse. It is evident that there will be an eclipse of the sun or moon, only when the sun, moon, and earth are in the same right line, or very nearly so. There must be two, and there may be three, eclipses of the moon every year. The sun can only be eclipsed at the new moon, or when the moon, at its conjunction, is in or near one of its nodes. There must be two, and there may be four, eclipses of the sun every year; and these may be *partial*, *total*, or, *annular* when the shadow is sufficiently extensive to hide only the centre of the sun's disc. Besides the cone of shadow, within which no rays can enter, there is a surrounding space, to which rays can come from some portions of the luminous body: this is called the penumbra (almost a shadow: *Lat.*) of the body causing the eclipse. The nearer the spectator is to the *umbra* or shadow, the deeper the *penumbra*, because the larger the portion of the luminous body screened by that which is interposed. With an eclipse of the sun, the relative positions of the sun and moon are not independent of the observer's position, since, as the sun is not actually deprived of his light, a spectator may see the sun, without perceiving the eclipse; as he may, on account of his position, have none of the rays coming to him from it intercepted. An eclipse of the sun begins on the western side of his disc, and ends on the eastern; and an eclipse of the moon begins on the eastern side of her disc, and ends on the western.——The ancient Greeks and Romans were greatly alarmed by eclipses, supposing them presages of the most dismal events.

ECLIP'TIC (*ekleipsis*, an eclipse: *Gr.*), in Astronomy, the sun's apparent path; or a great circle of the celestial sphere, supposed to be drawn through the middle of the zodiac; or it may be defined, that circle of stars in the heavens, through which the earth would appear to move, if it were seen from the sun. The axis of the earth is not perpendicular to the plane of the ecliptic, but declines from that perpendicular 23° 27′ 56″. [See **EARTH**.] The ecliptic obtained its name from the fact, that eclipses happen only when the moon is in its plane, or very near it.——**ECLIPTIC**, in Geography, a great circle on the terrestrial globe, not only answering to, but falling within, the plane of the celestial ecliptic.

EC'LOGUE (*eklogē*, a picking out: *Gr.*), a selection of passages from a book; a short poem. The Bucolics of Virgil consist of ten Eclogues, in which shepherds are represented conversing with each other.

ECON'OMY (*oikonomia*: from *oikos*, a house; and *nemo*, I manage: *Gr.*), the frugal expenditure of money, with the prudent management of all the means by which property is saved or accumulated. It also signifies a judicious application of time and labour. In a more extended sense, it denotes the regulation and disposition of the affairs of a state or nation, which is called *political economy*. And it is likewise applied to the regular operations of nature in the generation, nutrition, and preservation of animals or plants: as *animal* economy, *vegetable* economy.

ECPHONE'SIS (*ekphōnēsis*, an exclamation: *Gr.*), in Rhetoric, a figure of speech used by an orator to give utterance to the warmth of his feelings.

ECPHRAC'TIC (*ekphraktikos*, capable of removing obstructions: *Gr.*), in Medicine, that which has the property of dissolving or attenuating viscid matter, and of removing obstructions.

ECPHYSE'SIS (*ekphusēsis*, an emission of the breath: *Gr.*), in Medicine, a quick breathing.

ECPIES'MA (*ekpiesis*, a violent squeezing: *Gr.*), in Medicine, a fracture of the cranium when the bones press inwardly on the membranes of the brain

ECPLEX'IS (*ekplēxis*, a consternation: *Gr.*), in Medicine, that state of motionless stupor in which a person appears to lie when in a trance.

EC'STASY (*ekstasis*, entrancement: *Gr*), that state of mind in which the functions of the senses are either suspended or transported with rapture by the contemplation of some extraordinary object ——In Medicine, a species of catalepsy, in which the person remembers, after the paroxysm is over, the ideas he had during the fit

ECSTAT'ICI (*ekstatikoi*, from same: *Gr*), a sort of diviners amongst the Greeks, who for a considerable time lay in trances, deprived of all sense and motion, but when they returned to their former state, gave strange accounts of what they had seen and heard during their supposed absence from the body. Ecstatics are found among the saints of the Roman Catholic church.

ECTRO'PIUM (*ektropion*, from *ektrepo*, I turn aside: *Gr*), in Surgery, that state in which the eyelids are inverted or retracted, so as to show their internal or red surface, and not sufficiently to cover the eye. It arises from the tumefaction of the inner membrane, or from a contraction of the skin which covers the eyelid

EC'TYPE (*ektupos*, worked in high relief: *Gr*), a word sometimes used by antiquarians, and signifying an impression of a medal, seal, or ring, or a figured copy of an inscription or other ancient monument.

EDDAS The two Eddas (or Great Grandmothers), which afford us the earliest specimens of the Scandinavian language, were composed in Iceland. The elder one, containing old mythic poems, is of uncertain date. The younger one, a prose account of the ancient mythology, is attributed to Snorri Sturluson, who died 1241

ED'DY (*ed*, water; and *ea*, backwards: *Sax*), a current of water running in a contrary direction to that of the main stream. — EDDY-TIDE or EDDY-WATER, the water which runs back contrary to the tide; or that which falls back on the rudder of a ship under sail, and is called *dead-water*.—— EDDY-WIND, the wind returned or beat back by any obstruction.

EDE'MATOUS or ŒDE'MATOUS (*oidēma*, a swelling: *Gr.*), in Medicine an epithet applied to a white, soft, and insensible tumour, arising from water collected in the cellular membranes.

E'DICT (*edictum*, from *edico*, I publish; *Lat.*), an order issued by a prince to his subjects, as a rule or law requiring obedience. In Roman history we frequently meet with the edicts of the emperors; and the edicts of the prætors, containing notices to the people of the manner in which they intended to execute the laws.——The *Edictum perpetuum* was a collection of all the laws which had been yearly published by the prætors in their edicts It was made by direction of the emperor Adrian, and was so called because it was intended to continue in force, and serve as a guide and rule in the administration of justice throughout the empire.

EDI'TION (*editio*, a publishing: *Lat*), the number of copies of a work printed before the types are *distributed*. One who prepares the writings of another for publication is called the *editor*; the latter revises, adds notes, and sometimes makes additions to the work, and even rewrites a great portion of it. The *publisher* is the bookseller who negotiates the sale of the impression The edition sometimes goes by the name of the editor: thus, 'Bentley's Horace;' sometimes by the name of the printer or publisher, thus, the 'Aldine' and 'Elzevir' classics, from the celebrated houses of Aldus and Elzevir An *editio princeps* means the earliest printed edition of an author, an *editio optima* is what is considered the best edition.

EDUCA'TION (*educatio*, from *educo*, I bring up: *Lat.*), in its most extended sense, the art of developing and cultivating the physical, intellectual, and moral faculties *Physical education* includes all that relates to the organs of sensation and the muscular and nervous system. *Intellectual education* develops and improves the powers of the understanding. *Moral education* comprehends the various modes of cultivating and regulating the affections, and forming right ideas as to the relation of man to man. Nothing is more shackled by prejudice, more perverted by fanciful theorists, or more abused by the unblushing effrontery of ignorant and artful empirics, than EDUCATION. But too often, attention is almost wholly directed to external show, but little being given to the communication of solid and useful instruction. There is a great tendency in the present day to impart *superficial* knowledge, to instruct in *too many* branches, without teaching any of them thoroughly, or properly considering the kind of information which is required by the circumstances or position of the pupil. It is not too much to assume, that according as this intellectual nutriment is administered, it becomes the germ of happiness or misery to the individual A good educator considers not only the communication of knowledge, but also the training of the pupil; that is, the formation of habits, and the increase of his mental strength, by the right kind and amount of exercise. The education of each sex must be suited to its peculiar wants, and the peculiar position to be occupied by it in after life. The education of females should have a special reference to their performance of domestic duties, and to their obligations as wives and mothers; not that it is in all cases to exclude the higher branches of knowledge, or those usually considered as belonging properly to the other sex. When we consider the great and just influence which the female sex exerts in directing the early ideas of man, and in forming the habits of his future life, we must readily admit that it is most desirable they should be endowed with every species of knowledge which is conveniently within their reach, and which may turn that influence to good.—The education of youth was strictly attended to, both by the Greeks and Romans The minds and bodies of young persons were improved at the same time; their minds by every necessary branch of knowledge, and their bodies by the manly exercises of the Campus Martius, or private contests and trials of skill, agility, and strength. It was the chief aim of the Romans, as well as of the Greeks, to make their children shine in the senate and in the field, at the forum, and in the public games. Oratory was an object which they kept constantly in view; and whatever was their destination, they endeavoured to acquire the art of elocution and a habit of fluent reasoning. Lacedæmon trained her hardy sons to despise danger, endure fatigue, and seem insensible to pain—to maintain their honour unstained, to love their country, and hold in contempt riches, and all that train of enervating pleasures, which are the companions of affluence So far all this was meritorious in a high degree; but how circumscribed must the space have been which was then allowed for intellectual exertion, when the whole world of science was a *terra incognita!*

EDULCORA'TION (*edulco*, I sweeten. *Lat.*), in Chemistry, the act of separating, purifying, or freeing any substance from the saline particles with which it may be impregnated, or those that may be left adhering to it after any operation, by frequent ablutions with water.

EEL (*aal: Ger.*), the popular name of fishes belonging to several genera. They are of elongated form, and are distinguished from other fishes by the absence of ventral fins, and of the two bones in the upper jaw, called maxillary and premaxillary. The gill openings are usually small slits not placed at the edge of the gill covers. Most of them are very voracious. We have specimens in our streams and lakes of the freshwater genus *Anguilla*, and the sea contains the conger eel and many other species.

EEL'-SPEAR, a forked instrument with three or four jagged teeth, used for catching eels.

EFFECT' (*effectus*, from *efficio*, I bring to pass: *Lat.*), the consequence of a cause, sometimes simple and visible, sometimes complicated and invisible, but always simultaneous with the cause.——The word *effects* signifies personal or movable goods.

EFFEC'TIVE (*effectivus*, from same: *Lat*.), in Military language, an epithet for a body of men that are fit for service.

EFFERVES'CENCE (*effervesco*, I boil up: *Lat*.), the escape of gaseous matter from liquids, as in fermentation. The liquid has the appearance of boiling, and the effect is most frequently due to the liberation of carbonic acid.

EFFE'TE (*effetus*, exhausted, like one who has brought forth: *Lat.*), barren. An animal becomes *effete* by losing the power of conception: the earth may be rendered so by drought, or by exhaustion of fertility.

EFFI'CIENT (*efficio*, I bring to pass: *Lat.*), causing the intended effect. The *efficient cause* is that which produces; the *final cause* is that for which anything is produced

EFFLORES'CENCE (*effloresco*, I begin to bloom: *Lat.*), the spontaneous crumbling down of transparent crystals, on account of the loss of water. This term was adopted by the older chemists, because of a fancied resemblance of the resulting powders to flowers.

EFFLU'VIA (*effluo*, I flow forth: *Lat*.), the vapours arising from putrefying substances. Malignant effluvia are considered to be the frequent causes of plague and other diseases.

EFFU'SION (*effusio*, a pouring out: *Lat*.), in Surgery, the escape of any fluid out of the vessel or viscus naturally containing it; also the natural secretion of fluids Blood may, on account of a wound, flow from the chest into the cavity of the pleura, or an injury to the head may cause effusion on the brain

EFT (*Sax*.), or *Newt*, common names of some small batrachian reptiles, which live in water, and, like the frog, undergo metamorphosis The great white newt (*T palustris*) is about six inches long; common water newt (*Triton aquaticus*) about three.

EGG, a body formed in a peculiar cavity in the interior of female mammals and lower animals, from which, when fertilized, another member of the species is produced. Taking the egg of a hen as an example, we find on the outside a calcareous shell, which is lined by a double membrane. Inside this is an albuminous substance, the *white* consisting of several layers, and surrounding the *yolk*, which has its own membrane, the vitelline membrane. Before the egg was laid, there was in the middle of the yolk a minute vesicle, called the germinative vesicle, and this contained a smaller one, the germinative dot. The most important part of the egg is the *vitellus*, or yolk. It is an aggregation of granules and drops of oily fluid.——The quantity of eggs consumed in England appears almost incredible. Independently of the home produce, which is immense, the number of eggs annually imported from France, and other parts of the continent, is much more than 100 millions

EGG'-PLANTS, the common name of some plants belonging to the genus *So-*

'anum; so called because the fruit is like an egg.

EG'LANTINE (*églantier: Fr.*), the old English name of the *sweet-briar:* it has been incorrectly applied by Milton to the honeysuckle.

E'GRET (*aigrette: Fr.*) the name of two birds of the heron genus, viz. the great egret, or great white heron (*Ardea alba*), and the little egret (*Ardea garzetta*). Both are of extreme rarity in England.

EI'DER-DOWN (*eider dunen: Ger.*), the soft feathers of the *eider-duck*, plucked by the female from her breast, for the purpose of lining her nest. The bird breeds amongst precipitous coast rocks in the north of Europe.

EI'DOGRAPH (*eidos*, form; *graphein*, to write: *Gr.*), an instrument by which a drawing may be copied on a reduced or on an enlarged scale.

EISTEDD'FOD (*eistedd*, to sit: *Wel.*), the assemblies of the Welsh bards. Judges were appointed to decide on the merits of the respective minstrels by the Welsh princes, and, after the conquest of the principality, by the English kings The last commission issued for that purpose was in 1568. The Gwyimedigion and Cambrian societies have revived these meetings, for the recitation of prize poems, and performances on the harp.

EJECT'MENT (*ejectio*, a casting out: *Lat.*), a personal action, in the form of trespass, in which a tenant for years claims damages for his expulsion from land demised to him: it has become the usual mode of trying questions of right to a real property. The party who claims land, or its appurtenances, not in his possession, is the real plaintiff: but up to 1852, by a strange fiction, he did so through the means of a fictitious tenant named *John Doe*, who complained of being ejected from his farm by the defendant. The defendant disputed plaintiff's right to let the land, and if the plaintiff succeeded, he recovered *nominal damages*, and also the *land itself* for the term of *Doe's* supposed demise: that is, for the term of his own right But at present, the real name of the claimant is set forth in the writ.

ELÆAG'NUS (*elaia*, an olive tree; and *agnos*, a willow: *Gr.*), in Botany, a genus of trees, nat ord. *Elæagnaceæ.* Most of the species have their leaves covered with scurfy scales, which, under the microscope, are seen to be of a regular stellate form.

ELA'OLITE (*elaion*, oil; and *lithos*, a stone: *Gr.*), called also *fellstein*, a crystalline mineral, more or less translucent, of a greasy appearance, and varying in its colour from greenish-blue to flesh-red. It consists of silica, alumina, and potash.

ELASTIC'ITY, or ELAS'TIC FORCE (*elauno*, I set in motion: *Gr.*), that inherent property of bodies by which they restore themselves to their former figure, after any external pressure or tension. It is very observable in a bent bow, steel springs, and the like. *Perfectly elastic* bodies are those which restore themselves with the same force with which they were bent or depressed; those which do not restore themselves with exactly the same force being called *imperfectly elastic* bodies. The air is *elastic;* vapours are *elastic;* and when the force compressing them is removed, they instantly expand or dilate, and recover their former state. When an elastic solid body is made to vibrate by a sudden stroke, the vibrations are made in equal times, wherever the stroke may be applied; hence a bell always gives the same tone, however struck.

ELATER'IDÆ (*elatēr*, a driver: *Gr.*), in Entomology, a family of beetles possessing a pectoral spine in a sheath. When these insects are laid on their backs they bend themselves until they rest only on the extremity of the head and wing cases. The effort being suddenly relaxed, the head and thorax fly up, and the base of the wing-cases strikes the supporting surface so forcibly that the beetle is jerked a considerable height into the air. The *Pyrophorus noctilucus*, or fire-fly of the tropical parts of America, belongs to this family.

ELATE'RIUM (*elaterion*, literally that which drives away: *Gr.*), a substance prepared from the pulp of the *Ecbalium agreste*, or wild cucumber, a plant belonging to the nat. ord. *Cucurbitaceæ*, which grows in the south of Europe. It is imported in thin cakes, of a greenish colour and bitter taste. It is a powerful cathartic, and is used to diminish the amount of fluid in cases of dropsy.

EL'ATINE, the active principle of *elaterium.*

EL'BOW (*elbogen: Ger.*), in Anatomy, the juncture of the *cubitus* and *radius*, or the outer angle made by the flexure or bend of the arm.——ELBOW, in Architecture, a term used for an obtuse angle of a wall, building, road, &c., which deviates somewhat from a right line.

EL'DER (*ealdor: Sax.*), a person advanced in life, and who, on account of his age and experience, is selected to fill some important office. In Jewish history, the *elders* were persons the most considerable for age, experience, and wisdom. Of this sort were the seventy men whom Moses associated to himself in the government of his people; such also were those who afterwards held the first rank in the synagogue as presidents. In the first Christian churches *elders* were persons who enjoyed offices or ecclesiastical functions, and the word includes apostles, pastors, presbyters, bishops, or overseers; hence the first councils of the Christians were called *presbyteria*, or councils of *elders.* In the modern Presbyterian churches, *elders* are officers who, with the ministers and deacons, compose the sessions of the kirk, and have authority to inspect and regulate matters of religion and discipline.——ELDER, the popular name for small trees belonging to the genus *Sambucus*, nat. ord. *Caprifoliaceæ.* There are several species; some bear black, some white, and others red berries. The stem and branches contain a soft pith.

EL DORA'DO (the golden region: *Span.*), a name given by the Spaniards to an imaginary country supposed to be situated in the interior of America, between the rivers Orinoco and Amazon, abounding in gold and all kinds of precious stones. 'Guiana, whose great city Geryon's sons call El Dorado.'—MILTON.——In the language of poetry, it now means a paradise of boundless wealth and felicity.

ELEAT'IC, an epithet given to a certain sect of philosophers, so called from Elea, a town of Campania, where some of them lived about 500 years B.C. Xenophanes is usually considered the founder of the school, and his most celebrated followers were Parmenides and Zeno of Elea. Xenophanes thought that the universe was eternal and immutable. Parmenides taught that Reason alone was capable of recognizing truth, and that the impressions made on the senses were deceptive, and occasioned by two opposite principles, fire or light, and cold or darkness, whence came all the appearances of change. Zeno attempted to prove by four arguments that there is no such thing as motion, one of these having for its illustration the celebrated story of Achilles and the tortoise. The Eleatics are considered to be the founders of philosophical pantheism.

ELECAMPA'NE, in Botany, the vulgar name for the *Inula Helenium*, an aromatic composite plant, from the root of which a preparation was made that was formerly used as an expectorant; also, a name given to a coarse candy, containing little else than coloured sugar.

ELECT' (*electus*, chosen: *Lat.*), in Theology, among Calvinists, a term for those whom they believe God has chosen, or predestinated to be saved.——ELECT, in matters of polity, signifies chosen, but not inaugurated. Thus, the lord-mayor of London, before his predecessor's mayoralty is expired, is called the lord-mayor *elect*.

ELEC'TION (*electio*, a selection: *Lat.*), the act of choosing a person to fill an office or employment by any manifestation of preference. The term is applied to the choice of members of the legislature, which takes place within, at most, every seven years; to the selection of parish officers annually; and to the admission of members into societies. Sometimes it is practised by show of hands, sometimes by ballot, and at others by every elector giving his vote separately, with an oath in regard to his right and integrity.——ELECTION, in Theology, divine choice, by which persons, according to the Calvinistic creed, are distinguished as objects for salvation by the special grace of God, without reference to their good or bad deeds.

ELEC'TIVE (*electus*, a choice: *Lat.*), dependent on choice, as an *elective* monarchy: opposed to hereditary.

ELEC'TOR (a chooser: *Lat.*), in Law, any one who has the right of giving his vote at an election, particularly at the election of a member of parliament.——ELECTOR, in Political History, the title of such German princes as formerly had a voice in the election of the emperor of Germany; most of them have assumed the title of king.

ELEC'TORATE (from *last*), the dignity or territory of an Elector, that is, one who had the right of voting at the election of an Emperor of Germany. Most of them, since the abolition of the empire in 1805, have assumed the title of king.

ELEC'TRIC CLOCKS. It was soon found that electro-magnetism might be applied to the production of motion; masses of soft iron being alternately attracted by and set free from electro-magnets, by alternately making and breaking battery connection. But the means necessary to be employed were too complicated, and, compared with steam, too expensive for economic use. It has, however, been successfully applied as a means of communicating motion to clock-work; and it is particularly adapted to keep a number of clocks in perfect harmony, by using one, either ordinary or electric clock, to make and break battery communication, which simultaneously moves the hands of all the rest, however distant they may be.

ELEC'TRIC LIGHT. Many attempts have been made, from time to time, to use electricity as a means of illumination. The impossibility of insulating *machine electricity*, particularly in certain states of the atmosphere, on account of its high intensity, would alone be sufficient to render it inapplicable for the purpose. Galvanic electricity, being of much lower intensity, does not present the same obstacle. If two pieces of charcoal are made a portion of the connection between the elements of a powerful galvanic battery, provided they are not too far asunder, the electricity will pass between them; and on their being drawn farther apart, an intensely brilliant arch of light will be produced. But as carbon is gradually transferred by the electric current from one piece of charcoal to the other, the distance between the pieces becomes, after a while, too great, and the light is diminished or altogether extinguished. Various plans have been proposed to remedy this inconvenience; the best being the movement of one of the pieces of charcoal with machinery, regulated by the action of the apparatus itself, so as to maintain the proper space between them.

ELEC'TRIC TEL'EGRAPH, or, more correctly, the **ELECTRO-MAGNETIC TELEGRAPH.** If the conducting wire which unites the two elements of a galvanic battery be parallel to a magnetic needle before the current is transmitted, the needle will immediately arrange itself at right angles to the wire, when the current is made to pass along the wire. [See ELECTRO-MAGNETISM.] The effect of the electric current on the needle is doubled, if the conducting wire is bent round so as to pass along the opposite side of the needle; and as these convolutions of the wire are increased in number within certain limits, their effect also is augmented. With such an apparatus, each time the electric current is established and broken, there will be a separate deflection of the needle. As the conducting wire may be of any length, provided the battery is sufficiently powerful, we have at once a means of communication between distant places and a system of signs suggested: one deflection may mean one thing; two in succession another, and so on. But the signals at our disposal are doubled in number if, by reversing the electric current, we cause the deflections to be made in the opposite directions, and their amount is still further increased if we combine deflections in opposite directions. This is in fact the electric telegraph; since all the different forms it assumes are no more than modifications of it. It is found unnecessary to use two wires—one for the *direct* current from one place to another, and the other for the *return* current from the second place back again to the first: the earth answers for one of them. Of course, when more than one message may have to be communicated at the same time, different wires must be used. It is clear that all the needles in connection with a given wire will be deflected at the same time by the electric current. When, therefore, it is notified for what place the message is intended, the connection with the other needles at the different stations being cut off, the current is not uselessly retarded. As the telegraph clerk may not be attentive, his notice is attracted by an alarm bell, set ringing by the electric current. The wires are sometimes carried through the air on poles, insulation being secured by the use of glass or porcelain connections for attaching the wire to these supports; sometimes in tubes underground, insulation being effected by gutta percha, &c.; sometimes over the tops of houses, through the sea, &c. An apparatus with two needles is used at all principal stations: it may be considered as a combination of two simple ones; with it, the reading of the signals is more rapid; but it has the inconvenience of requiring two wires. Apparatus has been invented for printing or writing a message instead of merely indicating it.

ELEC'TRICAL EEL, the *Gymnotus electricus* of ichthyologists, a fish shaped like an eel, which inhabits rivers in tropical South America. It possesses an internal electrical apparatus, from which, at the will of the animal, a shock can be transmitted to another animal. These shocks are so violent that even horses are stupified by them. In this way the animal obtains its prey. Specimens 5½ feet long have been found, and smaller ones have been brought to Europe. With these various electrical experiments have been tried.

ELEC'TRICAL MACHI'NE, an instrument or apparatus for generating electricity. Electrical machines are of various kinds, but the *cylindrical* is the most common, and probably the most convenient. It consists of a glass cylinder, fixed in such a manner that it may be turned with a winch; a cushion, supported by a glass pillar, and having a piece of silk which comes between it and the cylinder; and a metallic body, which is supported by a glass pillar, and is called the *prime* or positive *conductor*, or simply the *conductor*. If the cushion also is insulated by a glass pillar, to which is attached a similar metallic body, the latter is called the *negative conductor*. The electricity obtained from the prime conductor is *positive* or vitreous: that from the negative conductor, *negative* or resinous. The *plate electrical machine* differs from the cylindrical, chiefly in having a circular plate of glass, instead of a glass cylinder which is electrically excited by friction of the rubber. If we require positive electricity, the prime conductor must be insulated, and the negative conductor joined by a wire or chain to the ground, since all the electricity capable of being removed from the cushion and negative conductor would soon be withdrawn from them. If we require negative electricity, it is the negative conductor which must be insulated, and the positive which must be connected, by a wire or chain, with the earth. ——ELECTRIC INDUCTION, that action which an electrified body possesses of exciting electricity in any other conducting body near it.——ELECTRIC RUBBER, a cushion of horsehair, covered with leather, and slightly coated with an amalgam, consisting of mercury, tin, and zinc, which have been fused together, and pounded with tallow in a mortar. The flap of silk attached to the rubber is used to keep the electricity from being dissipated before it is drawn away to the conductor, by points attached to the latter; and also to increase the friction. Everything connected with electrical apparatus must be perfectly dry and clean, since moisture or dust carries away the electric fluid. On a very damp day, it is extremely difficult to make electrical experiments successfully, whatever precautions are taken.——ELECTRIC SHOCK, the effect produced on the animal body by transmitting through it a current of electricity, or the sudden withdrawal of a charge of electricity.

ELECTRIC'ITY (*elektron*, amber: *Gr.*), a peculiar affection of matter. Also that branch of science which treats of this. The name is derived from the Greek word signifying amber, the electrical properties of which were remarked 600 years before the Christian era; but electricity can scarcely be considered to have become a distinct branch of science before the commencement of the 17th century, when a book, containing accounts of several electrical experiments, was written by Dr. William Gilbert; and it is only since the year 1745, when the properties of the *Leyden jar* were discovered, that it has made any considerable progress. From that time, however, electricity became the subject of constant research and careful experiment; and, as a science, it advanced with great rapidity under the auspices of Franklin, Priestley, and others. Various theories have been put forward as to what electricity is. It is usually spoken of as a fluid, and it is supposed that a body in the natural state is one which contains *two* species of electricity, the one termed positive or vitreous, and the other negative or resinous. These exhibit polar or antagonistic forces, so that if they meet they neutralize each other, and cease to be apparent. Bodies electrified with either electricity, by whatever name it may be called, repel those electrified with the same kind, but attract those electrified with the opposite kind. Bodies vary greatly in their power of transmitting electricity, hence their division into conductors and non-conductors. To the former the metals belong; to the latter, glass, wax, and resins. Substances of this description may be excited by friction, so as to exhibit the attraction and repulsion of light bodies, and emission of sparks or flashes of light, attended with a sharp snapping sound; and such is the rapidity of the electric fluid in motion, that no appreciable space of time is required for its passage to any known distance. The back of a cat, and even the human body, if rubbed in the dark, when the atmosphere is dry, may be made to give out sparks. It is now thoroughly ascertained that lightning is produced by vast quantities of the electric matter, and that thunder is the noise caused by the passage of the lightning. The *Aurora borealis*, or Northern lights, is the effect of the electric fluid moving in the higher regions of the atmosphere; and it may be extremely well imitated, by transmitting electricity through highly rarefied air, which acts, to a certain extent, as a conductor. It is also well known that earthquakes, whirlwinds, and waterspouts are generally accompanied with, and dependent upon, electrical phenomena. Indeed, a change in the condition of matter (for instance, from the liquid to the vaporous form, and *vice versâ*) is always accompanied by a change in its electrical state.

ELEC'TRO CHEM'ISTRY, that science which treats of the agency of electricity and galvanism in effecting chemical changes.

ELECTROL'YSIS (*lusis*, an unloosing: *Gr.*), the decomposition of metallic compounds, by the action of a galvanic current, when a deposition of metal takes place at the negative pole of the battery. Electrolysis is too expensive to be employed in the separation of the commercial metals from their compounds, but this process is largely applied in the operations of electrotyping and electroplating.

ELEC'TRO-MAG'NETISM. Electricity cannot pass through a conductor without magnetism being developed. This important fact, discovered by Oersted, may be proved by a simple experiment. Cause a piece of thin copper wire to lie very near and parallel to a magnetized needle capable of moving on a point: connect the wire with a galvanic battery, so that a current shall pass through: while the current is passing, the needle will not remain parallel with the wire, but will arrange itself transversely to it; and whether the north pole shall be deflected to one side of the wire or the other depends on *which direction* along the wire the current is proceeding, and whether the current is *under* or *over* the needle. Changing *both* the direction of the current and the side of the needle along which it flows, leaves the deflection towards the same side of the wire. This experiment teaches us how to magnetize a bar of steel permanently but slightly, and a bar of iron temporarily but strongly. For this purpose, we must cover a copper wire with silk, cotton, or some other insulating material, and coil it round the bar which is to be magnetized, and which may be either straight or in the form of a horseshoe, &c. On transmitting electricity through the wire, the bar will be rendered magnetic, and the intensity of its magnetism will depend on its softness, on (within certain limits) the length of the wire, and on the power of the galvanic battery employed.

ELEC'TRO-MET'ALLURGY. [See ELECTROTYPE.]

ELECTROM'ETER (*electron;* and *metron*, a measure: *Gr.*), an instrument for measuring the quantity or intensity of electricity, and determining its quality. Several contrivances have been devised for this purpose, but all of them depend on the mutual repulsion of similarly electrified bodies. The simplest is the *pith-ball electrometer*, which consists of two balls about the size of peas, made, for lightness, of the pith of elder, and suspended by two threads of silk. In their ordinary state, they lie in contact, but when electrified, they fly from each other, the amount of divergence depending on the degree of electrical excitement. —The *Gold-leaf Electrometer* consists of a small glass jar, to the upper end of which is attached a brass cap; in the centre of the latter is fixed a piece of glass tube; a wire passes through the tube, having at its upper end a brass ball, and at its lower, two narrow slips of gold leaf, hanging together by one end of each. These slips remain parallel, and in contact, when the instrument is unelectrified; but, when it is electrified, by placing an excited body in contact with or near its brass ball, the lower extremities of the gold leaves fly asunder. The glass jar protects the gold leaves from injury.—The *Quadrant Electrometer* consists of a stem of ivory, at the upper end of which is a graduated quadrant or semicircle, from the centre of which hangs down a very light index, having a pith ball at its lower extremity. When this instrument is fixed on an unelectrified conductor, the index and pith ball will lie close to the ivory stem; but when the conductor is charged with electricity the index and stem will mutually repel each other, and the divergence will be indicated by the quadrant or semicircle.—The *Torsion Electrometer* consists of two pith balls, fixed respectively at the ends of a short and slender slip of some very light substance. This slip is suspended horizontally, by the centre of gravity, to a silkworm's thread, or some other very fine filament, hung within a glass jar, in the centre of the upper end of which is fixed a tolerably large glass tube; and at the upper extremity of the glass tube, a movable knob, to the under part of which the filament is attached. The filament passes down through the tube, and into the jar. A short piece of brass wire is fixed in an aperture drilled through the side of the jar, and has a brass ball attached to both its interior and exterior ends. When the instrument is unelectrified, one of the pith balls remains quietly in contact with the brass ball inside the jar; but when it is electrified, by bringing the outer brass ball in contact with an excited body, the pith ball is driven away from the brass ball, in opposition to the force of torsion, the filament being forcibly twisted. If the brass and pith balls are *oppositely* electrified, it may be seen, by moving round the knob above, through what distance the brass and pith balls will attract each other, in opposition to the force of torsion; and as the force of torsion is proportional to the extent through which the filament is twisted, different repulsions or attractions may be very accurately compared.

ELEC'TRO-NEGA'TIVE, charged with *negative* or resinous electricity, and attracted by bodies *positively* electrified.——ELECTRO-POSITIVE, charged with *positive* or vitreous electricity, and attracted by bodies negatively electrified: for instance, by the negative pole or element of the galvanic battery.

ELECTROPH'ORUS (*electron;* and *phero*, I carry: *Gr.*), a very simple instrument for obtaining electricity. It consists of a flat smooth cake composed of resin and a little wax which have been melted together and poured into a small shallow circular tin tray; also, a brass plate with a glass handle; and the skin of a cat prepared for the purpose. Having dried and even slightly warmed the apparatus, and struck the resin smartly a few times with the catskin, we lay the brass plate on the resin; while there, a spark may be obtained from it—in the first instance, on account of the electricity, it removes from the parts of the resin with which it is in contact, and afterwards on account of the electricity produced upon it by the electrical action of those portions of the resin with which it is not immediately in contact On taking the plate away, a spark may be again obtained from it; and every time this is repeated, *two* sparks may be had in the same way—the first due to the electricity repelled from the brass plate by that which remains in the very slight hollow of the resinous cake; the second, to the restoration of the ordinary state of the brass plate when it has been removed from the inductive action of the cake If the apparatus is kept in a dry place, sparks sufficient to explode gases may, without fresh excitement, be taken from it for months.

ELEC'TROSCOPE (*electron;* and *skopeo*, I examine: *Gr.*). Any instrument, such as the gold-leaf electrometer, &c., for detecting the *presence* of electricity, is called by this name.

ELEC'TROTYPE (*electron;* and *typos*, a mark: *Gr.*), the process by which works in relief are reproduced by the agency of electricity, which precipitates certain metals, such as gold, silver, and copper, from their solutions, upon moulds, so as to form a coherent mass equal in toughness and flexibility to hammered metals. The applications of this beautiful process appear almost unlimited, and, as a means of producing facsimiles of art, it is invaluable. The nature of the operation may be illustrated by a very simple experiment:—Plunge two pieces of clean platinum into a solution of sulphate of copper, slightly acidulated with sulphuric acid. No effect will be produced until the pieces of platinum are connected respectively with the poles of a galvanic battery. On doing this, copper will be immediately precipitated on the *catalectrode* or *negative* surface, and the deposit may be made of any desired thickness: if the strength of the solution is kept up by occasionally adding sulphate, the copper will be in the solid form, and may be peeled off the platinum. If the electric current is reversed, the copper will be taken from one piece of platinum and deposited on the other. If the *negative pole* or *cathode* had been a medal, or other irregular surface, a matrix would be formed from it; and, using this matrix in the same way, copper deposited on it would represent the surface of the medal, &c If gold, silver, and other metals are substituted for the copper, the cathode will be gilt, silvered, &c A varnish protects any part we please from being coated with deposit, and a coating of black-lead will render a non-conductor capable of having a deposit formed upon it In the ordinary mode of carrying on the process, two vessels are used; and, dilute sulphuric acid having been poured into one of them, which may be a lamp chimney closed with a bladder at the lower end, it is placed in the other, which contains a strong acidulated solution of sulphate of copper, &c The medal to be copied is hung in the solution of sulphate, being connected by a wire with a piece of zinc hung in the dilute acid. The bladder prevents the fluids from mixing, but does not intercept the electric current from the zinc to the medal On the large scale, a somewhat different arrangement is used, but the principle is the same: the solution of sulphate of copper is placed in a trough of slate, &c; a plate of copper is suspended in it, and also, opposite to the copper, the medals, &c, to be copied. The plate of copper, being united by wire with the zinc element of a separate constant battery, and the metallic rod carrying the medals, &c., with its other metallic element, a deposit is formed on the medals, &c With this arrangement, the constant battery is called the *generating cell*, and the vessel with sulphate solution the *decomposing cell*. In the simple apparatus first described, the lamp chimney containing the zinc was the generating cell, and the external vessel the decomposing cell. When other metals are to be precipitated, plates and solutions of these metals are to be employed in the decomposing cell

ELEC'TRUM (*Lat*; from *elektron* · *Gr*), a term used by the ancients to indicate a metallic alloy, consisting of four parts gold and one silver; also amber.

ELEC'TUARY (*electuarium: Lat.*), in Pharmacy, a form of medicine, composed of powders or other ingredients, incorporated with some syrup, &c. [See ECLEGM.]

EL'EGANCE (*elegantia: Lat.*), in the Fine Arts, grace and lightness, but particularly the latter.

ELE'GIT (he has chosen: *Lat.*—on account of the creditor making a selection of the writ which he will sue out), in Law, a writ of execution, founded upon an ancient statute passed in the 13th year of Edward I. It is addressed to the sheriff, who gives to the judgment-creditor the lands and tenements of the debtor, to be enjoyed by him until the debt is fully paid. After it, the body of the debtor cannot be taken.

EL'EGY (*elegos: from e*, alas; and *lego*, I say: *Gr.*), a mournful and plaintive kind of poem. The principal writers of elegiac verse among the Greeks were Callimachus, Parthenius, and Euphorion; among the Latins, Propertius, Ovid, and Tibullus.

EL'EMENTS (*elementa*, first principles: *Lat.*), the indecomposable constituents of bodies, of which chemists have discovered about 65. These they class as metallic, non-metallic, and intermediate elements; but, in fact, the classes graduate into each other. A list of the elementary bodies will be found under EQUIVALENTS. In the ancient and still popular sense of the word, the elements are understood to be four in number, namely, fire, air, earth, and water; but it is fully demonstrated by the researches of modern science, that earth is a compound of many earths; air, a compound of at least two gases; water, a compound of hydrogen and oxygen; and fire, only the production of light and heat during combustion.——ELEMENTS, in a figurative sense, the principles and foundations of any art or science, as 'Euclid's Elements,' &c.——ELEMENTS, in Divinity, the bread and wine prepared for the sacrament of the Lord's Supper.

EL'EMI, a resin of a strong aromatic odour, and a hot spicy taste, which exudes from incisions made through the bark of various terebinthinous trees. The crystalline resin of elemi is called *elemine*, and is used in making lacquer.

ELEN'CHUS (*elenchos*, a proof: *Gr.*), in Logic, a sophism, or fallacious argument, which deceives the hearer under the appearance of truth.

EL'EPHANT (*elephas: Gr.*), the largest, strongest, and most sagacious of all quadrupeds. It is placed amongst the *Pachydermata*, in the order *Ungulata*. The form of this animal is altogether awkward; the head is massive, the eyes small, and the ears large and pendulous; the body is thick, and the back much arched; the feet are short, round, clumsy, and distinguishable only by the five rounded hoofs in which each of them terminates. The trunk, or proboscis, by which it conveys food and drink to its mouth, and the most singular part of its structure, is a cartilaginous double tube, seven or eight feet long, composed of numerous rings, and extending from the upper jaw. It is of such strength as to be capable of breaking off large branches from trees; whilst, at the same time, it is endowed with such exquisite sensibility, that it can grasp the smallest object. The two large tusks are of a yellowish colour, and extremely hard: the bony substance of these is called *ivory*. The disposition of the elephant is gentle, and his manners social; hence they are seldom seen except in troops. In wandering from place to place, the males, who are furnished with the largest tusks, put themselves at the head, and are the first to face every danger. Elephants shed their teeth eight times, their tusks only once. The latter take the place of the incisor teeth of other animals. Two species are distinguished, one inhabiting India, the other Africa. The latter has a remarkably large ear. The extinct mastodon and mammoth were closely allied animals. Elephants were first used in war by the Greeks, in the time of Alexander the Great; at least, there is no mention of their being so employed before that time. They carried upon their backs large towers, containing from ten to thirty soldiers, who threw missive weapons from thence upon the enemy, being themselves secured within their wooden walls; while the animals did great execution, by terrifying, tearing, and trampling down both horses and men.

EL'EPHANT-BEETLE, the *Megasoma elephas* of entomologists, is a native of South America. It is a member of the family *Dynastidæ*, in the *Lamellicorn* group. It has acquired its name from having a long horn on the thorax, with a shorter one on each side. This insect is frequently three inches in length, but in size it is much exceeded by the Hercules-beetle (*Dynastes Hercules*), also a native of South America, which has a length of five, and sometimes of six inches.

ELE'PHANT'S FOOT, the common name of a plant, *Testudinaria elephantipes*, nat. ord. *Dioscoreaceæ*, a native of the Cape of Good Hope. The short thick rough stem suggested the name.

ELEPHANTI'ASIS (*Gr.*, from *elephas*, an elephant), a species of leprosy, which derives its name from the skin being covered with incrustations like the skin of the elephant, and from the legs swelling to an immense size. It is a dreadful chronic disease, and is regarded as contagious.

ELEUSIN'IA (*Eleusis*, in Greece), in Grecian Antiquity, solemn and mysterious festivals in honour of Ceres and Proserpine They were of two kinds, the less and the greater. The *less*, which were held at Agræ on the Ilissus, were celebrated every year —according to some, in honour of Proserpine only. They were intended chiefly as a preparation for initiation in the *Mysteria*, or rites of the *greater* solemnity. The latter continued nine days, the first portion being celebrated at Athens: it included, most probably, a representation of the whole history of Ceres and Proserpine, and indicated to the initiated, according to common belief, a pleasing prospect of the future state—a purpose not originally contemplated, and perhaps introduced from Egypt. The presiding or initiating priest was termed a *hierophant*. To reveal the secrets of the Eleusinian mysteries was looked upon as a crime that could not fail to draw down the vengeance of heaven.

ELEUTHE'RIA (the feast of liberty: *Gr.*), in Grecian Antiquity, a festival celebrated at Platæa, in memory of the defeat of Mardonius, the general of Xerxes, and in honour of those who gallantly sacrificed their lives for the liberty of their country; also as a bond of union among the Greeks themselves. It was held every fifth year, when prizes where contended for. Slaves, on obtaining their liberty, kept a festival called *Eleutheria*.

ELEVA'TION (*elevatio: Lat.*), in Architecture, an orthographic drawing of the face or side of a building.——ELEVATION, in Astronomy, altitude; the height of the equator, pole, or stars, &c., above the horizon.——In Gunnery, the angle which the chase of a cannon or mortar makes with the plane of the horizon.——ELEVATION OF THE HOST, in the Roman Catholic church, that part of the ceremony of the mass which consists in the priest's raising the host above his head for the people to adore it.

EL'EVATOR (*elevo*, I lift up: *Lat.*), in Anatomy, the name of several muscles, which serve to raise those parts of the body to which they belong; as, the elevator of the external ear, the epiglottis, &c.——ELEVATOR, a surgical instrument, used for raising depressed portions of the skull in trepanning.

ELF (*ælfe: Sax.*), a term now almost obsolete, but formerly used to denote a fairy or hobgoblin, an imaginary being, the creature of ignorance, superstition, and craft.

ELF'-ARROWS, a name given to flints in the shape of arrow-heads, vulgarly supposed to be shot by fairies. They are frequently met with in Great Britain, and there is reason to believe they were weapons of offence among the ancient Britons.

EL'GIN MAR'BLES, a collection of splendid bassi-rilievi and fragments of statuary, which were sent chiefly from the Parthenon of Athens to England, in 1812, by Lord Elgin (hence the name). They are now in the British Museum, having been purchased by government in 1816 for 35,000*l.* They are unquestionably most valuable remains of ancient art, and offer the finest subjects for study. The most important part of the collection consists of sculptures, which were placed on the eastern and western pediments of the Parthenon at Athens. One set represented, when entire, the miraculous birth of Minerva from the head of Jupiter; the other the contest of Minerva and Neptune for the guardianship of Athens. They were executed under the superintendence of Phidias.

ELIMINA'TION (*elimino*, I turn out of doors: *Lat.*), in Algebra, the causing an unknown quantity to disappear from an equation. By means of this process, an equation having only one unknown quantity is obtained from any number of equations having the same number of unknown quantities.

ELIQUA'TION (*eliquatio*, a liquefying: *Lat.*), in Metallurgy, a separation of the different parts of mixed metals by the different degrees of heat required to melt them.

ELI'SION (*elisio*, from *elido*, I strike out: *Lat.*), in Grammar, the cutting off or suppressing a vowel at the middle or end of a word for the sake of sound or metre; as, *th' ensanguined field.*

ELIX'IR (*Arab.*), an old pharmaceutical term, expressing certain essences or tinctures: thus, the mixture of an aromatic tincture with sulphuric acid was called *elixir of vitriol.*——Also, solutions employed by the alchemists in their attempts to effect the transmutation of metals.

ELK, or MOOSE, a quadruped of the deer family, of which it is the largest species. It is a native of the northern regions of Europe and America. It is very shy and wary, requiring great skill on the part of the hunter to bring it within range of his gun. The height at the shoulders is frequently more than six feet, and the male carries a pair of horns which are very broad at the upper end, and weigh sometimes nearly 50 lbs. From the short neck and long legs, the animal is not graceful. The great Irish elk (*Megaceros hibernicus*), whose fossil remains are sometimes found in bone-caverns, was a still larger animal, and is now extinct. The skull and antlers have been known to weigh 86 lbs.

ELL, a measure, of different lengths in different countries. That formerly used in England was the English or Flemish ell: the former being three feet nine inches, or one yard and a quarter, and the latter only twenty-seven inches, or three-quarters of a yard.

ELLIP'SIS (*elleipsis*, literally a deficiency: *Gr.*), in Geometry, an oval or curved line returning into itself, and produced from the section of a cone by a plane obliquely cutting both its sides. It received its name from its plane forming with the base of the cone a *less* angle than that of the *parabola.*——In Grammar, a figure of syntax, by which one or more words are omitted, which the reader may supply; as, 'the horse I rode,' for 'the horse *which* I rode'——In Rhetoric, a figure of speech, by which the orator, through excessive emotion, passes over many things, which, had he been cool, ought to have been mentioned.

ELLIP'SOID (*elleipsis*, an ellipse; and *eidos*, form: *Gr.*), in Geometry, an elliptical spheroid, being the solid generated by the revolution of an ellipse about either axis.

ELM (*ulmus: Lat.*), *Ulmus campestris*, a large forest tree, the wood of which is very serviceable where it may be continually either dry or wet. Accordingly it is proper for water-works, mills, pumps, aqueducts, and ship-planks beneath the water-line. It is also used for naves of wheels, handles for single saws, axletrees, and the like. Three or four species are ascribed to Britain, including the wych elm (*ulmus montana*). About twenty species are known, all inhabiting the colder parts of the northern hemisphere

ELMO'S FIRE, St., an appearance caused by fiery meteors in the atmosphere, often seen playing about the masts and rigging of ships. It is undoubtedly an electrical phenomenon, and is caused, most probably, by the atmospheric electricity being gradually attracted by pointed bodies, such as masts of ships. It may be illustrated on the small scale by taking or giving out electricity with a point, in a dark room.

ELOCU'TION (*elocutio*, from *eloquor*, I speak out: *Lat.*), the art of choosing and adapting words and sentences to the ideas which are to be expressed; or, as it is more usually employed, the management of the voice, countenance, and gesture, in speaking.

ELO'HIM (*Heb.*), a word used in the Pentateuch to signify the Deity; sometimes in place of, sometimes along with, the word

Jehovah. Some critics believe that the passages containing these words may be separated into two distinct narratives, which seem to have been written by different hands, and the writers have been accordingly designated Elohistic and Jehovistic.

ELONGA'TION, in Astronomy, the apparent distance of a planet from the sun.

EL'OQUENCE (*eloquentia*, from *eloquor*, I speak out : *Lat.*), the art of clothing the thoughts in expressions the most suited to produce conviction or persuasion. Strictly speaking, the term should be applied only to *public speaking;* but it is frequently extended to written language. We may infer from Homer, that eloquence was very early in great esteem among the Greeks; and it attained the highest perfection in Demosthenes. The Romans, for a long time, had but little leisure for the cultivation of eloquence: but at length they produced many celebrated orators, the chief of whom was the illustrious Cicero, who was exceeded only by Demosthenes. Eloquence, as an art, comprises *invention, disposition, elocution,* and *delivery*. And a formal oration should contain an *exordium* or introduction; a *narration;* a *proposition, proof,* or *refutation;* and a *peroration*. The Romans distinguished three kinds of eloquence; the *demonstrative*, the *deliberative*, and the *judicial*. Our division is, that of the *bar*, the *senate*, and the *pulpit*. Among the moderns, eloquence is far more subdued and moderate in its character than among the ancients, who permitted very strong expressions, and the most violent gesticulation.

E'LUL, the name of a Jewish month, which nearly corresponded to our August; it was the twelfth month of the civil, and sixth of the ecclesiastical year.

ELUTRIA'TION (*elutrio*, I wash out: *Lat.*), in Chemistry, the separation of substances, by washing them in large quantities of water; the heavier particles fall to the bottom; and the lighter, being suspended in the fluid, are obtained by gradual subsidence. Elutriation is a most convenient way of procuring a substance in the state of an impalpable powder.

ELY'SIAN FIELDS, or ELY'SIUM (*ēlusion pedion*, or *ēlusion*, the pedion being left out by later writers: *Gr.*), in Heathen Mythology, the supposed residence of the blessed after death. The poets describe this region as consisting of beautiful meadows, alternating with pleasant groves, where a serene and cloudless sky was spread over them, and a soft celestial light shed a magical brilliancy over every object. The heroes there practised their favourite sports, danced to the sound of the lyre, from which Orpheus drew the most enchanting tones, or wandered through odoriferous groves, where warbling birds carolled forth their harmony by the side of refreshing fountains. There the earth teemed with plenteous fruits, and the verdure of spring was perpetual; while all cares, pains, and infirmities were exchanged for the purest bliss.——Also, a place on the coast of Campania.

ELY'TRA (*elutron*, the sheath of a beetle's wing: *Gr.*), in Entomology, a name for the hard external sheaths of beetles, under which the membranous wings used in flying are placed when the insects are walking or at rest. They are often adorned with rich colours and a metallic lustre.

EMANA'TION (*e*, out of; and *mano*, I flow: *Lat.*), in Theology, another term for *Pantheism*, which see.

EMANCIPA'TION (*emancipatio: Lat.*), in the Roman law, the setting free a son from subjection to his father. It differed from *manumission*, as the latter was the act of a master in favour of a slave, whereas emancipation put the son in a situation to manage his own affairs, and to marry without his father's consent, although a minor. The word *emancipation* has been applied to the liberation of negroes from Christian slavery, and to the abolition of the disabilities of Roman Catholics in England.

EMAR'GINATE (*emargino*, I take away the edge: *Lat.*), in Botany, having the edge notched. According to the kind of notches, a leaf is said to be *obtusely* or *acutely* emarginate.

EMBALM'ING (*balsamon*, balsam: *Gr.*), the opening a dead body, taking out the intestines, and filling their place with odoriferous and desiccative drugs and spices, to prevent putrefaction. The ancient Egyptians have always been celebrated for the skill with which they exercised the art of embalming. The term is derived from the use of *balsamic* substances in the operation, in addition to those which were saline, and to tanning materials. It appears to have been a dogma among some ancient nations, inculcated by their religion, that the soul continued with the body. Modern chemistry has made us acquainted with many means of counteracting putrefaction, more simple and more effectual than the laborious processes of the ancients.

EMBAR'GO (*Span.*), a prohibition issued by the authorities of a country, to prevent merchant vessels leaving their ports. It is generally imposed in time of war, or during fear of invasion; and in such cases, the ships under embargo are used in armaments, expeditions, &c.

EM'BER WEEK (*æmyrian*, ashes: *Sax.*); or, perhaps, an abbreviation for *Quatember*, from *quatuor tempora*, the four times: *Lat.*), four seasons in the year more particularly set apart for prayer and fasting, namely, the first week in Lent, the weeks next after Whitsuntide, the 14th of September, and the 13th of December.——EMBER DAYS, particular days of fasting and humiliation in the Ember weeks.

EMBERI'ZA, in Ornithology, a genus of passerine birds, including the yellow-hammer, the common and other buntings, and the ortolan (*Emberiza hortulana*), which is esteemed a great delicacy for the table.

EMBEZ'ZLEMENT (*embesler*, to filch: *Old Fr.*), in Law, a felony, which consists in a class of acts committed by one employed as a clerk or a servant, which would, if committed by others, amount to *larceny*. It differs from the latter by relating to property not at the time in the actual or legal possession of the owner.

EM'BLEM (*emblēma*, a tesselated pavement: *Gr.*), a kind of painted enigma, or certain metaphorical figures, painted or cut, expressing some action, or teaching some moral truth.

EM'BLEMENTS (*emblaver*, to sow with wheat: *Fr.*), in Law, a word used for the produce of land sown or planted by a tenant for life or years, whose estate is determined suddenly, by the act of God, after the land is sown or planted, and before a harvest. The tenant's executors shall have the *emblements*; but, in the case of a tenant for years, they include only what is not ripe before midsummer. Fruits on a tree, or natural grasses, are not emblements.

EM'BOLISM (*embolisma*, a patch: *Gr.*), in Astronomical Chronology, the insertion of days, months, or years, in an account of time, to produce regularity.

EMBOS'SING (*bosse*, a protuberance: *Fr.*), the forming of works in relief, whether by raising, or by depression. It is, in short, a kind of sculpture, where the figures project from the plane on which they are cut; and according as they are more or less prominent, they are said to be in *alto*, *mezzo*, or *basso rilievo*.——EMBOSSING CLOTH. Cotton, woollen cloth, silk, paper, and other fabrics, are embossed by the powerful pressure of revolving cylinders on which the required patterns are engraved.

EMBOU'CHURE (a mouth: *Fr.*), in Music, the aperture of a flute or other wind instrument.

EMBRA'CERY (*embrasserie*: *Fr.*), in Law, the endeavouring to corrupt or influence a jury; it is punishable by fine and imprisonment.

EMBRASU'RE (*Fr.*), in Architecture, an enlargement of the aperture of a door or window, on the inside of the wall.——In Fortification, a hole or aperture in a parapet, through which guns are pointed and discharged.

EMBROCA'TION (*en*, on; and *brecho*, I wet the surface: *Gr.*), in Pharmacy, a lotion or combination of medicinal liquids, with which any diseased part is washed or fomented.

EMBROID'ERY (*broderie*: *Fr.*), figured work wrought on silk, cloth, stuffs, or muslins. The art of embroidery was invented in the East, probably by the Phrygians or Persians: it was certainly introduced from Persia into Greece.——EMBROIDERING MACHINE. Until of late, embroidery was performed entirely by hand, and was practised, on account of its elegance, by ladies of rank; but various ingenious machines have been invented for this purpose, and are now used very extensively in England, France, and Germany. One of these machines, having 180 needles, will do as much work as fifteen expert hand embroiderers, and requires merely the labour of one grown-up person and two assistant children.

EM'BRYO (*embruon*, from *bruo*, I cause to burst: *Gr.*), the first rudiments of the animal in the womb, before it becomes a *fœtus*.——In Botany, a fleshy body occupying the interior of a seed, and constituting the rudiments of the future plant. It consists of the *plumula* or growing point, the *radicle* or root, and the *cotyledon* or *cotyledons*. [See SEED.]

EMENDA'TION (*emendatio*: *Lat.*), an alteration made in the text of any book, by verbal criticism.——In Law, the correction of abuses.

EM'ERALD (*émeraude*: *Fr.*), a well-known gem of a beautiful green colour, somewhat harder than quartz; it occurs in prisms with a regular hexagonal base, and ranks next in value to the Oriental ruby and sapphire. It becomes electric by friction, is often transparent, but sometimes only translucent, and before the blow-pipe is fusible into a whitish enamel, or glass. It consists chiefly of glucina, with silica, alumina, a very little lime and iron. Its colouring matter is probably a very minute quantity of oxide of chrome. The most intensely coloured and valuable emeralds are brought from Peru.——In Heraldry, an other name for *vert*, or the green tincture in coat armour.

EMER'SION (*emergo*, I come forth: *Lat.*), in Astronomy, the reappearance of the sun or moon after an eclipse; also of a star that passes from within the rays of the sun.

EM'ERY (from Cape *Emeri*, in the island of Naxos), in Mineralogy, a compact variety of *Corundum*, very generally regarded as a kind of iron ore. It is of a blackish-grey colour, and so very hard as to scratch topaz. It consists of alumina, silica, and iron; and is used in the form of a powder for polishing hard minerals and metals. The lapidaries cut ordinary gems by sprinkling their wheels with the moistened powder of emery; but it will produce no effect on the diamond.

EMET'IC (*emetikos* from *emeo*, I vomit: *Gr.*), a medicine for emptying the stomach by vomiting. Twenty grains of ipecacuanha is a very safe and good emetic, for evacuating the stomach, when it is disordered by improper food; it produces an effect in from ten to twenty minutes, and its action may be assisted by chamomile tea or warm water. When poison has been swallowed, the stomach is often insensible to the ordinary means of acting upon it, particularly if a large dose of opium has been taken. In such a case, half a drachm of sulphate of zinc, or of sulphate of copper, may be given, dissolved in three ounces of warm water; a third part to be taken every ten minutes, until it operates. The stomach-pump, however, is most to be relied upon.

EM'ETINE (*emetos*, a vomiting: *Gr.*), in Medicine, a peculiar vegetable principle, obtained from the root of the *Ipecacuanha*, of whose emetic properties it is conceived to be the sole cause. In a dose of half a grain it acts as a powerful emetic, followed by sleep; and six grains produces violent vomiting, stupor, and death.

EMICA'TION (*emicatio*, a springing forth: *Lat.*), a flying off in small particles, as from heated iron or fermenting liquors.

EMIGRA'TION (*emigratio*, a removal: *Lat.*), the removal of inhabitants from one country to another, for the purpose of permanent residence. Prohibitions of emigration are unjust, as well as impolitic, and always prove that a government which sanctions them has an incorrect idea of its duties. The power of reproduction is so great, that the vacuum caused by any amount of emigration is soon filled up.

EM'INENCE (*eminentia*, excellence, literally a prominence: *Lat.*), an honorary title given to various dignitaries at different times, but appropriated to cardinals by a decree of the pope in 1630.

E'MIR (a chief: *Arab.*), a title of dignity among the Saracens and Turks. It was at first given to all the caliphs, but it is now confined to those who are considered the descendants of Mahomet, by his son-in-law Ali and his daughter Fatima. Joined to another word, indicative of a particular office, it is a common title: thus, *Emir al Omrah*, that of viziers and pashas.

EMOLLES'CENCE (*emollio*, I make soft: *Lat.*), in Metallurgy, that degree of softness in a fusible body which alters its shape.

EMOL'LIENTS (same *deriv.*), in Medicine, such remedies as are supposed to relax the living animal fibre.

EMPA'LEMENT (*in*, on; and *palus*, a stake: *Lat.*), a cruel kind of punishment, in which a stake was thrust up through the body.——In Heraldry, a conjunction of coats of arms, pale-wise.

EM'PEROR (*imperator: Lat.*), among the ancient Romans, a title of honour conferred on a general who had been victorious; but, on the fall of the republic, it was applied to the head of the state. The Roman emperors united in their own persons many of the chief offices of the state. Thus, Octavius was emperor, proconsul, tribune, and pontifex maximus; also, perpetual consul, censor, prince of the senate, and augustus—the latter designation descending to those who reigned after him. The emperors appointed their own successors, who enjoyed the title of Cæsars. Charlemagne assumed the imperial dignity after his coronation at Rome, and since that time it has been claimed by the sovereigns of Germany. When the German empire was dissolved in 1805, the title passed to the emperor of Austria; and it was assumed in the same year by Napoleon in France. The czars of Russia have claimed it since the reign of Alexander.

EM'PHASIS (*Gr.*), in Rhetoric, a particular stress of utterance, or force of the voice and action, given to such parts or words of an oration as the speaker intends to specially impress upon his audience.

EMPHYSE'MA (*emphusēma*, an inflation: *Gr.*), in Surgery, a puffy tumour, formed by the air insinuating itself into the cellular membrane, and rendering the part affected tense and elastic: it crepitates when pressed.

EM'PIRE (*Fr.*; from *imperium: Lat.*), the territory or government of an emperor. The term was first applied to the dominions of ancient Rome, which were ultimately divided into the *Eastern* and *Western* empires. The Eastern was called also the *Lower* empire. The *Western* became, about the end of the 9th century, the *German*, or *Holy Roman* Empire. The word is often used to indicate an extensive territory, not governed by an emperor: thus, the *British Empire*.

EMPIR'IC (*empeirikos*, from *peira*, an experiment: *Gr.*), one whose knowledge is founded on experience. The *empiric school* of medicine was opposed to the *dogmatic*. The empirics were generally a pretending and ignorant sect; and hence the word is used for a quack or charlatan of any kind.

EMPLAS'TICS (*emplastikos*, fit for shutting up the pores: *Gr.*), an appellation given to medicines which constipate and shut up the pores of the body. Hence, *emplastic* means viscous, or adhesive, like a plaster.

EMPO'RIUM (*emporion*, a mart; from *emporos*, one who goes on shipboard as a passenger: *Gr.*), a common resort of merchants for trade; particularly a city or town of extensive commerce, or in which the commerce of an extensive country centres, or to which sellers and buyers resort from different countries.

EMPYE'MA (*empuēma*, a suppuration: *Gr.*), in Medicine, a disorder in which purulent matter is contained in the thorax or breast, after an inflammation and suppuration of the lungs and pleura: it is attended with a difficulty of breathing and an inability to lie on the side opposite to that which is affected.

EMPYRE'UM, or EMPYRE'AN (*empureuo*, I set on fire: *Gr.*), a term used by divines for the highest heaven, where the blessed enjoy the beatific vision. It derives its name from having been supposed to be the region of fire.——We use the word *empyreal* as pertaining to that region of space which is above the utmost limits of the atmosphere.

EMPYREU'MA (*empureuma*, a coal to preserve a smouldering fire; from *empureuo*, I set on fire: *Gr.*), in Chemistry, the peculiar smell produced from burnt substances. Hence oils obtained by distilling organic matters at high temperatures are called *empyreumatic* oils.

EMPYREU'MATA (same *deriv.*), in Medicine, the remains of a fever after the disease has abated.

EMU, the *Dromaius Novæ Hollandiæ* of ornithologists, a large bird of the ostrich family. It attains the length of seven feet, and has brown and grey plumage. It is a shy bird, and being a fleet runner, is chased with dogs. The male hatches the eggs, whilst the female keeps guard.

EMUL'GENT (*emulgeo*, I milk out: *Lat.*), a term applied to the artery and vein of the kidney.

EMUL'SION (same *deriv.*), in Medicine, any milklike mixture prepared by uniting oil and water by means of another substance: as *almond emulsion*.

EMUNC'TORY (*emungo*, I blow the nose: *Lat.*), in Anatomy, a term for any part which serves to carry off the matters thrown off by the blood and other humours: thus, the skin is the *emunctory* of the body.

ENAL'LAGE (*enallagē*, an exchange: *Gr.*), a figure in Grammar, where there is a change of one case or mood for another.

ENAM'EL (*émail: Fr.*), a vitrifiable substance, chiefly formed of the oxides of lead and tin, with soda and silica, in the shape of powdered quartz or flint. These, when melted together, yield a white enamel. Other metallic oxides are employed to communicate colours to the white basis. Enamels are distinguished into transparent and opaque: in the former, all the elements have experienced an equal degree of liquefaction, and are thus run into crystal glass, whilst in the others, some of their elements have resisted the action of heat, so that their particles retain sufficient aggregation to prevent the transmission of light. Enamels are used either in imitating precious stones, in painting in enamel, or in the ornamentation of gold, silver, and other metals. The faces of watches are commonly enamelled Of modern enamels, the Champlevé, the Cloisonné, and Limoges, are most prized by collectors. This art is of such great antiquity as to render it difficult, if not impossible, to trace it to its origin. It was practised by the Egyptians in very remote times, as appears from the ornaments that have been found on the envelopes of mummies. It passed from Egypt into Greece, and afterwards into Rome and its provinces, whence it was probably introduced into Great Britain, as various Roman antiquities have been dug up in different parts of the island, particularly in the barrows, in which enamels have formed portions of the ornaments. Iron cooking vessels are now coated with enamel, and in a very permanent manner, the fire having no effect on them. Artificial eyes are formed so skilfully in enamel, that it is difficult, when in use, to discover that they are not real ——Painting in enamel, &c, is performed on plates of gold or silver, but more commonly of copper, previously coated with the white enamel: the colours are melted in the fire, where they take a lustre like that of glass This painting is prized for its peculiar brightness and vividness, which are very permanent, the colours not being effaced or sullied by time. Jean Petitot, a Genevese, born in 1607, acquired great celebrity as a painter in enamel, and his works are much sought after by collectors. [See LIMOGES ENAMEL.]

ENANTIO'SIS (a contradiction: *Gr.*), a rhetorical figure, by which that which is spoken negatively is to be understood affirmatively.

ENARTHRO'SIS (*Gr.*: from *en*, in; and *arthron*, the socket of the joint), in Anatomy, that species of articulation which consists in the insertion of the round end of a bone into the cavity of another, forming a movable joint.

ENCÆ'NIA (*enkainia*: from *en*, in; and *kainos*, new: *Gr.*), in Antiquity, anniversary feasts to commemorate the completing or consecrating any new and public work, such as the founding of cities, consecration of temples, &c.——ENCÆNIA, among the Jews, the anniversary of the dedication of the Temple. In modern times, this term is used for any commemorative festival.

ENCAUS'TIC PAINT'ING (*enkaustikos*, belonging to burning: *Gr.*), a mode of painting used by the ancients, the nature of which is not well understood The colours were kept in boxes with divisions, and sometimes were made into crayons by means of wax, and melted on the picture by subjecting them to heat as they were applied. When finished, the picture was covered with a varnish of wax, and, lastly, was well polished Though resins, &c., were used, wax was indispensable: it kept the work from cracking The burning-in also was necessary. The colours were very brilliant, and were not acted on by the weather. It has been attempted to revive this art in Germany.——Some have used the term *encaustic* for painting on porcelain and work in enamel; and in the same way, it was given to the painting on glass of the middle ages, such as is still to be seen in the windows of some Gothic churches, &c. It has also been just as erroneously applied to works in metal, where gold and silver were inlaid, melted, or laid on, which was called gold or silver encaustic; and to everything gilt or silvered by fire.

ENCE'INTE (*Fr*), in Fortification, the wall or rampart which surrounds a place, sometimes composed of bastions and curtains Flanked by round or square towers, it is called a Roman wall.——In Law, a term for a state of pregnancy.

ENCHA'SING [See CHASING]

ENCHIRID'ION (*Gr.*: from *en*, in; and *cheir*, the hand), a manual or small volume. Arian, the disciple of Epidetus, the stoic philosopher, compiled certain aphorisms of his master under the title of Enchiridion

ENCLAVE' (enclosed: *Fr*), in Heraldry, something let into another, especially when the piece so let in is square

ENCLIT'IC (*enklitikos*, that which leans: *Gr.*), in Grammar, a particle so closely united with any other word as to seem part of it; thus, *que* in *virumque*.

ENCRATI'TES (*enkrateia*, a holding fast, and hence a restraining one's self: *Gr.*), or CONTINENTES, in Church History, a sect which appeared towards the end of the 2nd century: so called because they abstained from marriage, and the use of wine and animal food

EN'CRINITE (*krinon*, a lily: *Gr.*), the fossil remains of a radiate animal, frequently called the stone lily, found in the mountain limestone and other formations The jointed stalk by which it was attached to a rock was crowned by a disc, surrounded by ten ray-like arms, the centre being occupied by the mouth. This head somewhat resembles a flower, whence the name A close ally of this animal is now living in the West Indies, and is called by naturalists *Pentacrinus caput-medusæ.*

ENCROACH'MENT, in Law, an unlawful intrusion upon the rights and possessions of another.

ENCYCLOPÆ'DIA. [See CYCLOPÆDIA.]

ENDEC'AGON or UNDEC'AGON (*endeka*, eleven; and *gōnia*, an angle: *Gr.*), a plane figure bounded by eleven sides. When the latter are all equal, the surface is the square of one side multiplied by 9·36564.

ENDEM'IC (*en*, amongst; and *dēmos*, the people: *Gr.*), a non-infectious disease, peculiar to a certain district, and arising from local causes. It differs from an *epidemic*, which is a disease that spreads over a whole country.

EN'DIVE (*Fr.*), the *Cichorium endivia* of botanists, a herbaceous composite plant, used in salads.

ENDO'GENOUS (*endon*, within; *gennao*, I produce: *Gr.*), an epithet for plants, the growth of whose stems takes place by additions of vascular bundles internally. In endogenous plants there is no distinction of pith-wood, bark, and medullary rays, as in *exogenous* stems. Palms, grasses, orchids, and lilies, fall into this important division; all the plants constituting it being *monocotyledonous*.

ENDOR'SING (*endorser*, to write on the back of anything: *Fr.*), the writing one's name on the back of a bill of exchange, by which responsibility for its amount is incurred, if duly presented and not paid.

EN'DOSMOSE. [See EXOSMOSE.]

ENDOW'MENT (from *dōs*, a portion: *Gr.*), in Law, the act of giving or assuring a dower to a woman. Also, the settlement of a property for the support of some religious or charitable institution, &c.

ENE'MA (*Gr.*, from *enēmi*, I send into), in Medicine, a clyster or injection.

ENFE'OFFMENT. [See FEOFFMENT.]

ENFILA'DE (*enfiler*, to put on a string: *Fr.*), a fire of artillery or musketry, in the direction of the *length* of an enemy's line. A trench, &c., is said to be *enfiladed* when shot can be fired so as to pass through it lengthways.

ENFI'LED (from *same*), in Heraldry, an epithet implying that the head of a man, beast, or any other charge, is placed on the blade of a sword.

ENFRAN'CHISEMENT (*affranchissement*: *Fr.*), in Law, the incorporating a person into certain societies; as when one is admitted to the privileges of a freeman.—In Feudal Law, a *villein* was said to be *enfranchised* when made free by his lord. The term is also applied to the conversion of the copyhold tenure of lands into freehold.

ENGINEE'R (*ingénieur*: *Fr.*), a term which, in strictness, means the manager of an engine, but which is now applied to any one whose pursuits relate to manufacturing or constructive operations, in which engines of any kind are used. There are two kinds of engineers, military and civil. A *military engineer* is one who, by a perfect knowledge of mathematics, delineates upon paper, or marks upon the ground, forts or other works proper for offence and defence. He should understand the art of fortification, so as to be able not only to discover the defects of a place, but to find a remedy proper for them; as also how to attack as well as to defend. It is his business likewise to delineate the lines of circumvallation and contravallation, taking all the advantages of the ground; to mark out the trenches, places of arms, batteries, lodgments, &c. *Civil engineers* are employed in delineating the plans and superintending the construction of public works, as aqueducts, canals, bridges, railroads, &c.

ENGISO'MA (a fracture of the skull: *Gr.*), in Surgery, a fissure of the cranium. Also, a surgical instrument used in fractures of the cranium.

ENG'LAND, CHURCH OF. Although Henry VIII. threw off the supremacy of the pope, he allowed no freedom in matters of belief, and it was not until the accession of Edward VI. that the English Church was reformed by law. Its constitution was settled by Elizabeth. Few and unimportant are the changes which have been made since, and there has been no alteration in the Liturgy since 1661. The government of the Church of England is episcopal; and all the bishops, except the one last appointed, sit in the House of Lords in right of the temporal baronies into which their sees were converted by William the Conqueror.

ENG'LISH LAN'GUAGE. The ancient language of Britain is generally admitted to have been the same with that of the Gauls; and, when the country was subdued, the original inhabitants retired to the western portion of the island, where it continued to be spoken without any foreign admixture. The greatest part of Britain having become a Roman province, the Roman legions, which resided in Britain for above two hundred years, undoubtedly disseminated the Latin tongue; and the people being afterwards governed by laws written in Latin, it must have necessarily followed that their language would undergo a considerable change. In fact, the British tongue continued for some time mixed with the provincial Latin; but at length it was in a great measure destroyed, and that of the Saxons introduced instead of it. What the Saxon was long before the conquest, viz. about the year 700, may be seen in the most ancient manuscript of that language, which is a gloss on the Evangelists, by bishop Eadfride, in which the three first articles of the Lord's prayer run thus: 'Uren fader thic arth in heofnas, sic gehalgud thin noma, to cymeth thin ric. Sic thin willa sue is in heofnas, and in eortho, &c.' In the beginning of the ninth century, the ancient English acquired a tincture of the Danish; but the Normans, as a monument of their conquest, endeavoured to introduce their language; and English became, under them, a medley. About the year 900, the Lord's prayer in the ancient Anglo-Saxon was as follows: 'Thu ure fader the eart on heofenum, si thin nama gehalgod; cume thin rice si thin willa on eorthan swa, swa on heofenum, &c.' And, about the year 1160, pope Adrian, an Englishman, thus rendered it in rhyme:

'Ure fader in heaven rich,
Thy name be hayled ever lich,
Thou bring us thy michell blisse:
Als hit in heaven y-doe,
Evar in yearth beene it also, &c.'

The English language continued to undergo various mutations till the year 1537, when the Lord's prayer was thus printed: 'Oure father which arte in heven, halowed be thy name: let thy kingdome come, thy will be fulfiled as well in erth as it is in heven; geve us this daye in dayly bred, &c.' Here, it may be observed, the diction is brought almost to the present standard, the chief variations being only in the orthography. After the Conquest, it was ordained that all law proceedings should be in the Norman language; and hence the early records and reports of law cases came to be written in Norman. But neither royal authority, nor the influence of courts, could absolutely change the vernacular language. After an experiment of three hundred years, the law was repealed; and since that period, the English has been, for the most part, the official as well as the common language of the nation. Since the Norman invasion, the language has not suffered any shock from the intermixture of conquerors with the natives of England; but it has undergone great alterations, by the disuse of a large portion of Saxon words, and the introduction of others from the Latin, Greek, French, Italian, and Spanish. In some instances, words have been borrowed by authors, directly from the Latin and Greek, but in the rest, they have been received through the medium of the French and Italian. For terms in the sciences, authors have generally resorted to the Greek; and from this source, as discoveries in science demand new terms, the vocabulary of the English tongue is receiving continual augmentation. We have also a few words derived from the German and Swedish, chiefly terms in mineralogy; and commerce has introduced new commodities of foreign growth or manufacture, with their foreign names, which now make a part of our language. It may then be stated, that the English is composed of, 1st, Saxon and Danish words of Teutonic and Gothic origin: 2nd, British or Welsh, which may be considered as of Celtic origin: 3rd, Norman, a mixture of French and Gothic: 4th, Latin: 5th, French: 6th, Greek: 7th, a few words directly from the Italian, Spanish, German, and some other languages of the continent: 8th, a few foreign words, introduced by commerce, or by political or literary intercourse. Of these the Saxon portion constitute our mother tongue. The Danish and Welsh also are primitive words, and may be considered as part of our vernacular language. Taking the sum total of words in a large English dictionary at 43,566, it will be found that 29,853 are of Greek or Latin origin, 13,230 come from Teutonic sources, whilst the remaining 483 are of miscellaneous derivation.

ENGRAVING (*gravan*, to dig: *Sax.*), the art of producing, most usually by the aid of an instrument called a graver, representations on hard substances, such as metal or wood, which, by means of ink and a printing-press, may be transferred to paper. For this purpose, copper was formerly used. But latterly mixed metals, not liable to be corroded in printing, or steel, have been introduced. The art of engraving on wood is very ancient; and it has been revived with great effect, as may be seen in the 'pictorial' editions of various works recently published. It was in use among the Chinese, at least when they discovered the mode of manufacturing paper, or about 95 years B.C.; and was very probably introduced from that country into Europe, after which it was long and successfully practised by Europeans. The art of engraving on copper was invented in Europe in the early part of the 15th century. The earliest book in which engravings are found is an edition of Dante, published at Florence in 1481. Then, and long before, it had been usual to decorate church and other plate in *niello;* which consisted in etching the designs, with a steel point, upon gold or silver, then engraving with a burin, and filling in with a combination of silver, lead, copper, sulphur, and borax, which was easily fusible, and of a black colour. Before melting in the niello, the artists were in the habit of taking impressions of the design with liquid sulphur; but Finiguerra improved this process, by using for the purpose a mixture of soot and oil, and pressing damp paper upon the plate with a roller. This led to copper-plate engraving.——WOOD ENGRAVING, or *xylography*, (*xulon*, wood; and *grapho*, I write: *Gr.*), is performed on blocks of box or pear-tree, cut in a direction perpendicular to that of the fibres. The subject is first drawn with Indian ink, or a lead-pencil, and then the wood is cut away, so as to leave merely the lines which have been drawn. Impressions are taken from the blocks, in the same way as from printing types.——COPPER-PLATE ENGRAVING is effected by cutting lines representing the subject on a plate of copper, with a graver or burin, the burr being taken off with a scraper.——*Etching* is an engraving on copper, &c., produced by an acid. The plate having been covered with a varnish, and the design having been drawn through the varnish with a suitable implement, the acid is poured on the plate, and this acts upon (or bites, as it is technically termed) the plate where the varnish has been removed *Stippling* differs from etching only in having dots instead of lines.——MEZZOTINTO ENGRAVING consists in first scoring the copper over thickly in every direction, so that if printed from, it would give a uniform black impression: the outline is then traced with an etching needle; after which the plate is scraped, so as to leave enough of the scoring to produce the required tints, in the different parts of the work.——AQUATINTA ENGRAVING gives an effect like that of an Indian-ink drawing. It is effected by first etching the design, then covering the plate with a solution of Burgundy pitch, or mastic, in spirits of wine The rapid evaporation of the spirit leaves a granulated texture; and aquafortis being poured on the plate, it is corroded in the parts left uncovered by the spirits of wine. As in *etching*, when the lighter parts are sufficiently acted upon, they are *stopped out*, that is, protected from further action of the acid.——ETCHING ON GLASS. The glass is covered with bees' wax, and, the design being drawn with an etching needle, is subjected to the action of sulphuric acid sprinkled with powdered Derbyshire spar, which causes hydrofluoric acid to be evolved: the parts covered with bees' wax are entirely protected from the corroding action of this acid. The process may be reversed, by drawing the design with a solution of bees' wax, in turpentine, and then corroding as before.—— LITHOGRAPHY (*lithos*, a stone: and *grapho*, I write: *Gr.*). This process was discovered in 1800. It depends on the facility with which certain kinds of stone imbibe water, and the mutual repulsion between oily or resinous substances and that fluid. The stone employed is a limestone, obtained at Solenhofen in Bavaria, the rock being a member of the oolite. Drawings are made on the stone, which is of a fine grain, with a resinous or oily ink: it is then wetted, and an ink roller is passed over it. The ink will adhere to the lines, which constitute the design, but will leave the rest of the stone perfectly clean, on account of the repulsive action of the water, with which it is soaked. Impressions may be taken every time the ink roller has been passed over the stone. A drawing made with the proper kind of ink may be transferred, by pressure, to the stone, while it is in a dry state.—— CHROMOLITHOGRAPHY (*chrōma*, a colour; *lithos*, a stone; and *graphē*, a drawing: *Gr.*), is the art of printing in colours from stone. A drawing in outline is made in the ordinary way, and transferred to as many different stones as there will be colours employed — sometimes to so many as thirty or more. The first stone, generally that required for flat local tints, is covered with lithographic ink, in those places in which there is to be solid colour; and the different gradations are produced by rubbing the stone with *rubbing stuff*, or tint ink, which is made of soap, shellac, &c., and, where necessary, with a coloured lithographic chalk. The stone is then washed over with nitrous acid, &c.; and, as in ordinary cases, a proof is taken, after which the lithographic ink is immediately washed off with turpentine. If the proof is satisfactory, the stone is ready for use. The other stones are treated in the same way, for the other colours—of course each impression must be printed with all the stones. The colours are ground up with linseed oil.——ZINCOGRAPHY. This consists in drawing the design with a protecting medium on zinc: then biting away the unprotected portions with an acid, which leaves the design prominent, so that impressions may be taken from it.

EN'GYSCOPE (*engus*, near; and *skopeo*, I examine: *Gr.*), a kind of microscope, for viewing small bodies more distinctly.

ENHARMON'IC (*enharmonikos*, in accord: *Gr.*), in Music, an epithet applied to such species of composition as proceed on very small intervals, or smaller intervals than the diatonic and chromatic.

ENIG'MA (*ainigma*, from *ainisso*, I speak darkly: *Gr.*), a dark or ambiguous saying, in which the true meaning is concealed under obscure language. The enigma is, at present, a mere *jeu d'esprit:* in former times it was a more serious matter. The Eastern monarchs used to send embassies to each other for the solution of enigmas. Samson proposed an enigma to the Philistines.

ENNEAHE'DRIA (*ennea*, nine; and *hedra*, a base: *Gr.*), a genus of columnar and double-pointed crystals, composed of a trigonal column, terminated at each end by a trigonal pyramid.

ENNEAN'DRIA (*ennea*, nine; and *anēr*, a male: *Gr.*), the name of the ninth class in Linnæus's sexual system; consisting of plants which have hermaphrodite flowers, with nine stamens.

ENNEAT'ICAL DAYS (*ennea*, nine: *Gr.*), every ninth day of a disease.——ENNEATICAL YEARS, every ninth year of a person's life.

EN'NUI (*Fr.*), a word expressive of lassitude, or weariness, arising from the want of employment.

ENS (*Lat.*), among Metaphysicians, denotes entity, being, or existence: this the schools call *ens reale* and *ens positivum*, to distinguish it from their *ens rationis*, which exists only in the imagination.

EN'SEMBLE (*Fr.*), a term used in the fine arts to denote the general effect of a whole work, without reference to the parts.

EN'SIFORM (*ensis*, a sword: *Lat.*), sword-shaped, applied by botanists to the leaves of the lily, iris, and similar plants.

EN'SIGN (*enseigne: Fr.*), the flag or banner under which soldiers are ranged, according to the different regiments to which they belong. Also, he who carries the colours; the lowest commissioned officer in a company of infantry.——A large flag hoisted on a staff, and carried over the poop or stern of a ship. A national ensign, hoisted with the upper corner downwards, is a signal of distress. Ships do not display their ensigns at sea, except on meeting strangers. In harbour, the ensign is not shown before 8 A.M. nor after sunset.

ENTAB'LATURE (*entablement: Fr.*), the horizontal continuous work which rests upon a row of columns. It consists of the *architrave*, which is immediately over the columns; the *frieze* over this; and the *cornice*, which is the uppermost portion.

ENTAIL (*entailler*, to notch: *Fr.*), in Law, a restriction regarding the alienation of lands and tenements, by one on whom they had been settled with a limitation to a particular class of heirs. Estates tail are *general*, where only one person's body is specified from which the issue must be derived; *special*, where both the progenitors are marked out. Estates tail being contrary to the general policy of the law, modes were invented in early times to destroy the special limitations of the gift, and create an estate in fee simple, without forfeiture being incurred. This was formerly done by the fiction of *common recoveries;* but the more simple means of an ordinary deed of conveyance, duly enrolled, was substituted by 3 & 4 Will. IV. c. 74. By such a deed a tenant in tail in possession (but not a tenant for life), may cut off the entail, and bar all the remainders over. The tenant for life in possession, and the tenant in tail in remainder, frequently join in executing a deed of this description for the purpose of resettling the estate.

ENTA'SIS (a stretching in: *Gr.*), in Architecture, a nearly imperceptible swelling in the middle of the shaft of a column, found in almost all Grecian examples, and preventing them from being strictly frusta of cones.

EN'TE (*Fr.*), in Heraldry, an epithet signifying grafted or engrafted.

ENTERI'TIS (*enteron*, the intestines: *Gr.*), in Medicine, inflammation of the intestines; a disorder always accompanied by considerable danger, and consequently requiring immediate attention.

EN'TEROCELE (*enteron*, the intestines; and *kēlē*, a tumour: *Gr.*), in Surgery, a rupture of the intestines.

ENTEROL'OGY (*enteron*, the intestines; and *logos*, a discourse: *Gr.*), a treatise or discourse on the internal parts of the body.

ENTEROM'PHALOS (*enteron*, the intestines; and *omphalos*, the navel: *Gr.*), an umbilical or navel rupture.

ENTHYME'ME (*enthumēma*: from *en*, in; and *thumos*, the mind: *Gr.*), in Logic, an argument having only one premiss of a syllogism expressed. Thus, 'All men are fallible; therefore so is the pope,' is an enthymeme. The whole syllogism would be, 'All men are fallible; the pope is a man; therefore the pope is fallible.'

ENTI'RETY, in Law, the whole of a thing, in distinction from a part.

ENTOMOL'OGY (*entoma*, insects; and *logos*, a discourse: *Gr.*), that branch of Zoology which treats of insects, a division of articulated animals having their bodies in three distinct portions, head, thorax, and abdomen; antennæ on the head; three pairs of legs; usually one or two pairs of wings, and aerial respiration. Thus defined, spiders, centipedes, worms, and crustaceans are all excluded from the class of Insects. This class is divided by entomologists into 15 orders, viz.:—1. *Coleoptera*, the immense order of beetles. 2 *Euplexoptera*, earwigs. 3. *Orthoptera*, grasshoppers, locusts, crickets, &c. 4. *Thysanoptera*, thrips insects. 5. *Neuroptera*, dragon flies, May-flies, &c. 6. *Trichoptera*, caddice flies. 7. *Hymenoptera*, bees, wasps, &c 8. *Strepsiptera*, bee parasites. 9. *Lepidoptera*, butterflies and moths. 10. *Homoptera*, cicadas, lantern flies, &c. 11. *Heteroptera* (or *Hemiptera*), bugs. 12. *Aphaniptera*, fleas. 13 *Diptera*, two-winged insects, such as the house-fly, blue-bottle-fly, &c. 14. *Anoplura*, parasites. 15. *Thysanura*, spring-tails, &c. The soft parts of insects are protected by an integument, which has sometimes been termed an external skeleton. To this the different muscles are attached. The body is usually composed of thirteen segments; some, however, are frequently soldered together so as to form one piece, whilst others are much reduced in size, and concealed under the adjacent ones. The head forms the first segment. Here are the antennæ, the eyes, and the mouth, which last organ is so greatly varied in structure that, in some of the orders, it is taken as a guide in the classification. In an ordinary biting insect, the mouth is thus composed: above, there is a small horny plate, called the *labrum*, forming the upper lip; below, there is a pair of horny *mandibles*, one on each side of the orifice, and the principal agents in gnawing; behind these there is a second pair of jaws, called *maxillæ*, composed of several pieces, and to the outside of each maxilla is a jointed organ of touch, called a *palpus*. Sometimes there is a second pair of palpi. The lower lip of the mouth is formed by the *labium*, consisting of two parts, the *mentum*, or chin, and the *ligula*, or tongue, and bearing another pair of palpi. Instead of this apparatus for biting, many insects possess an organ for sucking The moths and butterflies, the two-winged flies, the bugs, and many other tribes, are furnished with a suctorial apparatus infinitely varied. The eyes of insects are compound, that is, they consist of a number of eyes grouped together, each showing itself as a six-sided facet. In the eye of the common house-fly there are 4000 facets, in some of the butterflies 17,000 facets compose an eye, and in a small beetle, 25,000. The second, third, and fourth body segments of an insect form the *thorax*, and these are usually separate, when the parts are styled the *prothorax* (the first of them), the *mesothorax*, and the *metathorax* (the last of them); but sometimes they are completely united. The under side of the thorax is called the *sternum*. The organs of motion are attached to the thorax, three pairs of legs, and the wings when they are present. Each pair of legs is attached to a segment of the thorax, and each leg is divided into five parts, the last part, the *tarsus* or foot, being usually composed of from three to five joints. It is by the number and relative size of the tarsi that the order of Coleoptera is divided into sections. One or more hooked claws are attached to the last joint of the tarsus, and in several insects there is also a pair of soft pads called *pulvilli*. The wings, when present, are attached to the upper side of the thorax, the first pair to the mesothorax, the second pair to the metathorax. The wings consist of two membranes in close contact with veins, or nervures, between them. The wings of many insects are quite naked, but in others they are densely covered with scales, which are so minute that their shape can only be made out with the help of the microscope. The abdomen is composed normally of nine segments, but all of these are seldom visible, some being usually modified or concealed underneath others. At the hinder end of the abdomen of female insects, there is often an instrument called an *ovipostor*, for depositing their eggs. The blood of insects is nearly colourless. Its oxygenation is effected by numerous minute tubes, called *tracheæ*, which convey the atmospheric air that enters through apertures, termed *stigmata*, or *spiracles*, to every part of the body. Nearly all insects are produced from eggs, and these eggs are frequently curiously covered with a pattern of raised lines. After leaving the egg, the great majority of insects undergo a series of transformations, the first stage of which resembles a worm. In this, the larval state, they are called *caterpillars*, *grubs*, or *maggots*, the first name being usually applied to those that feed on the outside of plants, the second to those that burrow inside plants on or in the ground, and the third to those that are destitute of feet and a visible head. This is the state in which insects do so much damage to plants, furniture, clothes, furs, &c. After feeding voraciously, and casting its skin several times, the larva passes into the quiescent state of an *aurelia*, *chrysalis*, or *pupa*. From this it emerges as the perfect insect, to flit about for a few hours or days, copulate, lay eggs, and die. This is the series of changes which constitutes a *complete metamorphosis;* but many insects undergo an incomplete metamorphosis, being hatched nearly in the form of the parents, but without wings, which they acquire subsequently; and other insects undergo no metamorphosis at all. In some tribes, the male and female closely resemble each other, but in others the female is wingless and the male winged [see COCCUS], and in other tribes there are not only male and female forms, but neuters, all living together in colonies. [See ANTS and BEES.]

ENTOMOS'TRACA (*entoma*, insects; *ostrakon*, a shell: *Gr.*), a division of the class *Crustacea*, consisting of minute animals, which haunt stagnant freshwater and pools on the sea-shore. They are covered with a shell of a horny or leathery texture, and formed of one or two pieces. In some this covering is buckler-shaped, in others it has the appearance of a bivalve shell. They change their shells as they grow, and this change, in some cases, amounts to a kind of transformation. Some of the commoner entomostraca are popularly known as *water-fleas*. Many fossil species have been discovered.

ENTOZO'A (*entos*, within; and *zōon*, an animal: *Gr.*), an extensive series of low-organized, invertebrate, and generally vermiform animals, most of which are parasitic on the internal organs of other animals. Their colourless blood circulates in the higher organized species in a closed system of vessels, without auricle or ventricle. They possess no respiratory organs, no articulated members for locomotion, and they have no organs of sense. Their digestive system consists either of tubes or cavities without an anal outlet, and excavated in the parenchymatous texture of the body; or of a tube with both oral and anal orifices, freely suspended in the abdominal cavity. In those which are more highly organized, a filamentary nervous system has been detected, sometimes having a ganglion near the mouth. The generative system is unisexual, hermaphrodite, or diœcious. They are of various shapes, some being short and cylindrical, others long and ribband-like, such as the *Tænia solium*, the common tape-worm. Some adhere by means of sucking disks, others by the hooks with which their mouths are armed. Fourteen species of these pests have been found in the human body, some growing to an extraordinary length, and most possessing wonderful powers of reproduction.

ENTREMETS' (a by-dish: *Fr.*), small and delicate dishes, set between the principal ones at table.——In Music, the inferior movements inserted in a composition between those of more importance.

ENTREPA'S (a broken pace: *Fr.*), in Horsemanship, a short broken pace, nearly resembling an amble.

ENTREPO'T (*Fr.*), a warehouse or magazine, for the deposit of goods which are intended for re-exportation, and which therefore pay no duty. It is synonymous with what, on the continent, is termed a *free port*, and in this country a *bonded warehouse*. It is understood popularly as a port which exports the productions of the country around it, and imports what is necessary for the supply of the same.

EN'TRY (*entrée*, an entrance: *Fr.*), in Law, the act of taking possession of lands and tenements, where a man has title of entry. Also, a writ showing that the tenant commenced possession in an unlawful way, and thus disproving his title.——In Commerce, the act of setting down in an account book the particulars of trade. Book-keeping is performed by either *single* or *double entry*.——ENTRY, at the custom-house, the exhibition or deposit of a ship's papers in the hands of the proper officers, and obtaining permission to land the goods.

ENUMERA'TION (*enumeratio*, a counting up: *Lat.*), an account of several things, in which mention is made of every particular article.——ENUMERATION, in Rhetoric, is that part of a peroration in which the orator recapitulates the principal points or heads of the discourse or argument.

ENUR'NEY, in Heraldry, an epithet for a bordure charged with wild beasts.

EN'VELOPE (*enveloppe: Fr.*), in Fortification, a small rampart of earth, with a parapet

ENVIRON'NE', in Heraldry, surrounded with other things: thus, a lion is said to be *environné* with so many bezants.

EN'VOY (*envoyé: Fr.*), a person deputed by a government to negotiate some affair with a foreign prince or state. There are envoys *ordinary* and *extraordinary*, as well as ambassadors; they are equally under the protection of the law of nations, and enjoy all the privileges of ambassadors: but, being in rank below them, they are not treated with equal ceremony. The word *envoy* is also sometimes applied to resident ministers.

E'OCENE (*ēōs*, the morning; and *kainos*, new: *Gr.*), in Geology, the oldest formation of the *tertiary* or *supercretaceous* group of rocks, containing the least amount of organic remains belonging to living species of animals; and therefore indicating the dawn, as it were, of the present state of animal creation. Eocene strata have been divided into three formations, upper, middle, and lower. The first and second include various beds developed in the Isle of Wight and Hampshire. To the lower eocene belong the strata of the London basin, from the London clay proper to the sands of Thanet, which rest upon the chalk.

E'PACT (*epaktos*, supplemental: *Gr.*), in Chronology, the moon's age at the end of the year; or the number of days by which the last new moon has preceded the beginning of the year. The annual epact is 11 days, the common solar year being 365 days, and the common lunar year 354. In the calendar of the Church of England, Easter and other movable feasts are determined in the same way as in the Roman Catholic, except that the golden numbers are prefixed to the days of the full, instead of the new moons; and, therefore, epacts are not used.

EPAGO'GE (*epagōgē*, literally a bringing on: *Gr.*), in Rhetoric, a figure of speech, which consists in demonstrating universal propositions by particulars.

EPAN'ODOS (*Gr.*, literally a return), in Rhetoric, a figure, in which the same or similar words are used in two or more sentences.

EPAPHÆ'RESIS (*epaphairesis*, literally a second taking away: *Gr.*), in Medicine, a removal or taking away; applied particularly to repeated phlebotomy.

EP'ARCHY (*eparchia*, a province: *Gr.*), the prefecture or territory under the jurisdiction of an *eparch* or governor.

EPAU'LE (a shoulder: *Fr.*), in Fortification, the shoulder of the bastion, or the angle of the face and flank; which is often called the *angle of the epaule*.

EPAU'LEMENT (*Fr.*, from *épaule*, a shoulder), in Fortification, a work raised to cover laterally, made of earth, gabions, &c. It also denotes a mass of earth, called a *square orillon*, raised to cover the cannon of a casemate, and faced with a wall.

EPAULETT'E or **EP'AULET** (*Fr.*: from *épaule*, the shoulder), an ornamental badge, usually formed of gold lace, and worn on the shoulder by military and naval officers. In the English army, all commissioned officers wear two epaulettes. In the navy, masters and commanders have one epaulette on the left shoulder; post captains under three years, one epaulette on the right shoulder, afterwards two epaulettes; rear-admirals have one star on the strap of the epaulette, vice-admirals two stars, and admirals three stars.

EPEN'THESIS (*Gr.*), the insertion of a letter or syllable in the middle of a word; as, *alituum* for *alitum*.

E'PHAH or **E'PHA**, a Hebrew measure both for liquids and dry goods.

EPHE'LIS (freckles brought out by the sun: *Gr.*), in Medicine, a broad solitary or aggregated spot, on the face, back of the hand, or breast, arising from exposure to the sun.

EPHE'MERA (*ephēmeros*, living but a day: *Gr.*), a genus of neuropterous insects, so called from their living only about a day. [See DAY-FLY and MAY-FLY.]

EPHEM'ERIS (*Gr.*: from *epi*, on; and *hēmera*, a day), in Astronomy, a table or collection of tables, showing the daily state of the heavens, or the places in which all the planets are to be found every day at noon. It is from these tables that the eclipses, conjunctions, and aspects of the planets are calculated.——In Medicine, *ephemerides* were those diseases which were supposed to return at particular times of the moon.

EPHIAL'TES (*Gr.*, literally one who leaps upon), in Medicine, the incubus, or nightmare.

EPHIDRO'SIS (an after perspiration: *Gr.*), in Medicine, a violent and morbid perspiration.

EPH'OD (*Heb.*, from *aphad*, to clothe), an ornament or upper garment worn by the Jewish priests. It is supposed to have been a sort of girdle, which, being brought from behind the neck over the two shoulders, and hanging down before, was put across the stomach, then carried round the waist, and used as a girdle to the tunic.

EPH'ORI (*ephoroi*, literally overseers: *Gr.*), in Grecian Antiquity, magistrates established in ancient Sparta, to control all others, even the kings. The authority of the *ephori*, who were five in number, was very great: they judicially decided important causes, presided over shows and festivals, had the care of the public money, specially superintended the education of youth, and were the arbiters of war and peace. Ephori were common to many Dorian constitutions in very ancient times.

EP'IC (*epikos*, from *epos*, a verse: *Gr.*), or *heroic poem*, a poem narrating a story, which may be partly true or altogether fictitious, representing, in an elevated style, a series of striking events connected with the history of the human race or some of its nations. The great epic writers of antiquity are Homer and Virgil; among the moderns, Milton, Tasso, Camoens, Dante, and Ariosto.

EPICAN'THIS (*epi*, upon; and *kanthos*, the corner of the eye: *Gr.*), in Medicine, a tumour in the inner corner of the eye.

EPICHIRE'MA (*epicheireo*, I put my hand to: *Gr.*), in Logic, a mode of reasoning, which comprehends the proof of one or both the premises of a syllogism, before the conclusion is drawn.

EPICŒ'NE (*epikoinos*, literally common: *Gr.*), in Grammar, an epithet applied to those Greek and Latin words to which the masculine and feminine article may be indifferently attached.

EPICRA'NIUM (*epi*, upon; and *kranion*, the skull: *Gr.*), in Anatomy, the common integuments, aponeurosis, and expansion of the occipito-frontalis muscle, which lie upon the cranium; by some, it is considered to comprise only the last; and by others, to consist merely of the skin.

EPICURE'ANS, a numerous sect of philosophers in Greece and Rome, the disciples of *Epicurus*, who flourished about 300 years B.C. They maintained that the gratification of the senses ought to be man's chief aim; that the world was formed by a concourse of atoms, and not governed by Providence; that the gods resided in the extramundane spaces, in soft inactive ease, and eternal tranquillity; that future rewards and punishments were idle chimeras; and that the soul was extinguished with the body. They are mentioned in the seventeenth chapter of the Acts of the Apostles. The doctrines of *Epicurus* himself were more dignified than those held by the generality of his followers: he maintained, indeed, that pleasure was the chief end of human pursuit; and this pleasure he placed in an exemption from pain and a perfect tranquillity of body and mind; but the means which he pointed out as conducive to attain it were prudence temperance, fortitude, and justice, in the union of which perfect happiness consists. He pursued pleasure, therefore, in its most rational acceptation. He maintained that the pleasures and pains of the mind exceed those of the body, and that to obtain happiness it is necessary to rule our desires by the help of reason. He thought that the imperfections of the world exhibiting themselves in pain and misery were a sufficient proof that it could not have emanated from an intelligent cause, such an origin being, moreover, inconceivable and not reconcilable with the nature of the gods. What appear marks of design and contrivance are only fortuitous coincidences. The soul has a corporeal nature, but more refined than the body, and both perish together by the dissolution of their component atoms.

EPICY'CLE (*epikuklos*, literally upon a circle: *Gr.*), in Ancient Astronomy, a small circle whose centre is in the circumference of a greater.

EPICY'CLOID (*epikuklos*, an epicycle; and *eidos*, form: *Gr.*), in Geometry, a curve generated by a point in one circle, which revolves about another circle, either on the concavity or convexity of its circumference, and thus differs from the common cycloid, which is generated by the revolution of a circle along a right line.

EPI'DEMIC (*epi*, upon; *demos*, the people: *Gr.*). [See ENDEMIC.]

EPIDEN'DRA (*epi*, upon; and *dendron*, a tree: *Gr.*), in Botany, a term sometimes used for plants which grow on other plants; as the mistletoe, dodder, &c.

EPIDER'MIS (*Gr.*: from *epi*, upon; and *derma*, the skin), in Anatomy, the cuticle or scarf skin; a thin membrane covering the *cutis*, or true skin of animals. In plants this name is given to a skin which lies under the superficial pellicle, and covers all parts of the plant except the stigma.

EP'IDOTE, a mineral, found crystallized in rhombic prisms variously modified, both laterally and at its extremities. Its colour is usually some shade of green. It is composed of silica and alumina with other bases. There are several varieties, one of which, *Zoizite*, contains lime; *Tremolite* contains lime and magnesia. Fine crystals, two or three inches in length, and between one and two in diameter, are found at Arendal, in Norway, and have received the name of *Arendalite;* but they are not much esteemed in jewellery.

EPIGAS'TRIC (*epigastrion*, the region from the breast to the navel: *Gr.*), pertaining to the upper part of the abdomen.—EPIGASTRIC VESSELS, the arteries and veins belonging to the *epigastric region;* the former being branches of the cœliac artery, and the latter of the iliac veins.

EP'IGENE (*epigenēs*, after-growing: *Gr.*), a term applied to forms of crystals not natural to the substances in which they are found.

EPIGLOT'TIS (*Gr.*: from *epi*, upon; and *glōtta*, the tongue), in Anatomy, one of the cartilages of the larynx: its use is to cover the glottis when food or drink is passing into the stomach, to prevent it from entering the larynx and obstructing the breath.

EP'IGRAM (*epigramma*, an inscription *Gr.*), a short composition in verse, treating only of one thing, and ending with some lively, ingenious, and natural thought or point. From its concise and expressive character, it is well fitted for satire; but an epigram may be didactic, satiric, comic, lyric, or elegiac. Originally, epigrams were inscriptions on tombs, statues, temples, triumphal arches, &c.

EP'IGRAPH (*epigrapho*, I inscribe: *Gr.*), a quotation from an author, or a sentence written for the purpose, placed at the commencement of a work, or of a division.

EP'ILEPSY (*epilēpsia*, from *epilambano*, I lay hold of: *Gr.*), a disease which deprives the patient of sensation and volition, accompanied by involuntary contraction of the muscles. It is popularly called the falling sickness, because those who are attacked by it fall suddenly to the ground.

EPILO'BIUM, in Botany, a genus of plants, nat. ord. *Onagraceæ.*

EP'ILOGUE (*epilogos: Gr.*), in the Drama, a speech addressed to the audience when the play is ended. In modern tragedy, the epilogue is usually smart and lively, being intended to compose the strong feelings which may have been raised in the course of the representation.—In Rhetoric, the conclusion of a speech, containing a recapitulation of the whole.

EPINI'CION (*epinikion:* from *epi*, upon; and *nikē*, a victory: *Gr.*), in Greek and Latin poetry, a poem or composition celebrating a victory. Also, a festival on account of a victory.

EPIPH'ANY (*epiphania*, literally a manifestation: *Gr.*), a Christian festival observed on the 6th of January (the twelfth day after Christmas), in commemoration of Christ being manifested by the miraculous appearance of a star to the magi, or wise men, who came to adore him and bring him presents. In some countries the day is styled the day of the kings. The Greek fathers applied the word to the appearance of Christ in the world, the sense in which St. Paul uses it, 2 Tim. i. 10.

EPIPHONE'MA (*epiphōnēma*, an exclamation: *Gr.*), in Rhetoric, a sententious exclamation or remark, not closely connected with the general tenor of the oration, and usually expressed with vehemence; or a sentence added as a conclusion to a speech.

EPIPH'ORA (*Gr.*, from *epiphero*, I lay upon), in Rhetoric and Poetry, an emphatic repetition of a word, or a series of words, at the end of several sentences or stanzas.—In Medicine, a morbid defluxion of the eyes.

EPIPH'YSIS (*epiphusis*, an aftergrowth: *Gr.*), in Anatomy, a bony substance, or as it were a smaller bone, affixed to a larger or principal bone by a cartilage.

EPI'PHYTE (*epi*, upon; and *phuton*, a plant: *Gr.*), a plant which has its home upon another plant. In the forests of Brazil, the trunks and branches of the trees are covered, not with mosses and lichens, but with orchids, cacti, arums, and other plants of epiphytous habits. Most of these derive their nourishment from the moisture of the bark of the tree on which they are seated, or on the decayed matter of lowlier forms of vegetation, but some are truly parasitical, that is, their roots penetrate into the tree and feed upon its juices.

EPIPLEX'IS (*epiplēxis*, a chastisement: *Gr.*), a Rhetorical figure, which, by an elegant kind of upbraiding, endeavours to convince.

EPIP'LOCE (*epiplokē*, a plaiting together: *Gr.*), a Rhetorical figure, by which one aggravation, or striking circumstance, is added to another; as, 'He not only spared the rebels, but encouraged them; not only encouraged, but rewarded them.'

EPIP'LOCELE (*epiplokēlē*: from *epiploon*, the omentum; and *kēlē*, a rupture: *Gr.*), in Surgery, a rupture of the omentum.

EPIP'LOON (the omentum: *Gr.*), in Anatomy, the omentum or caul.

EPIR'RHEOLOGY (*epirreo*, I influence; and *logos*, a discourse: *Gr.*), a branch of botany treating on the influence of external agents on plants.

EPIS'COPACY (*episcopos*, literally an overseer: *Gr.*), the form of church government which includes bishops.

EPISCOPA'LIANS (same *deriv.*), an appellation given to those who adhere to the episcopal form of church government and discipline. Until the Test Act was repealed, none but episcopalians, or members of the Church of England, were qualified to fill any office, civil or military.

EP'ISODE (*epeisodion*: from *epi*, at; and *eisodos*, an entrance: *Gr.*), in Poetry, a minor story which a poet adds to the main story of the piece by way of giving variety. The story of Dido, in the Æneid, the story of Dorothea, in Don Quixote, and the loves of Lorenzo and Jessica, in the Merchant of Venice, form episodes in the respective pieces. In epic poetry, there is much more room for the episode than in dramatic, where the poem is confined to a present action. The term *episode* has also been transferred to historical painting, in a sense analogous to that which it bears in poetry.

EPISPAS'MOS (*Gr.*), in Medicine, a quick inspiration of the breath.

EPISPAS'TIC (*epispastikos*, attracting: *Gr.*), in Medicine, a blister, or a topical remedy for attracting the humours of the skin.

EPISTAX'IS (*epistazo*, I trickle: *Gr.*), in Medicine, a repeated bleeding from the nose.

EPIS'TROPHE (*epistrophē*, a return: *Gr.*), in Rhetoric, a figure of speech in which several successive sentences end with the same word or affirmation, as, 'Are they Hebrews? so am I. Are they Israelites? so am I. Are they of the seed of Abraham? so am I,' &c.

EP'ISTYLE (*epistulion*: from *epi*, upon; and *stulos*, a column: *Gr.*), in Ancient Architecture, a term used by the Greeks for what we call the *architrave*, viz. a massive piece of stone, &c., laid immediately over the capital of a column.

EP'ITAPH (*epitaphion*: from *epi*, upon: and *taphos*, a tomb: *Gr.*). The Romans inscribed their epitaphs, which sometimes were full of moral sentiments, to the *manes* (*diis manibus*); and frequently introduced the dead as speaking to the living. During the first twelve centuries of the Christian era, monumental inscriptions in this country were written in Latin. French was adopted about the 13th century, and the vernacular tongue began to be used from the middle of the 14th; but the learned have continued to prefer the Latin.

EPITA'SIS (*Gr.*, literally a stretching), in Ancient Poetry, the second part or division of a dramatic poem, in which the plot, entered upon in the first part, or *protasis*, was carried on, and worked up, till it arrived at its height, called *catastasis*.——In Medicine, an increase of the paroxysm of a fever.——In Rhetoric, that part of an oration in which the orator addresses himself most forcibly to the passions.

EPITHALA'MIUM (*epithalamion*: *Gr.*), a nuptial song, or poetical composition in praise of the bridegroom and bride, with wishes for their prosperity. Among the Greeks and Romans, it was sung by young men and maids at the door of the bridal chamber. Amongst the poems of Ben Jonson and other poets of the time of Elizabeth and James, will be found several specimens of epithalamia.

EP'ITHEM (*epithema*, a cover: *Gr.*), in Medicine, any external application used as a fomentation.

EPIT'OME (*epitomē*, a cutting short: *Gr.*), a brief summary or compendium, containing the substance or principal matters of a book. To *epitomize*, therefore, is to shorten a literary production by judicious abridgment

EPIT'ROPE or EPIT'ROPY (*epitropē*, a surrender: *Gr.*), in Rhetoric, a figure of speech, by which something is granted with a view to obtain an advantage, as, 'I concede the fact, but this very concession overthrows your own argument.'

EPIZEUX'IS (a joining: *Gr.*), in Rhetoric, a figure which repeats the same word, without any other intervening: such is that of Virgil, 'nunc, nunc, insurgite remis.'

EPIZO'OTY (same *deriv.*), a pestilence among brutes.

E'POCH (same *deriv.*), a certain fixed period, or point of time, made famous by some remarkable event, and serving as a standard in chronology and history. An epoch is the *commencement of an era*. [See Era.]

EP'ODE (*epōdē*: from *epi*, upon; and *ōdē*, an ode: *Gr.*), in Lyric Poetry, the third or last part of the ode, the ancient ode being divided into strophe, antistrophe, and epode The word is now used for any short verse or verses, that follow one or more greater: thus, the epodes of Horace are supplementary odes.

EPOPEE' or EPOPŒ'IA (*epopoiia*: from *epos*, a discourse; and *poieo*, I make; *Gr.*), in Poetry, the fable, or subject of an epic poem.

EPOP'TÆ (*epopteuo*, I inspect: *Gr.*), in Antiquity, a name given to those who were admitted to view the secrets of the greater mysteries, or religious ceremonies of the Greeks.

EPO'TIDES (*Gr.*: from *epi*, upon; and *ōta*, the ears: *Gr.*), in ancient Naval Architecture, two thick blocks of wood, one on each side the prow of a galley, for warding off the blows of the rostra of the enemy's vessels. They had somewhat the appearance of ears; hence the name.

EPROUVETTE' (*Fr.*), the name of an instrument for ascertaining the strength of gunpowder, or comparing the strength of different kinds of gunpowder. It consists of a small gun which is fastened to a frame, and is capable of swinging on a horizontal axis. When this gun is fired, the recoil moves the frame; and the arc through which it passes shows the strength of the powder

EP'SOM SALTS, in Chemistry, sulphate of magnesia, which was formerly procured by boiling down mineral water from the spring at Epsom.

EPULO'TIC (*epoulōtikos*, from *epoulos*, I cicatrize: *Gr.*), in Medicine, an application for cicatrizing and healing wounds or ulcers, or disposing the parts to recover soundness.

EQUA'TION (*equatio*, a making equal: *Lat.*), in Mathematics, a statement of a relation of equality between two functions of a magnitude Thus $a^2 + b = x$, and $b - c = y$, are simple forms of equations An equation is the basis of all mathematical investigation. [See ALGEBRA]——EQUATION, in Astronomy, a term used to express the quantity added to, or subtracted from, the mean position of a heavenly body to obtain the true position.——EQUATION OF PAYMENTS, in Arithmetic, a rule for finding a time when, if a sum be paid which is equal to the sum of several others due at different times, no loss will be sustained by either party——EQUATION OF TIME, the reduction of the apparent time or motion of the sun to equable, mean, or true time The difference between true and apparent time arises from the excentricity of the earth's orbit, the obliquity of the ecliptic, and the perturbations of the moon and planets, which sensibly affect the sun's motion in longitude.

EQUA'TOR (*æquo*, I make equal: *Lat.*), in Astronomy and Geography, a great circle of the terrestrial globe, equidistant from its poles, and dividing it into two hemispheres, one north and the other south It is called the *equator*, because, when the sun is over it, the days and nights are of *equal* length; hence it is called also the *equinoctial*, and, when drawn on maps and globes, the *equinoctial line*, or by mariners simply *the line* All places through which it passes have invariably equal days and nights It crosses the centre of Africa, the islands of Sumatra, Borneo, Celebes, &c., in Asia; then traverses the Pacific Ocean; and, having gone through South America, by Quito and the mouth of the Amazon, proceeds by the Atlantic back to Africa——To *cross the line*, in Navigation, is to pass over the equator

EQUATO'RIAL, an astronomical instrument, contrived for the purpose of directing a telescope to any celestial object, of which the right ascension and declination are known; and of keeping it in view, notwithstanding the diurnal motion.

E'QUERRY (*écuyer*: *Fr.*), in this country, an officer of state under the master of the horse. The chief equerry is styled the *Clerk Marshal*: there are four equerries in ordinary, and an equerry of the crown stable. Their duties are to accompany the sovereign on horseback when taking exercise, &c.

E'QUES AURA'TUS (a gilded knight: *Lat.*), a *knight bachelor*, so called because none but knights were allowed to gild their armour

EQUES'TRIAN OR'DER, in Roman Antiquity, the second rank in Rome, and the next to that of the senators. [See EQUITES.]

EQUIAN'GULAR (*æquus*, equal; and *angulus*, an angle: *Lat.*), in Geometry, a term applied to figures whose angles are all equal; thus, to a square, an equilateral triangle, a parallelogram, &c

EQUICRU'RAL (*æquus*, equal; and *crus*, a leg: *Lat.*), in Geometry, having equal legs, but longer than the base; as, an *equicrural triangle* Such triangles belong to the species termed *isosceles*.

EQUIDIF'FERENT (*æquus*, equal; and *differentia*, a difference: *Lat.*), in Mathematics, a term applied to such things as have equal differences, or are arithmetically proportional.——In Crystallography, having a different number of faces presented by the prism and by each summit; but their numbers form a series in arithmetical progression, as 6, 4, 2

EQUILAT'ERAL (*æquilateralis*: from *æquus*, equal, and *latus*, a side: *Lat.*), in Geometry, having all the sides equal; as an *equilateral triangle*.

EQUIL'IBRIST (from *next*), one who keeps his balance in unnatural positions and hazardous movements, entertaining the spectator by his skilful motions and varying attitudes Equilibrists are very common in the East, and their feats are truly surprising.

EQUILIB'RIUM (an even balance: *Lat.*), in Statics, a state in which two or more forces balance each other, that is, counterbalance each other's effect, so as to leave the body at rest——In the Fine Arts, the due combination of light, shadow, &c.

EQUIMUL'TIPLE (*æquus*, equal; and *multiplex*, manifold: *Lat.*), in Arithmetic and Geometry, one of two or more numbers multiplied by the same number or quantity. Hence *equimultiples* are always in the same ratio to each other as the simple numbers or quantities before multiplication. Thus, if 2 and 3 are multiplied by 4, the multiples 8 and 12 will be to each other as 2 and 3.

EQUINOC'TIAL (*æquinoctialis*, from *æquinoctium*, the equinox: *Lat.*), in Astronomy, a great circle of the sphere, under which the equator is situated It is so called, because, whenever the sun comes to it, the days and nights are equal all over the globe; as it is the circle which the sun seems to describe at the time of the two equinoxes of spring and autumn——EQUINOCTIAL POINTS, the two points, Aries and Libra, where the equinoctial and ecliptic cross each other.——EQUINOCTIAL COLURE, the great circle passing through the poles of the sphere and the equinoctial points

E'QUINOX (*æquinoctium*: from *æquus* equal, and *nox*, night: *Lat.*), in Astronomy, the time when the sun enters either of the equinoctial points, where the ecliptic intersects the equinoctial. When the sun is in this situation, the horizon of every place is divided into two equal parts by the circle bounding light and darkness: hence the sun is visible everywhere 12 hours, and invisible for the same time, in each 24 hours. As the sun is in one of them in the spring (about March 21), it is called the *vernal* equinox; and as it is in the other in autumn (about September 23), it is called the *autumnal* equinox. At all other times, except under the line, the lengths of the day and night are unequal, and their difference is the greater the nearer we approach either pole; but in the same latitude their relative lengths are everywhere the same. Under the line this inequality entirely vanishes; there, during the day, which is equal to the night, the sun always ascends six hours, and descends six hours.

EQ'UIPAGE (*Fr.*), the furniture of an army or body of troops, infantry or cavalry, including whatever is necessary for a military expedition. Camp equipage includes tents, and everything required for accommodation in camp. Field equipage consists of arms, artillery, wagons, tumbrils, &c.——When we speak of a body of troops being furnished with arms and warlike apparatus, we say they are *equipped* for service.

EQUIPOL'LENCE (*æquipollens*, equivalent: *Lat.*), in Logic, an equivalence or agreement in the grammatical sense of any two or more propositions; that is, when they signify one and the same thing, though they express it differently.

EQUI'RIA (*equus*, a horse: *Lat.*), in Antiquity, games which were instituted by Romulus in honour of Mars, and consisted in horse-racing. They were celebrated every year, and if the Campus Martius happened to be overflowed by the Tiber, they were solemnized on the *Mons Cœlius*, which was thence called *Martialis Campus.*

EQUISE'TUM (*Lat.*), in Botany, a genus of cryptogamic plants: nat. ord. *Equisetaceæ*. The species are common in marshy places, and are known as horsetail.

EQ'UITANT (*equito*, I ride: *Lat.*), in Botany, a term used in the foliation of plants, for leaves that ride, as it were one over another.

EQ'UITES (*Lat.*), among the Romans, the *knights*, who constituted the second degree of nobility, and immediately succeeded the senators in point of rank. They were ordinarily the cavalry of the Roman state: at first their number was only 300. They received a horse or money to purchase it, and its maintenance from the treasury; but subsequently a class of knights was instituted who found their own horses, but received pay. Ultimately, all who possessed the property which qualified for knighthood, that is 400 sestertia, or about 3,200*l.*, were considered *equites;* but the dignity of the order was then greatly lessened. The badge of equestrian rank was a ring, which was given by the state.

EQ'UITY (*æquitas: Lat.*), a branch of jurisprudence. Blackstone says, 'Since the laws in all cases cannot be foreseen or expressed, it is necessary that, when the general decrees of the law come to be applied to particular cases, there should be somewhere vested a power of defining those circumstances which (had they been foreseen) the legislator himself would have expressed.' The English judges have constantly assumed the authority to pronounce c [illegible] be within the 'equity,' as it is termed, of statutes or rules, when they are not within its words. But, at present, the word *equity* is applied to a separate body of law, created and sustained on the strength of precedents, and administered by tribunals distinct from the common law courts of the country. Equity, then, is the law administered by the judges of the court of chancery giving remedy in cases to which the courts of law are not competent. It will remove legal impediments to the fair decision of a question pending at law. It will prevent a party from improperly setting up at a trial some title or claim which would be inequitable. It will compel him to discover, on his own oath, facts which he knows are material to the right of the other party, but which a court of law cannot compel the party to reveal. It will provide for the safety of property in dispute, pending litition. It will counteract, control, or set aside fraudulent judgments. It will also exercise, in many cases, *exclusive* jurisdiction; particularly in granting special relief, beyond the reach of the common law. It will grant injunctions to prevent waste or irreparable injury, or to secure a settled right, or to prevent vexatious litigation, or to compel the restitution of title deeds; it will appoint receivers of property, where it is in danger of misapplication; it will prohibit a party from leaving the country in order to avoid a suit; it will decree a specific performance of contracts respecting real estates; it will in many cases supply the imperfect execution of instruments, and reform and alter them according to the real intention of the parties; it will grant relief in cases of lost deeds and securities; and in all cases in which its interference is asked, its general rule is, that he who asks equity must do equity. The court of chancery requires the defendant to put in, on his oath, a written answer to the plaintiff's charge. [See CHANCERY.]

EQ'UITY OF REDEMP'TION, in Law, the right which a mortgagee has in a court of equity to redeem the mortgaged property on repayment of the money borrowed, and interest thereon. Such a right exists, notwithstanding the expiration of the time mentioned in the deed for repayment, until the mortgagee has obtained a decree of foreclosure, that is, a decree depriving the mortgagee of his right to redeem. Although at law the estate on non-payment of the money at the date mentioned on the deed becomes vested in the mortgagee, yet in equity it is still considered only a pledge for the money.

EQUIV'ALENTS (*equivalens*, having equal power: *Lat.*), a term employed in Chemistry to express the proportional weight or quantity of any substance which is necessary to saturate any other with which it can combine. The following is a table of the chemical equivalents or atomic weights of the elementary substances, hydrogen being considered as unity:—

Name.	*Symb.*	*Equiv.*	*Sp. Grav.*
Aluminium	Al	13·67	2·56
Antimony	Sb	129·00	6·70
Arsenic	As	75·00	5·67
Barium	Ba	68·50	4·70
Bismuth	Bi	213·09	9 80
Boron	B	11·00	2·68
Bromine	Br	80·00	5·411
Cadmium	Cd	56·00	8·63
Cæsium	Cæ	133·00	
Calcium	Ca	20·00	1·58
Carbon	C	6·00	0·829
Cerium	Ce	46·00	
Chlorine	Cl	35·50	2·453
Chromium	Cr	26·27	5·90
Cobalt	Co	29·50	8·53
Copper	Cu	32·00	8·72
Didymium	D	68 00	
Erbium	E		
Fluorine	Fl	19·00	1·327
Glucinum	G	6·97	
Gold	Au	98 33	19·5
Hydrogen	H	1·00	0 0692
Ilmenium	Il		
Indium			
Iodine	I	127·00	8·7827
Iridium	Ir	98·56	18·63
Iron	Fe	28·00	7·84
Lanthanum	La		
Lead	Pb	104·00	11·30
Lithium	L	7·00	0·5936
Magnesium	Mg	12·00	1·75
Manganese	Mn	26·00	8·00
Mercury	Hg	100·00	13·50
Molybdenum	M	48·00	8·60
Nickel	Ni	29·50	8·63
Niobium	Nb		
Nitrogen	N	14·00	0 9713
Norium	No		
Osmium	Os	98·41	10·00
Oxygen	O	8·00	1·1056
Palladium	Pd	53·24	11·50
Pelopium			
Phosphorus	P	32·00	4·284
Platinum	Pt	99·00	21·50
Potassium	K	39·00	0·865
Rhodium	Ro	52·16	11·20
Rubidium	Rub		
Ruthenium	Ru	52·11	8·60
Selenium	Se	40·00	7·696
Silicon	Si	21·00	
Silver	Ag	108·00	10·43
Sodium	Na	23·00	0·97
Strontium	Sr	44·00	2·54
Sulphur	S	16·00	2·214
Tantalum	Ta		
Tellurium	Te	64·08	6·30
Terbium	Tb		
Thallium	Tl		
Thorium	Th	59·50	
Tin	Sn	59·00	7·29
Titanium	Ti	24·12	5·28
Tungsten	W	92·00	17·5
Uranium	U	60·00	10 15
Vanadium	V	63·46	
Yttrium	Y		
Zinc	Zn	32·52	6·91
Zirconium	Zr	33·58	

EQUIV'OCAL (*equivocus*, ambiguous: *Lat.*), in Logic, a word that has several significations, and is, therefore, applicable to different objects, is said to be equivocal. A word is employed equivocally in a syllogism when the middle term is used in different senses in the two premises.

EQ'UIVOQUE (*Fr.*), a word or phrase susceptible of different significations.

ERA'DIATION (*e*, from; and *radiatio*, a sending forth of rays: *Lat.*), emission of rays of light, heat, &c.

ERAD'ICATED (*eradico*, I pluck up by the roots: *Lat.*), in Heraldry, an epithet for a tree or plant torn up by the root.

ERA'SED (*raser*, to erase: *Fr.*) in Heraldy, an epithet for the head or limb of any creature violently torn from the body, so as to give it a jagged appearance.

ER'EBUS (*erebos: Gr.*), according to Homer, this was a dark region under the earth, through which was the passage to Hades, the abode of departed souls.——Also, in Greek Mythology, a son of chaos, to whom Night bore Æther and Day.

ERECT' (*erectus*, upright: *Lat.*), in Botany, an epithet for a stem, leaf, or flower, &c.: as, *erectus caulis*, a stem standing perpendicularly from the ground; *flos erectus*, an erect flower, or one which has its aperture directed upwards, &c.——In Heraldry, an epithet for anything upright, or perpendicularly elevated, as wings *erect*, &c.

EREMACAU'SIS (*erēmos*, waste; *kausis*, burning: *Gr.*), a term applied by some chemists to that process of decay which takes place in moist organic substances, when freely exposed to the air; putrefaction being limited to decomposition under water. One theory as to the origin of the diamond is, that it was formed from an organic compound by a process of eremacausis.

EREMIT'ICAL (*eremos*, a desert: *Gr.*), living in solitude or in seclusion from the world.

ER'GOT (*Fr.*), in Farriery, a stub, like a piece of soft horn, situated behind and below the pastern joint.——Also, a diseased condition of rye and other grains, by which the ovary assumes the form of a long spur, and becomes of a dark colour. This is caused by a minute fungus. The eating of such diseased grain has been known to produce a dreadful disease; nevertheless, it is sometimes administered medicinally.

ERICA'CEÆ, a nat. ord. of exogenous plants, with evergreen leaves and monopetalous flowers. They are not of much use to man, but several genera bear very handsome flowers, such as the genera *erica* (the heaths, which contains some hundreds of species), rhododendron, azalea, and kalmia. The heaths abound at the Cape of Good Hope; the rhododendrons in the Himalayas and in North America.

ERIOM'ETER (*erion*, wool; and *metron*, a measure: *Gr.*), an instrument for measuring the fibres of wool, silk, &c.

ER'MINE (from *Armenia*), the *Mustela erminea* of zoologists, an animal of the weasel tribe, between nine and ten inches in length. A great number of skins are annually imported by our furriers. In winter, the whole body of the ermine is of a pure snow white, except the tip of the tail, which is of a deep black; in summer, the upper part of the body is of a pale tawny brown colour. The fur of the ermine is greatly prized; it was formerly one of the insignia of royalty, and is still used by judges, of whose 'unspotted ermine' we speak figuratively. The ermine worn by the queen and the royal family is distinguished from that of the nobility and judges by being thickly set with the black paws of the Astrakhan lamb. That worn by noblemen indicates the rank of the wearer by the number of tail tips with which it is spotted. The ladies of England make extensive use of it without licence from the herald's office. In Russia and Austria the use of ermine is restricted to the imperial families, and in Germany, Spain, and Portugal to the sovereigns. This animal inhabits the northern climates of Europe, Asia, and America, and in its habits strongly resembles the weasel, frequenting barns and outhouses, and feeding not only on mice and rats, but destroying poultry, birds, eggs, &c.——ERMINE, in Heraldry, a fur used in coat armour, and supposed to represent the linings and doublings of mantles and robes.

EROʹTIC POʹETRY (*erōtikos*, amatory; from *erōs*, love: *Gr.*), a term for amatory poetry.

ERPETOLʹOGY. [See HERPETOLOGY.]

ERRAʹTUM (*Lat.*), in the plural *Errata*, an error of the press. A list of *errata* is sometimes printed at the beginning or end of a book.

ERUʹGINOUS (*æruginosus*, from *ærugo*, the rust of brass: *Lat.*), covered with rust. Statues of bronze have always been considered to be improved by *ærugo*, which see.

ERUPʹTION (*eruptio*, a bursting forth: *Lat.*), a violent breaking or bursting forth of anything, particularly of flames and lava from a volcano.——In Medicine, a sudden and copious excretion of humours on the skin in pustules.

ERYSIPʹELAS (*erusipelas*: from *eruthros*, red; and *pella*, the skin: *Gr.*), in Medicine, an inflammatory affection, particularly of the skin, attended with fever. This disease is often called St. Anthony's fire; it is brought on by the various causes that are calculated to excite inflammation, such as injuries of all kinds, the external application of stimulants, exposure to cold, and obstructed perspiration.

ERYTHRIʹNA (*eruthros*, red: *Gr.*), in Botany, a genus of leguminous trees with handsome flowers, commonly called Coral trees.

ESCALAʹDE (*Fr.*), in the Military art, a furious attack made upon a rampart or fortification, by scaling the walls with ladders, the ditches being filled up with bundles of fagots, called fascines, without proceeding in form, breaking ground, or carrying on regular works to secure the men.

ESCAPAʹDE (*Fr.*), unconscious impropriety of speech or behaviour.

ESCAʹPE (*échapper*, to escape: *Fr.*), in Law, the act by which a person arrested gains his liberty before he is delivered by law. In *civil* cases, after the prisoner has been suffered wrongfully to escape, the sheriff is liable for the damage *actually* sustained by the judgment creditors in respect of the escape, and to an attachment besides. In *criminal* cases, the escape of a person arrested is an offence against public justice, and the party aiding is punishable.

ESCAʹPEMENT (*échappement*: *Fr.*), in Horology, a mechanical contrivance for transmitting, in a modified way, the power of a clock or watch, to the regulator, whether the latter is a *balance* or *pendulum*, for the purpose of restoring the motion lost at each vibration by friction, &c.

ESCARʹGATOIRE (*Fr.*, from *escargot*, a shell-snail), a nursery of snails.

ESCARPʹMENT (*Fr.*), in the Military Art, the exterior surface of the revetment.——In Geology, the steep face presented by the sudden termination of strata, so as to form a precipice.

ESʹCHAR (*eschara*: *Gr.*), in Surgery, the crust or scab occasioned by burns or caustic applications.

ESCHAROTʹIC (*escharotikos*, forming an eschar; from same: *Gr.*), in Medicine, a caustic application, or one which has the power of searing or destroying the flesh.

ESCHEATʹ (*eschet*, from *échoir*, to fall due: *Fr.*), in Law, the reversion of land to the original grantor. It occurs when a tenant in fee simple dies without having left any heir to the land. On sentence of death for murder, but not for other felonies, which leave the offender the power of disposing of his estate after death, the land goes to the lord of the fee. There is no escheat of equitable estates.

ESʹCORT (*escorte*: *Fr.*), a guard or company of armed men attending an officer, or baggage, provisions, or munitions, conveyed by land, to protect them from an enemy, &c.

ESCROʹLL (*escrou*, a scroll: *Fr.*), in Heraldry, one of the exterior ornaments of the escutcheon, representing a slip of parchment or paper, on which the motto is generally put.

ESʹCROW (same *deriv.*), in Law, a deed given to a third party, to be the deed of the party making it when a certain condition is fulfilled, until which it has no effect.

ESʹCUAGE or SCUʹTAGE (*scutum*, a shield: *Lat.*), in feudal customs, a pecuniary satisfaction, paid in lieu of military service by tenants in chivalry.

ESCULAʹPIAN (from *Æsculapius*, the physician), pertaining to the healing art.

ESʹCULENT (*esculentus*, from *esca*, food: *Lat.*), an epithet for such plants or roots as may be eaten.

ESCUʹRIAL, a celebrated palace and monastery in Spain, about 22 miles from Madrid, which took its name from the village at which it was erected, and which, in Arabic, signifies the *place of rocks*. It is in the shape of a gridiron, and contains the king's palace, St. Lawrence's church, the monastery of Jeronymites, and the free schools. It was erected by Philip II. in consequence of a vow made by him on the day of the battle of St. Quentin, in 1557, and dedicated to St. Lawrence, whose festival occurred upon that day, and who is said to have suffered martyrdom on a gridiron. Though the building is immensely large, and the most superb in the kingdom, its exterior has rather the austere simplicity of a convent than the elegance of a palace. The principal façade, looking towards the west, is 740 feet long, and 60 feet high to the cornice: it is cut up into five ranges of windows. Towers which are 200 feet high flank the edifice at each angle. The eastern front is 1100 feet long, and the southern 580. The church of the monastery is 364 feet long, 230 feet wide, and 170 feet high. The Escurial occupied 22 years in building.

ESCUTCH'EON (*écusson: Fr.*), in Heraldry, the shield on which a coat of arms is represented. It is an imitation of the shields anciently used in war.

ES'DRAS, the name of two apocryphal books, usually bound up with the Scriptures. They were always excluded from the Jewish canon.

ESOTER'IC (*esōterikos*, from *esō*, within: *Gr.*), an epithet applied to the private instructions and doctrines of Pythagoras; opposed to *exoteric* (*exō*, without: *Gr.*), or public.

ESPA'LIER (*Fr.*), a fruit tree, having the branches trained to a frame, or fastened to stakes, and spread laterally. *Espaliers* are usually planted in rows about a garden so as to enclose separate portions.

ESPAR'TO, a species of grass, the *Lygeum Spartum* of botanists, growing abundantly on the European and African shores of the Mediterranean. It is imported into England for the use of the paper maker. Baskets, mats, ropes, fishing-nets, and brushes, are made of it in the countries where it grows; and in the north of Africa it is the principal food of camels and horses during a journey.

ES'PIONAGE (*espionnage: Fr.*), a system of employing spies, or secret emissaries, either in military or political affairs.

ESPLANA'DE (*Fr.*), in Fortification, the glacis of the counterscarp, or sloping of the parapet of the covered way towards the country. The word is now also used for a sloping walk or promenade.

ESPOU'SALS (*épousailles: Fr.*), in Law, a contract or mutual promise of marriage between a man and woman. A promise to marry hereafter merely gives a right to an action for damages. If the party making it is not twenty-one years of age it is not binding in any way.

ESPRI'T DE CORPS, a French phrase, signifying that species of attachment which persons, and more especially military men, feel towards the service to which they belong.

ES'QUIMAUX, ES'KIMOS, a race of people who live on the shore of a vast extent of country in the extreme north of America, and also in Asia. They appear to be a distinct race from the Red Man, with whom they have very little intercourse. They are strictly a littoral people, never going far inland. They live in villages, and feed on the flesh of reindeer, birds, whales, seals, and fish. In personal courage they are superior to the neighbouring Indians, and they have made a greater advance in civilization. They make light and swift canoes, which they manage with great address, and they have sledges, which are drawn by dogs over the snow in winter. The name by which they are known to Europeans is of uncertain derivation, but some say that it comes from Indian words signifying eaters of raw flesh. Their own name for their nation is Iowit. A belief in witchcraft, and in the agency of evil spirits, prevails amongst them; and they attribute to certain persons amongst them the power of sorcery.

ESQUI'RE (*écuyer: Fr.*), anciently a shield or armour bearer: the person that attended a knight in time of war, and carried his shield. It is now a title given to the sons of knights, or those who serve the king in any important appointment; thus, to officers of the king's courts, barristers-at-law, &c. It has, however, become a sort of vague and undefined compliment, placed at the end of a man's name, and may be regarded more as an expression of respect than anything else.

ES'SAY (*essai: Fr.*), in Literature, a composition intended to prove or illustrate a particular subject, and usually shorter and less methodical than a treatise.

ES'SENCE (*essentia: Lat.*), in Philosophy, that which constitutes the particular nature of a being or substance, and which distinguishes it from all others.——ARTIFICIAL ESSENCES, in Pharmaceutical Chemistry, a number of compounds used in flavouring spirituous liquors or confectionery, and consisting chiefly of ethers and essential oils. The flavours of several fruits are thus successfully imitated.

ESSE'NES or ESSE'NIANS, one of the three ancient Jewish sects; it was more exact than the Pharisees, in attending to the most rigorous observances. The Essenes admitted a future state, but denied a resurrection from the dead. Their way of life was very singular: they did not marry, but adopted the children of others, whom they instructed in the tenets and ritual of their sect; they despised riches, and had all things in common. They are not once mentioned in the New Testament.

ESSEN'TIAL OILS (*essentia*, an essence: *Lat.*), in Chemistry, volatile oils, which have a strong aromatic smell, and are usually drawn from plants by distillation with water. Their taste is acrid and burning, and their odour very pungent; both their taste and smell generally resembling those of the vegetables affording them. The principal volatile or essential oils are those of turpentine, aniseed, nutmeg, lavender, cloves, caraway, peppermint, spearmint, sassafras, camomile, and citron. Perfumers style the essential oils used by them ottos.——ESSENTIAL PROPERTIES, in Logic, such as necessarily depend upon, and are connected with, the nature of a thing; all others are *accidental.*

ESSOIN' (*exoine: Fr.*), in Law, an excuse, by reason of sickness or any other just cause, for one that was summoned to appear and answer an action, &c. It was not neces sary that there should be any ground for this excuse.——The first day of every term was formerly called the *essoin day*, because the court sat on it to take essoins.

ES'SORANT (drying: *Fr.*), in Heraldry, a term for a bird standing on the ground with its wings expanded, as if it had been wet and was drying itself.

ESTAB'LISHMENT (*établissement: Fr.*), in a military sense, the quota of officers and men in an army, regiment, or company, which, being much greater in war than in peace, has given rise to the distinctive terms of *war establishment* and *peace establishment*.——The word is also used when speaking of the ministers of a church established by law; as, belonging to the *establishment*.

ESTACA'DE (*estocade: Fr.*), in the Military art, a dyke constructed with piles in the sea, a river, or morass, to oppose the entry of troops.

ESTAFET'TE (an express: *Fr.*), a military courier sent from one part of an army to another, or a speedy messenger who travels on horseback.

ESTA'TE (*état: Fr.*), in Law, the title or interest that one has in lands, tenements, or other real property. Also the property itself, in which sense estates are either *real*, consisting of lands, tenements, or hereditaments; or *personal*, consisting of goods, money, and all other movables, and of such rights and profits as relate to movables; otherwise distinguished into *freeholds*, which descend to heirs; or *chattels* and effects, which go to executors or administrators.——ESTATES OF THE REALM, the distinct parts of any state or government; as, the king, lords, and commons in England.

EST'HER, a canonical book of the Old Testament, containing the history of a Jewish virgin dwelling with her uncle Mordecai at Shushan, in the reign of Ahasuerus, one of the kings of Persia. Archbishop Usher supposes Darius Hystaspes to be the Ahasuerus of Scripture, and Artystona to be Esther. Scaliger considers him as Xerxes, and his queen Hamestris as Esther. Josephus asserts that Ahasuerus was Artaxerxes Longimanus, and the Septuagint, throughout the whole book of Esther, translates Ahasuerus by Artaxerxes. Some admit the canonicity of Esther only as far as the third verse of the tenth chapter, which, according to the most ancient opinion, is the only portion that is canonical.

ESTIVA'TION. [See ÆSTIVATION.]

ESTOP'PEL (*étouper*, to stop: *Fr.*), in Law, an impediment or bar to the right of action, arising out of a person's own act, or that to which he is privy.

ESTO'VERS, in Law, a reasonable allowance out of lands or goods, for the subsistence of a man accused of felony, during his imprisonment. Also, certain allowances of wood made to tenants, and called, from the Saxon, *house-bote*, *hedge-bote*, *plough-bote*, &c.

ESTRAPA'DE (*Fr.*), the motion of a restive horse, which, to get rid of its rider, rears high, and kicks violently.

ESTRAY', a tame beast found without any known owner, which, if not reclaimed within a year and a day, falls to the lord of the manor.

ESTREAT' OF RECOG'NIZANCE (*extractum*, extracted from: *Lat.*), in Law, a copy of a recognizance which has been forfeited, taken from among the other records, and sent up to the exchequer.

ES'TUARY (*æstuarium*, from *æstus*, the tide: *Lat.*), an arm of the sea; or the broad mouth of a river, &c., where the tide meets the current.

ETCH'ING (*etzen*, to etch; from *eeten*, to eat: *Ger.*), a method of engraving on copper, in which the lines and strokes are eaten in with aquafortis. [See ENGRAVING.]

ETE'SIAN WINDS (*etēsiai*, literally yearly; from *etos*, a year: *Gr.*), a term applied to yearly or regularly periodical winds, answering to the monsoons of the East Indies.——The *Etesian winds* of ancient writers are such as blow at stated times of the year, from whatever part of the compass they may come.

E'THER (*aithēr*, pure air: *Gr.*), SULPHURIC, in Chemistry, a light, volatile, and inflammable liquid, the product of the distillation of equal quantities of alcohol and sulphuric acid. In Chemical Language, it is the oxide of ETHYL, and is composed of one atom of oxygen united to one of that radical. Pure ether is colourless; its specific gravity at 60° is 0·720, and it boils at 96°. It has never been frozen by the severest cold. It burns with a white flame. Fats and oils are dissolved by it.—Physicists, to explain their theories, often invoke the aid of a subtle gas of extreme tenuity, which they term *ether*. In this the motions take place which are supposed to cause the phenomena requiring explanation.

ETH'ICS (*ethikos*, arising from custom; from *ethos*, manners: *Gr.*), the science of morals, or that which treats of the duties of men as intelligent and social beings.

E'THIOPS MIN'ERAL (*aithiops*, sunburnt: *Gr.*), in Chemistry, black sulphuret of mercury. *Ethiops, Martial*, black oxide of iron. *Ethiops per se*, black oxide of mercury.

ETH'MOID (*ēthmos*, a strainer; and *eidos*, form: *Gr.*), in Anatomy, one of the most curious bones in the human body; it is exceedingly light and spongy, and consists of many convoluted plates, which form a network like honeycomb. It is curiously enclosed in the *os frontis*, between the orbitary processes of that bone. One horizontal plate receives the olfactory nerves, which perforate it with such a number of small holes that it resembles a sieve, and hence is named the *cribriform bone*, or *cribrosum os*, which see. Other plates, dropping perpendicularly from this, receive the divided nerves, and give them an opportunity of expanding with the organ of smell. The bones upon which the olfactory nerves are spread out, and which are called the *spongy bones*, are so much convoluted as to greatly extend the surface devoted to this sense. Another flat plate lies in the orbit of the eye; and, being very smooth, that it may not impede the rolling of the eye, it is named the *os planum*, or smooth bone. So that the ethmoid bone supports the fore part of the brain, receives the olfactory nerves, forms the organ of smell, and makes a chief part of the orbit of the eye.

ETH'NICAL (*ethnikos*, belonging to the nations, heathenish: *Gr.*), pertaining to the heathen nations, or those which were not converted to Christianity.

ETHNOL'OGY (*ethnos*, a people; and *logos*, a discourse: *Gr.*), that branch of science which is concerned with ascertaining the relationship of the races of men. For the purpose of arriving at true conclusions, anatomists, who have examined the physical structure of men of different races, linguists, who have studied the languages they speak, and travellers who have recorded their traditions and manners, are consulted.

ETHOL'OGY (*ethos*, custom; and *logos*, a discourse: *Gr.*), a treatise on morality or the science of ethics. Hence, one who writes on the subject of manners and morality is termed an *ethologist*.

ETHYL', in Chemistry, a compound radical, consisting of four atoms of carbon and five of hydrogen, and forming a colourless liquid. It is the base of alcohol and a great number of ethers Thus, the oxide of ethyl is ether; the hydrate of the oxide, alcohol; the nitrate of the oxide, nitrous ether (the basis of the sweet spirits of nitre of the shops), &c.

ETIOLA'TION, the operation of being whitened, by excluding the light of the sun: a term used by botanists and gardeners. The stalks of the leaves of celery are designedly etiolated.

ETIOL'OGY (*aitiologia:* from *aitia*, a cause; and *logos*, a discourse: *Gr.*), an account of the causes of anything, particularly of diseases

ETIQUETTE (*Fr*), the rules and ceremonies which good manners require to be observed towards particular persons.

EU'CHARIST (*eucharistia*, gratitude *Gr*), the sacrament of the Lord's Supper, so called because Christ's death is thereby commemorated with thankful recollection, and bread and wine are taken 'in remembrance of him.' The Roman Catholics maintain that the bread and wine *cease to exist* in the Eucharist, the body and blood of Christ taking their place The Lutherans believe that Christ's body and blood are present *along with* the bread and wine [See TRANSUBSTANTIATION and CONSUBSTANTIATION.]

EUCHLO'RINE (*eu*, very; and *chlōros*, green: *Gr.*), in Chemistry, oxide of chlorine

EUCHOL'OGY (*euchologion:* from *euchē*, prayer; and *lego*, I collect: *Gr.*), the ritual of the Greek church, in which are set down the order of ceremonies, sacraments, and ordinances.

EUCHY'MIA or EU'CHYMY (*eu*, well; and *chumos*, juice: *Gr.*), in Medicine, a good state of the blood and other fluids of the body.

EUCHYSID'ERITE (*eu*, easily; and *chusis*, a melting: *Gr*), in Mineralogy, a species of *Pyroxene*, consisting of silicate of lime, magnesia, and protoxide of iron.

EU'CLASE (*eu*, easily; and *klasis*, a breaking: *Gr.*), a species of emerald, of a greenish colour. It is a rare mineral, consisting of silicate of glucina and alumina.

EU'CRASY (*eukrasia:* from *eu*, right; and *krasis*, a mixing: *Gr.*), in Medicine, such a well-proportioned combination of qualities in bodies as to constitute sound health

EUDI'ALYTE (*eu*, easily; and *dialutos*, dissolved: *Gr.*, from the facility with which it is gelatinized by hydrochloric acid), a mineral from Greenland, of a red colour, containing silica, zirconia, lime, and soda, with the oxides of iron and manganese.

EUDIOM'ETER (*eudia*, calm air; and *metron*, a measure: *Gr.*), an instrument for ascertaining the purity of air—erroneously supposed to be dependent on the quantity of oxygen present, which, however, is found to be invariable. The best kind of eudiometer is a glass tube, in which a mixture of atmospheric air and hydrogen is exploded: one-third of the gas, which, being formed into water, disappears, is oxygen, and the proportion which it bears to the quantity of atmospheric air employed, is known.

EUHARMON'IC (*eu*, correctly; and *harmonikos*, harmonic: *Gr.*), in Music, producing harmony or concordant sounds.

EUK'AIRITE (*eukairos*, rich: *Gr.*), a native seleniuret of silver and copper, from Sweden.

EU'LOGY (*eulogia:* from *eu*, well; and *logos*, a discourse: *Gr.*), a speech or writing in commendation of a person.

EU'PEPSY (*eupepsia*. from *eu*, right; and *pepsis*, digestion: *Gr.*), in Medicine, a good action of the stomach; perfect digestion.

EU'PHEMISM (*euphēmismos:* from *eu*, agreeable; and *phēmē*, a speech: *Gr.*), in Rhetoric, a figure by which things in themselves disagreeable or offensive, are expressed in terms neither offensive to good manners nor repulsive to 'ears polite.'

EU'PHONY (*euphonia:* from *eu*, agreeable; and *phōnē*, a sound: *Gr.*), an easy and smooth enunciation of words. A grammatical licence, by which a letter that is too harsh is converted into a smoother, contrary to the ordinary rules, for the purpose of promoting smoothness and elegance in the pronunciation.

EUPHOR'BIACEÆ, an extensive order of plants, of which many abound with a poisonous juice that is usually milky. The flowers are unisexual. The secretions of some are used in medicine, and a nutritious starch is obtained from others. To this order belong the common box, the croton oil tree, the physic nut tree (*Jatropha purgans*), the manihot, from the root of which CASSAVA and TAPIOCA are obtained, the CASTOR OIL plant, *Siphonia elastica*, yielding India rubber, and *Stillingia sebifera*, the TALLOW-TREE Some species are highly ornamental plants, cultivated in hot-houses, whilst others curiously resemble cactuses, and some are common weeds. In England there are several wild herbaceous species belonging to the genus *Euphorbia*, so named by Linnæus after Euphorbus, physician to king Juba of Mauritania.

EUPHOR'BIUM, in Medicine, a concrete

gum-resin, the produce of the *Euphorbia officinalis*. When first chewed it has little taste, but it soon gives a very acrid burning sensation to the tongue, palate, and throat, which is very permanent, and almost insupportable. Its very dust is a dangerous stimulant to the nose.

EU'RITE (*eurus*, broad: *Gr.*), in Geology, very small-grained granite, with the parts so intimately blended as often to appear compact. The name is also applied to a rock, in which common felspar predominates, without any mica. It is thin, of a white colour, and may be called a felspathic granite.

EU'RYTHMY (*euruthmia*: from *eu*, right; and *ruthmos*, proportion: *Gr.*), in Architecture, Painting, and Sculpture, a certain majesty, elegance, and ease in the various parts of a body, arising from its just proportions.——In Medicine, a good action of the pulse.

EUSTA'CHIAN TUBE (named after the celebrated anatomist *Eustachius*), in Anatomy, the communication between the ear and mouth. Persons who have a perforated tympanum can blow tobacco-smoke through it; deafness results if it is stopped. Though its discovery has been attributed to Eustachius, Aristotle, who accurately describes it, quotes an earlier Greek anatomist as having known it.

EUSTA'THIANS, the followers of Eustathius, who, in the 4th century, under pretence of great purity and severity, introduced many extravagant notions. His teaching was condemned by the council of Gangra, held soon after the council of Nice.

EU'STYLE (*eustulos*: from *eu*, correct; and *stulos*, a column: *Gr.*), in Architecture, a style of building in which the columns are placed at the most convenient distances from each other, most of the intercolumniations being generally two and a quarter diameters of the column.

EUTY'CHIANS, a religious sect in the 5th century, called after Eutyches, abbot of a monastery at Constantinople, who maintained, among other things, that the human nature of Christ was absorbed by the divine, so that there was only one nature in him, and that the divine. This was in opposition to the Nestorians, who asserted the distinctness of the two natures of Christ so far, that they considered the human nature as the mere dwelling-place of the divine. The Eutychian doctrine was the occasion of a long and violent controversy, and led to a civil war. It was first condemned, and Eutyches excommunicated, by an occasional council. Eutyches was then acquitted by the general council of Ephesus A.D. 449. By the council of Chalcedon, 451, he was again condemned.

EVAN'GELIST (*euangelistēs*, a bringer of good tidings: *Gr.*), a general name given to those who write or preach the gospel of Jesus Christ. But it is specially applied to the writers of the four Gospels, viz. Matthew, Mark, Luke, and John.——The word also denotes certain ministers in the primitive church, who assisted the apostles in diffusing the knowledge of the gospel, and travelled about to execute such commissions as they were intrusted with, for the advancement of Christianity.

EVAPORA'TION (*evaporatio*: *Lat.*), in Natural Philosophy, that conversion of substances into vapour, which is caused by heat. The vapour which rises from water, in consequence of becoming lighter than the atmosphere, ascends considerably above the surface of the earth, and afterwards, by condensation, forms clouds. When water is heated to 212°, it is rapidly converted into steam; and if the heat is applied below, it *boils*. The same change takes place at much lower temperatures; but in that case the evaporation is slower, and the elasticity of the vapour is less. The vapour, and the fluid from which it rises, are always of the same temperature; the caloric which disappears being required on account of the greater capacity which the vapour has for caloric: steam at 212° contains 1000° more heat than water at the same temperature. As a very considerable proportion of the earth's surface is covered with water, and as this water is constantly evaporating and mixing with the atmosphere in the state of vapour, a precise determination of the rate of evaporation must be of very great importance in meteorology.

EVEC'TICA or **EVEC'TICS** (*euektikos*, conducive to sound health: from *eu*, well; and *echo*, I keep myself: *Gr.*), that part of medicine which teaches how to acquire a good habit of body.

EVEC'TION (*eveho*, I raise up: *Lat.*), *of the moon*, in Astronomy, one of her most considerable irregularities, caused by the action of the sun upon her; the general effect of which is to diminish the equation of the centre at the syzygies, and to increase it in the quadratures. When the transverse axis of the lunar orbit lies in the same direction with the line of the syzygies, or that joining the sun and earth, the quantity by which the solar force diminishes the gravitation of the moon is greatest if the moon is in apogee, and least if in perigee. The difference between the moon's gravitation at her apogee and perigee is therefore increased by the solar action, and consequently her orbit seems to have its excentricity augmented. When the line of the apsides is in the quadratures, the contrary happens: the difference of her gravitation is diminished, and the excentricity of her orbit seems also diminished. The result is, that the moon is alternately in advance and in arrear of her elliptic place by about 1¼°.

E'VENING or **EVE** (*efen*: *Sax.*). In strictness, evening commences at the setting of the sun, and continues during twilight; and *night* commences with total darkness. But it sometimes includes a portion of the afternoon; and in customary language it extends to bed-time.——**EVENING STAR**, in Astronomy, Hesperus or Vesper; *Venus*, when visible in the evening.

EV'IDENCE (*evidentia*: *Lat.*), in its most general sense, means the proofs which establish, or have a tendency to establish, any facts or conclusions. It may be divided into three sorts, mathematical, moral, and legal. The first is employed in the demonstrations which belong to pure mathematics; the second, in the general affairs of life, and in those reasonings which are applied to convince the understanding in cases not admitting of strict demonstration; the third is that which is adduced before judicial tribunals, for the purpose of obtaining decisions upon the rights and wrongs of litigants. According to our system of jurisprudence in common-law trials, it is the peculiar province of a jury to decide all matters of fact. The verdict of the jury is, however, to be given, and the trial is to take place, in the presence of a judge or judges who preside, and are bound to decide all matters of law which suggest themselves in the course of the trial. Whenever, therefore, a question arises, whether anything offered as proof at such trial is or is not proper to go before the jury as evidence, that question is to be decided by the court, and, unless permitted by the court, it can never legally come before the consideration of the jury. Hence, whatever is so permitted to be brought before the jury, for the purpose of enabling them to decide any matter of fact in dispute between the parties, is, in a legal sense, *evidence*, and is so called in contradistinction from mere argument and comment. This gives rise to a very important distinction, at common law, as to the *competency* and the *credibility* of evidence. It is *competent*, when, by the principles of law, it is admissible to establish any fact, or has any tendency to prove it. It is *credible*, when, being introduced, it affords satisfactory proof of the fact. It follows, therefore, that evidence may be *competent* to be produced before a jury, when it may nevertheless not amount to *credible* proof so as to satisfy the minds of the jury; and, on the other hand, it may be such that, if before them, it would satisfy their minds of the truth of the fact, but yet, by the rules of law, it is not admissible. Whether there is *any evidence* of a fact is a question for the court; whether it is *sufficient* is a question for the jury.

EVOCA'TI (*Lat.*, from *evoco*, I call out), soldiers among the Romans, who, having served their full time in the army, went afterwards as volunteers at the request of some favourite general; on which account they were called by the honourable names of *Emeriti* and *Beneficiarii*.

EV'OLUTE (*evolutus*, unrolled: *Lat.*), in Geometry, an original curve from which another is described.

EVOLU'TION (*evolutio*, an unrolling: *Lat.*), in Algebra, the extraction of roots from powers; the reverse of *involution*.——In Geometry, the unfolding or opening a curve, and making it describe an evolvent.——In Military tactics, the complicated movement of a body of men when they change their position by counter-marching, wheeling, &c.

EVOL'VENT (*evolvo*, I unroll: *Lat.*), in Geometry, the curve described from the evolute.

EW'RY (*eyer*, a ewer: *Norm. Fr.*; from *eye*, water: *Sax.*), a department in the royal household, which had charge of the table-linen, &c., in former times.

EXACERBA'TION (*exacerbo*, I aggravate: *Lat.*), in Medicine, the increased violence of a disease. The term is generally restricted to the periodical increase of remittent and continued fevers, where there is no absolute cessation of the fever.

EXÆ'RESIS (*exairesis*, a taking out: *Gr.*), in Surgery, the operation of extracting or taking away something that is hurtful to the human body.

EXAGGERA'TION (*exaggeratio*, literally a heaping up: *Lat.*), in Rhetoric, a kind of hyperbole, in which things are augmented or amplified by saying more than the strict truth would warrant.——In Painting, the representation of things in a manner stronger than the reality.

EXALTA'TION (*exaltatio*, a raising up: *Lat.*), in Astrology, the dignity which a planet acquires in certain signs or parts of the zodiac, and which is supposed to give it an extraordinary efficacy and influence.

EXAMINA'TION (*examinatio*: *Lat.*), in judicial proceedings, an attempt to ascertain the truth, generally on the oath of the party examined.

EXAM'INERS (*examinator*: *Lat*), in Law, officers in the Court of Chancery, who are appointed to examine witnesses on either side. The evidence taken by them follows the same rules as that given in a court of common law.

EXAN'THEMA, or **EXANTHE'MATA** (*exanthēma*, a flower, and hence an eruption: *Gr.*), among physicians, any kind of efflorescence or eruption; as in measles, small-pox, scarlatina, &c. The term is now limited by systematic nosologists to such eruptions as are accompanied with fever. ——The adjective is *exanthematous*.

EXANTHRO'PIA (*exanthrōpos*, degraded: *ex*, away from; and *anthrōpos*, a man: *Gr.*), in Medicine, a species of melancholy madness, in which the patient fancies himself a brute.

EX'ARCH (*exarchos*: *Gr.*), in Antiquity, an officer sent by the emperors of the East into Italy as prefect or governor.——Exarch also denotes an officer still found in the Greek church, who visits the provinces in order to see whether the bishops and clergy do their duty.

EXARTICULA'TION (*ex*, out of; and *articulus*, a joint: *Lat.*), in Surgery, the dislocation of a joint.

EXCALCEA'TION (*excalceo*, I take off the shoes: *Lat.*). Among the Jews, a widow, whom her husband's brother refused to marry, had a right to summon him to a court of justice, and, upon his persevering, to pull off one of his shoes and spit in his face, both which actions were considered very ignominious.

EX'CELLENCY (*excellence*: *Fr.*), a title of honour, formerly confined to kings and emperors, but now given to governors, ambassadors, and diplomatic ministers. The title of excellency is in no case hereditary or transferable, but exclusively belongs to the office; and it is borne, on the European continent, only by ministers in actual service, by the highest court and military dignitaries, and by ambassadors and plenipotentiaries. Foreign ministers are addressed as *your excellency*, by way of courtesy, even if they have no rank which entitles them to this distinction; but *chargés d'affaires* never receive this title. The lord-lieutenant of Ireland, and the governors of British colonies, are styled *excellency*.

EXCEP'TION (*exceptio: Lat.*), in Law, the denial of the matter alleged in bar of action. In Chancery, what is alleged against the sufficiency of the answer.——**BILL OF EXCEPTIONS**, a statement of exceptions to the direction or decision of a judge at a trial, on account of his misstating the law, &c., tendered to him by one of the parties, and which the judge must sign or seal.

EXCESS' (*excès: Fr.*), in Arithmetic and Geometry, the difference between any two unequal numbers or quantities; or that which is left after the less is taken from or out of the greater.——In Trigonometry, the difference between the sums of the three angles of a spherical triangle and two right angles.

EXCHAN'GE (*Fr.*), in Commerce, traffic by permutation, or the act of giving one thing or commodity for another. Also, the receipt or payment of money in one country for the like sum in another, by means of *bills of exchange*. Thus, *A* in London is creditor to *B* in Paris to the amount of 100*l.*; *C* in London is debtor to *D* in Paris in a like sum. By the operation of the bill of exchange, the London creditor is paid by the London debtor, and the Paris creditor is paid by the Paris debtor, and consequently two debts are paid, though no specie is sent from London to Paris, or from Paris to London. This is the principle of a bill of exchange; and its great convenience is the foundation of exchange itself. That variation *above* and *below par*, which is called the course of exchange, results from the same causes that act upon the price of commodities of every other kind. If bills upon Paris be scarce, that is, if Paris is but little indebted to London, the London creditor, who wants bills on Paris to remit to that city, is obliged to purchase them dearly, then the course of exchange is *above par*. If, on the other hand, London owes less to Paris than Paris owes to London, Paris bills will be proportionably plenty, and the exchange with that city *below par*. Hence, it is a maxim that, when the course of exchange rises *above par*, the balance of trade runs against the country where it rises.——In London, bills of exchange are bought and sold by brokers, who go round to the principal merchants and discover whether they are buyers or sellers of bills. A few of the brokers of most influence, after ascertaining the relative supply of and demand for bills, suggest a price at which the greater part of the transactions of the day are settled, with such deviations as particular bills, from their being in very high or low credit, may be subject to. In London and other great commercial cities, a class of middlemen speculate largely on the rise and fall of the exchange, buying bills when they expect a rise, and selling them when a fall is anticipated.——*Exchange* (often contracted into *Change*, and termed in France the *Bourse*), a building or other place in considerable trading cities, where the merchants, agents, bankers, brokers, and other persons concerned in commerce, meet at certain times to confer and treat together on matters relating to exchanges, remittances, payments, adventures, assurances, freights, and other mercantile negociations both by sea and by land. ——*Course of exchange*, the rate at which bills of exchange may be obtained. It is affected by variations which may be either real or nominal. They are *real* when they grow out of circumstances affecting trade; *nominal*, when they arise from any discrepancy in the actual weight or fineness of the coin (which in scarcely any foreign country corresponds to our Mint standard), from the use of paper money, &c. A fall of the *nominal* exchange has no effect on trade; but an unfavourable *real* exchange has, since it increases exportation and decreases importation. The true *par* forms the centre of the oscillations arising from the favourable and unfavourable states of the real exchange. ——*Arbitration of exchanges*, the mode of estimating the value of the money of any one place, not drawn directly, but through one or more other places.——**EXCHANGE OF PRISONERS**, in War, the act of giving up men on both sides, upon certain conditions agreed to by the contending parties.——**EXCHANGE**, in Arithmetic, the finding what quantity of the money in one place is equal to a given sum in another, according to a certain course of exchange.

EXCHEQ'UER (*échiquier: Fr.*), in British Jurisprudence, an ancient court of record, in which all causes concerning the revenues and rights of the crown were heard and determined, and where the crown revenues were received. It took its name from the cloth that covered the table, which was parti-coloured or chequered. This court is said to have been established by William the Conqueror. In its modern form, it is a combination of several distinct ancient courts. It acquired concurrent jurisdiction with the other two superior courts, in all personal actions, by the fiction of the complaining party being debtor to the king—a fiction now obsolete. It has exclusive jurisdiction in cases in which the king's revenue is concerned. It had also an equitable jurisdiction, exclusive with respect to matters connected with the revenue, concurrent with the Court of Chancery in civil suits and in tithes, but all its power and jurisdiction as a court of equity has been transferred to the Court of Chancery, and it is now only a court of revenue and of common law. Its chief, and four Puisne or younger judges, are termed barons.

EXCHEQ'UER-BILLS, bills for money, or promissory notes, issued from the exchequer under the authority of government, and bearing interest, generally from 1½*d.* to 2*d* per day, per 100*l.* Advances made by the bank to government are made on exchequer bills.

EXCI'SE (*Fr.*), an inland duty, paid in some instances upon the commodity consumed, or on the retail, which is the last stage before consumption; but paid in others at the manufactories. The excise was first introduced by the parliament which beheaded Charles I., its founder being Pym; and it is now one of the most considerable branches of the national revenue. It was formerly farmed out, but is at present managed for the government by commissioners, who receive the whole produce of the excise and pay it into the exchequer.

EXCIS'ION (*excisio: Lat.*), in Surgery, a cutting out or cutting off any part of the body.

EXCITABIL'ITY (*excito*, I stimulate: *Lat.*), susceptibility of increased vital action by the force of stimulants.

EXCLAMA'TION (*exclamatio: Lat.*), emphatical utterance, or the sign by which emphatical utterance is marked: thus (!). ——In Grammar, a word expressing wonder, fear, &c.

EXCOMMUNICA'TION (*excommunicatio: Lat.*), an ecclesiastical censure, by which a person is excluded from communion with the church, and deprived of some civil rights. In the Church of England, the practice of excommunication has long been obsolete. Roman Catholics say that an excommunication is *fulminated* (*fulmen*, lightning: *Lat.*), to signify the solemn pronouncing of it after several admonitions, and to indicate what they believe to be its awful character. This fulmination principally consists in curses and execrations. ——EXCOMMUNICATION, amongst the Jews, was of three kinds or degrees. The first was called *Niddui*, and was a separation for a few days. The second was *Cherem*, a separation attended with execration and malediction; the third was *Shammatha*, and was the last and most solemn.——EXCOMMUNICATION, amongst the Greeks and Romans, excluded the person on whom it was pronounced from the sacrifices and temples, and delivered him over to the *Furies*

EXCRES'CENCE (*excresco*, I grow out of: *Lat.*), in Surgery, a tumour which arises upon the skin, either in the form of a wart or tubercle.

EXCRE'TION (*excretus*, sifted out: *Lat.*), in Medicine, a separation of some fluid mixed with the blood, by means of the glands. The term is applied also to the discharges from the bowels, which are called *alvine excretions*.

EX'EAT (let him go out: *Lat.*), in Ecclesiastical History, a term expressing the permission which a bishop grants to a priest to go out of his diocese, for the purpose of receiving an ecclesiastical appointment in another.

EXECU'TION (*executio: Lat.*), in Law, the completing or finishing some act, as the signing, sealing, and delivering a written deed. Also, the carrying into effect a sentence or judgment of court.

EXEC'UTIVE (*exequor*, I accomplish, literally I follow to the end: *Lat.*), in Politics, that branch of the government which executes the functions of governing the state. The word is used in distinction from *legislative* and *judicial*. The body that deliberates and enacts laws is *legislative*; the body that judges or applies the laws to particular cases is *judicial*; and the body that carries the laws into effect, or superintends their enforcement, is *executive*. In all monarchical states the executive power vests in the prince.

EXEC'UTOR (from same), in Law, a person appointed by any one in his last will and testament to have the execution of it after his decease, and the disposing of his goods and effects according to the intent of the will.

EXEC'UTORY (from same), in Law, signifies that which is to take effect on a future contingency; as an *executory* devise or remainder.

EX'EDRA or EXHE'DRA (*Gr.*: from *ek*, provided with; and *hedra*, a chair), in Antiquity, a covered walk or space in front of a house; also, a hall, in baths and other buildings, appropriated to conversation.——A general name for such buildings as were distinct from the main body of the churches, and yet within the limits of the consecrated ground.

EXEGE'SIS (*exēgēsis*, an explanation: *Gr.*), a discourse intended to explain or illustrate a subject, particularly the sacred Scriptures

EXEM'PLAR (*Lat.*), a pattern or model: the ideal model which an artist endeavours to imitate.

EXEQUA'TUR (let it be carried out: *Lat.*), an official recognition of a person as consul or commercial agent, authorizing him to exercise his powers.

EXER'GUE (*Fr.*), a term used by medallists to denote the small space around, and without, the work or figures of a medal, for an inscription, &c.

EXHAUS'TION (*exhaustus*, emptied: *Lat.*), in Mathematics, a method of proving the equality of two magnitudes, by showing that their difference is less than any assignable magnitude. As the ancients admitted no demonstrations which were not strictly rigorous, they did not consider curves as polygons with an infinite number of sides; but they regarded them as the fixed terms or limits to which the inscribed and circumscribed polygons continually approach, and approach the nearer as the number of their sides is increased. They exhausted, as it were, the space between the polygons and the curves.—— In Pneumatics, the amount of rarefaction produced by the air-pump.

EXHEREDA'TION (*exhæredatio: Lat.*), in the Civil Law, the excluding a child from inheriting any part of his father's estate.

EXHIB'IT (*exhibitum*, something shown: *Lat.*), any paper produced or presented to a court, or to auditors, referees, or arbitrators, as a voucher, &c.——In Chancery, a deed or writing produced in court and sworn to, or referred to in an affidavit sworn out of court. A certificate of identity is indorsed on it by the examiner or commissioner.

EXHIBI'TION (*exhibitio: Lat.*), a public display of whatever is interesting, either in nature or art. Also, a fund settled for the benefit of scholars in the universities, who are not on the foundation. The person receiving this is called an *exhibitioner*.——

EXHIBITION was anciently an allowance for meat and drink, such as the religious appropriators made to the poor depending vicar.——Medical men speak of the exhibition, that is, the administering of such or such a medicine.

EX'IGENT (they shall demand: *Lat.*), in Law, a writ or part of the process of outlawry. The *exigent* or *exigi facias* requires the defendant to be summoned by proclamation, in five county courts successively, to deliver himself up; and if he does not, he is outlawed.

EX'ILE (*exilium: Lat.*), a state of banishment or expulsion from one's country by authority.

EXIS'TENCE (*existo*, I am: *Lat.*), the state of being, or having an actual essence. Locke says that we arrive at the knowledge of our own existence by intuition; of the existence of God, by demonstration; and of other things, by sensation.

EX'IT (he goes away: *Lat.*), a departure; a term used to denote the action of quitting the stage by a player after he has performed his part.

EXOCŒ'TUS (*Lat.*), in Ichthyology, a genus of flying-fishes. The *Exocœtus exiliens*, or the Mediterranean flying fish, is about fourteen inches in length, and found principally in the Mediterranean and the Atlantic, frequently alone, and sometimes in small shoals. By the extraordinary length of its pectoral fins it is enabled to quit the water and continue flying, about three feet above the surface, for the distance of 80 or 100 yards. These fishes are persecuted by the dolphin under the water, and by the gull or the albatross above its surface, and thus often escape destruction by the one only to incur it from the other.

EX'ODUS (*exodos*, a going out: *Gr.*), a canonical book of the Old Testament, being the second of the Pentateuch or five books of Moses. It contains a history of the departure of the children of Israel from Egypt, whence the name.

EX-OFFI'CIO (on account of his office: *Lat.*), in Law, the power a person has, by virtue of his office, to do certain acts without special authority.——EX-OFFICIO INFORMATIONS are prosecutions commenced on behalf of the Crown by one of the law officers.

EXO'GENOUS (*exō*, on the outside; and *ginomai*, I am produced: *Gr.*), a Botanical term applied to plants which increase by successive external additions of their wood in contradistinction from *endogenous*. All dicotyledonous plants are exogenous. The stems of exogenous trees, for example, the oak, beech, and elm, have distinct cellular and vascular systems. To the former belong the outer bark, the pith, and the medullary rays; to the latter, the inner bark, the woody layers and the medullary sheath.

EXOM'PHALOS (*ex*, away from; and *omphalos*, the navel: *Gr.*), in Surgery, a rupture of the navel.

EX'ORCISM (*exorkismos: Gr.*), the expulsion of evil spirits from persons or places, by certain adjurations and ceremonies. Exorcism makes a considerable part of the ritual of the church of Rome, which prohibits the exorcising any person except with the bishop's leave, or through the ministration of one who has been ordained *exorcist*.

EX'ORCIST (*exorkistēs: Gr.*), one who professes to cast out evil spirits by prayers or incantations.——A person who has received one of the four *minor orders* of the church of Rome.

EXOR'DIUM (a beginning: *Lat.*), in Rhetoric, the commencement of a speech, serving to prepare the audience for the main subject. It may be formal and deliberate, or abrupt and vehement, according to the nature of the subject and the occasion.

EX'OSMOSE (*ex*, out of; *mõ*, I seek: *Gr.*), a term denoting the passage outward from within, of fluids, through membranes, in opposition to *endosmose* (*endon*, within: *Gr.*). When fluids of different densities are placed on opposite sides of a membrane, whether animal or vegetable, a certain portion of each will pass through in opposite directions. This process is of universal occurrence in living plants.

EXOS'TOSIS (*ex*, away from; and *osteon*, a bone: *Gr.*), in Surgery, a morbid excrescence on a bone, whether attended with an erosion or not.

EXOS'TRA (*exōstra: Gr.*), in Antiquity, a bridge thrust out of a turret on the walls of a town, by which the besiegers gained an entrance into it.——Also, in the ancient drama, a machine for representing the interior of a building, where the parts supposed to occur in privacy were recited.

EXOT'ERIC. [See ESOTERIC.]

EXOT'IC (*exōtikos: Gr.*), an appellation for the produce of foreign countries.

EXPAN'SION (*expansio: Lat.*), in Natural Philosophy, enlargement or increase of bulk. It is one of the most general effects of heat which produces it in all bodies, whether solid or fluid, or in an aeriform state. Some bodies expand as they grow cold, thus water in the act of freezing; but they form no exceptions to the general rule: since the effect is due to a peculiar arrangement of their particles during crystallization, and is not a regular and gradual expansion, like that which occurs by means of heat. Several of the metals expand, in passing from a fluid to a solid state. The degree of expansion produced by heat, in different liquids, varies very considerably. In general, the denser the fluid, the less the expansion: water expands more than mercury; and alcohol, which is lighter than water, expands more than water. The expansion of aeriform fluids may be exhibited by bringing a bladder, partly filled with air, and the neck closely tied, near the fire: the bladder will soon be distended, and, if the heat be strong enough, will burst.

EX-PAR'TE (from a part: *Lat.*), in Law, on one side; as *ex-parte* statement, a partial statement, or that which is made by one side only.

EXPEC'TANCY (*expecto*, I look for: *Lat.*), in Law, a state of waiting or suspense. An *estate in expectancy* is one which is to take effect or commence after the determination of another estate. Estates of this kind are *remainders* and *reversions*.

EXPECTA'TION (*expectatio: Lat.*), in the doctrine of chances, is applied to any contingent event, upon the happening of which some benefit is expected.——EXPECTATION OF LIFE, a term referring to the number of years which, according to the data afforded by statistical tables, persons at any age may be expected to live.

EXPEC'TORANTS (*expectoro*, I expectorate: *Lat.*), those medicines which promote expectoration, or a discharge of mucus from the trachea and respiratory organs.

EXPER'IMENT (*experimentum: Lat.*), an act or operation designed to discover some unknown truth, principle, or effect.——In Chemistry, a trial of the results of certain combinations of bodies, in order to discover something of their laws.

EXPERIMEN'TAL PHILOS'OPHY (same *deriv.*), those branches of science, the deductions in which are founded on experiment, as contrasted with the moral, mathematical, and speculative departments of knowledge. The principal experimental science is Chemistry; but there are many others, as Optics, Pneumatics, Hydrostatics, Electricity, Magnetism, &c.

EXPERIMEN'TUM CRU'CIS (the experiment of the cross: *Lat.*). [See CRUCIAL.]

EXPIA'TION (*expiatio*, an atonement: *Lat.*), a religious ceremony, by which satisfaction is made for sins of omission or commission, accidental or intentional. The chief mode of expiation among the Jews and pagans was by sacrifice.——EXPIATION is applied by divines to the pardon procured for sin by the obedience and death of Christ.

EXPIRA'TION (*expiratio: Lat.*), in Animal Physiology, that part of respiration which consists in expelling the air out of the lungs.

EXPLO'SION (*explosio: Lat.*), in Natural Philosophy, a sudden and violent expansion of an aerial or other elastic fluid, by which it instantly overcomes any obstacle that happens to be in the way, sometimes with incredible force, and in such a manner as to produce the most astonishing effects. For example, gunpowder explodes on the application of heat, by the sudden conversion of a solid into gases. It differs from mere expansion, by being sudden and violent, while the latter acts gradually and uniformly for some time.

EXPO'NENT (*expono*, I exhibit: *Lat.*), in Algebra, the literal or numerical quantity which, placed above a root at the right hand, denotes how many multiplications are necessary to produce the power. It is a mere abbreviation:—thus, a^4 is a short way of expressing $a \times a \times a \times a$, or *aaaa*.

EXPONEN'TIAL (same *deriv.*), that which relates to exponents. Thus, an *exponential curve* is a curve defined by an exponential equation, such as [illegible]

EXPOS'ITOR (*Lat.*), one who explains the writings of others; the term is applied particularly to those who profess to expound the Scriptures.

EX POST FAC'TO (from something done afterwards: *Lat.*). An *ex post facto* law is one which operates upon a su liable to it at the time it was ma

EXPOSTULA'TION (*expostula* in Rhetoric, a warm address to who has done another some inju senting the wrong in the strong and demanding reparation.

EXPRESS' (*exprès: Fr.*), a me courier sent to communicate in of an important event, or to d portant despatches.

EXPRESS'ED OILS (*exprimo*, out: *Lat.*), in Chemistry, such procured from any substance pressure, as the oil of almonds, &

EXPRES'SION (*expressio: Lat.*) ing, the distinct and natural exh character or of sentiment in the i represented. The term expressi quently confounded with pass they differ in this: that *expres* general term, implying a represe an object agreeably to its natur racter, and the use or office it is t the work; whereas *passion*, in denotes a motion of the body, acc with certain indications of stro portrayed in the countenance; so that every passion is an expression, but not every expression a passion.——EXPRESSION, in Rhetoric, the elocution, diction, or choice of words, suited to the subject and sentiment.——In Music, the tone and manner which give life and reality to ideas and sentiments.

EXPROPRIA'TION (*ex*, from; and *proprius*, one's own: *Lat.*), the surrender of a claim to exclusive property.

EXPUI'TION (*expuitio*, a spitting out: *Lat.*), in Medicine, a discharge of saliva by spitting.

EXPUR'GATORY (*expurgatio*, a cleansing: *Lat.*), serving to purify from anything considered noxious or erroneous; as, the *expurgatory* index of the Roman Catholics. This is a catalogue of the books prohibited to be read; it is very comprehensive, and includes all works on religious subjects written by heretics, all works written on any subjects by heresiarchs, and many works seemingly having but little connection with religious matters. It is particularly strict in the prohibition of the *Bible* in *vernacular* tongues. The reader of books placed on this *Index* incurs serious ecclesiastical penalties and censures by the *very fact*. It is published annually at Rome.

EXSAN'GUIOUS (*exsanguis*, bloodless: *Lat.*), an epithet for animals which are destitute of red blood.

EXSICCA'TION (*exsicco*, I dry up: *Lat.*), the act of drying, or the evaporation of moisture.

EXSTIP'ULATE (*ex*, from; and *stipula*, a husk: *Lat.*), in Botany, an epithet for plants which have no stipules.

EXSUDA'TION (*exsudo*, I perspire: *Lat.*), in Medicine, a discharge of humours or moisture from animal bodies, by sweat or through the pores.

EX'TANT (*extans*, existing: *Lat.*), an epithet for anything which still subsists or is in being; thus we say, a part only of the writings of Cicero is *extant*.

EXTEM'PORE (on the emergency: *Lat.*), without previous study or meditation. Though an adverb, it is often unnecessarily and improperly used as an adjective; as, an *extempore* sermon, instead of an *extemporary* or *extemporaneous* sermon, &c.——To *extemporize* well requires a ready mind well furnished with knowledge.

EXTEN'SION (*extensio*, a stretching out: *Lat.*), in Philosophy, one of the common and essential properties of matter, or that by which it occupies some part of universal space.

EXTEN'SOR (*extendo*, I stretch out: *Lat.*), in Anatomy, an appellation given to several muscles, from their extending or stretching the parts to which they belong.

EXTENT', in Law, a writ of execution, sometimes called an *extendi facias* (you shall cause to be appraised at their full or extended value), directed to the sheriff, against the body, lands, and goods, or the lands only of a debtor. It is either extent *in chief*, or extent *in aid*. The former is a proceeding for the king to recover his own debt; the latter, a proceeding for recovering the debt due to a crown debtor, and in this the crown is the nominal plaintiff, on the ground that it is entitled to the debts due to the debtor.

EXTENUA'TION (*extenuatio*, a diminishing: *Lat.*), the act of representing anything less faulty or criminal than it is in fact; it is opposed to *aggravation*.

EXTIN'GUISHMENT (*extinguo*, I quench: *Lat.*), in Law, the annihilation of an estate, &c., by means of its being merged in or consolidated with another. Thus, a term of years is extinguished when the lessee acquires the legal reversion.

EX'TRA, a Latin preposition, denoting beyond or excess: as, *extra-work*, *extra-pay*, &c. It serves as a prefix to numerous English words.

EX'TRACT (*extractus*, drawn out: *Lat.*), in Pharmaceutical Chemistry, the purer or more active parts of any substance extracted from its inert and grosser parts by means of decoction, and formerly also by distillation, until they were of the consistence of paste.——EXTRACTIVE PRINCIPLE, a peculiar principle, supposed to form the basis of all vegetable *extracts*.

EXTRAC'TION OF ROOTS (same *deriv.*), in Algebra and Arithmetic, an operation by which the *root* of a given quantity is found; that is, a quantity which, raised to the power indicated by the *exponent* of the root, would produce the given quantity. Thus, a is the cube root of a^3, since a raised to the cube would be a^3.

EXTRAVAGAN'ZA (*Ital.*), in Music, a kind of composition remarkable for its wildness and incoherence.——Irregular dramatic pieces, generally of the burlesque cast, are also sometimes called *extravaganzas*.

EXTRAVASA'TION (*extra*, on the outside; and *vas*, a vessel: *Lat.*), a term applied to fluids when out of their proper vessels. Thus, when blood is thrown out on the brain, it is said to be *extravasated*.

EXTRE'ME (*extremus*, the last: *Lat.*), in Logic, the same as *term*. In a syllogism, the extremes are the terms of the conclusion: the *major* or greater extreme being that found in the major proposition, and the *minor*, or less extreme, that found in the minor proposition. Thus, in 'Man is an animal: Henry is a man, therefore Henry is an animal;' the word *animal* is the greater extreme, *Henry* the less extreme, and *man* the medium. The subject and predicate are the extremes of a proposition, the copula being placed between them.——In Mathematics, the *extremes* are the first and last terms of a proportion or series.

EXTRE'ME UNC'TION, one of the seven sacraments of the Roman Catholic church. It consists in the anointing various parts of the body, and the recitation of certain prayers; and is supposed to cleanse from sins not expiated by other means. It derives its name from the fact, that it is not administered unless there is some reason to believe that the recipient is near death. It is intended only for such as are in danger of death from *sickness*; and, therefore, is never received by those who are condemned to death juridically, or who are about to embark in any enterprise, however perilous.

EXTREM'ITY (*extremitas*: *Lat.*). In Painting and Sculpture, the *extremities* of the body are the head, hands, and feet.——In Anatomy, this term is applied to the limbs, as distinguishing them from the other divisions of the animal, the head and trunk.

EXU'VIÆ (*Lat.*), in Natural History, the cast skins, shells, or coverings of animals.

EY'AS (*niais*, simple: *Fr.*), in Falconry, a young hawk just taken from the nest, not able to procure its own food. It is a contraction of *faucon niais*.

EYE (*eag*: *Sax.*), in Anatomy, the organ of sight amongst mammals. It consists of many parts. The outermost membrane of the ball of the eye is called the *sclerotic* (*skleroo*, I harden: *Gr.*), and to this the muscles that move the eye are attached. Its internal surface is lined by the *choroid* (so called from a fancied resemblance to another membrane, termed *chorion*: *Gr.*), and this is continuous with the *iris*, a movable curtain floating in the aqueous humour, with a rounded opening at its middle, known as the pupil. This opening is continually varying when the eyelids are separated, according to the quantity of light. When the light is strong the pupil is made smaller; when the light is less abundant, it is enlarged. The *crystalline lens* is a pellucid body, enclosed in a delicate *capsule*, and placed in the concave depression of the front of the *vitreous humour*, a transparent and pellucid pulpy matter, filling the ball of the eye behind the lens, and covered externally by the *hyaloid* or *arachnoid* membrane. The *optic nerve* enters the back of the eyeball by a perforation in the sclerotic and choroid coats, and is spread on the posterior and interior surface of the latter, forming a nervous expansion, termed the *retina*. The eye is moved by six muscles. In speaking of the mechanism of the organ of vision, we may not improperly liken it to a natural camera obscura, provided with a ens, which, at the back of the eye, forms a icture on the retina. When the lens is oo convex, the picture falls short of the erve, and the person is short-sighted: hen the picture tends to form beyond the erve, owing to the lens not being sufficiently convex, then the person is longighted. In the first case, a concave glass s required, and in the latter a convex, as in ged persons. The principal *appendages* of he eye are the *eyelids*, with their *ciliæ* or eyeashes; the *lachrymal glands*, which secrete he tears; the *tunica conjunctiva*, a thin transarent membrane, which lines the posterior urface of the eyelids and the front part of he eyeball. Its outer surface is always noist. The small red tubercle at the inner ngle of the eyelids is called the *caruncula achrymalis*, in front and without which are the apertures known as *puncta lachrymalia*, one situate on each lid opposite the other. These are the external openings of the *lachrymal ducts*, along which the tears travel from the *lachrymal sac*, a membranous bag, situate at the inner angle of the orbit——**Eye**, in Architecture, any round window made in a pediment, an attic, the reins of a vault, &c.——**Eye**, in Gardening, a small bud or shoot, inserted into a tree, by way of graft.——**Eye** of a volute, the centre of the volute, or that point in which the helix or spiral of which it is formed commences.——**Eye** of an anchor, the hole by which the ring of the anchor is put into the shank.——**Eyes** of a ship, the parts which lie near the hawseholes, particularly in the lower compartments.——**Eye** of a dome, an aperture in the top of a dome, as that of the Pantheon in Rome, or of St. Paul's in London; it is usually covered with a lantern.

EY'EBOLT, in ships, a bar or bolt of iron, with an eye, formed to be driven into the deck or sides, for the purpose of hooking tackle to.

EY'EBRIGHT, the common name of an English wild plant, belonging to the genus *Euphrasia*, nat. ord. *Scrophulariaceæ*. It was at one time supposed to be efficacious in diseases of the eye.

EYE'-PIECE, the lens or combination of lenses, placed next the eye, in telescopes and microscopes.

EY'E-SERVICE, service performed only while under the inspection of an employer.

EYRE (*Fr.;* from *itinere*, on a journey: *Lat.*), an old law term applied to judges when travelling through the country to administer justice. They were then called justices in eyre.

EY'RIE, or **EY'RY** (*ey*, an egg: *Teut.*), the nest of a bird of prey.

F

F, the sixth letter of the English and Latin alphabets, is a labio-dental aspirate, formed by placing the upper teeth on the under lip, while emitting the breath. Its kindred letter is *v*, which is distinguished from it chiefly by being more vocal. The Romans borrowed the *digamma* or Ϝ of the Greeks, and used it inverted for some time; thus, Ⅎ, for V consonant, as DIℲI for DIVI. Some have supposed that this was done first by Claudius; but many inscriptions belonging to periods much anterior to his time exhibit this singular use of the letter. As an abbreviation on medals, monuments, &c., F. stands for *Fabius*, *Furius*, *Felix*, *Faustus*, &c.—With merchants, it signifies *folio* (page). F, in medical prescriptions and on documents, is often used for *fiat* (let it be made or done). It also stands for *Fellow*, as F.A.S. *Fraternitatis Antiquariorum Socius* (Fellow of the Antiquarian Society). F, as a numeral, with the Romans, signified 40; and with a dash over it, 40,000.——In Music, *f.* over a line means *forte; ff. fortissimo* or *molto forte;* and F is the nominal of the fourth note in the natural diatonic scale of C.

FA, in Music, one of the syllables invented by Guido Aretino, to mark the fourth note (F) of the modern scale, which rises thus: *ut* (*do*), *re*, *mi*, *fa*, &c.

FA'BIAN, an epithet signifying that line of military tactics which declines the risking of a battle in the open field, but seeks every opportunity of harassing the enemy by countermarches, ambuscades, &c. It is so called from Q. Fabius Maximus, the Roman general opposed to Hannibal.

FA'BLE (*fabula: Lat.*), a short fictitious narration, forming a didactic allegory. Fables are congenial with an undeveloped stage of thought; they pleased the man of early times and the children of modern days. Jotham's fable of the trees is the oldest that is extant. Nathan's fable of the poor man is next in antiquity. We find Æsop in the most distant ages of Greece; and in the early days of the Roman commonwealth, we read of a mutiny appeased by the fable of the belly and the members. ——**Fable**, the plot of an epic or dramatic poem: this, according to Aristotle, is the principal part, and, as it were, the soul of the entire poem.

FAB'ULOUS AGE (*fabulosus*, from *fabula*, a fictitious narrative: *Lat.*), that period in the history of every nation in which supernatural events are represented to have happened. The fabulous age of Greece and Rome is called also the *heroic* age.

FAÇA'DE (*Fr.*), in Architecture, the front or face of an edifice. As, in most buildings, only one side is conspicuous, viz. that which faces the street, and usually contains the principal entrance, this has been, in a special manner, denominated the façade

FACE (*Fr.*), in Geometry, one of the plane surfaces of a polyhedron.——In Fortification, a line of rampart, or the extent between the two outermost points of two adjacent bastions.

FA'CETS (*facettes: Fr.*), small faces or planes in brilliant and rose diamonds.

FA'CIAL LINE or AN'GLE. These terms are used in describing the conformation that exists in the bones of the face A small angle indicates projecting jaws, a high angle, that the forehead overhangs the jaws. Suppose a straight line drawn at the base of the skull from the great occipital cavity across the external orifice of the ear to the bottom of the nose. If we draw another straight line from the bottom of the nose, or from the roots of the upper incisor teeth, to the forehead, then both lines will form an angle, which will be more acute in brutes, the less the shape of their face resembles that of men. In apes, this angle is only from 45° to 60°; in the orang-outang, 63°; in the skull of a negro, about 70°; in a European, from 75° to 85°. In Grecian statues, this angle ordinarily amounts to 90°, that is a right angle.

FA'CIES HIPPOCRAT'ICA (Hippocratic face: *Lat.*), in Medicine, that deathlike appearance which consists in the nostrils being sharp, the eyes hollow, the temples low, the tips of the ears contracted, the forehead dry and wrinkled, and the complexion pale or livid. It is so called from Hippocrates, by whom it has been so correctly described in his *Prognostics*.

FAC-SIM'ILE (*facere*, to make; and *simile*, like: *Lat.*), an imitation of an original in all its traits and peculiarities.

FAC'TION (*factio: Lat.*), in Antiquity, one of the troops or companies of combatants in games of the circus. They were four in number; the green, blue, red, and white, to which the purple and yellow were added by Domitian.——FACTION, in modern times, a party in political society, combined or acting in union, in opposition to the government. The term is usually, but not necessarily, applied to a minority, and is now employed in an opprobrious sense.

FACTI'TIOUS (*factitius*, artificial: *Lat.*), in Chemistry, &c., any epithet for what is made by art, in distinction from what is produced by nature; as, *factitious* cinnabar

FAC'TOR (a maker: *Lat.*—he is a maker of bargains), in Commerce, an agent employed to dispose of goods, consigned or delivered to him by or for a principal, and paid by a commission He may buy or sell for his principal in his own name, whilst a broker must always name his principal. He is entrusted with the possession, control, and disposal of the goods. He has a special property in them, and a lien on them for what may be owing to him. He may pledge the goods for advances, made on account of the principal, or for advances to himself as far as his lien extends. A factor is liable criminally for pledging goods for his own benefit in violation of good faith. A buyer or pawnee without notice is protected in his dealings with a factor, who has possession of bills of lading, warrants, &c., and his *bonâ fide* contracts are valid.

FAC'TORY (*factura*, a making: *Lat.*), an establishment supplied with machinery for the purpose of carrying on any branch of manufacture. Until 1802, no statutes existed regarding the employment of children in mills or factories. In 1833, inspectors of factories were appointed; and it was prohibited by law to employ any young person or female under eighteen years of age in any factory, before six in the morning or after six in the afternoon, or on Saturdays after two in the afternoon; and all young persons under thirteen years of age are bound to attend school during some period of the day.

FAC'ULÆ (*facula*, a little torch: *Lat.*), in Astronomy, a name given to certain bright spots in the sun.

FAC'ULTY (*facultas: Lat.*), a term used to denote the powers or capacities of the human mind, viz. understanding, will, memory, imagination, &c. If it be a power exerted by the body alone, it is called a *corporeal* or animal faculty; if it belong to the mind, it is called a *rational* faculty; and it may further be distinguished into a *natural* faculty, or that by which the body is nourished, and a *vital*, or that by which life is preserved, &c.——FACULTY, a term applied to the different departments of a university, divided according to the arts and sciences taught there. In most universities there are four faculties: of arts, including humanity and philosophy; of theology; of physic; and of civil law The degrees in the several faculties of our universities are those of bachelor, master, and doctor ——FACULTY, in Law, a privilege granted to a person, by favour and indulgence, of doing that which, by the strict letter of the law, he ought not to do.——FACULTY OF ADVOCATES, a term applied to the college or society of advocates in Scotland, who plead in all actions before the court of session, justiciary, and exchequer. Their elective president is termed *Dean of Faculty*.

FÆ'CES (*Lat.*), in Chemistry, dregs, impurities, or sediment that settles at the bottom after distillation, fermentation, &c

FA'GUS (*Lat.*), in Botany, a genus of plants, nat. ord. *Corylaceæ*, including the common beech tree *F. sylvatica*, which rises to the height of sixty or seventy feet. Its flowers are produced in globular catkins, and are succeeded by angular fruit called *mast*, which, like acorns, serves as food for swine. Its bark has a peculiar silvery appearance, which, added to the gracefulness of its growth and the elegance of its foliage renders it a beautiful object in forest scenery. Its wood is much employed in turnery and for chairs.

FAHL'ERZ, in Mineralogy, grey copper ore; sometimes called tetrahedral copper pyrites.

FAH'LUNITE (because found at *Fahlun*), in Mineralogy, a sub-species of octahedral *Corundum*. It is a hydrated silicate of alumina.

FAI'ENCE, or IMITATION PORCELAIN, a kind of pottery, superior to the common sorts in its glazing, beauty of form, and richness of painting. It derived its name from the town of Faenza, in Romagna, where it is said to have been invented in 1299. It reached its highest perfection in the 16th century; and some pieces which were painted by the great artists of the period are highly valued as monuments of early art.

FAINTS (*faner*, to fade away: *Fr.*), in the distillation of whiskey, the weak spirituous liquor that runs off first and last from the still. This crude spirit is much impregnated with fœtid essential oil, and is therefore very unwholesome.

FAIR (*feriæ*, holidays: *Lat.*), a kind of market, on an extensive scale, granted to a town, by privilege, for the more speedy and commodious providing of such things as the place stands in need of. The most important fairs now held are probably those of Germany; and particularly of Leipsic, where books form so important a branch of commerce. But neither at home nor abroad can they have the importance they formerly had, because the communication between different places is now so easy, that merchandise may be readily obtained direct from the locality in which it is produced or manufactured. At all fairs held within ten miles of Temple Bar, business and amusements of every kind must cease at 11 o'clock in the evening, and not recommence before 6 o'clock in the morning.

FAI'RY (*ferhth: Sax.*), an imaginary spirit or being. Fairies were supposed to assume a human form, though they were of an extremely diminutive size; to be distinguished by a variety of fantastical actions, good or bad; and always to exercise a magic power over mortals. In an age of ignorance, the imagination easily substitutes a poetical mythology in the place of natural causes. The *Fata* of the Italians, whence the French derived the word *fée*, is not identical with our fairy; being a kind of prophetess. The Italians, as well as the Arabians, had stories of a country inhabited by fairies.——FAIRY RING or CIRCLE, a phenomenon frequently seen in the fields, consisting of a bare, and seemingly beaten track, round a circular space, covered with grass, and formerly ascribed to the dances of the fairies. It has been supposed by some, that these rings are the effect of lightning; but a more rational theory ascribes them to a kind of fungus, which grows in a circle from the centre outwards, destroying the grass as it extends. The interior of the circle, being enriched by the decayed roots of the fungi, is soon covered again with verdure.

FAKIR' or FAQUIR' (poor: *Arab.*), a devotee, or Indian monk. The fakirs are a kind of fanatics in the East Indies, who retire from the world and give themselves up to contemplation. Their great aim is to gain the veneration of the world by their absurd and cruel penances, outdoing even the mortifications and severities of the ancient anchorets. Some of them mangle their bodies with scourges and knives; others never lie down; and others remain all their lives in one posture. Some classes of them, however, avoid these absurdities.

FALCA'DE (*falx*, a sickle: *Lat.*, from the form assumed by the horse's legs), in Horsemanship, the act by which the horse throws himself upon his haunches; as in very quick curvets.

FAL'CATED (*falcatus*, scythe-shaped: *Lat.*), an epithet for anything in the form of a sickle: thus, the moon is said to be *falcated* when she appears horned.

FAL'CHION (*fauchon: Fr.*; from *falx*, a sickle: *Lat.*), a kind of sword, having its extremity turned up somewhat like a hook.

FAL'CIFORM PRO'CESS (*falx*, a sickle; and *forma*, a form: *Lat.*), in Anatomy, a process of the *dura mater*, in the form of a sickle. It separates the two hemispheres of the brain.

FAL'CO (a falcon, from *falx*, a sickle: *Lat.*, on account of the shape of its bill), in Ornithology, a genus of ancipitrine diurnal birds. They are characterized by a powerful beak, generally armed with a kind of tooth on each side, near the apex; their wings are strong, long, and pointed; and they are remarkable for courage and activity. The superciliary arch projects above the eye, giving them a bold and threatening physiognomy. Most of them subsist on living prey. Their first plumage differs from that of maturity, which is not acquired before the third or fourth year; but so rapid is the growth of the true falcons, that in three months the young equal the old ones in size. The female is generally one-third larger than the male. There are several species in the British Isles, the best known of which are the Gyr falcon (*F. Islandicus*), the Peregrine falcon (*F. peregrinus*), the Hobby (*F. subbuteo*), the Merlin (*F. æsalon*), and the Kestrel (*F. tinnunculus*).——In Heraldry, the falcon is usually represented on coats of arms with bells on its legs, and also decorated with a hood, virols, rings, &c.

FALCONET' (*falconette*, literally a small falcon: *Fr.*), a small cannon, or piece of ordnance used in former times.

FAL'CONRY (*falco*, a falcon: *Lat.*), the art of training all kinds of hawks, but more especially the *Falco peregrinus*, called the *gentle falcon*, for the sport of hawking. This was much practised in Europe and Asia in the chivalric ages, and continued a favourite amusement till the 17th century; but the invention of firearms gradually superseded it. 'In the language of Falconry,' says Yarrell, 'the female peregrine is exclusively called the Falcon, and on account of her greater size, power, and courage, is usually flown at herons and ducks. The male peregrine being sometimes one-third less than the female, is called the tiercel or tiercelet, and is more frequently flown at partridges and sometimes at magpies.' In France, England, and Germany, falconry was at one time in such high esteem, that during the reign of Francis I. of France, his grand falconer received a salary of 4,000 livres a year, had under him fifteen noblemen and fifty falconers, and enjoyed the privilege of hawking through the whole kingdom at pleasure. His entire establishment, which cost annually about 40,000 livres, attended the king wherever he went, and those who were distinguished for their skill in the sport were loaded with royal favours. In England, also, falconry was greatly valued as a recreation; and there is to this day an hereditary grand falconer (the Duke of St. Alban's), who, by virtue of his office, presents the sovereign with a cast of falcons on the day of the coronation. A similar service is performed by the person who represents the Stanley family, in the Isle of Man.

FAL'DAGE (*faldagium: Mod. Lat.*; from *fald*, a fold: *Sax.*), a privilege which certain lords anciently reserved to themselves of setting up folds for sheep in any fields within their manors, the better to manure them.

FAL'LACY (*fallacia*, deceit: *Lat.*), a logical artifice, or an argument framed so as to deceive; a sophism. The word is now frequently employed erroneously to signify a simple mistake.

FALL'ING SICK'NESS. [See EPILEPSY.]

FALL'ING STARS. [See AEROLITES.]

FALLO'PIAN TUBES, in Anatomy, two canals or ducts arising in the womb and terminating in the ovarium. They received their name from Gabriel Fallopius, a celebrated Italian anatomist and physician of the 16th century, who is said to have first ascertained their office.

FAL'LOW (*falewe*, pale yellow: *Sax.*), a term applied to land which is left uncultivated for one or more years. *A naked* fallow is one in which the soil remains a whole year without any kind of crop. A *turnip* or *green crop* fallow is one in which the land is left idle from harvest till the beginning of summer, and is then sown with turnips, or similar crops, in rows. Fallowing was practised by the Romans, and it was very common among ourselves until the middle of the last century. But where a proper rotation is adopted, fallowing is unnecessary, except in strong clays; and probably not even in these, if they are properly drained.

FAL'LOW-DEER (same *deriv.*), the *Dama vulgaris* of zoologists. It has a brownish bay colour with pale spots. Its horns are broad and palmated: their extremities point a little forward, and are branched on the hinder sides; unlike the stag, every branch of whose horn is shaped like the stem that supports it, the fallow-deer has two sharp and slender brow antlers, and above them two small slender branches. These horns are made into knife-handles, and similar articles. This animal usually forms one of the ornaments of English parks. Persia is its native country.

FALSE CA'DENCE (*falsus*, false: *Lat.*), in Music, one in which the bass rises a tone or semitone, instead of rising a fourth or falling a fifth.

FALSE KEEL, the timber added below the main keel, both as a defence and as a means of making the ship hold a better wind.

FALSE ROOF, in Carpentry, that part of a house which is between the roof and the covering.

FALSET'TO (*Ital.*), in Music, that species of voice in a man, the compass of which lies above his natural voice.

FAMILIAR SPIRITS (*familiaris*, familiar: *Lat.*), demons, or evil spirits, supposed to be continually within call, and at the service of their masters; sometimes under an assumed shape, sometimes compelled by magical skill, and sometimes doing voluntary service. In Eastern stories, nothing is more common than the mention of magic gems, rings, &c., to which are attached genii, sometimes good, sometimes bad. The genius or *daimōn*, which Socrates and some other celebrated ancients were said to have had as companions, was a kind of *familiar*.

FAM'ILY (*familia: Lat.*), in Natural History, a tribe of animals or vegetables allied to each other by certain distinctive characteristics.——FAMILY OF CURVES, in Mathematics, a congeries of several kinds of curves, all of which are defined by the same equation, but in a different manner, according to their different orders.

FANAT'IC (*fanaticus*, from *fanum*, a temple: *Lat.*), an enthusiastic visionary person, who, in religious matters, adopts extravagant opinions. The expression was anciently given to a set of prophetic priests, who passed their time in temples (*fana*), and being often seized with a kind of enthusiasm, as if inspired by the divinity, exhibited wild and frantic gestures.

FANDAN'GO, an old Spanish dance, which proceeds gradually, from a slow and uniform, to the most lively motion. It is seldom danced but at the theatre, and in the parties of the lower classes; nor is it, in these cases, even customary to dance it with those voluptuous looks and attitudes which distinguish the true fandango. There is another species of fandango, called the *bolero*, the motions and steps of which are slow and sedate, but grow rather more lively towards the end. In these dances the time is beaten by castanets.

FANFAR'E (*Fr.*), a short, lively, loud, and warlike piece of music, composed for trumpets and kettle-drums. Also, short lively pieces, performed on hunting-horns, in the chase. From it are derived *fanfaron*, a boaster, and *fanfaronade*, boasting.

FAN-PALMS, palms with leaves like fans. [See PALM.]

FANTA'SIA (a fancy: *Ital.*), in Music, the name generally given to a species of composition, supposed to be struck off in the heat of the imagination, and in which the composer is allowed to give free range to his ideas, unconfined by the rules of science. Some limit the term to mere extemporaneous effusions, which are transitive and evanescent; differing from the *capriccio* in this—that though the latter is wild, it is the result of premeditation, and becomes permanent; whereas the *fantasia*, when finished, is thought of no more.

FARCE (*farcire*, to stuff: *Lat.*), a dramatic piece or entertainment, of a low, comic character. It was originally a droll, or petty show, exhibited by mountebanks and their buffoons in the open streets to gather the people together. It has, however, long been removed to the theatre; and instead of being performed by merry-andrews, to amuse the rabble, is acted by comedians, and has become the entertainment of a polished audience. As the aim of a farce is to promote mirth, the dialogue is not refined, nor is there any opportunity lost to excite laughter, however wild or extravagant the plot, or however ridiculous the characters. The farce is restricted to three acts, and frequently contains only two. The French *vaudeville* corresponds to the English farce.

FARI'NA (*Lat.*), the mealy albumen of cereal grains. It consists chiefly of starch.

FAR'MERS-GE'NERAL. These were persons who, under the old French monarchy, farmed the government taxes; that is, they paid a certain sum into the treasury, and then collected the taxes on their own account. In 1728 these contractors were formed into a company. Although they were at a vast expense in the collection, they made large profits. One chief cause of the Revolution was the oppressive nature of the taxes thus collected, and by that outbreak the *fermiers-généraux* were swept away.

FAR'RIERY (*ferrier*, a farrier; from *fer*, iron: *Fr.*), the art of preventing or curing the diseases of horses. This is now generally called the *veterinary* art; and the smith whose business it is to shoe horses is denominated a farrier.

FAS'CES (*Lat.*), in Roman Antiquity, bundles of rods, with an axe projecting from one end of each bundle, and carried by officers called *lictors*, before consuls and others. They were popularly believed to have been derived from the kings, and they were considered emblems of supreme power, the axe signifying the power to decapitate, and the rods the power to beat the criminal, as was usual before capital execution. The civic prætors had two fasces, proconsuls and provincial prætors six, consuls twelve, and dictators twenty-four. The consuls had all their fasces in turn.

FAS'CIA (*Ital.*), in Architecture, any flat member having a considerable breadth and but a small projecture, as the band of an architrave, larmier, &c.——In Astronomy, the bright stripes or belts observed on the discs of some planets, particularly Jupiter. ——In Anatomy, the tendinous expansions of the muscles.

FASCIC'ULITE (*fasciculus*, a bundle: *Lat.;* and *lithos*, a stone: *Gr.*), in Mineralogy, a variety of fibrous hornblende, of a fascicular structure.

FASCIC'ULUS (a bundle: *Lat.*), in Medicine, denotes a handful, or, according to some, as much as can be taken up in the arm when bent.——FASCICULUS, in Botany, a species of inflorescence similar to the corymbus, except that the expansion is centrifugal instead of centripetal.

FASCINA'TION (*fascinatio: Lat.*), the fact of being charmed, operated upon, or influenced by the look of certain persons: it is generally taken in an evil sense. A belief in fascination appears to have been very generally prevalent in most ages and countries. Until very recently, it was prevalent among the Scotch Highlanders and the inhabitants of the western islands, where the fear of the evil eye has led to various precautions against its influence; and in some remote districts it is not even yet extinct. In Turkey, when a child is born, it is immediately laid in the cradle and loaded with amulets, while the most absurd ceremonies are used to protect it from the noxious fascination of some invisible demon. Nay, the evil eye is there feared at all times, and supposed to affect persons of all ages, who, by their prosperity, may be the objects of envy. It is equally a source of terror to the lower orders at Naples.

FAS'CINES (*Fr.*), in Fortification, small branches, or bavins, bound up in bundles, and used in raising batteries, filling up moats, binding ramparts where the earth is bad, making parapets, &c.

FASH'ION-PIECES, in ships, the hindmost timbers which terminate the breadth, and form the shape of the stern.

FAS'SITE, in Mineralogy, a variety of augite, found in *Fassa*, in the Tyrol.

FAS'TI (*Lat.*), in Antiquity, the name given to the Roman calendar, in which were set down all days of feasts, pleadings, games, ceremonies, the names of public officers, and the different important matters, changeable each year. Ovid wrote a poem, describing the Roman festivals, their origin, &c., but only half of it has come down to us.

FASTS (*fasten*, to fast: *Ger.*), occasional abstinence from food, on days appointed by public authority to be observed in fasting and humiliation. Solemn fasts have been observed in all ages and nations, especially in times of mourning and affliction. The Jews, besides their stated fast days, occasionally enjoined others in the time of any public calamity. They were observed upon the second and fifth days of the week, beginning an hour before sunset, and continuing till midnight of the following day. The Jews, on these occasions, always wore *sackcloth* next their skins, rent their clothes, which were of coarse white stuff, sprinkled ashes on their heads, went barefoot, and neither washed their hands nor anointed their bodies as usual. They thronged the temple, made long and mournful prayers, and had every external appearance of humiliation and dejection. In order to render their abstinence complete, they were allowed to eat nothing at night but a little bread dipped in water, with some salt for seasoning, unless they chose some bitter herbs and pulse. In the Roman Catholic church *fasting* differs from *abstinence*, in being a refraining for a certain time from all kinds of food. The distinction was not known in ancient times.

FAT (*fett: Ger.*), oleaginous matter secreted by the blood, and deposited in the adipose tissues of animal bodies.—Fats vary in consistence, colour, and smell, according to the animals from which they are obtained: thus, they are generally fluid in the cetaceous tribes, soft and rank-flavoured in the carnivorous, solid and nearly scentless in the ruminants, usually white and copious in well-fed young animals, yellowish and more scanty in the old. Their consistence varies also according to the organ of their production, being firmer under the skin, and in the neighbourhood of the kidneys, than among the movable viscera. The animal oils and fats combine with the alkalis, and form perfect soaps. With some of the earths, and metallic oxides also, they produce saponaceous compounds; and they even facilitate the oxidation of some of the metals, as copper and mercury, by the atmospheric air. Animal fat is not homogeneous, but consists of four proximate principles, viz. stearine, margarine, oleine, and glycerine, the two former being solid, and the two latter fluid, at ordinary temperatures. The first three are compounds of carbon, hydrogen, and oxygen, with water; the last is a compound of carbon, hydrogen, and oxygen, without water. As to the applications of the fats, see CANDLES and SOAP.

FA'TALISM (*fatalis*, fatal: *Lat.*), the belief in an unchangeable destiny, to which everything is subject, or the doctrine which teaches that all events take place by an inevitable necessity.

FA'TA MORGA'NA (the fairy Morgana: *Ital.*), a singular aerial phenomenon occasionally seen in the straits of Messina. This peculiar atmospherical refraction is not, however, altogether confined to that locality, having occasionally been seen on our own coasts. It consists in the appearance in the air, over the surface of the sea, of multiplied images of the objects on the surrounding coasts. They are cases of an unusually strong *mirage*.

FATE (*fatum*: *Lat.*), destiny depending on a superior cause, and uncontrollable. According to the Stoics, every event is the result of fate. In the sense in which the moderns use the word, it implies the order or determination of Providence.

FA'THER (*vater*: *Ger.*), a term applied, in Church History, to ancient authors who have preserved in their writings the traditions of the Church. No author who wrote later than the 12th century is dignified with the title of *father*. The primitive fathers are usually considered to be: Clemens Romanus, bishop of Rome, who d. A.D. 100; Ignatius, bishop of Antioch, who d. 107; Polycarp, bishop of Smyrna, who suffered martyrdom, 167; Justinus, who suffered martyrdom at Rome; Theophilus, bishop of Antioch, who d. about 180; Irenæus, who suffered martyrdom; Clement of Alexandria, who d. about 220; Cyprian, bishop of Carthage, who suffered martyrdom about 258; Origen of Alexandria, who d. about 254; Gregory, bishop of Neo-Cæsarea, who d. about 264; Dionysius, bishop of Alexandria, who d. 265; Tertullianus, who died in the reign of Alexander Severus. In the fourth century, after Christianity had been embraced by the emperors, the following are enumerated as the fathers of the Greek or Eastern Church; Eusebius of Cæsarea, d. 340; Athanasius, bishop of Alexandria, d. 371; Basilius the Great, bishop of Cæsarea; Gregorius Nazianzenus, d. 389; Gregorius, bishop of Nyssa, d. 396; Cyril, bishop of Jerusalem, d. 386; St. John Chrysostom, patriarch of Constantinople, d. 407; Epiphanius, bishop of Salamis, d. 403; Cyril, bishop of Alexandria, d. 444; Ephraim the Syrian, d. 378. The fathers of the Latin or Western Church were Lactantius, d. 316; Hilarius, bishop of Poictiers, d. 368; Ambrose, archbishop of Milan, d. 397; Jerome, d. 420; Augustine, bishop of Hippo, d. 430.

FATH'OM (*fædm*: *Sax.*), a measure of six feet, used chiefly at sea in sounding the depth of water.

FAULT (*fautes*: *Fr.*), a term applied by miners and geologists to a fracture across a series of strata, one side of which has been elevated or depressed out of correspondence with the other side. In the Great Pennine Fault, in the north of England, there is a difference of 1000 yards in height between the beds on one side and the same beds on the other.

FAU'NA (*fauni*, rural deities: *Lat.*), a general term by which the whole of the animals of a country are designated. *Avi-fauna*, the birds of a particular country.

FAUNS (*fauni*: *Lat.*), rural deities, among the Romans, represented with horns on their heads, sharp pointed ears, and the rest of their bodies like goats. They were the mythological demi-gods of woods and forests, and hence were called *sylvan* deities.

FAUX JOUR (a false light: *Fr.*), a term used in the fine arts, and signifying that a picture is placed so that the light falls upon it in a direction differing from that in which the painter has represented the light as thrown upon the objects it represents; or that it is covered with a bright glare, so that nothing can be properly distinguished.

FAWN (*faon*, from *fauve*, fawn-coloured: *Fr.*), a young deer; a buck or doe of the first year.

FE'ALTY (*fidelitas*, faithfulness: *Lat.*), in Feudal Law, an oath taken on the admittance of any tenant, to be true to the lord of whom he held his land. Under the feudal system of tenures, every vassal or tenant was bound to be true and faithful to his lord, and to defend him against his enemies; the tenant was called a *liege man*, the land a *liege fee*, and the superior a *liege lord*.

FEASTS or FES'TIVALS (*festivitas*, a festival: *Lat.*), in a religious sense, anniversary times of feasting and thanksgiving, such as Christmas, Easter, &c.——Among Christians, they were observed in the church from the very beginning. But, in process of time, the number became inconveniently great. The English church retains only the Nativity, Circumcision, Epiphany, the death, resurrection, and ascension of Christ; the purification and annunciation of the Virgin; Whit-Sunday, Trinity Sunday, the festivals of the most remarkable apostles and evangelists, and All-Saints. Festivals are either *movable* or *immovable*. The former depend on Easter: the latter are assigned to fixed days.

FEASTS OF THE AN'CIENTS. These were conducted with great ceremony. The guests wore white garments, decorated themselves with garlands, and often anointed the head, beard, and breast with fragrant oils. The banqueting-room was also often adorned with garlands; and roses were hung over the table, as the emblem of silence: hence the common phrase, to communicate a thing *sub rosâ* (under the rose). The luxurious Romans drank out of crystal, amber, and the costly *murra* (a kind of porcelain introduced by Pompey), as well as onyx, beryl, and elegantly wrought gold, set with precious stones. After the meal was ended, flute-players, female singers, dancers, and buffoons of all kinds, amused the guests; or the guests themselves joined in various sports and games.

FEATH'ERS (*feder: Ger.*), consist of a tube, a shaft, and barbs or vanes. The *tube* is a hollow, transparent, horny cylinder; the *shaft* is elastic, and contains a white, dry, and very light pith; the *barbs*, which run in a uniform direction and cover each side of the shaft, are broad on one side and narrow on the other: the *barbules* are attached to the sides of the barbs. The feathers of birds are periodically changed, which is called *moulting*. When part of a feather is cut off it does not grow again; and a bird whose wings have been clipped remains in that state till the next moulting season, when the old stumps are shed, and new feathers are produced. Chemically analyzed, feathers seem to possess nearly the same constituents as hair.—They may be considered as of four kinds: 1. quills, or the feathers of the wings; 2. those which cover the body; 3. the down which grows close to the skin; and 4. the long ones of the tail. The goose, the turkey, and the crow supply those of the first description, employed in writing. The down of the swan is sometimes made into muffs and other articles of dress. Goose feathers are most esteemed for beds: and they are best when plucked from the living bird, which is done, very inhumanly, thrice a year, viz. in the spring, midsummer, and beginning of harvest. The plumage of the eider-duck, called *eider-down*, possesses in a superior degree all the good qualities of goose down, but should be used only as a *covering* to beds, since much pressure destroys its elasticity. ——Feathers make a considerable article in commerce, particularly those of the ostrich, heron, swan, peacock, turkey, goose, and duck. They also afford a source of employment to the artisans who prepare them for female use, or for military purposes. ——Ostrich feathers are imported from Algiers, Tunis, Alexandria, Madagascar, and Senegal.

FEB'RIFUGE (*febris*, a fever: and *fugo*, I drive away: *Lat.*), in Medicine, an appellation given to such medicines as mitigate or remove a fever.

FEB'RUARY (*februum*, in the Sabine language, a purification), the second month of the year, reckoning from January. February derived its name from the *Februa*, a feast held by the Romans on the 15th of this month, in honour of Lupercus, the god of fertility, and as a purification of the land. In a common year it consists of only 28 days, but in the bissextile year it has 29, on account of the intercalary day then added to it.

FED'ERAL GOV'ERNMENT (*fœdus*, a league: *Lat.*), one that consists of several independent provinces or states, united under one head; but the extent to which such states give up their individual rights may be very different, although, as relates to general politics, they have one common interest, and agree to be governed by one and the same principle. The United States of America afford an example of this form of government.

FEE, ESTATE IN (*feoh*, cattle: *Sax.*, be[illegible] the only property in very early states of society), in Law, properly signifies an inheritable estate in land, held of some superior or lord; and in this sense it is distinguished from *allodium*, which is an absolute property in land. It is the *theory* of the English law that all the lands of the kingdom, except the royal domains, are held in fee, or by a tenure, of some superior lord, the absolute or allodial property being only in the king; so that all the tenures are strictly feudal. The most ample estate a person can have is that of *fee-simple*, or one which he holds to himself and his heirs general, both lineal and collateral, male and female; and such an estate can be had only in property that is inheritable, and of a permanent nature. *Fee conditional*, or *fee-simple conditional*, is when the estate to a man and his heirs is qualified by a condition or limitation, such as his paying a certain sum of money on a stipulated day, &c. But it is generally understood to refer to a limitation, in the form of donation to some *particular* heirs; as, the *heirs of his body*. ——FEE-FARM, a kind of tenure without homage, fealty, or other service, except that mentioned in the feoffment; which was usually the full rent. The nature of this tenure was, that if the rent was in arrear or unpaid for two years, the feoffor or his heirs might have an action for the recovery of his lands. No grant in fee-farm can now be made.

FEEL'ERS (*fuhlen*, to feel: *Ger.*), or PALPI, in Entomology, short jointed processes proceeding from the mouth, and very conspicuous in some insects. They are not to be confounded with *antennæ*, which are jointed bodies, situated on each side of the head.

FEEL'ING (*fühlend: Ger.*), one of the five physical senses, by which we obtain the ideas of solid, hard, soft, rough, hot, cold, wet, dry, and other tangible qualities. This sense is the coarsest, but at the same time it is the surest of the five; it is besides the most universal. We see and hear with small portions of our body, but we feel with all. Nature has bestowed that general sensation wherever there are nerves, and they are everywhere, where there is life. All the nervous solids, while animated by their fluids, have this general sensation; but the papillæ in the skin, those of the fingers in particular, have it in a more exquisite degree.

FEINT (feigned: *Fr.*), in Military tactics, an attack made to conceal the true one.

FE'LIDÆ (*felis*, a cat: *Lat.*), a family of carnivorous mammals, including the lion, tiger, leopard, jaguar, lynx, cat, and other animals. In this family the organs of destruction reach their highest development. They are strong and agile, armed with sharp talons and teeth, set in powerful jaws.

FEL'LOES (*felge: Dan.*), the pieces of wood which form the circumference or circular part of a wheel.

FEL'LOW (*felow: Sax.*), a superior member of a college. Fellows are, *in general*, graduates; and, in most cases, are obliged to abandon their fellowships at a certain time, if they do not take orders: there are, however, lay fellowships. Fellowships are vacated by the marriage of the holder. In some colleges, there is a distinction, in point of emolument, between *senior* and *junior fellows*. Fellowships are very various in value, some being worth 100*l.* per annum, or less, and others 600*l.*; the average is from 150*l.* to 300*l.*—The members of most societies incorporated by charter for the prosecution of some branch of science are usually styled fellows.

FEL'LOWSHIP (same *deriv.*), in Arithmetic, a rule by which the loss and gain of each particular person in a joint-stock concern is discovered.

FE'LO-DE-SE (a felon with reference to himself: *Mod. Lat.*), in Law, a person who, being of sound mind, and of the age of discretion, wilfully causes his own death. The goods and chattels of a *felo-de-se* are forfeited to the king; but the coroner's jury, summoned to inquire into the cause of death, &c., frequently saves the forfeiture, by finding a verdict of lunacy, on the supposition that it is impossible for a person in his senses to do a thing so contrary to nature. Formerly, persons committing suicide were buried in the highway, with a stake driven through the heart: at present, the law requires that their interment shall take place in a burial-ground, between the hours of nine and twelve at night.

FEL'ONY (*felon*, a felon: *Fr.*; from *fel*: *Sax.*), comprehends all crimes which, at common law, occasion the forfeiture of lands and goods; and therefore, strictly speaking, it includes treason, though, in common language, it is not understood to do so. Its punishment, unless otherwise marked out, is death. The principal species of felony are:—1. Murder, manslaughter, rape, and other serious crimes against the person. 2. Larceny. 3. Embezzlement. 4. Burglary. 5. Malicious injury to property, such as arson, riotous demolition of churches, houses, &c. 6. Forgery. 7. Many offences of a public nature.

FEL'SPAR or **FELD'SPAR** (*feldspath*, literally field-spar: *Ger.*), a mineral compound of silica, alumina, and potash, with traces of lime, and often of oxide of iron. It is one of the constituents of granite, is softer than quartz, and usually white, greyish, or reddish. The general figure of the numerous crystals of felspar is an oblique prism, with unequally produced planes, whose number varies from four to ten. These prisms are terminated by summits, ordinarily composed of two large culminating faces, and several smaller faces, which seem to obey no constant law of arrangement: hence it results, that the forms of felspar are among the most difficult of any to understand and describe. Common felspar, in which potash is the predominant alkali, is often called *orthoclase*. Where soda is the predominant alkali, it has received the name of *albite*. In the variety called *Labradorite*, there is from 8 to 11 per cent. of lime present. A fourth variety is termed *oligoclase*. In its decomposed state, felspar furnishes the *petuntse*, or Cornish stone, so much used in the porcelain and best pottery manufactures.

FELT (*filz*: *Ger.*), coarse wool, fur, or hair, matted together in a peculiar way, and used in the making of hats, &c. The method of working up such materials into a species of cloth, independently of either spinning or weaving, is called *felting*, and consists in causing the hairs to interlace with each other, which they readily do by virtue of their tendency to curl, and of the minute serratures with which they are ringed throughout their length. For this purpose, they are intimately mixed together by the operation of *bowing*, which is effected by means of the vibrations of an elastic string, the rapid alternations of whose motion are peculiarly well adapted to remove all irregular knots and adhesions among the fibres, and to dispose them in a very light and uniform mass. This, when pressed under cloths and leather, readily unites into a fabric of some firmness; and this is brought to the proper shape by various subsequent operations.

FELUC'CA (*Ital.*), a small vessel, carrying two masts, and propelled by oars and sails. Also, small war-boats. Feluccas are used in the Mediterranean.

FE'MALE SCREW, a screw, the spiral thread of which is cut on the inner surface of a hollow cylinder.

FEME COV'ERT (*femme couverte*, a sheltered woman: *Fr.*), in Law, a married woman who is under covert of her husband. By the common law of England, the legal capacity of a woman to contract, or sue and be sued, separately, ceases on her marriage; and her husband becomes accountable for her debts existing at that time.——FEME SOLE, a single woman.——FEME-SOLE MERCHANT, a woman who carries on trade alone, or without her husband.

FEM'ORAL (*femur*, the thigh: *Lat.*), belonging to the thigh; as, the *femoral* artery.

FEN (*fenn*: *Sax.*), a portion of land, in which the sub-soil is constantly saturated with water, and the surface liable to be overflowed in spring and autumn. The soil is generally dark and rich, and produces bushy crops of grass and corn. Fens can seldom be drained naturally; but when this is done by machinery, they are highly productive. Windmills were formerly much employed in draining them; but steam is now preferred, as most to be depended on.

FEN'CING (*défense*: *Fr.*), the art of using skilfully a sword or foil, either in attack or defence. In practising this art, foils or thin swords are used, which, being blunted or covered at the points, and bending readily, are harmless.

FEN'DERS (*défendre*, to defend: *Fr.*), a sea term for pieces of old cable, &c., hung over the sides of a ship, to prevent injury from contact with other ships.

FENES'TRA (a window: *Lat.*), in Anatomy, a term applied to two openings, or *foramina*, within the ear, distinguished by the names of the oval and the round fenestra

FEN'NEL (*fenouil: Fr.*), the common name of the *Anethum fœniculum*, an umbelliferous plant, with a peculiar fragrance. It is wild in England.

FEO'DUM, FE'OD, or **FEUD** (*feodum*, a fief: *Mod. Lat.*), in Feudal Law, the right which the vassal had to use and take the profits of land, &c., rendering to his lord such fees, duties, and services as belonged to military tenure. But the actual property in it always remained to the lord.

FEOFF'MENT (*fief*, a fief: *Fr.*), the old common law method of conveying lands to another in *fee*, that is, to him and his heirs for ever, by delivery of seisin, and possession of the estate granted. The giver is called the *feoffor*, and the person who is thus invested is called the *feoffee*. This mode of conveyance is very seldom used.

FE'RÆ (wild beasts: *Lat.*), in Zoology, an order of mammals, including the rapacious beasts, or those that subsist, more or less exclusively, on the flesh of other animals. They are characterized by the possession of *incisors*, *canine*, and *molar* teeth, and unguiculate extremities, without an opposite thumb on the forefoot, but with the power of rotation in the forearm. It includes five families: *Felidæ*, the cat-tribe; *Ursidæ*, the bears; *Talpidæ*, the moles; *Macropidæ*, the kangaroos; and *Phocidæ*, the seals.

FE'RÆ NATU'RÆ (of a savage nature: *Lat.*), in Law, beasts and birds that are wild; as foxes, hares, wild ducks, &c., in which no person can claim any property.

FERA'LIA (*Lat.*), in Antiquity, a festival observed among the Romans in February, in honour of the *manes* of their deceased friends and relations. During the ceremony, which consisted in making offerings at their graves, marriages were forbidden, and the temples of the divinities shut up. They fancied that, while this festival lasted, departed spirits suffered no pains in hell, but were permitted to wander about their graves, and feast upon the meats prepared for them.

FER DE FOURCHETT'E (an iron fork: *Fr.*), in Heraldry, a cross, having at each end a forked iron, like that formerly used by soldiers to rest their guns on.

FE'RIA (*Lat.*), a term applied, in the Roman Catholic breviary, to the several days of the week; thus, Monday is the *feria secunda*, Tuesday the *feria tertia*, and so on.

FE'RIÆ (*Lat.*), in Roman Antiquity, holidays, or days upon which no business was transacted. The *feriæ* were either *Publicæ* or *Privatæ*, the latter being observed only by families or individuals. The *Feriæ Publicæ* were divided into *Feriæ Stativæ*, or stated festivals; *Feriæ Conceptivæ*, or movable feasts; and *Feriæ Imperativæ*, or occasional festivals, enjoined by the consuls, or other magistrates, on some public occasion. The *Feriæ Latinæ*, kept on Mount Albanus by the thirty Latin towns, were *Feriæ Conceptivæ*, and were observed by the consuls before they set out for their provinces. The *Feriæ Nundinæ* were days in which the country people assembled, and exposed their commodities for sale—so called on account of being held every ninth day. They were, for a long time at least, *dies fasti*, or those on which business could be transacted, for the people only; but, for the patricians, they were *dies nefasti*, or holidays.

FERMENTA'TION (*fermento*, I ferment: *Lat.*), a peculiar change to which certain complex organic bodies are liable, under the influence of an external disturbing force. If to a solution of sugar there be added a little blood, flour, paste, or other putrescible azotised matter, fermentation will set in, and the sugar will be converted into alcohol, carbonic acid being at the same time disengaged. Nothing acts more powerfully as an exciter of fermentation than yeast—the matter thrown off by beer when fermenting. A certain amount of heat is required, and the presence of atmospheric air is necessary at the commencement. In making wine the vegetable albumen of the must absorbs oxygen from the atmosphere, and thus excites the action of fermentation in the sugar of the juice, which becomes changed into alcohol. In brewing, the liquor in which malted grain has been infused is caused to ferment by the addition of yeast, and this results in the conversion of the saccharine liquor into beer. In this case, however, the fermentation is not allowed to run its full course. The beer is drawn off into casks at a particular stage of the fermenting action, and a very slow fermentation afterwards goes on, which charges the liquor with carbonic acid. Fermentation is also made use of in preparing the weak spirit from grain, which is afterwards distilled into what, when rectified and flavoured, is called gin. The preceding are cases of *alcoholic* or *vinous* fermentation. *Acetous* fermentation takes place if weak alcohol be mixed with a little yeast, or other azotised organic matter, liable to putrefy, and be then exposed to the air. Oxygen is absorbed from the atmosphere, and the alcohol is converted into acetic acid or vinegar. Carbonic acid is not disengaged during this fermentation. Vinegar is usually made either from wine by spontaneous acidification, assisted by a temperature of about 80° F., or from a kind of beer prepared for the purpose.

FERNS (*fearn: Ang. Sax.*), the *filices* of botanists, an order of cryptogamic plants, of which examples occur in all parts of the world. The great majority have short stems, which creep upon or under the surface of the ground, but in some regions, such as New Zealand, a trunk rises to the height of several feet, rough with the stalks of withered fronds (leaves), and bearing green fronds at the summit, so as to resemble in some degree a small palm. The shapes of the fronds are very varied; some are entire, others much divided. The reproductive organs are borne on the back of the frond or at the margin, and consist of collections of spore cases containing spores, which are the true seeds, minute as dust. The spore cases are usually surrounded by an elastic ring, by the bursting of which, when ripe, the spores are thrown into the air. Ferns are of little use in any point of view, but for the sake of their elegant fronds they are much cultivated in greenhouses, and in those small glass cases called Wardian, after their inventor. From the neatness with which the dried fronds can be arranged upon paper, dried collections are common. In Great Britain, about 45 species have been found belonging to 19 genera. The world contains probably 3,000 species.

FER'RET (*furet: Fr.*), the *Putoris Furo* of naturalists, a blood-thirsty animal of the weasel tribe (*Mustelidæ*). It is a native of Africa, but has been domesticated with us for the purpose of killing rabbits and rats. It has white fur and red eyes

FER'RIC (*ferrum*, iron: *Lat.*), pertaining to or extracted from iron.— FERRIC ACID, an acid composed of one equivalent of iron united to three of oxygen.

FERRICAL'CITE (*ferrum*, iron; and *calx*, lime: *Lat.*), in Mineralogy, a species of calcareous earth or limestone, combined with a large amount of iron.

FER'RILITE (*ferrum*, iron: *Lat.*; and *lithos*, a stone: *Gr.*), in Mineralogy, a variety of *trap*, containing iron in the state of oxide.

FERROCY'ANIDE, in Chemistry, a compound of *ferrocyanogen* and a base.

FERROCYAN'OGEN, in Chemistry, a radical, consisting of one atom of iron and three cyanogen; known, in combination with two atoms of hydrogen, as *ferrocyanide of hydrogen*, or hydroferrocyanic acid; and with two atoms of potash, as *ferrocyanide of potassium*, or yellow prussiate of potash.

FERROSIL'ICATE, in Chemistry, a compound of ferrosilicic acid, with a base: a substance analagous to a salt.

FERROSILI'CIC, in Chemistry, a term designating a compound of iron and silex.

FERRU'GINOUS (*ferrugineus: Lat.*), of the colour of rust or oxide of iron.

FER'ULA (a rod: *Lat.*), in Ecclesiastical History, a place in which the *audientes* were kept. It was separated from the church, which such persons were not allowed to enter.——Under the Eastern empire, the *ferula* was the emperor's sceptre, as is seen on a variety of medals: it consisted of a long stem, or shank, and a flat square head.——FERULA, in Botany, a genus of umbelliferous plants, known as giant fennel. Asafœtida is the dried milky juice of several of the species.

FER'ULÆ (*Lat.*), in Surgery, splinters or chips of different matter, as of wood, bark, leather, paper, &c. The term is applied also to bones that have been disjointed, when they are set again.

FESCENNI'NE VER'SES (from *Fescennia*, a city of Etruria), among the Romans, a kind of extemporary dialogue, in which the performers, using a gross and rustic kind of raillery, reproached each other, as well as their audience, with their vices and foibles. Though they are said to have received their name from the town where this species of rude poetry was first used, it is not likely that they were peculiar to any one locality. Under cover of them much indecency prevailed, and the emperor Augustus prohibited them, as tending to corrupt the public morals.

FESSE (*fascia*, a wide belt: *Lat.*), in Heraldry, one of the nine honourable ordinaries, consisting of a line or belt drawn directly across the shield, from side to side, and containing the third part of it. When figures are contained within the breadth of the fesse, it is said to be charged, and they are said to be *in fesse*. When a fesse does not extend to the sides of the escutcheon, it is said to be *couped*. The diminutives of a fesse are the *bar*, the *closet*, and the *barulet*. A fesse, with a barulet on each side of it, is said to be *cotised*. A fesse removed to the top of the escutcheon is termed a *chief*, and is considered an honourable augmentation.——FESSE POINT, the exact centre of the escutcheon.——FESSEWAYS, or *in fesse*, denotes anything borne in the way of a *fesse*: that is, in a rank across the middle of the shield.——PARTE PER FESSE, a parting across the middle of the shield, from side to side, through the *fesse point*.

FES'TIVALS. [See FEASTS.]

FESTOO'N (*feston: Fr.*), in Architecture, Sculpture, &c., an ornament representing flowers, fruits, and leaves, gracefully intermixed or twisted together; suspended at the ends, and falling down in the form of an inverted arch.

FESTU'CA (a stem: *Lat.*), in Botany, a genus of perennial grasses, known as fescue grass.

FET'ICHISM or **FET'ICISM**, the worship of idols among the negroes of Africa, among whom *fetich* is a name by which an idol is designated. They believe that the household or family *fetich* narrowly inspects the conduct of every individual in the house, and rewards or punishes each according to his deserts.

FET'LOCK (for *foot-lock*), a tuft of hair that grows behind the pastern joint in the feet of many horses.

FEUD (*fehde: Ger.*), an inveterate quarrel between families, or parties in a state. The word is not applicable to wars between different nations

FEU'DAL SYS'TEM (*feodum*, a fief: *Mod Lat.*), a form of government anciently subsisting in Europe, and which was fully consolidated in the beginning of the 11th century. It forms the basis of many modern customs, and our law of real property was moulded with reference to it, and bears to this day the strongest marks of its origin. With respect to the origin of this system, it is probably to be found in the military customs of the Celtic or northern nations, known by the names of Goths, Vandals, Franks, Huns, and Lombards, who overran Europe on the declension of the Roman empire, and brought it with them from the countries out of which they emigrated: it was entirely unknown to the Romans. According to the feudal scheme, a victorious leader took possession of a country as supreme lord, and then allotted considerable portions of it, called *feoda*, *fiefs* or *feuds*, to his principal officers, who in their turn divided their possessions among their inferiors, and the condition upon which these rewards were given was that of faithful military service both at home and abroad. Their followers engaged themselves to this by an oath of fealty; and in the event of their not performing the service agreed upon, or deserting their lord in time of battle, &c., the lands were to return to their original possessor. Every person, therefore, who was a feudatory, i. e. who had received lands in this way, was bound to do everything in his power to defend the lord of his fee; while, on the other hand, the latter was not less subordinate to his immediate superior; and so on up to the prince himself. Thus the several orders of vassals formed a system of concentric circles, of which each was under the influence of the next; and all moved round a common centre, which was the king, the supreme feudal lord. As there was a graduated scale from the lowest vassal to the prince, or lord paramount of the territory, every man's interest was involved in the security of the whole; and every man was a pledge of security to his neighbour. In its vigour the feudal system constituted a regular, powerful, and compact system of government, and secured a unanimity which pervaded the various departments of the state; and while internally the power was diffused, it presented to foreign nations a united and formidable front. When the ideas which originate in the possession of property advanced, and the great grew more avaricious of money than of glory, and when, it ought perhaps to be added, a love of justice and order had become general, nothing was heard of but the enormities of the powerful, and the sufferings of the humbler classes; and the strength of feudal governments declined amidst a spirit of disaffection too universal to be checked. The ceremonies used in conferring a fief were principally three:—*homage*, with or without a feudal obligation, the latter only by great feudatories, such as those just mentioned; an oath of *fealty*; and *investiture*, or conveyance of the lands, either actual or symbolical. The division of ranks, under the feudal system, corresponded in theory, though not altogether in practice, with the territorial division of lands according to their tenures. Those who held by *knight's service* were the original nobility.

FEUIL'LANS, an order of bare-footed monks, who observe the same rule as the Bernardines. They derive their name from the abbey of *Feuillans*, five leagues from Toulouse, where the Bernardines were first reformed.

FE'VER (*febris*: *Lat.*), in Medicine, a disease characterized by an increase of heat, an accelerated pulse, great thirst, and an impaired state of several functions. It generally begins with languor of body and mind, chilliness amounting to shivering, though the skin often at the same time feels hot; the pulsation is quicker than it ought to be; respiration is hurried or laboured; there are pains in various parts of the body, particularly about the head, back, or loins; there is a loss of appetite, or nausea and vomiting; the mouth is dry; the bowels generally constipated; the urine small in quantity and deep in colour. The varieties of this disease are numerous; but the grand division is into *remittent* fevers, which subside or abate at intervals; *intermittent* fevers, which intermit or entirely cease at intervals; and *continued* fevers, which neither remit nor intermit.

FI'AT (let it be done: *Lat.*), in Law, a short order or warrant, signed by a judge, for making out and allowing certain processes.——In Bankruptcy, the order of the court by which a person is declared bankrupt.

FI'BRES (*fibra*: *Lat.*). A great number of plants afford fibres which are capable of being usefully employed by man, yet it is only a few of them that serve all the purposes required; and it is somewhat remarkable that, with the exception of jute, all the vegetable fibres used in the manufactures of Europe are derived from the plants, which, in the earliest ages, supplied the spindles and looms of Babylonia and Egypt. The chief fibres employed in textile manufactures are *Flax*, the produce of the stalks of *Linum usitatissimum*, a plant grown in nearly every part of the world: *Hemp*, the produce of the stalks of the *Cannabis sativa*, a plant allied to the nettles grown chiefly in Europe and Asia: *Jute* and *bast*, the inner bark of an Indian tree, *Corchorus capsularis*, allied to our lime tree: *New Zealand flax*, obtained from the leaves of a plant, *Phormium tenax*, belonging to the lily order: *Rhea fibre*, afforded by the stems of a plant, *Bœhmeria nivea*, or China grass, growing in India and China: *Sunn Hemp*, obtained from several leguminous plants: *Silk Cotton*, or Baraguda cotton, obtained from a large tree, the *Bombax ceiba*, growing in South America: *Pine apple fibre*, obtained from the leaves of pine apples and allied plants growing in tropical countries: *Manilla hemp*, or Abaca, obtained from the leaf stalks of a banana, *Musa textilis*, growing in the tropics: *Pita fibre*, afforded by the leaves of the American aloe, *Agave Americana*.

FIBRIL'LA (a *dim.* of *fibra*, a fibre: *Lat.*), in Botany, the branch or division of a radical fibre.— FIBRILLÆ, in Anatomy, small fibres

FI'BRINE (*fibra*, a fibre: *Lat.*), a substance found in solution in blood. When obtained clear of the other constituents, it forms long elastic filaments. More than half of dried fibrine consists of carbon, the other components being oxygen, nitrogen, and hydrogen, with a little sulphur and a trace of phosphorus: the proportions of these matters being nearly the same as in albumen With the exception of phosphorus, the fibrine of flesh has the same constituents, but in different proportions. When blood is drawn from the living animal the fibrine begins to coagulate.

FIB'ROLITE (*fibra*, a fibre: *Lat.*; and *lithos*, a stone: *Gr.*), a mineral that occurs associated with corundum; it is of a white or grey colour, and is composed of minute fibres.

FIB'ULA (a brace: *Lat.*), in Anatomy, the outer and smaller bone of the leg. It is nearly of a triangular figure, and stands parallel to, but distinct from, the *tibia*. Also a brooch, used both by men and women amongst the ancient Romans for the purpose of fastening their scarves or cloaks. It consisted of a pin and a curved portion.

FI'CUS (a fig: *Lat.*), in Botany, a large genus of plants, nat. ord. *Urticaceæ*, including the common fig (*F. carica*), the Banyan (*F. indica*), and the Pipul, or Sacred Fig of India (*F. religiosa*). Some yield caoutchouc of the finest quality: the *Ficus elastica* is particularly remarkable for it. Though the ordinary fig is so agreeable a fruit, the milky juice of the tree is acrid, and of the same nature, though less intense in its properties, as the *Ficus toxicaria*, *Demonum*, &c., which receive their names from their venomous qualities. 'The species of fig in hot countries,' says Dr. Lindley, 'often constitute vast forests, and have generally very thick trunks with extremely strong branches, and a prodigious crown. Travellers say that the colossal fig trees are among the most grateful presents of nature to hot countries; the shade of their magnificent head refreshing the traveller when he reposes under their incredibly wide spreading branches and dark shining foliage.'

FIEF (*Fr.*), a fee; an estate held of a superior on condition of military service. [See FEUDAL SYSTEM.]

FIELD, in Heraldry, the tincture, or combination of tinctures, which forms the ground of the escutcheon.——In Military tactics, the ground chosen for any battle.——In Painting, the ground or blank space on which anything may be drawn.

FIELD'FARE, the *Turdus pilaris*, a migratory bird of the thrush kind. It passes the summer in the northern parts of Europe, but visits Great Britain in winter.

FIELD-MAR'SHAL, the highest military rank in England.——FIELD-OFFICER, a military officer above the rank of a captain, as a major or colonel.——FIELD-COLOURS, in War, small flags about a foot and a half square, which are used by the quartermaster-general, for marking out the ground for the squadrons and battalions.——FIELD-PIECES, small cannons, from three to twelve-pounders, carried along with an army in the field.——FIELD-WORKS, in Fortification, those thrown up in besieging a fortress, or by the besieged to defend the place.

FI'ERI FA'CIAS (*quod fieri facias de bonis*, that you cause the sum or debt to be made from the goods: *Lat.*), in Law, a judicial writ, commanding the sheriff to levy the debt or damages on the goods of one against whom judgment has been had in an action of debt.

FIFTEEN'TH, an ancient tribute or tax laid upon cities, boroughs, &c., through all England, and so termed because it amounted to a fifteenth part of the sum at which each city or town had been valued; or it was a fifteenth of every man's personal estate, according to a reasonable estimate.——In Music, an interval of two octaves. Also, a stop on the organ, a double octave above the diapason.

FIG (*figue*: *Fr.*), the fruit of the fig-tree (*Ficus Carica*), formed of a fleshy hollow peduncle, which is covered inside with flowers that produce small one-seeded nuts. Figs are produced abundantly in Turkey, Greece, Italy, Spain, France, and northern Africa. They are of an oblong shape, and of a dark purple or greenish colour. When ripe, they are generally dried in ovens to preserve them, and are then packed very closely in the small chests and baskets in which we import them. Dried figs, with barley bread, are the ordinary food of the lower classes in Greece and the Archipelago.

FIG'URAL, or FIG'URATE NUM'BERS (*figura*, a figure: *Lat.*), such as do or may represent some geometrical figure, in relation to which they are always considered as *triangular* numbers, *pentagonal* numbers, *pyramidal* numbers, &c.

FIG'URATIVE (same *deriv.*), a term applied to whatever is expressed by obscure resemblances; as the types and mysteries of the Mosaic law. Also to any expression which is not taken in its primary and literal sense.

FIG'URE (*Fr.*, from same *deriv.*), in Astrology, a description of the disposition of the heavens at a certain hour, in which the places of the planets and stars are marked within a *figure* of twelve triangles, called houses.——FIGURE, in Geometry, a space bounded on all sides, either by lines or surfaces. Or the representation on paper, &c., of the object of a theorem or problem, to render its demonstration or solution more easy to be understood; in which sense it is a *diagram*.——FIGURE, in Fortification, the plan of any fortified place; or the interior polygon, which, when the sides and angles are equal, is called a *regular*, and, when unequal, an *irregular* figure.——FIGURE, in Rhetoric, a mode of speaking or writing, in which words are deflected from their ordinary signification, so as to express a passion with more emphasis and beauty than by the ordinary way. The principal figures of Rhetoric are the metaphor, allegory, simile, and personification; which, with their further divisions into hyperbole, climax, antithesis, &c., will be found under their respective heads.——FIGURE, in Painting and Designing, the representation of any animal, but more particularly of a human being.——FIGURES (inaccurately so called), in Arithmetic, certain characters by which we denote any number. They are more correctly termed digits.

FIL'ACER (*fil*, a thread or wire: *Fr.*), an officer of the Common Pleas and Queen's Bench, so called from his filing the writs on which he makes out processes.

FIL'AMENT (*filum*, a thread: *Lat.*), in Natural History, anything slender, like a thread; for example, the support of the anther in a flower.

FILA'RIA (same *deriv.*), a genus of entozoa, having long slender and filiform bodies. They infest even insects and their larvæ, as well as the larger animals. The species most dreaded by man is the *Filaria medinensis*, or Guinea-worm, which is endemic within the tropics of Asia and Africa, and entering beneath the skin, generally of the leg, sometimes produces the most excruciating pain. Its length varies from six inches to twelve feet, and its body, which is cylindrical, is nearly of a uniform size throughout.

FILE (*feile: Ger.*), in Mechanics, a well-known instrument formed of steel, which is cut in small furrows, and used in smoothing and polishing metals. Files are called by different names, according to their various degrees of fineness; and are also distinguished by their shape, as flat, half-round, three-square, four-square, and round.

FILE FISH, so called, either because of the skin being rough and cross hatched, like a file, or because the first spine on the back somewhat resembles a file. This spine, when erected, can be secured in that position by the second spine, which has a projection at its base, locking into a corresponding cavity at the base of the first. Until the hinder spine has been depressed, the first one cannot be brought down. Hence the fish is sometimes called the trigger-fish. This fish, which belongs to the genus *Balistes*, in the order of *Plectognathi*, is sometimes taken on the British coast, but more frequently in the Mediterranean.

FIL'ICES (ferns: *Lat.*). [See FERNS.]

FIL'IFORM (*filum*, a thread; and *forma*, a form: *Lat.*), having the form of a thread or filament; as, a filiform style or peduncle.

FIL'LET (*filet: Fr.*), in Architecture, a small square member, ornament, or moulding, used in various places, but generally as a corona over a moulding.——Among carpenters and joiners, a small piece, to which boards, joists, or quarters are nailed. ——In Heraldry, a kind of narrow bordure, which runs quite round, near the edge.

FIL'LIBEG, a dress reaching only to the knees, worn in the highlands of Scotland.

FIL'LIGREE-WORK (*filigrane: Fr.*; from *filum*, a thread; and *granum*, a grain: *Lat.*), a delicate and elaborate manufacture, primarily executed in threads of gold and silver, but lately imitated with coloured and gilt paper. In Sumatra, manufactures of filligree-work are carried to very great perfection. In China, where the filligree is chiefly of silver, many beautiful articles are produced. Malta has also a celebrity for articles of this kind.

FILTRA'TION (*filum*, a thread: *Lat.*—on account of the liquid passing off in a slender stream), the process by which a liquid is freed from solid bodies mixed with it, or from any impurities which it holds in suspension, by passing it through a linen or woollen bag, or filtering paper. Various other contrivances have also been invented for purifying muddy and putrid water, and rendering it fit for drinking; such as the use of a porous kind of stone, sand, charcoal, &c.; and numerous patents have been obtained for filtering apparatus, some of which are excellent.

FIM'BRIÆ (an extremity: *Lat.*), appendages disposed by way of fringe round the border of anything. Hence, *fimbriate* is a term used in Botany for fringed, or surrounded by hairs; and *fimbriated*, in Heraldry, is an epithet for an ordinary, with a narrow bordure or hem of another tincture.

FI'NAL CAU'SES (*finalis*, pertaining to the end; and *causa*, a cause: *Lat.*), the purposes or ultimate ends in view. The *efficient* cause is that which produces the event or effect; the *final* cause is that for which anything is done.

FINA'LE (*finalis*, pertaining to the end: *Lat.*), the concluding part of a musical composition. In instrumental pieces, it has most usually a character of vivacity, and requires a quick movement with lively performance.

FINAN'CES (*Fr.*), in Political Economy, the revenues of a state. The English system of finance rests on the produce of the various taxes which have been imposed at different periods, the aggregate amount of which, after deducting the expenses of collection, together with a few small items which cannot properly be called taxes, forms the whole of the public income. This income is annually appropriated to the several branches of the national expenditure: and when, in consequence of any extraordinary expenses, it is known that the income of the current year will be insufficient to meet all the demands upon it, it is usual to borrow the sum necessary to make up the deficiency, either from individuals or public bodies; and to allow a fixed rate of interest on the money thus obtained, till the principal is repaid, or till the period originally agreed upon has expired.——A person employed in the economical management and application of the public money is called a *financier*.

FINCH (*finke: Ger.*), in Ornithology, a numerous class of passerine birds, forming the family *Fringillidæ*, of which the most remarkable are the goldfinch, canary, and linnet.

FINE (*pœna*, a punishment: *Lat.*), in Law, a penalty or amends, made in money, for an offence; also money paid for the renewal of a lease.——There was formerly a mode of conveying land by fine and recovery; but it has been abolished. It was the termination of an imaginary action at law, and barred issue in tail immediately; but not those in remainder or reversion, except when the tenant had such reversion to himself. A *fine* also was the usual method formerly adopted for joining a feme covert in the sale, settlement, or incumbrance of an estate. [See ENTAIL.]

FINE ARTS, a term somewhat indefinite in its meaning, but generally applied to those arts which depend on the mind and imagination; opposed to the *mechanical*.

FI'NERY, the furnace in which metals are refined, i. e. hammered and fashioned into what is called a bloom, or square bar.

FIN'GER (*Ger.*, from *fangen*, to seize), in Anatomy, one of the extreme parts of the hand. The names of the fingers, reckoning from the thumb, are—1. *pollex*; 2. *index*; 3. *medius*; 4. *annularis*; 5. *auricularis*. In the thumb there are two, in each of the other fingers three, bones called phalanges, the upper of which are much larger than the lower.

FIN'GERING, in Music, the disposing

of the fingers in a convenient, natural, and suitable manner, in the performance of any instrument, but more especially of the organ and pianoforte.

FI'NITE (*finitus*, bounded; *Lat.*), in Mathematics, an epithet for a series, line, &c., which is limited in extent, duration, &c., in distinction from *infinite*.

FINS (*pinna: Lat.*), in Natural History, well-known parts of fishes, consisting of membranes supported by rays, which are either stiff spines, or flexible unjointed rays, or flexible jointed rays, the latter being frequently branched. The dorsal fins are those on the back. Some fishes have none there, others from one to four In the Salmon family, the second dorsal fin is rudimentary, and is termed *adipose*. The *pectoral* fins are two, one on each side, usually placed about the middle of the height of the fish, just behind the gill covers In some fishes they are absent The ventral fins are also two, usually placed close together under the pectoral fins, and then termed *thoracic*. If placed in front of the pectoral fins, they are termed *jugular*, and if on the belly, at some distance behind the pectoral fins, they are called *abdominal* When they are altogether absent, the fishes are said to be *apodal*, as in the case of the eel tribe. The *anal* fin is placed behind the vent: sometimes there are two, very rarely three The *caudal* fin is placed at the end of the tail. It varies much in shape, rounded, truncate, lunate, forked, &c The tail, with its fin, is the principal organ of locomotion, the other fins serving more to steer than to propel In works on ichthyology, a notation is employed, which briefly but clearly expresses their characters The fins in the perch are thus described — D 15, 1 + 13; P 14; V 1 + 5; A 2 + 8, C 17 which means that of D, the dorsal fins, the first has 15 rays, all spinous or bony; the second, 1 spinous, plus 13 that are soft, that P, pectoral fin, has 14 rays, all soft, V, the ventral fin, 1 spinous ray, plus 5 that are soft; C, the tail, or caudal fin, 17 rays In enumerating the rays of the caudal fin, only those which extend from the longest ray in the upper portion to the longest ray in the lower portion, both inclusive, are counted

FIN'TO (counterfeited: *Ital.*), in Music, a feint, or an attempt to do something without doing it. Thus, in a *cadenza finta*, when everything proper for a true cadence has been done, instead of falling on the right final, a higher or a lower note is taken

FIR'-TREE (*furh Sax.*), the name of several species of the genus *Pinus*· as the Scotch fir, the silver fir, spruce fir, &c. [See PINE]

FIRE (*feuer: Ger.*). In former times, fire obtained a place among the elements. It is now known that what is ordinarily called by that name is merely solid or gaseous matter at a high temperature. [See CALORIC and HEAT]——*Subterranean fires.* The high temperature of thermal springs, the effects produced formerly by extinct volcanoes, and at present by those still in activity, with the fact that the earth becomes warmer the deeper we descend, have induced philosophers to adopt the idea of a central fire. This supposes that the globe was once in a state of igneous fusion; that the surface has gradually become solid by cooling; and that the interior of the earth is still liquid and hot, and may remain so for an indefinite period, during which the lost by radiation will become gradually more slow. [See EARTH, VOLCANO, &c.]

FI'RE-ARMS, a general designation for all sorts of guns, fowling-pieces, blunderbusses, pistols, &c., which produce their effect by the combustion of gunpowder. The manufacture of these weapons in England is very extensive; and in order to prevent the numerous accidents which would otherwise occur from the bursting of ill-constructed barrels, the Act 55 Geo. III, c 59, imposes a fine of 20*l.* on any person using, in any of the progressive stages of its manufacture, a barrel not duly proved, on any person delivering the same, except through a proof-house; and on any person receiving, for the purpose of making guns, &c, any barrels which have not passed through a proof-house.

FI'RE-BALLS, in Military operations, balls which are capable of being ignited: such, for instance, as are thrown by night from mortars or howitzers towards quarters which it is desirable to examine.——In Natural Philosophy, globular masses of fire, of different magnitudes, occasionally seen moving through the atmosphere with greater or less velocity. With regard to the nature of these phenomena, there are various conjectures. [See FALLING STARS, METEORS, &c.]

FI'RE-DAMP [See DAMPS]

FI'RE-DRESS, an invention of the Chevalier Aldini, consisting of an exterior light armour of metallic gauze, which was discovered by Sir Humphry Davy to be impervious to flame, and of an inner covering of a material which is a slow conductor of heat Among flexible fibrous substances capable of being spun and woven into tissues, the asbestos possesses preeminently the property of slowly conducting heat; but wool, cotton, &c., if immersed in certain saline solutions, prevent the transmission of injurious heat to the body, during an exposure of some minutes to the action of flame on the outward covering of wire gauze

FI'RE-ENGINE, an engine for extinguishing fire It consists of two forcing pumps, so combined that their joint action produces a constant and powerful stream of water, which, by means of a pipe, may be directed at pleasure to any point. The handles are so disposed, that, while the piston of one pump is up, that of the other is down; and they are elongated for the purpose of enabling a great number of men to work them at the same time.——By an ingenious application of steam power to the working of fire-engines, their usefulness has been greatly increased. As soon as an alarm is given, the fire is kindled, and the bellows attached to the engine are worked by hand. By the time the horses are harnessed, the fuel is thoroughly ignited, and the bellows are then worked by the motion of the wheels; so that generally, by the time the engine reaches the fire, the steam is ready. One of the ordinary construction will work in eighteen minutes after the fire is lighted, and will deliver about 9000 gallons an hour to a height of 90 feet, through an orifice of 7-8ths of an inch. Some of the insurance companies in London have floating fire-engines on the Thames, which are extremely serviceable in case of fire among the shipping, or buildings near the river.

FI'RE-ESCAPE, any machine or apparatus for enabling persons to escape from buildings on fire. Sometimes the object is effected with, and sometimes without, external aid. In the first case, a very portable kind of ladder, or a contrivance for raising by a rope and pulley a basket or other means of lowering persons to the ground, is generally used. In the second there is usually a rope ladder, or a long cord, with something like a seat, and so arranged that a person may lower himself.

FI'RE-FLY. Several flying insects give out light in tropical countries. Most of these are beetles, belonging to the order of *Elateridæ*. One of the most brilliant is the *Pyrophorus noctilucus*, an inhabitant of South America. Two or three of these, placed under a glass, will give out light sufficient for the reading of a book.

FI'RE-SHIP, a vessel filled with combustibles, and fitted with grappling irons, which, with the advantage of a favourable wind, hook on to the enemy's vessels, and set them on fire.

FI'REWORKS, compositions of sulphur, saltpetre, charcoal, and other ingredients, which produce a brilliant effect when ignited. [See PYROTECHNY.]

FI'RING-IRON, in Farriery, an instrument not unlike the blade of a knife; which, being made red-hot, is applied to a horse's hams, or other places, where there are morbid swellings, farcy knots, &c., in order to dissipate them.

FIR'KIN, an English measure of capacity, containing nine ale gallons, or seven and a half imperial gallons.

FIR'MAMENT (*firmamentum: Lat.*), in Scripture, denotes the great arch or expanse over our heads, in which are placed the atmosphere and the clouds, and in which the stars *appear* to be. Its name is due to the supposition that it was a transparent solid, in which the heavenly bodies were fixed.——In the Ptolemaic astronomy, the firmament is the eighth heaven or sphere, with respect to the seven spheres of the planets which it surrounds. It was supposed to have two motions—a diurnal, given to it by the *primum mobile*, from east to west about the poles of the ecliptic; and another opposite motion from west to east. There is a revolution in this direction, which, according to Tycho Brahe, is completed in 25,412 years; according to Ptolemy, in 36,000; and according to Copernicus, in 25,800; in which time the fixed stars would return to the same points in which they were at the beginning. This period is commonly called the Platonic, or great year.

FIR'MAN, or more properly **FER'MAN** (a command: *Pers.*), a mandate or certificate of the sovereign, in Turkey, Persia, &c., for various purposes, but best known to Europeans as a passport for travellers.

FIRST-FRUITS, offerings made to God by the Jews, of part of the fruit of their harvest, as an acknowledgment of his sovereign dominion. They were called first-fruits because they were offered in the temple before any part of the crop was touched.——FIRST-FRUITS, in the church of England, are the profits of every spiritual benefice for the first year. Before the Reformation, they were given to the pope, but since to the sovereign. The valuation is that made by Henry VIII. The first-fruits and tenths of all livings over 50*l.* were transferred, in the reign of Queen Anne, to a fund called *Queen Anne's bounty*, for the increase of smaller benefices, which are freed from any kind of payment.

FISC or **FIS'CUS** (a basket used by private persons for carrying money: *Lat.*), in Roman Antiquity, the treasury of a prince or state. It differs from the *ærarium*, which was the treasury of the public: thus, when the money arising from the sale of condemned persons' goods was appropriated to the use of the public, their goods were said to be *publicati*; but when it was destined for the support of the prince, *confiscati*. The *fiscus* did not exist until the time of the emperors; and as soon as they obtained possession of everything, the distinction between *fiscus* and *ærarium* was no longer observed. [See ÆRARIUM.]

FIS'CAL (from last), in the Civil Law, relating to the pecuniary interest of the prince or people. The officers appointed for the management of the fisc were called *procuratores fisci* and *advocati fisci*.

FISH (*Ger.*). [See PISCES.]——FISH, in Architecture, a piece of wood fastened to another to strengthen it.——FISHES, in Heraldry, are the emblems of silence and watchfulness, and are borne upright, imbowed, extended, endorsed, &c.

FISH'ERIES (*fischerey: Ger.*), places where fish are caught in great abundance, so as to constitute an important article in commerce. The principal fisheries for salmon, herrings, mackerel, pilchards, &c., are along the coasts of England, Scotland, and Ireland; for cod, on the banks of Newfoundland, Nova Scotia, and Labrador, as also on the coasts of Holland; and for whales, in those seas which wash the shores of Greenland, and also in various parts within the tropics.——*Anchovies* are fished for on the coast of Provence, in the months of May, June, and July, at which season shoals of this fish regularly come into the Mediterranean through the Straits of Gibraltar. They are likewise found in plenty in the river of Genoa, on the coast of Sicily, and on that of the island of Gorgona, opposite to Leghorn; those obtained at the latter place are reckoned the best. Anchovies are seldom fished for but in the night-time; for if a fire is kindled on the poops of the vessels, the anchovies come in greater numbers into the nets. About 120,000 lbs. weight of them are annually consumed in Great Britain.——

The *Cod fishery* is most important. It is carried on at the banks of Newfoundland and the neighbouring coasts. The cod are usually taken by line, nets being but rarely employed; and as they bite with great voracity, almost anything serves for bait. The number of vessels engaged in the North American *cod fishery*, including the British, American, French, Dutch, and Spanish, is calculated to amount to 6,000 or 7,000, which take about 40,000,000 fish annually.——The *Herring fishery* was at first engrossed almost entirely by the Dutch; but in 1749, parliament, to encourage it, granted a tonnage bounty on vessels employed in it. This had not, however, the desired effect, and was withdrawn. The most important seats of the fishery are on the coast of Scotland So long ago as 1834, 11,000 boats and 82,000 persons were employed in it. Herrings are remarkable for their immense numbers; they move in shoals, sometimes occupying many miles in extent, and several fathoms in depth Their presence is easily discovered, during the day, by the great numbers of birds which accompany them, and by the unctuous matter with which the water is covered; and in the night, by the brilliant phosphoric light which they emit. They are taken generally by night in nets, which are sometimes of enormous extent, and are dragged by a capstan Herrings are very plentiful about the Orcades in June and July; in the German Ocean in September and October; and in the English Channel in October, November, and December. ——*Mackerel* are found in large shoals in the ocean, but especially on the French and English coasts. They enter the English Channel in April; and proceeding as the summer advances, about June they are on the coasts of Cornwall, Sussex, Normandy, Picardy, &c, where the fishery is most considerable They are taken either with a line or nets, the latter being preferable; and most usually in the night-time. They are eaten fresh, and are also pickled in salt or brine.——The *Salmon* fishery in these countries has greatly diminished of late. It is carried on chiefly in the rivers, and sea-coasts adjoining to the river mouths Those rivers most distinguished for salmon in Scotland, are the Tweed, the Clyde, the Tay, the Dee, the Don, the Spey, the Ness, the Bewly, &c., in most of which it is very common, about the height of summer, especially if the weather happen to be very hot, to catch four or five score of salmon at a draught. The chief rivers in England for salmon are the Tyne, the Trent, the Severn, and the Thames. The fishing usually begins about January; and ceases in Scotland about the 15th of August, because, as it is then supposed, the fish come up to spawn. ——The principal *Sturgeon fishery* is in the mouth of the Volga, on the Caspian Sea, where the Russians employ a great number of hands.——The *Northern Whale fishery*, on the coast of Greenland, begins in May, and continues till the end of July.——The *Southern Whale fishery* consists of three distinct branches: 1st, that of the *spermaceti whale*, which is found in all tropical climates, but especially on the coasts of New Zealand and Japan: the ordinary duration of the voyage of a ship from England, employed in this department of the fishery, is about three years. 2nd, that of the common *black whale* of the southern seas, met with principally on the coast of Brazil. And, 3rd, that of the *sea-elephant*, or southern walrus, met with in the seas near California and the islands of Desolation, South Georgia, &c. Vast numbers of these animals are annually captured, and they furnish an abundance of oil——It appears that, while our northern whale fishery has long been declining, the American southern whale fishery has risen into great importance. It is, however, very generally believed that in the south, as well as in the north, there is a very perceptible decrease in the supply of fish, and that the whale fisheries have consequently passed their zenith——Besides the before-mentioned fisheries, there are several others, both on the coasts of Great Britain and in the North Seas, which, although not much the subject of merchandise, employ great numbers of persons; as, the *oyster* fishing at Colchester, Feversham, the Isle of Wight, in the Swales of the Medway, &c; and the *lobster* fishing in the British Channel, the Firth of Forth, on the coast of Northumberland, the coast of Norway, &c, &c.

FISH'ING (*fischen*, to fish: *Ger.*), the art of catching fish, whether by means of nets, or of spears, lines, rods, and hooks. By several statutes it is provided, that no person shall fish in any pond or moat without the owner's consent, on pain of three months' imprisonment; and if any one take fish in a river without a licence obtained from the proprietor, he shall forfeit 10s. to the poor, and triple damages to the party aggrieved

FISH'ING FROG, or ANGLER, the *Lophius piscatorius* of icthyologists, called also the toad-fish and sea devil It is the most ill-shaped of fishes, resembling the tadpole of the frog. The head is larger, circumferentially, than the whole body; the mouth is nearly as wide as the head, and the lower jaw is much longer than the upper, and bearded all round the edge, both jaws being armed with numerous teeth; while it lies hid in mud, which it stirs up to render the water turbid. Upon the snout and head are two or three flexible spines covered with skin, one of which has a fleshy tag at the end. It is said that this acts as a bait and brings small fish within reach of the unwieldy Lophius. The common angler is from three to six feet long.

FIS'SILE (*fissilis*: *Lat.*), an epithet often used in Mineralogy, &c., for that which may be cleft or divided in the direction of the grain, natural joints, or laminæ.

FIS'SIPED (*fissus*, cleft; and *pes*, a foot: *Lat.*), in Zoology, an epithet for an animal whose toes are separate or not connected by a membrane.

FIS'SURE (*fissura*: *Lat.*), a narrow chasm made by the parting of any substance.——In Surgery, a crack or slit in a bone, either transversely or longitudinally.

FIS'TULA (a pipe: *Lat.*), in Surgery, a long sinuous ulcer, communicating with a larger cavity, and having a small external opening.——FISTULA LACHRYMALIS, a disease which attacks the great caruncle in the inner corner of the eye; a disorder accompanied with a flowing of tears. ——FISTULA, an ancient musical instrument resembling our common flute or flageolet.

FIS'TULAR (same *deriv.*), among botanists, an epithet applied to leaves and flowers that are tubular, or resemble a hollow pipe.

FISTU'LIFORM (*fistula*, a pipe; and *forma*, a form: *Lat.*), in Mineralogy, an epithet for such substances as are in round hollow columns.

FIT (a corruption of *fight*, because every fit of sickness is a struggle for life), a sudden and violent attack of disorder, in which the body is often convulsed, and sometimes senseless: as, a *fit* of apoplexy or epilepsy, &c. We also apply the word to the first attack or the return of certain diseases; as, a *fit* of the gout, &c.——FIT, or FYTTE, an old word for a division of a lyric poem or ballad.

FITCH'ET (*fissau: Fr.*), an animal of the weasel kind: the polecat.

FIXED AIR, the name formerly given by chemists to the air which was liberated from certain compounds of lime, magnesia, and alkalis: it is now commonly called *carbonic acid gas*, which see.

FIXED OILS, in Chemistry, such oils as bear a high temperature before they give off vapour, in distinction from volatile or essential oils.

FIXED STARS, in Astronomy, the stars that are exterior to our solar system. The great majority of such stars retain the same apparent position and distance with respect to each other; and are thus distinguished from planets and comets, which are moving bodies.

FLAG, a general name for colours, standards, banners, ensigns, &c.——*To strike or lower the flag* is to pull it down in token of respect or submission.——*To strike the flag*, in an engagement, is the sign of surrendering.——*To hang out the white flag* is to ask quarter; in some cases, it denotes that the vessel has no hostile intention, but comes to trade, &c. The *red* flag is a sign of defiance and battle.——*To hang the flag half-mast high* is a token or signal of mourning.——The chief naval flags are: the royal standard; the admiralty flag, an anchor on a red ground; and the union or jack, in which are blended together the crosses of St. George, St. Andrew, and St. Patrick; it is carried by the admiral of the fleet.——FLAG, a name applied to several plants with bladed leaves. There is the common flag, or water iris, that grows in rivers, and bears a yellow flower, the *Iris pseudacorus* of botanists. The *corn-flag* is a species of gladiolus. The *sweet-flag*, *Acorus calamus*, a plant that has an aromatic odour with an acid taste, and is used as a stimulant and tonic.

FLAG'-OFFICERS, those who command the several squadrons of a fleet; as, admirals, vice-admirals, and rear-admirals. [See ADMIRAL.]

FLAG'-SHIP, a ship which has on board an officer, who has a right to carry a flag, in distinction from the other vessels under his command.

FLA'GELLANTS (*flagellans*, scourging: *Lat.*), in Church History, a fanatical sect in the 13th century, who maintained that remission of sins was not to be obtained without flagellation. Accordingly, they walked in procession, preceded by priests carrying the cross, and publicly lashed themselves till the blood ran down their naked bodies. They were joined by nobles, ecclesiastics, nuns, and children, and their pilgrimages extended throughout all the provinces of southern Germany, and even farther. They were dressed in sombre garments, with red crosses on the breast, back, and cap, and they carried triple scourges, tied in three or four knots, in which points of iron were fixed. Even by night and in the severest winter they traversed the cities in thousands with burning torches and banners, chanting penitential hymns.

FLAME (*flamma: Lat.*), a gaseous or vaporous body in a state of intense ignition. When the vapour or gas is intimately mixed with a supporter of combustion, such as oxygen, the ignition is so sudden and so general, on the application of heat, as to be what is termed an *explosion*. Unless the supporter is thrown into the interior of the flame, as with the blow-pipe, the combustion is on the exterior of the flame only; and the flame is more elongated, and the ignition and light less intense, in proportion as the inflammable gases come more slowly into contact with the requisite quantity of supporter. Every one must have remarked that the flame of a lamp immediately contracts, and the light becomes more brilliant, the instant a glass chimney, which increases the current of air, and therefore the supply to the flame, is placed over the burner. A flame is gas or vapour at a white heat; anything, therefore, that lowers its temperature, destroys the flame. If a wire gauze is placed over a flame, the latter cannot pass through the meshes; for the vapour or gas, in passing them, is so cooled down as to be no longer flame. This is the principle on which Davy's safety-lamp for miners is covered with wire gauze. No temperature less than that of flame will explode mixed gases in the mine; and that temperature is lost in passing from the interior of the lamp through the gauze.

FLA'MEN (*Lat.*), in Roman Antiquity, the name of an order of priests, said to have been instituted by Romulus or Numa. Originally there were three priests so called: the *Flamen Dialis*, consecrated to Jupiter; *Flamen Martialis*, sacred to Mars; and *Flamen Quirinalis*, who superintended the rites of Quirinus or Romulus. But the number was afterwards increased with the introduction of new gods and the worship paid to deceased emperors.

FLAMIN'GO (*flamma*, a flame: *Lat.*), the popular name of a genus of long-legged, web-footed birds (*Phœnicopterus*), with scarlet plumage, of which one species, *P ruber*, haunts the shores of the Mediterranean. Two other species are natives of South America. They feed on worms, shell-fish, &c.

FLANK (*flanc : Fr*), the side of an army, or a battalion encamped on the right or left.——In Fortification, that part of a bastion which reaches from the curtain to the face; or any part of a work that defends another work along the outside of its parapet.

FLAT, in Music, a character which lowers a note one semitone.

FLAT'TING, in gilding, the giving a light touch to the work in the places not burnished; it is done with a pencil dipped in size, in which a little vermilion is sometimes mixed.

FLAT'ULENCE (*flatus*, a blast of air: *Lat*), in Medicine, air generated in a weak stomach and intestines by imperfect digestion, occasioning distension, uneasiness, and frequent eructations.

FLAX (*flex: Sax.*), the fibre obtained from the stalks of the *Linum usitatissimum*, an annual plant with a blue flower, which is extensively cultivated throughout Europe and in other parts of the world. The most suitable soil is a light dry loam, with a moderately tenacious subsoil. The plants are pulled by hand, and are then placed in water until a certain amount of putrefaction has ensued. This is called *retting* The fibre is then easily separated from the soft non-fibrous portion of the straw by the process called *scutching*, which is done by machinery. After scutching the fibre is *hackled*, that is, it is repeatedly drawn through sets of iron teeth, by which the broken pieces are combed out, and the fibres are arranged parallel-wise. It is then ready for the spinner. The aggregate value of goods annually manufactured from flax in the United Kingdom is upwards of 15 millions sterling; and nearly a million persons are employed in the manufacture.

FLEA (*Sax.*), an insect of the genus *Pulex*, a member of the order *Aphaniptera*. The species undergo complete metamorphosis, that is, they are grubs and pupas before they are perfect insects. The muscular power of the flea is truly wonderful. It has been known to draw 70 or 80 times its own weight: it resists the ordinary pressure of the fingers in our endeavours to crush it, and leaps two hundred times its own length. Hence it is called by the Arabians 'the father of leapers.' Supposing the same relative force to be imparted to the body of a man six feet high, he would be enabled to leap three times the height of St. Paul's! Latreille tells us of a flea which dragged a silver cannon 24 times its own weight, mounted on wheels; and was not alarmed when this was charged with gunpowder and fired.

FLEAM (*flamme : Fr.*), an instrument for bleeding cattle: it is a small blade, which is projected from a sheath by a spring.

FLEECE (*fliess : Ger.*), a flock of wool, or what comes from a sheep at one shearing. ——ORDER OF THE GOLDEN FLEECE, an order of knighthood instituted by Philip III., duke of Burgundy, in 1430.

FLEET (*flota*, a company of ships : *Sax.*), a squadron of ships, either of war or commerce.——FLEET (*fleoh*, a place where the tide comes up . *Sax.*) was also the name of a prison in London, where debtors were confined, and to which persons were committed by the courts of Chancery and Common Pleas. It was situated in Farringdon Street, and derived its name from a stream which formerly ran near the building, and was called the Fleet In time it became little more than a sewer, and, being offensive, was covered over

FLESH (*fleisch: Ger.*), in Anatomy, the muscular part of an animal body, in which the blood-vessels are so small as to retain only blood enough to give them a red colour.——FLESH, in Botany, the pulpy substance of any fruit or root

FLEUR-DE-LIS, in Heraldry, a charge supposed to represent an iris; or, as some have supposed, the head of a javelin. It was borne from an early period in the arms of France

FLEX'OR (*flecto*, I bend · *Lat*), in Anatomy, a name applied to several muscles, whose office it is to bend the parts to which they belong: they are opposed to the *extensors*, which open or stretch these parts.

FLEX'URE (*flexura*, a bending . *Lat.*), in Geometry, the bending or curving of a line or figure The *point of contrary flexure* is that point in a curve at which the curvature passes from convex to concave, or *vice versâ*

FLINT (*Sax*), a semi-pellucid stone, consisting of nearly pure silex It is a subspecies of quartz, of different shades of colour. Flints occur almost always in nodules or tubercular concretions of various and very irregular forms. They are formed in regular layers in chalk strata How they came to be so deposited is a question geologists have not yet solved They break with an even, glossy surface, are moderately transparent, very hard, and capable of a fine polish; readily strike fire with steel; and burn to whiteness They are employed in the manufacture of glass and pottery ware

FLINT GLASS, or CRYSTAL. It derives its name from flint, because that substance was formerly employed in its manufacture. It is important to the maker of optical instruments, as it possesses the property of causing a greater dispersion of the rays of light, passing through a prism or lens formed of it, than any other vitreous substance—which is due to the lead it contains. Hence its use in the manufacture of achromatic lenses. [See ACHROMATISM.] But then there is great difficulty in obtaining large pieces of flint-glass quite free from streaks.

FLOAT (*flott*, a float: *Ger.*), a raft, or number of pieces of timber fastened together and floated down a river with the tide.

FLOAT'ING (same *deriv.*), THE ART OF. Persons have sometimes been saved from drowning by remembering that the human body is specifically lighter than water, and will float on it, particularly if the lungs are well inflated and it is kept quiet. But it must lie along the water on the back, or the mouth will not be above the surface.——

Floating Battery, a vessel used as a battery to cover troops landing on an enemy's coast.——**Floating Breakwater**, a marine contrivance, consisting of a series of square frames of timber, connected by mooring chains or cables, and intended to break the violence of the agitated waves: vessels may ride within these quadrangular basins with more safety; and they produce smooth water in bathing-places, on a rough coast.——**Floating Bridge**, in War, a kind of double bridge, the upper part of which projects beyond the lower. It is capable of being moved forward by pulleys, and is used for carrying troops over narrow moats in attacking the outworks of a fort. Floating bridges, in the form of ferry-boats of a very large size have of late been constructed for the transit of passengers and goods across creeks, harbours, &c., by the application of steam-power.——**Floating Light**, on shipboard, a hollow vessel of tinned iron-plate, with a lantern. It is used for the purpose of saving those who may have the misfortune to fall overboard in the night.——**Float-boards**, those boards fixed to water-wheels or under-shot mills, serving to receive the impulse of the stream, by which the wheel is carried round.

FLOETZ, or **FLETZ** (*flötz*, a layer: *Ger.*), in Geology, a term formerly employed by Werner and other German geologists, to signify what are now known as secondary rocks.

FLOOD'-GATE (*fluth*, a flood: *Ger.*), a sluice or gate that may be opened or shut, for the admission or exclusion of the water.

FLOOD'-MARK, the mark which the sea makes on the shore at the highest tide: high-water mark.

FLO'RA (the goddess of flowers: *Lat.*), the term used to designate the plants which are indigenous in a country, as we say, the Flora of Great Britain, meaning the wild plants of the country.

FLOR'ID STYLE (*floridus*, flowery: *Lat.*), in Literary Composition, that which is much enriched with figures and flowers of rhetoric. Longinus uses the terms *florid* and *affected style* indifferently, and describes them as quite contrary to the true sublime.

FLOR'IN (*Fr.*, from *Florence*, in Italy, where it was first coined), a coin of different values; the silver florin of Austria is worth about 2*s.* 1*d.* The two shilling piece of the United Kingdom is called a florin.

FLOS (a flower: *Lat.*), in Botany, the name of several species of plants. Also a general name for the flower.

FLOS'CULE (*flosculus*, a little flower: *Lat.*), in Botany, a floret of a compound flower.

FLOS'CULOUS (same *deriv.*), in Botany, an appellation sometimes given to compound flowers, made up of a number of florets enclosed in the same common cup.

FLOSS SILK, the name given to the portions of ravelled silk broken off in the filature of the cocoons. It is carded like cotton or wool, and spun into a soft coarse yarn or thread, for making shawls, socks, and other articles where an inferior kind of silk may be used.

FLOT'SAM, in Law, a term for goods lost by shipwreck, but which are floating on the sea. There are two other uncouth terms made use of to describe wrecked goods, viz. *jetsam* and *ligan*: the former is used when the goods are sunk; and the latter also when they are sunk, but are tied to a cork or buoy, that they may be found again.

FLOUR'ISH (*floresco*, I flourish: *Lat.*—used metaphorically), in Music, a prelude or preparatory air, which does not follow any settled rule. Also the notes which a singer or instrumental performer occasionally introduces.——In Military language, the sounding of trumpets, on receiving an officer or other person of distinction.

FLOW'ER (*fleur*: *Fr.*), that part of a plant which contains the organs of fructification. The parts are arranged in whorls. In a complete flower the outer one consists of the calyx formed of one or more leaves, termed sepals; the next is the corolla composed of one or more petals; the third whorl is formed by the stamens, and the innermost of the pistils. Sometimes there is only one whorl of floral leaves, and then the flower is said to be *monochlamydeous*, if neither whorl is present it is termed *achlamydeous*. If both calyx and corolla are present, but so blended together that they are not easily distinguished, the floral envelope is termed a *perianth*.

FLOW'ERS, in Chemistry, a term formerly applied to a variety of substances procured by sublimation; as flowers of sulphur, &c.

FLOW'ERS, ARTIFI'CIAL, a considerable article of manufacture, particularly in France. The savages of South America manufacture, with feathers derived from the brilliant plumage of their birds, flowers which closely resemble the products of vegetation.

FLU'ATES, in Chemistry, salts which are more correctly termed *Fluorides*, and consist of fluorine combined with a metal, &c.

FLU'ID (*fluo*, I flow: *Lat.*). From the facility with which the particles of fluids move among each other, the pressure exerted by a given particle, which depends on the specific gravity of the fluid and the height of the column above, is equal in every direction. The pressure of a fluid on any surface is equal to the surface multiplied by the depth of its centre of gravity below the surface of the fluid. Fluids are divided into elastic and non-elastic: these are, however, relative terms, all fluids being more or less elastic. That which is termed an *elastic* fluid, is in the form of an air or vapour: it is *permanently* elastic, if it retains its aeriform nature at the ordinary temperature of the atmosphere; but *non-permanently* elastic, if, like steam, it becomes a liquid in the same circumstances. The elasticity of non-elastic fluids is so trifling that for a long time it was not certain that they had any. Whether a given body shall be a solid, liquid, or gas, depends on heat, or heat and pressure.

FLUKE, the common name of a species of Distoma (a genus of intestinal worms), which infests the liver of sheep, and produces the disease called *rot*. Other species are found in the alimentary canal, or other internal parts of other mammals, and of birds and fishes. These animals, some of which are very small, have soft bodies with two suckers by which they adhere. One of the suckers surrounds the mouth. All are destitute of eyes and other organs of special sense.

FLUOR'IC A'CID. [See Hydrofluoric Acid.]

FLU'ORINE, in Chemistry, an element presumed to be gaseous, which, when combined with hydrogen in the proportion of nineteen parts to one of the latter, forms hydrofluoric acid. It has never been obtained isolated, in consequence of its energetic action on the metals, and especially silicium, a component of glass.

FLU'OR SPAR, in Mineralogy, the fluate of lime; a mineral which abounds in nature, and consists of calcium in combination with fluorine. Though sometimes massive, it is almost always regularly crystallized. The variously coloured specimens called *Derbyshire spar* are, by means of the turning-lathe, formed into vases and other ornaments.

FLUOSILIC'ATE, in Chemistry, a compound containing fluosilicic acid.

FLUOSILIC'IC ACID, in Chemistry, an acid consisting of fluorine and silicon.

FLUSH, in Carpentry, a term signifying that two bodies joined together make an even surface.

FLUTE (*flûte: Fr.*), *the common or English*, a musical wind instrument, consisting of a tube of wood about eighteen inches in length, furnished with holes at the side, for the purpose of varying its sounds, by stopping and opening them with the fingers. The *German flute*, unlike that just mentioned, is blown by a hole at the *side:* besides the other holes at the side, intended to be stopped by the fingers, it has brass or silver keys, to produce the various flats and sharps, &c.

FLUTES or FLU'TINGS (same *deriv.*), in Architecture, perpendicular channels cut along the shaft of a column or pilaster. They are scarcely ever used in the Tuscan order: their section is circular, segmental, or elliptical. The Doric column has twenty round its shaft: columns of the other orders, twenty-four. The flutings of columns are sometimes *cabled*—that is, have their lower parts partly filled up with cylindrical pieces, like a cable.

FLUX (*fluxus*, a flowing; *Lat.*), in Chemistry, a general term to denote any substance or mixture added to assist in the fusion of minerals. The fluxes made use of in experiments consist usually of alkalis, which render earthy mixtures fusible, by converting them into glass. When tartar is deflagrated with half its weight of nitre, a mixture of charcoal and carbonate of potash remains, which is called *black flux*. When an equal weight of nitre is used, the entire charcoal is burned off, and *white flux* remains. Limestone, fluor spar, borax, and several earthy or metallic oxides, are employed as fluxes in metallurgy.——Flux, in Medicine, an extraordinary issue, or evacuation of some humours of the body.——Flux and Reflux, the regular and periodical motion of the sea, which happens twice in 24 hours 48 minutes. By the flux or advancing motion of the tide, the water rises; by the reflux, or ebbing of the tide, it sinks.

FLUX'IONS (*fluxio*, a flowing: *Lat.*), a method of algebraic calculation invented by Sir Isaac Newton. In this branch of mathematics, magnitudes of every kind are supposed to be generated by motion. The method is the same as that of limits complicated with the idea of motion. By a comparison derived from mechanics, it represents the method of prime and ultimate ratios. This method has been abandoned by mathematicians for Leibnitz's invention, the Differential Calculus, because it was found weak in resources and embarrassing in operation.

FLY, the popular name of many species of winged insects chiefly belonging to the vast order Diptera. The common blue-bottle fly, *Musca vomitoria*, and the common house fly, *Musca domestica*, are amongst the best known species.——Fly, in Mechanics, a heavy wheel or other body, intended to regulate the velocity of a machine, or to accumulate power. Its efficiency as a regulator arises from the comparatively large number of its particles, which require a vast increase or diminution of motion, in order that the velocity of the whole mass may be *sensibly* changed. It absorbs motion when there is too much, and gives it out when there is too little. In this way it is used as a regulator of the steam-engine. It serves as a means of accumulating force; and suddenly giving out the force which it received gradually, it enables a power, in coining, &c., to produce a far greater effect than would be possible without such a contrivance. Its shape is of little consequence, only so far as that the less it is resisted by the air the better; but the farther the mass from the centre of motion, that is, the greater the circle it describes, the more effective it is. A fly is generally in the shape of a wheel, or of a rod with a heavy ball of metal at each extremity.——Fly, among mariners, that part of a compass on which the thirty-two points are described.

FLY'-BLOW, the deposit of eggs by flies, which afterwards become larvæ or maggots, and ultimately flies.

FLY'-CATCHER, the common name for passerine birds belonging to the genus *Muscicapa*. They eagerly devour insects on the wing. Two species are summer visitors to England, where they breed.

FLY-OR'CHIS, in Botany, the *Orchis muscifera:* a plant, so called from the resemblance it bears in figure to a fly.

FLY'-TRAP, the *Dionæa Muscipula*, or Venus's Fly-trap, a North American plant allied to the Sundew. The leaves are divided into two parts, and each carries three minute bristles, which are so extremely irritable, that if a fly touches them, the two parts of the leaf collapse, and at the same time take the fly a prisoner. After a while they spontaneously open.

FLY'ERS (*fliegen*, to fly: *Ger.*), in Architecture, stairs that do not wind, but are made of an oblong square figure, and go straight forward, the second standing behind the first, and so on.

FLY'ING (*fliegen*, to fly: *Ger.*), the progressive motion of a bird, or other winged animal, in the air The parts of birds chiefly concerned in flying are the wings, by which they are sustained or wafted along. Flying is effected in the following manner:—the bird first bends his legs, and springs with a violent leap from the ground; then opens and expands the joints of his wings, so as to make a right line perpendicular to the sides of his body: thus the wings, with all their feathers, constitute one continued lamina. Being now raised a little above the earth, and vibrating the wings with great force and velocity against the subjacent air, that fluid resists, both from its natural inactivity and elasticity, and thus the whole body of the bird is moved forward. Birds never fly upwards in a perpendicular line, but always in a parabola. In a direct ascent, the natural and artificial tendency would oppose and, to a great extent, destroy each other, so that the progress would be very slow. In a direct descent they would aid one another, so that the fall would be too precipitate.

FLY'ING BUT'TRESS, in pointed Architecture, a buttress connected with the main building by an arch, which abuts against the springing of another arch in the interior—generally the vaulting of the nave. If these buttresses were built solid, their appearance would be heavy, and they would interrupt the vista along the sides of the church, &c. Their stability depends on the resistance derived from the weight of the vertical buttress, whence they spring.

FLY'ING FISHES These belong to the genera *Exocœtus* and *Cypselurus* of naturalists. They are allied to the garfish and saury pike of our coasts, and are remarkable for the extraordinary length of the pectoral fins. Voyagers in warm seas have often described their habit of rising into the air, in large bands, like a flight of larks or sandpipers, and sinking again into the sea, after a rapid course of several hundred feet. The cause of this movement is supposed to be an attempt to escape from other fishes. Before finally subsiding into the water, they frequently undulate, and even touch the crests of waves, as if to wet their dry fins. It has been denied that they move their fins during their flight, but the evidence of several good observers proves that they do. They have also been seen to change the direct line of their flight for one nearly at right angles, and this a shoal of them will do simultaneously.

FLY'ING PIN'ION, that part of a clock, to which is attached a fly or fan, which gathers air, and checks the rapidity of the clock's motion, when the weight descends, in the striking part.

FO'CAL DIS'TANCE (*focus*, a fire-place: *Lat.*), in Optics the distance between the centre of a lens, or mirror, and the *focus* or point at which the rays are collected.

FOCIM'ETER (*focus*: *Lat.*; and *metron*, a measure: *Gr.*), an instrument contrived for the purpose of enabling the photographer to ascertain the focus of the photogenic rays. The principle of the instrument is the placing before the camera at the same moment a circular arrangement of cards formed into segments, each segment being at a different distance from the lens. A photographic picture of all these is simultaneously produced. The picture of some one among them will always be found to be more distinct than those of the others, and it follows that the plate or paper is in the photogenic focus corresponding to that one.

FO'CUS (a fire-place: *Lat.*), in Optics, the point of convergence at which all the rays of light meet after passing through a convex lens. It should be observed, however, that the focus is not, strictly speaking, a *point*, but a small circle, which bears the same relation to the apparent diameter of the lens, that the image of any other object, formed in the focus of the lens or mirror, bears to the object itself. Only a point can give the image of a point.——FOCUS, in Geometry and conic sections. The focus of a *parabola* is a point in the axis having this property, that a radius drawn from it to any point in the curve makes the same angle with the tangent, at that point, that the tangent makes with the axis. Hence, if parallel rays of light fall on the parabola, they are reflected to the focus; or rays emitted from the focus will be reflected in a direction parallel to the axis. The foci of an *ellipse* are situated in the major axis, at equal distances from the centre; and the *sum* of two straight lines drawn from them to any point in the curve, is, with the same ellipse, always the same quantity. Also these two lines make equal angles with the tangent at that point. Hence rays of light, &c., emitted from one focus, are reflected to the other. The foci of an *hyperbola* are also in the major axis, at equal distances from the centre; but the *difference* between two straight lines drawn from them to any point in the curve, is, with the same hyperbola, always the same quantity; and these two lines make equal angles with the tangent at that point, but at opposite sides of the curve. Hence a ray of light emitted from one focus will be reflected into the direction of a ray coming from the other; or rays passing towards one focus will be reflected to the other.

FOD'DER (*futter*: *Ger.*), in Husbandry, any kind of food for cattle. *Green fodder* consists of grass, tares, &c.; *dry fodder*, of oats, barley, and beans.

FŒ'TUS (the young of any creature: *Lat.*), in Physiology, the child in the womb of its mother, after the fifth month of pregnancy. Before that time it is termed an *embryo*.

FOG (a storm: *Dan.*), in Meteorology, a dense vapour near the surface of land or water. Fogs generally arise from the nocturnal cooling of the atmosphere, which becomes incapable of retaining in solution the same quantity of water it held when at a higher temperature. A part, therefore, is precipitated as a cloud, which, if near the earth, is termed a fog. The heat of the day causes the air to redissolve the precipitated vapour, which enables the air to again become clear. The dense and gloomy fog so common in London is often due to a different cause. The wind carries the smoke of the city in a long train extending twenty or thirty miles; as may be seen in a clear day by any person on an eminence five or six miles from the city, and looking across in the direction of the wind. If the wind changes suddenly, this great body of smoke will be brought back in an accumulated mass, and, as this repasses the city, will be augmented by the smoke from every fire. Fogs have been observed which contained no moisture, and could be accounted for only by supposing them to be the vapours and ashes ejected by volcanoes, and diffused in the atmosphere by the wind.

FOG'-BANK, an appearance at sea in hazy weather which frequently resembles land at a distance, but which vanishes as it is approached.

FOIL (*feuille*, literally a leaf: *Fr.*), among jewellers, a thin leaf of metal placed under precious stones to increase their lustre and improve their colour. Hence anything of a different colour or quality, which serves to adorn or set off another thing to advantage, is termed a *foil*.——In Fencing, an elastic rod of steel, or sword without a point, used to fence with by way of exercise. It generally has at the end a button or piece of cork covered with leather.

FOLIA'CEOUS (*foliaceus*, leafy: *Lat.*), in Botany, having leaves, or being leaf-like. A foliaceous spike is one that has leaves intermixed with flowers.——In Mineralogy, having the form of a leaf or lamina; as, a *foliaceous* spar.

FO'LIAGE (*feuillage: Fr.*), in Architecture, the representation of leaves, flowers, and branches, intended to ornament and enrich capitals, friezes, pediments, &c.

FO'LIATE (*foliatus*, having leaves: *Lat.*), in Botany, furnished with leaves.

FO'LIATED (same *deriv.*), in Mineralogy, consisting of thin plates; lamellar; as, a *foliated* structure.

FO'LIATING (same *deriv.*), a term used for covering the backs of looking-glasses with a thin coat of tin and quicksilver.

FOLIA'TION (*folium*, a leaf: *Lat.*), in Botany, the leafing of plants.

FO'LIO (a leaf: *Ital.*), in account books, denotes a page, or rather both the right and left hand pages, these being marked with the same number.——FOLIO, a book of the largest size, the leaves of which are formed by once doubling a sheet of paper.

FO'LIOLE (a *dim.* from *folium*, a leaf: *Lat.*), in Botany, one of the single leaves, or leaflets, which together constitute a compound leaf.

FO'LIOUS (*foliosus*, leafy: *Lat.*), in Botany, having leaves intermixed with the flowers.

FO'LKLAND (*folk*, the people; and *land: Sax.*), in Saxon Law, land held by the commonalty at the will of the lord.

FO'LKMOTE (*folk*, the people; and *gemote*, to assemble: *Sax.*), a word used in England before the Norman conquest, to denote an annual assembly of the people, answering in some measure to a modern parliament. Some authors, however, allege that the folkmote was an inferior court, or the common-council of a city or borough.

FOL'LICLE (*folliculus*, a small bag: *Lat.*), in Botany, a seed-vessel, opening on one side longitudinally, and containing several seeds. Examples may be seen in the fruit of larkspur and columbine.

FOMENTA'TION (*fomentum*, a warm lotion: *Lat.*), the act of bathing any part of the body with hot water, or a decoction of herbs, &c., made hot, for the purpose of easing pain or dispersing tumours.

FONT (*fons*, a fountain: *Lat.*), a large basin or vessel, in which water is contained for baptizing infants or other persons. It is so called, probably, because baptism was usually performed among the primitive Christians at springs or fountains. The following Greek inscription, which reads *backwards and forwards* equally well, is often found on the walls of baptisteries, and on fonts:—ΝΙΨΟΝ ΑΝΟΜΗΜΑΤΑ ΜΗ ΜΟΝΑΝ ΟΨΙΝ (*nipson anomēmata mē monan opsin*)—'Wash away transgressions, not the appearance alone.'——FONT or FOUNT, a complete assortment of printing types of one size, including a due proportion of all the letters, points, figures, accents, &c.

FOOD (*futter: Ger.*), comprises all substances capable of digestion and assimilation. But the proximate principles, or elements, on which the nutritive properties of these depend, are very few. Those of vegetable substances are gluten and its modifications, starch, gum, sugar, and lignin or woody fibre: those of animal substances, albumen, gelatine, and their modifications. Both animal and vegetable substances afford fats and oils. Sometimes the nutritious parts of food are so combined with or protected by indigestible matters as to resist the solvent powers of the stomach, unless prepared or modified. Indurated lignin will pass unchanged through the stomach and bowels: hence the kernels of the apple, pear, &c., the seeds of the currant, gooseberry, &c., peas, beans, &c., wheat, barley, &c., on account of their covering of lignin, will not be digestible unless these coverings are broken down or removed. Much of the digestibility and nutritious power of the food of man is due to the chemical operations carried on in the kitchen. Meat is not only softened by heat, but new substances are generated in it: thus, *osmazone*, which gives such an agreeable odour and flavour, by roasting. The salt also, and the condiments employed, have their own uses; the former contributing an element to the gastric juice, and the latter stimulating the stomach. If the nutritive elements of food are few, its ultimate elements are still fewer, being little more than carbon, hydrogen, oxygen, and nitrogen. Among vegetable substances, albumen, including gluten, is the only one which contains much nitrogen; all the others may actually be considered as compounds of *charcoal and water*. An animal cannot subsist long on food containing no nitrogen, or on food exclusively of one kind, though habit will do much in accustoming the stomach to particular kinds of food. Nothing is fit for food which has not undergone organization by forming a part of an animal or a vegetable. Hence food never can be made from its ultimate elements.

FOOL'S PARS'LEY, the *Æthusa Cynapium* of botanists, an umbelliferous plant, found abundantly in waste ground, and resembling parsley sufficiently to deceive the ignorant. It is poisonous, acting like hemlock.

FOOT (*fuss: Ger.*) Animals are distinguished, with respect to the number of their feet, into *bipeds*, two-footed, as men and birds; and *quadrupeds*, four-footed, as most land animals. The human foot consists of the tarsus, metatarsus, and phalanges or toes. The *tarsus* is composed of seven bones in two rows, in the first of which is the *os calcis* or heel bone. The *metatarsus* is composed of five bones, one to each toe; whilst the toes are composed, like the phalanges of the fingers, of fourteen bones, the big toe having two, the rest three each. Man is distinguished from his relatives in the zoological scale, amongst other things, by being able to plant his foot flat on the ground, whilst the foot of the quadrumana, when attempting to walk, rests on its outer side.——Foot, a measure of length, varying in different countries, but in all divided into twelve parts. A *square foot* is a square surface, each of whose four sides is a foot in length. A *cubic* or *solid foot* is a solid contained within six surfaces, each of which is a square foot. A square foot contains 144 square inches, and a cubic foot 1728 cubic inches.

FOOT'STALK, in Botany, the stalk by which a leaf is connected with the branch; a petiole. Leaves destitute of petioles are termed *sessile*.

FOR'AGE (*fourrage: Fr.*), all kinds of provender for cattle, especially for horses in time of war.——*A foraging party* is a body of men sent out to collect provisions, either for the horses or for the troops.

FORA'MEN (*Lat.*), in Anatomy, a small opening. The *foramen ovale* is the opening between the two auricles of the heart of the fœtus, which before birth allows the blood to pass from one to the other without going through the lungs. It closes when the child is born, for, the blood being no longer purified by passing through the lungs of the mother, it is indispensable that it should now pass through the lungs of the infant. Hence, if a child has *ever* breathed, its lungs will *float* in water, from their air-cells having been rendered light by inflation. In Botany, the foramen is an opening through the integuments of an ovule by which the fecundating influence of the pollen reaches the nucleus.

FORAMIN'IFERA (same *deriv.*), animals belonging to a very low type of organization, inhabiting small shells, usually calcareous, which are frequently of elegant form. They belong to the class of Rhizopods, and have received their name from the shell being, in many instances, pierced with minute holes, through which the animal extends parts of its body for the purpose of collecting food. The animals are destitute of special organs, and consist of a mass of featureless matter called *sarcode*. The shells are sometimes one-chambered, but generally they are divided into several chambers, being increased by additional chambers as the animal grows. The forms are very varied, globular, flask-shaped, dagger-shaped, nautilus-like, &c. Some of the minute forms are interesting objects for the microscope. They are all inhabitants of the sea, and, whilst some are found on shore-seaweed, others have been brought up from a depth of 1800 fathoms. Their fossil remains abound in prodigious numbers in the tertiary beds. The miliolite limestone of the Paris basin, which is largely employed in building, is composed entirely of foraminifera. [See Nummulite.] A considerable portion of the chalk beds is formed of minute foraminiferous shells.

FORCE (*Fr.*), in Mechanics, whatever produces, modifies, or destroys motion. The effect of a force depends on its intensity, the point of the body at which it acts, and its direction. It may be either uniform or variable. If *uniform*, as long as it continues to act on a body, it *uniformly accelerates* its velocity. If *variable*, the effect is correspondingly modified. Sometimes there is a *combination of forces*, that is, two or more forces act together on the same body; and the *resultant*, that is, the resulting force, except when their directions are parallel, is in the direction of none of them.——Physical Force, the force of material bodies.——Moral Force, the power of acting on the reason in judging and determining.——Force, in Law, signifies any unlawful violence offered to the person or to property. A *forcible entry* is a violent and actual entry into houses or lands; and a *forcible detainer* is a violent withholding the possession of lands, &c., so that the person who has a right of entry is hindered therefrom.——Living Force, or *vis viva*, a term formerly used by Mathematicians to denote the action of a force when it is modified in such a way as to be proportional to the square of the velocity.——Conservation of Force. It is an axiom in physical science that force can neither be created nor destroyed. Since matter is only known by its forces, to admit that force is destructible would be to admit that matter can cease to exist. When we see a case of the apparent disappearance or suspension of a force, it is simply the transference of its exertion from one into some other direction. Inertia is a pure case of the conservation of force. It has a strict relation to force in any way acting upon a body, and it enables a body to take up and conserve a given amount of force, until that force is transferred to other bodies, or is changed into an equivalent of some other form.

FOR'CEPS (*Lat.*), in Surgery, an instrument for holding or gripping anything. Also, a pair of scissors for cutting off or dividing the fleshy membranous parts of the body.

FOR'CING (*forcer*, to force: *Fr.*), in Horticulture, a method of obtaining fruits and flowers before their season, by the application of heat.——The artificial ripening of wines by means of heat, and their fining down, so as to render them fit for immediate use, are also called *forcing*.

FORE (*Sax.*), a sea term for near the stem; 'fore and aft' means from stem to stern

FO'RECASTLE, a short deck in the forepart of the ship above the upper deck. It contains the berths of the common sailors.

FO'RECLOSURE, in Law. [See EQUITY OF REDEMPTION.]

FO'REMAST, the mast of a ship which is placed in the forepart or forecastle, and carries the foresail and foretopsail yards. ——*Foremast-men*, those who take in the topsails, furl the sails, &c.

FORE-SHORT'ENING, in Painting, the art of correctly conveying to the mind the impression of the entire length of an object, when represented as viewed in an oblique or receding position.

FOR'EST (*forst: Ger.*), a large tract of land covered with trees, differing from a *wood* chiefly in its extent, and from a *plantation* in its young trees growing of themselves without being sown or planted.——The *forests* in England are of such great antiquity that, excepting the New Forest in Hampshire, made by William the Conqueror, and Hampton Court, by Henry VIII., it is said that there is no record or history which makes any certain mention of their origin; though they are noticed by several writers, and in many of our laws and statutes. The four principal forests are the New Forest in Hampshire, Sherwood Forest in Nottinghamshire, Dean Forest in Gloucestershire, and Windsor Forest in Berkshire.

FO'RESTALLING (*fore*, a front; and *stal*, a station: *Sax.*), the act of buying or bargaining for any provisions or merchandise, before they reach the market to which they are going, with an intent to sell the same again at higher prices. It was formerly punishable.

FO'RESTAY, in a ship's rigging, a rope reaching from the foremast head towards the bowsprit end, to support the mast.

FOR'FEITURE (*forisfactura*, an expulsion or outlawry: *Lat.*), in Law, the loss of some right, privilege, estate, goods, lands, or employments, &c, for neglecting to do one's duty, or for some crime committed.

FORFIC'ULA (a small pair of shears: *Lat.*), in Entomology, the *Earwig*, which see.

FORGE (*Fr.*), a small furnace, in which smiths and other artificers in iron, steel, &c., heat their metals red hot, in order to soften and render them more malleable. The word *forge* is also used for a large furnace or *ironworks*, in which the ore taken from the mine is melted down. [See IRON.]

FOR'GERY (*forgeur*, a forger: *Fr.*), in Law, the fraudulent making or altering any deed or writing, to the prejudice of another man's right; particularly the counterfeiting the signature of another with intent to defraud.

FORGET'-ME-NOT, the *Myosotis palustris* of botanists (nat. ord. *Scrophulariaceæ*), a small herbaceous plant, growing in damp places, whose blue flowers are well known. It bears a similar name in German, Dutch, and Danish.

FORLO'RN HOPE, in Military affairs, a detachment of men appointed to lead in an assault, to storm a counterscarp, enter a breach, or perform any other service attended with great and imminent peril.

FORM (*forma*, an appearance: *Lat.*), in Physiology, the essential and distinguishing modification of the matter of which any body is composed.——FORM, in Law, the rules established and requisite to be observed in legal proceedings.——FORM also denotes the external appearance or surface of a body, or the disposition of its parts, as to length, breadth, and thickness. —— FORM, in Printing, the pages or columns of type, properly arranged, and enclosed and locked in an iron frame called a chase, for the purpose of being put to press. There are two forms required for every sheet, one for each side; and each form consists of more or fewer pages, according to the size of the books.

FOR'MA PAU'PERIS (in the character of a pauper: *Lat.*), a Law term. When a person has just cause of suit, but is so poor that he cannot defray the usual charges of suing at law or in equity, on making oath that he is not worth 5*l.* except his wearing apparel, and producing a certificate from some lawyer that he has good cause of suit, the judge will admit him to sue *in formâ pauperis*: that is, without paying any of the usual fees to court, counsel, &c. He will be exempt from these as plaintiff, but not as a defendant. If he lose his suit he will not have to pay costs; but he may be made to suffer other punishment, at the discretion of the judges. He may recover costs.

FORMA'TION (*formatio*, a fashioning: *Lat.*), in Geology, any assemblage of rocks having some common character, such as origin, age, or composition.

FOR'MIC A'CID (*formica*, the ant: *Lat.*), an acid which received its name from being found in the bodies of ants. It may be obtained by several methods. It is composed of carbon, oxygen, and hydrogen. Its salts are termed *formates*.

FOR'MULA (a rule: *Lat.*), a short way of expressing acts by notation. Thus, in Chemistry, *carbonic acid* consists of one atom of carbon, with two of oxygen; and is indicated by CO_2.——In Mathematics, a general theorem or literal expression for resolving any part of a problem.——In Medicine, a prescription.——In Theology, a profession of faith.

FOR'MYLE (*formic*; and *ulē*, the material of which a thing is made: *Gr.*), a chemical compound, the hypothetical radical of *formic acid*.

FORTIFICA'TION (*fortis*, strong: and *facio*, I make: *Lat.*), the art or science of fortifying a place, or of putting it in such a state, that every one of its parts defends, and is defended by, some other parts, by means of ramparts, parapets, moats, and other bulwarks; so that a small number of men within may be able, for a considerable time, to withstand the assaults of a numerous army without.——ANCIENT FORTIFICATION. In early times, when the sling and bow were the principal weapons of offence, a single wall, or a bank of earth, behind which missiles could be discharged at assailants, was a sufficient protection. Projecting towers, afterwards added, increased the front of the besieged, and enabled them to attack the besiegers in flank when they attempted to scale the wall. The invention of the battering-ram rendered it necessary to increase the thickness of the wall; and projecting galleries, called *machicolations*, were constructed along its summit, and round the towers, through the pierced floors of which stones and other missiles were showered down. Apertures or loop-holes for discharging arrows were pierced in the walls and battlements; and the whole was surrounded with a *moat* or deep ditch—if possible, filled with water. But the invention of gunpowder rendered a different system of fortification necessary; walls of masonry, which, however thick, could not long withstand the assault of artillery, were exchanged for mounds of earth.——MODERN FORTIFICATION. The principal works belonging to a modern fortification are the ditch or trench made round each work; the rampart, or elevation of earth, raised along the faces of any work, to defend the inner portion; the parapet, or that part of a rampart which serves to protect the troops planted there; the bastion, that part of the inner enclosure of a fortification making an angle towards the field; the counterscarp, the slope of the ditch facing the body of the place; the covered way, the space extending round the counterscarp; and the glacis, the part beyond the covered way, to which it serves as a parapet. In recent times, however, fortification has undergone important changes, and engineers have adopted different systems; but those which have acquired the greatest reputation in Europe, are the systems of count Pagan, the baron de Coehorn, von Scheiter, and marshal Vauban.

FO'RUM, in Rome, a public place, where causes were judicially tried, and orations delivered to the people. It was a large open parallelogram, surrounded by porticoes. There were six of these forums, viz. the *Romanum*, *Julianum*, *Augustum*, *Palladium*, *Trajanum*, and *Sallustii* forum. The chief of these was the *forum Romanum*, called, by way of eminence, *the forum*. In it was the rostrum, or pulpit, where the Roman orators pleaded, or harangued the people, &c. Here too was the *comitium*, or hall of justice, with the sanctuary of Saturn, the temple of Castor, &c., altogether producing a most splendid effect.——The word *forum* was also applied to a place of traffic, or market place: of these there were vast numbers, as the *forum piscarium*, *olitorium*, &c. They were generally called *fora venalia*, in distinction from the first-mentioned, which were called *fora civilia*. ——FORUM, in Law, a term sometimes used for a court of justice; the place where disputed rights are settled. Hence *forum competens*, a competent jurisdiction; *forum incompetens*, a court not authorized to try the cause, &c.

FOSS (*fosse: Fr.; from fossio, a digging: Lat.*), in Fortification, a ditch, commonly full of water, lying between the scarp and the counterscarp.——FOSS, or FOSSA, in Anatomy, a kind of cavity in a bone, with a large aperture, but no exit or perforation.——FOSS-WAY, one of the four principal ancient highways of England, having a ditch on one side. They crossed the kingdom in various directions, and are supposed to have been the work of the Romans. One of them reached from Totness, in Devonshire, to Barton-on-the-Humber.

FOS'SILS (*fossile: Fr.;* from same *deriv.*), in Natural History, the remains of ancient organic existences discovered in the earth. They are usually converted entirely into stone, all the animal matter having been removed. The substituted material is in some cases silex, in others lime. Of vertebrate animals, not only have the bones and teeth been preserved in this way, but their footprints have been retained for our inspection. Shells are the most abundant forms of animal remains. Sometimes only the impression of the external surface is left; sometimes only that of the internal surface, leaving a cast or mould; and occasionally the space between the outer and inner surfaces having been left vacant by the gradual destruction of the shell, it has been afterwards filled up by the infiltration of another substance, and thus an accurate representation of both the exterior and interior surfaces is obtained. As to vegetable remains, sometimes there is only an impression of the exterior, sometimes the vegetable matter itself is preserved as carbon, and sometimes the vegetable is converted into mineral matter. Travellers have often expressed their astonishment at finding the trunks of trees, many feet in circumference, changed into silex in such a manner that every vessel and microscopic pore has been perfectly preserved.

FOTH'ERING, a sea term for stopping leaks in the bottom of a ship, by letting down a sail by the corners, and putting chopped rope-yarn, wool, oakum, &c., between it and the ship's side. By repeating this operation several times, these substances are sometimes sucked into the cracks, so as either wholly or partially to stop the leak.

FOUGA'SS (*Fr.*), in military engineering, a small mine, from six to eight feet under ground.

FOUNDA'TION (*fondation: Fr.;* from *fundamentum: Lat.*), the basis or groundwork of anything; usually that part of a building which lies under the ground.——FOUNDATION denotes also a donation or legacy, either of money or lands, for the maintenance and support of some community, school, or charitable institution.

FOUN'DER (*fundator: Lat.*), one from whom anything originates; as the founder of a sect of philosophers, the founder of a family. Also one who endows any public establishment.——FOUNDER (*fundo*, I pour out: *Lat.*), likewise implies an artist who casts metals in various forms for different uses; as a founder of cannon, bells, statues, printing type, &c.——TO FOUNDER, in

Nautical Language, is to sink to the bottom of the sea, an expression derived from the French *fondre*, which is connected with the Latin *fundus*, a bottom.

FOUN'DRY (*fonderie: Fr.*), from *fundo*, I pour out: *Lat.*), the building in which metals are cast in moulds or shapes. Various furnaces are used in the operation. The *wind furnace* is either square or circular; it has generally three apertures—one above, for the purpose of introducing the crucible and fuel, usually closed by a tile or brick; another below, to admit the air, which is to pass through the fuel; and the third communicating with the chimney, which should be lofty, and supplied with a damper. The *blast furnace* differs from the wind furnace, in having no grating, and in the air being supplied by a bellows or a blowing machine. The *reverberating furnace* is so constructed that the flame and hot air from the fire-place are directed into a separate cavity, called a *hearth*, where the materials to be fused are laid. The melted metal is either run out through an aperture in the bottom, or lifted out with ladles. The *moulds* are made of a variety of materials: those for stereotype founding, of plaster of Paris; those for bronze, of a mixture of plaster of Paris and brickdust, prepared with the greatest care. Iron is generally cast in sand; brass, and other metals, in clay; and sometimes the moulds are of cast iron. Iron founding is far the most important branch of the art carried on in this country, which abounds with the two substances almost indispensable to it—iron ore and coal.

FOUN'TAIN (*fontaine: Fr.; from fons: Lat.*), in Natural Philosophy, a spring or source of water rising out of the earth. Among the ancients, fountains were held sacred, and even worshipped as a kind of divinities.——An *artificial fountain*, or *jet d'eau*, is water ejected from a pipe, by being either raised to a higher level than the top of the pipe, or forced out by an engine, &c. [See ARTESIAN WELLS.]

FOVIL'LA (*foveo*, I nourish: *Lat.*), in Botany, the matter contained within the grains of pollen, and the fructifying principle of the plant.

FOX (*fuchs: Ger.*), the *Vulpes vulgaris* of zoologists, a well-known animal, closely related to the dog, with a sharp muzzle and a long bushy tail. It is a native of Europe and the northern parts of Asia and America. It burrows in the earth, and is generally described as crafty and cunning beyond measure. Foxes prowl about in the night, and prey on poultry, rabbits, and hares; but they are very timid, fleet, and, when old, sagacious in evading their enemies. They emit an odour which enables dogs to scent and follow them. Foxes breed only once a year, and bring forth commonly in April four or five young, which, like puppies, are born blind.

FOX'-GLOVE, the *Digitalis purpurea* of botanists, nat. ord. *Scrophulariaceæ*. Its leaves, when carefully dried and powdered, or made into a tincture or infusion, are used in medicine. In small and repeated doses, it lowers the pulse in a very extraordinary way, and produces debility and fainting; combined with other substances, it forms an ingredient in some powerful diuretics.

FRAC'TION (*fractio*, a breaking: *Lat.*), in Arithmetic and Algebra, a combination of numerical or literal quantities representing one or more parts of a unit or integer; thus $\frac{4}{5}$ is a fraction, formed by dividing a unit into five equal parts, and taking four of them. A fraction consists essentially of two numbers, usually placed one over the other, and separated by a line: the lower tells the number of parts into which the unit is divided, that is, the denomination of the quantities in question, and is called the *denominator;* the upper tells what number of these parts is taken, and is called the *numerator.* If the numerator is equal to, or greater than, the denominator, since the quantity is then not less than unity, it is called an *improper* fraction. If the denominator consists of 10, or some power of 10—that is, if it consists of 1, with one or more ciphers to the right hand—it is a *decimal* fraction: otherwise it is a *vulgar* fraction. Thus $\frac{3}{100}$ is a decimal fraction, $\frac{3}{200}$ a vulgar fraction. Decimal fractions are too frequently confounded with decimals. Decimal fractions consist of a numerator and denominator, like any other fractions. Decimals follow the laws of the ordinary system of numbers; the value of a quantity expressed by them being marked not by a denominator, but by their *position* with reference to the *decimal point.* $\frac{3}{1000}$ is a decimal fraction; 0·003, its quotient or equivalent, is a decimal.

FRAC'TURE (*fractura: Lat.*), in Mineralogy, the manner in which a mineral breaks, which is one of its specific characters. The fracture is either compact or smooth, foliated or lamellar, conchoidal, striated, or nodular, &c.——FRACTURE, in Surgery, the breaking of any bone by an external act of violence. It is *simple* when the bone only is divided; *compound*, when the bone is broken, with a laceration of the integuments.

FRÆ'NUM (a bridle: *Lat.*), in Anatomy, a term applied to some membranous ligaments of the body: as, the *frænum linguæ*, or ligament under the tongue. Sometimes it ties down the tongue too close to the bottom of the mouth, and then requires to be incised or divided, in order to give this organ its proper and free motion.

FRANC (from being originally stamped with the figure of a Frank or Frenchman), a French coin, worth 9·69*d.* sterling.

FRAN'CHISE (*Fr.*), in a general sense, signifies some privilege, or exemption from ordinary jurisdiction. A franchise may be vested either in bodies politic or corporations; in borough towns, or in individuals. Corporate liberties, being usually held by charter, are all said to be derived from the crown, but some lie in prescription without any charter.

FRANCIS'CANS, Friars-Minor, or Grey-Friars, the religious order of St. Francis, by whom they were founded about the year 1209.

FRANK (*franc*, free: *Fr.*), an exemption of letters from paying postage, which, before the 'penny postage' act came into operation, January 10, 1840, was enjoyed to a certain extent by all members of parliament. It is said that, before this act abolished the privilege of *franking*, nine millions of letters were annually sent post-free.——**FRANK-ALMOIGNE**, in Law, a tenure by which a religious corporation held lands to them and their successors for ever, on condition of praying for the soul of the donor.——**FRANK-CHASE** or **FREE CHASE** was the liberty of keeping beasts of chase or royal game, protected even from the owner of the land himself, with a power of hunting them.——**FRANK-FOLD**, a privilege which the lord had of folding his tenant's sheep within his manor.——**FRANK-FREE**, a term much used in our old law: thus frank-pledge freemen were pledges or sureties for the good behaviour of those who were of their community.

FRANK'INCENSE, the gum-resin *Olibanum*, which is the produce of an Indian tree, the *Boswellia serrata*, nat. ord. *Amyridaceæ*. Sprinkled on live coals, it exhales a fragrant and powerful odour.

FRANK'LINITE, a ferriferous oxide of zinc, found in New Jersey, North America, and named from Dr. Franklin.

FRANKS, an appellation given by the Turks and other nations of Asia to all the people of the western parts of Europe, English, French, Italians, &c.

FRATER'NITIES (*fraternitas*, a brotherhood: *Lat.*), in the middle age consisted of pious laymen, who formed societies for the purpose of relieving the sick and destitute and performing other Christian duties

FREE-BENCH, in law, a widow's dower in a copyhold estate.

FREE'HOLD, a legal term which refers either to the quantity of estate which a man may have in lands or tenements, or to the tenure by which lands and tenements are held. As to the quantity of estate he may have, it may be either of inheritance or not of inheritance: if of inheritance, it may be either fee-simple, fee-tail, or fee simple conditional; if not of inheritance, it is for life, or an uncertain period limited within the term of a life. As to the tenure, freehold tenure is derived from the ancient free socage: hence copyholds are not within this denomination, but lands held by custom of the manor, not by a copy of court roll, are customary freeholds.

FREE'HOLDER, the possessor of a freehold estate, who is thereby qualified to vote for a knight of the shire, or representative of the county in parliament, if the estate is of the annual value of 40s.

FREE'MAN, in the middle ages one who belonged to a class below the gentry, but above the villeins. The citizens and burghers of chartered towns, the socagers whose tenure was free, and tenants for term of life, were freemen. At the present day, a freeman is one who has been in due form admitted to the freedom of a city or borough.

FREE'MASONRY. A well-known institution, the origin of which has given rise to great discussion. There is no doubt that the fraternity of architects or builders was very widely diffused in the middle ages, and it is thought that we owe to it the erection of the magnificent cathedrals, &c., so different from the other efforts of those times. It is not known when the society became changed from a professional body to one that admitted persons of every description.

FREE'STONE, a hard and durable kind of gritstone, so called from its being of such a nature as to cut freely in any direction: such are the Portland stone and the freestone of Kent. A granite which works freely is in some places called freestone.

FREE'ZING (*frieren*, to freeze: *Ger.*), in Philosophy, the conversion of a fluid body into a firm and solid mass by the action of cold. Upon the principle of the absorption of heat are founded the various artificial methods of producing cold and congelation. Evaporation causes cold, particularly when the vapour is removed as fast as produced. If a body suddenly liquefies without the application of external heat, cold is produced; this is the principle of freezing mixtures. When a body, air for instance, is made suddenly to expand, it abstracts heat from the surrounding bodies. In Spain, a kind of earthen jars, called *buxaros*, is used, the material of which is so porous, being only half baked, that the outside is kept moist by the water that filters through it; and, though placed in the sun, the water in the jar becomes as cold as ice. It is a common practice in China to cool wine or other liquors by wrapping a wet cloth round the bottle and hanging it up in the sun. The water in the cloth evaporates, and thus cold is produced. Ice may be made at any time by the evaporation of ether. The most intense cold yet known is obtained by the evaporation of a mixture of solid carbonic acid and sulphuric ether, the temperature being lowered to 166° Fahr. below the freezing point. The old nobles of Russia used to obtain very strong and intoxicating drink by placing their wines and spirits in the ice of their rivers: the water they contained froze and separated from the spirits so as to be easily removed. This plan has been adopted for concentrating lemon juice, &c. [See ICE-MAKING MACHINES.]

FREIGHT (*fret: Fr.*), in Navigation and Commerce, the hire of a ship, or of a part of it, for the conveyance of goods from one place to another; or the sum agreed on between the owner and the merchant for the hire and use of a vessel. In a more extended sense, it means the burden of such ship. Freight being the return made for the conveyance of goods or passengers to a particular destination, no claim arises for its payment in the event of a total wreck; and our law authorities have decided, that, in case of a total loss with salvage, the merchant may either take the part saved or abandon it. But after the merchant has made his election, he must abide by it.——**FREIGHT** is now used in a large portion of America as a term to indicate the merchandise sent by a goods train on a railway, the latter being called a *freight train*.

FRENCH CHALK, in Mineralogy, a variety of indurated talc, in masses composed of small scales. It combines with grease, and is useful in drawing.

FRENCH HORN, a musical wind instrument made of copper. It possesses a compass of three octaves, and is capable of producing tones of great sweetness.

FRENCH POL'ISH, a solution of shellac in spirits of wine, with sometimes a little gum elemi; a small quantity of linseed-oil is added to it at its application. It is laid on with a ball of cotton wool, and rapidly rubbed in the direction of the fibres of the wood; and when dry, it is finished by friction with tripoli and oil.

FRES'CO (fresh: *Ital.*), a species of painting with mineral colours on walls, which will endure the weather. It is executed on fresh plaster, so that the colours incorporating with it, and drying on the wall, become very durable in favourable climates. In our humid climate it does not succeed. This mode of painting is of very early invention. It is asserted that there are specimens of fresco-painting extant of the time of Constantine the Great. Fresco was long neglected, but began to revive in the 15th century; but though Michael Angelo and Raphael produced some noble specimens of the art, it fell again into disrepute until practised by the Germans in recent times. As it is very difficult to alter the colour when once absorbed, it requires great exactness.

FRET (*frethan*, to adorn: *Sax.*), in Architecture, an ornament consisting of two lists or small fillets variously interlaced or interwoven, and running at parallel distances equal to their breadth.——**FRETWORK** is sometimes used to fill up and enrich flat empty spaces; but is most frequently employed in roofs which are fretted over with plaster-work.——**FRET**, in Heraldry, a bearing composed of six bars, crossed and interlaced; by some called a *true lover's knot*.——**FRETS**, in Music, certain short pieces of wire fixed on the fingerboards of guitars, &c., at right angles to the strings, and which, as the strings are brought into contact with them by the pressure of the fingers, serve to vary and determine the pitch of the tones. Formerly these frets or stops consisted of strings tied round the neck of the instrument.

FRETTS (*frotter*, to rub: *Fr.*), a term used by miners to express the worn sides of the banks of rivers in mine countries.

FRI'AR (*frère*, a brother: *Fr.*), a term common to all monks, but specially applied to those of the mendicant orders, the four chief of which were the Dominicans, Franciscans, Carmelites, and Augustinians. In London there are several places that retain the names of the friars who formerly had their monasteries there, Black Friars, White Friars, Austin Friars, &c.

FRIC'TION (*frictio: Lat.*), in Mechanics, the rubbing of the parts of engines and machines against each other, or upon surfaces along which they may be drawn or rolled, whereby a great part of the power applied is lost. The amount of friction depends on:—1. The roughness of the contiguous surfaces. 2. The irregularity of the figure, which arises either from imperfect workmanship or from the pressure of one body on another. 3. An adhesion, or attraction, which is more or less powerful according to the nature of the bodies in question. 4. The interposition of extraneous bodies, such as moisture, dust, &c. It has been found by experiment that friction diminishes with the velocity, and it varies with the surface rubbed or with the specific pressure, i. e. the pressure on the unit of surface. There is no extra amount of friction on starting from rest to motion. The resistance arising from friction performs important offices in nature and the works of art. Were there no friction, all bodies on the surface of the earth, that is, almost everything constructed by man, would fall in pieces with the slightest strain, as the wedge, the screw, and the nail would be powerless to keep them together. The least motion would be likely to dash one thing against another; but at present, whenever a body acquires a great velocity, it soon loses it by friction against the surface of the earth. The friction of water against the surfaces it runs over soon reduces the rapid torrent to a gentle stream. The fury of the tempest is lessened by the friction of the air on the surface of the earth, and the violence of the ocean is subdued by the friction of its own waters against coasts, &c. Friction may be greatly diminished by causing surfaces working together to be of different materials, which prevents the attraction of cohesion from coming so powerfully into action; by interposing oil or some anti-friction substance; by using wheels and friction rollers, which make the friction as much less than it otherwise would be, as the diameter of the axle is less than that of the wheel or roller attached to it. Friction is one of the most effective means of arresting motion. Hence the use of *breaks* on railways, and *friction bands* with machinery.——**FRICTION**, in Medicine, the rubbing any part of the body with the hand, flesh-brush, flannel, or other substance, or with oils, liniments, &c., with a view to the preservation or restoration of health; it is often found a most efficacious remedy.

FRI'DAY (*Freitag: Ger.*), the sixth day of the week, so called from Frea, or Friga, a goddess worshipped by the Saxons on this day. Every Friday, unless Christmas day fall upon it, is either a day of abstinence or a fast day in the Roman Catholic church.

FRIEZE (*frise: Fr.*), in Architecture, that part of the entablature which is between the architrave and cornice. It is usually enriched with figures of animals or other sculptured ornaments.

FRIG'ATE (*frégate: Fr.*), a ship of war, having one covered gun-deck, and more than 28 guns.

FRIGATOO'N, a Venetian vessel, built with a square stern, without any foremast; it is used in the Adriatic.

FRI'GID ZONE (*frigidus*, cold: *Lat.*), the space about either pole of the earth, terminated by a parallel of 76½ degrees of latitude, called the *polar circles*. Within the latter, the sun remains visible in summer, and invisible in winter, for a space of time depending on the distance of the place from either pole. At the pole itself the sun remains half a year above and half a year below the horizon. [See CLIMATE.]

FRINGILL'IDÆ, in Ornithology, the family of finches, including several genera with well known species, such as the chaffinch, house sparrow, goldfinch, and linnets.

FRIT or FRITT (*fritte*: *Ger.*), in the glass manufacture, the ingredients of which glass is to be made after they have been calcined in a furnace. It is of different kinds, according to the quality of the glass, but is chiefly composed of silex and alkali.

FRITH (*fretum*, a narrow sea: *Lat.*), an arm of the sea, or the opening of a river into the sea; as, the *frith* of Forth, the *frith* of Clyde, &c.

FRITH'GILD (*frith*, peace; and *gild*, a fraternity: *Sax.*), in Archæology, a guildhall; also a company or fraternity.

FRITILLA'RIA, a genus of bulbous-rooted plants with showy flowers, nat. ord. *Liliaceæ*.

FRIZE (*Frise*, Friesland: *Fr.*—because first made there), a coarse kind of woollen cloth.

FROG (*frosch*: *Ger.*), a well-known animal of the Batrachian order, in the class of *Amphibia*. It is oviparous, and the young when hatched are called tadpoles. They have a tail, but no legs, and being furnished with gills, they live in the water. The tail afterwards drops off, legs are developed, the gills disappear, and lungs are substituted. Having undergone this metamorphosis, they live henceforth on land. Frogs remain in a torpid state during winter. Besides the common frog, there are a great many other species, the most singular of which is that called the *bull-frog*, a native of the northern parts of America. This animal, when the limbs are extended, measures nearly two feet, the trunk of its body being about eight inches long and four or five in breadth. It is very voracious, and frequently swallows the young of water-fowl before they have strength to shift for themselves. Its croaking is so loud as to resemble the roaring of a bull heard at a distance, whence its name.——FROG, in Farriery, the hard projecting substance in the hollow of a horse's foot.

FROND (*frons*, a leafy branch; *Lat.*), in Botany, the leaf of a fern.

FRONDES'CENCE (*frondesco*, I get leaves: *Lat.*), in Botany, the precise time of the year and month in which each species of plant unfolds its leaves.

FRONT (*frons*, the forehead: *Lat.*), in Perspective, a projection or representation of the face or fore part of an object, or of that part directly opposite to the eye.

FRON'TAL (*frontalia*, an ornament for the forehead; *Lat.*), in Architecture, a small pediment or frontispiece over a small door or window.——In Medicine, a preparation to be applied to the forehead.——FRONTAL BONE, in Anatomy, the front bone of the head, which forms the forehead.

FRONTA'LIS (same *deriv.*), in Anatomy, an epithet for a muscle of the forehead, which serves to contract the eyebrows.

FRON'TISPIECE (*frontispice*: *Fr.*), in Architecture, the principal face of a building. ——An ornamental engraving fronting the first page of a book.

FROST (*Ger.*), in Meteorology, the congelation of water, or of the vapours of the atmosphere, by cold. This occurs when the mercury, in Fahrenheit's thermometer, sinks to 32°. At this temperature, water begins to freeze unless kept in motion. Frost is very injurious to vegetables, particularly when they are saturated with moisture, on account of a previous thaw or heavy rains. Masses of ice formed within a tree, by the expansion which takes place at the moment of congelation, cause a rupture of the vegetable fibre. *Hoar frost*, which occurs chiefly in autumn and spring, is merely frozen dew.

FRUCTIFICA'TION (*fructus*, fruit: and *facio*, I make: *Lat.*), in Botany, the part composing the fruit.

FRUIT (*Fr.*; from *fructus*: *Lat.*), in Botanical language, the ovary arrived at maturity; but the term is generally extended to whatever is combined with the ovary, when it is ripe.

FRUS'TUM (a fragment: *Lat.*), in Mathematics, part of some solid body, separated from the rest.——FRUSTUM OF A CONE, the part of a cone that remains when the top is cut off by a plane parallel to the base; if cut off otherwise, it is called a *truncated cone*.

FRUTES'CENT (*frutex*, a shrub: *Lat.*), in Botany, an epithet for that which, from herbaceous is becoming shrubby; as a *frutescent* stem. *Fruticose* signifies shrubby.

FRU'TEX (*Lat.*), in Botany, a *shrub*, a plant having a woody stem, but under the height of 17 or 18 feet.

FU'CUS (*Lat.*), the name given by the ancients to a plant, from which a material for dyeing woollen and linen cloths was procured. It was probably the lichen *Roccella tinctoria*, and the other species, from which *orchil* and *cudbear* are obtained. In modern botany, it is a genus of marine algæ. The word, or its plural form *fuci*, is frequently applied to the whole tribe of seaweeds.——FUCUS, a composition anciently applied on the face to beautify it and heighten the complexion. The fucus of the Roman ladies was a kind of white earth or chalk, brought from Chios and Samos.

FU'EL (*fuayl*: *Nor. Fr.*), any material which serves to maintain fire; as alcohol, tallow, coal, &c.; but the term is more properly limited to coal, coke, charcoal, wood, and a few other common sources of heat. Whatever the substance used as fuel, its ultimate elements are carbon, hydrogen, or both; and the heat obtained is derived from their combination with the oxygen of the air. Unless fuel is free from moisture, much of the heat which would be otherwise available is lost in converting the water into vapour. Hence the superiority of dry over green wood, and of charcoal over wood: hence also coke gives a greater heat than coal, which contains vaporizable bodies which must be driven off at an expenditure of heat. The following are the quantities of water which may be raised from 32° to 212° Fahr. by one pound of the most ordinary kinds of fuel:—

Fresh wood . .	25 lbs. of water.
Dry wood . . .	35 „ „
Turf	26 „ „
Turf when dense .	30 „ „
Pit coal . . .	60 „ „
Coke	65 „ „
Dry charcoal . .	73 „ „

Charcoal has a very great tendency to absorb water from the atmosphere, which greatly diminishes its heating powers.

FUGUE (*Fr.*; from *fuga*, a flight: *Lat.*), in Music, a species of composition, in which the different parts follow one another, each repeating in order what the first had performed, but at a certain interval above or below the preceding part.

FUL'CRUM (a prop: *Lat.*), in Mechanics, the prop or support by which a lever is sustained.

FULGURA'TION (*fulguratio*, sheet lightning: *Lat.*), in the art of assaying, a term for the sudden brightening of the melted gold and silver in the *cupel*, when the last film of oxide of lead, or copper, leaves the surface.

FUL'LER'S EARTH, a mineral, essentially consisting of silex and alumina, with about 24 per cent water. Like other soft aluminous minerals, it has the property of absorbing grease, and it was at one time largely employed in fulling cloth, that is in cleaning it from greasy matters, but it has been to a great extent superseded by soap.

FULL'ING (*fullo*, a fuller: *Lat.*), the art of cleansing, scouring, and pressing cloths, to make them stronger, closer, and firmer, which is done by means of a fulling or scouring mill.

FUL'MAR PETREL, a web-footed seabird, the *Procellaria glacialis* of naturalists. It is larger than a gull, possessing, like all the petrels, the singular faculty of spouting from its bill a quantity of pure oil. It abounds in northern latitudes.

FUL'MINATING POW'DER (*fulmen*, lightning: *Lat.*), a powder that explodes upon the application of certain degrees of heat or concussion, with instantaneous combustion and a loud noise. Fulminating powders are sometimes made with metals, and sometimes without. If that which is made of nitre, potash, and the flowers of sulphur, triturated in a warm mortar, is fused in a ladle, and then set on fire, it will explode with a noise like thunder. If a solution of gold be precipitated by ammonia, the product will be fulminating gold, a grain of which, if held over a flame, will explode with a sharp loud noise. But of all these explosive compounds, that which from a manufacturing point of view is the most useful, is the fulminate of mercury, now so extensively employed, mixed with a little sulphur and nitre, for charging percussion caps. Fulminating silver detonates even more powerfully than fulminating mercury.

FULMINA'TION (a thundering: *Lat.*), in Chemistry, an explosion or detonation, accompanied with a loud report. All these equally imply rapid combustion with or without flame; and the intensity of sound alone distinguishes the idea of *fulmination* from those of *detonation* and *explosion*.

FULMIN'IC A'CID, in Chemistry, the explosive constituent of fulminating mercury and fulminating silver; it is generated by the reaction of alcohol and the acid nitrates of these metals. This curious acid is composed of 4 equivalents of carbon, 2 of nitrogen, and 2 of oxygen, but all attempts to obtain it have hitherto failed.

FUMARO'LE (*Ital.*), orifices in the earth, emitting vapours of different kinds. They occur in volcanic countries.

FUMIGA'TION (*fumigo*, I fumigate: from *fumus*, smoke; and *ago*, I act with: *Lat.*), a process by means of which disinfecting vapours are diffused through the atmosphere, in order to purify apartments, goods, or articles of apparel supposed to be imbued with some contagious poisons. The most effectual agents for this purpose are chlorine and nitric acid vapour, but particularly the former.

FUNC'TION (*functio*, a performing; *Lat.*), in Algebra, any mathematical expression, considered with reference to its form, and not to the value which it receives, by giving particular values to the symbols contained in it. Thus $a + x$, and $a^2 + x^2$, are functions of x, though of different forms. In whatever way a function may be compounded of constant and variable quantities, it is a function of the variable quantities only. The calculus of functions may be considered as standing in the same relation to algebra that algebra does to arithmetic. In the calculus of functions, the generalization is carried still further than in algebra.

FUNC'TIONS (same *deriv.*), in Physiology. There are two classes of functions by which life is manifested in animals. 1. Those of animal life being functions of relation, including sensation and voluntary motion; 2. Those of vegetative life, or functions of nutrition and reproduction. The functions of the first class bring us into relation with the world around us; those of the second are necessary to the support of life and the perpetuation of the species.

FUNDS (*fundo*, I pour into: *Lat.*), the public funded debt, due by government. Money was first borrowed to meet the expenses of a war in the reign of William III., and at the beginning was obtained on the security of some tax, or portion of a tax, which was to pay the interest and principal. But, instead of paying off old loans, fresh ones were obtained, on similar securities; and at length the plan of borrowing for a fixed period, or, as it was called, upon *terminable* annuities, was given up, and most loans were made on those which were *interminable*, or until it might be convenient for the government to pay off the principal. [See DEBT, NATIONAL.] At the commencement of the system, the word *fund* signified the taxes or funds appropriated to pay off the loans obtained, and the interest arising from them; but it gradually came to mean, not the security, but the loan itself. The rate of interest at first paid by government was high; and it varied according to the abundance of disposable capital, and the public confidence. In the reign of George II., the rate of interest was fixed at *three* or *three and a half* per cent.; but to pay, for example, at the rate of four and a half per cent., government gave nearly 150*l*. of stock for 100*l*. in money: hence the present national debt amounts to about two-fifths more than the sum which was actually lent. This uniform rate of interest renders the debt more manageable, and its transfer, from sellers to buyers, more simple and convenient. Any amount may be bought in the funds, the buyer paying the interest due on it at the time of purchase, along with the price of the *stock*, as it is called, which is bought. The interest obtained by a purchaser is generally more than the nominal interest, since he rarely gives 100*l* for 100*l*. of stock. If the funds were up to *par*, that is, if 100*l*. stock would bring 100*l*. in money, it would show that money was extremely plentiful, or that profitable and safe modes of investment were very hard to be obtained. [See SINKING FUND.]

FU'NERAL GAMES (*funereus*, belonging to a funeral: *Lat.*) Among the Greeks these generally consisted of horse-races: the prizes were of different sorts and value, according to the quality and magnificence of the person that celebrated them. The garlands given to victors on these occasions were usually of parsley, which was supposed to have some particular relation to the dead. Among the Romans, the funeral games consisted chiefly of processions; but sometimes also of mortal combats of gladiators around the funeral pile.

FU'NERAL RITES (same *deriv.*), ceremonies accompanying the interment or burial of any person. These rights differed among the ancients, according to the different genius and religion of each country. The ancient Christians abhorred the pagan custom of burning the dead, and always deposited the body entire in the ground, and it was usual to bestow the honour of embalming upon the martyrs, at least, if not upon others.

FUN'GATE (*fungus*, a mushroom: *Lat.*), in Chemistry a compound of fungic acid and a base.

FUN'GIA, a genus of corals which somewhat resemble mushrooms.

FUN'GIC A'CID (same *deriv.*), in Chemistry, an acid obtained from mushrooms.

FUN'GIFORM (*fungus*, a mushroom; and *forma*, a form: *Lat.*), in Mineralogy, having a termination similar to the head of a mushroom.

FUN'GIN, the fleshy part of mushrooms, purified by digestion in hot water. It is now considered as a peculiar vegetable principle.

FUN'GUS (a mushroom: *Lat.*), in Botany, the old name of a genus of cryptogamic plants, of which the common mushroom may be taken as an example. The name *Fungi* or *Fungales* is now applied to the extensive class containing this and many allied forms. They are distinguished from Algæ by their deriving their nutriment from the substances to which they are attached, and not from the surrounding medium. They vary greatly in appearance. Some grow in living animals, or on animal substances; others on living vegetables, such as the rusts and mildews, or upon decaying vegetable matter. Some are hard and horny, others soft and fleshy. Even the yeast of beer has been pronounced to be an abnormal form of fungus. A few are edible, such as the mushroom, morel, and truffle; but the majority are poisonous. In Tierra del Fuego a fungus growing on living beech trees is a staple article of food to the savages. ——FUNGUS, in Surgery, a term applied to any morbid excrescence, whether arising from wounds, or spontaneously.

FUR, the hair of animals living in the colder parts of the globe. The furs of commerce are the dressed skins of such animals with the hair attached. Immense quantities of rough skins are annually imported, as they are well adapted for articles of clothing during winter. A great number of persons are employed in trapping the animals that yield the furs in request in the prairies and wilds of North and South America, the deserts of Africa, the steppes of Russia and Siberia, and the jungles of India. The Hudson's Bay Company had vast hunting grounds in Arctic America, where the half-savage trappers roamed in pursuit of their calling, and collected those shiploads of skins which were annually sent over here. Furs were at one time used in this country as emblems of rank. In the sumptuary laws of Henry VIII. it was ordered that no nobleman should use sable unless he was above a viscount. In the time of Edward III. only the royal family might wear ermine; and that fur under the heraldic name of miniver still denotes, on state occasions, the rank of the wearer, according to the manner in which it is worn. ERMINE is the most valuable of furs, there being a great demand for it in Europe. The SABLE ranks next to the ermine in value, and then the fur of the Silver Fox, a native of the neighbourhood of the Columbia River in Oregon. The fur is long and black, except that of a part of the back, which is white. Skins of the blue fox are much sought after, and a single specimen highly dressed has fetched forty guineas in London. Chinchilla fur is a great favourite with ladies, from its extreme softness. It is obtained from a small rodent animal, a native of South America. Many other furs are imported, such as those of the mink, several species of marten, and the glutton, all animals allied to the weasel; the wild cat; several species of fox, including the black fox, which has a white tipped tail (for a very fine skin as much as 100*l*. have been given), and the red fox, with a bright fur much prized by the Turks. Even the skins of monkeys are imported for their handsome fur.

FUR'LONG (*furlang*: *Sax.*), a measure of length equal to one-eighth of a mile, or forty poles. It is also used in some law-books for the eighth of an acre.

FUR'LOUGH (*urlaub*: *Ger.*), leave granted to a non-commissioned officer or soldier to be absent for a given time from his regiment.

FUR'NACE (*fornax*, a vault: *Lat.*), an apparatus for melting metals, &c., variously constructed, according to the use for which it is intended. It consists of a suitable fire-place, and receptacles to contain the substances to be operated upon; and is sometimes supplied with a dome, so as to reverberate the heat and flame. [See FOUNDRY.]

FUSE or **FUZE** (*fusée*: *Fr.*), a small tube, filled with combustible materials, by which fire is communicated to the powder in a bomb, &c. As its contents burn slowly, time is given, before the charge takes fire, for the bomb to reach its destination. It is used also in mining, &c., but has, in a great degree, been superseded by the use of a galvanic current in producing ignition.——FUSEE, in Watchwork, the conical piece round which the chain of a clock, watch, &c., moved by a spring, is wound. It is of varying diameter, acting with least power when the watch, &c., is first wound up, that is, when the spring is strongest, and with most when the watch, &c., has run nearly down, that is, when the spring is weakest; and thus the power applied to the watch, &c., is rendered nearly uniform. The speed with which the spring uncoils to produce a given effect, and by consequence the quantity of chain unwound from the fusee, are constantly varying, since, in accordance with a well-known mechanical law, what the spring wants in power it must make up in velocity, and *vice versâ*.

FU'SEL OIL (*fusel*, impure spirit: *Ger.*), an acid volatile oil, found in the crude spirit manufactured from potatoes and grain. It exhales a powerful and suffocating odour. It is supposed to be a product of the fermentation of sugar. When purified it is styled by chemists the hydrated oxide of amyl.

FUSI'L (*Fr.*), a light musket, similar to a carbine, but better finished: it was formerly used by officers in light companies, and has given its name to several regiments.——In Heraldry, a bearing of a rhomboidal figure, more slender than a lozenge, its upper and lower being more acute than its middle angles.

FUSILEE'R (*fusilier*: *Fr.*), a soldier belonging to what is termed the light infantry. One of the regiments of Life-guards is known as the Fusileers. They are distinguished by the white cockade.

FU'SION (*fusio*: *Lat.*), the liquefaction of a solid body by means of heat; as in the case of metals, glass, and similar bodies. Those substances which admit of being fused are termed *fusible*, but those which resist the action of fire or heat are termed *refractory*.——AQUEOUS FUSION, the melting of a salt in its water of crystallization; the resulting liquid is a saturated hot solution.

FUS'TIAN (*futaine*: *Fr.*), a kind of coarse thick twilled cotton, of which velveteen, corduroy, and thick-set are varieties.——In Literature, an inflated style of writing in which high-sounding and bombastic terms are used, instead of such as are natural, simple, and suited to the subject.

FUS'TIC, the wood of a species of mulberry (*Morus tinctoria*), a large tree growing in North and South America, and the West India Islands. It is very extensively used as an ingredient in the dyeing of yellow, for which purpose large quantities of it are annually imported. There is another kind, called Zante, or *young* fustic, obtained from the *Rhus Cotinus*, a small shrub of the sumach genus. This imparts a beautiful bright yellow dye to cottons, &c., which, when proper mordants are used, is very permanent.

FUT'TOCKS (corrupted from *foot-hooks*), in Naval Architecture, the lower timbers raised over the keel that hold the ship together. The small shrouds in a ship's rigging, passing from the mainmast, foremast, and mizenmast shrouds, to those of the topmast, are termed *futtock shrouds*.

G

G, the seventh letter in the English alphabet; but in the Greek and all the oriental languages, it occupies the third place. It is a mute, and cannot be sounded without the assistance of a vowel. It has a hard and a soft sound, as in *game* and *gesture*; and in many words, as in *sign*, *reign*, &c., the sound is not perceived. As an abbreviation, it stood for *Genius*, *Gens*, *Gaudium*, &c. G.V. signified *Genius urbis* (the genius of the city); G.L. *Genius loci* (the genius of the place); G.P.R. *Gloria populi Romani* (the glory of the Roman people). With us it stands for *Grand*, *Garter*, *Gratiâ*, &c., as G.C.B. *Grand Cross of the Bath*; K.G. *Knight of the Garter*; D.G. *Dei gratiâ* (by the grace of God); &c. As a numeral, it formerly stood for 400, and, with a dash over it, for 400,000. On French coins, it indicates the city of Poitiers.——In the Calendar, it is the seventh Dominical letter.——In Music, it is the nominal of the fifth note in the natural diatonic scale of C, and to which Guido applied the monosyllable *sol*. It is also the name of the highest or treble clef.

GA'BIONS (*Fr.*), in Fortification, baskets made of osier-twigs, of a cylindrical form, six feet high and four wide, which, being filled with earth, serve as a shelter from the enemy's fire.

GAB'RONITE (*gabro*, a rock consisting of diallage and felspar: *Ital.*), a silicate of alumina, soda, and potash, found in a vein of titaniferous iron, near Arendal, in Norway. It has also been termed *fuscite* and *compact scapolite*.

GAD (a club: *Sax.*), among miners, a tool in the form of a pointed wedge, having its sides of a parabolic figure.

GAD'FLY, the *Œstrus Bovis*, a dipterous insect, which deposits its eggs on the backs of oxen, where it raises a tumour called *worble* by farmers. Another species lays its eggs in the nostrils of the sheep, whence the larvæ climb up into the interior of the head, where they feed. A third species deposits its eggs amongst the hairs of the horse's hide. The animal licks the part, and the larvæ are hatched in the mouth, whence they pass into the intestines, and form the well-known Bots. [See BREEZE-FLY.]

GAD'OLINITE, a mineral, containing yttria and oxide of cerium, found almost exclusively in Sweden, and named after Gadolin, its discoverer.

GA'DUS, in Ichthyology, a genus of malacopterygian fishes, containing the common cod-fish, *Gadus morrhua*, the whiting, *G. merlangus*, the haddock, *G. æglefinus*, the coal-fish, *G. carbonarius*, the pollack, *G. pollachius*, and other less known species.

GAE'LIC, or ERSE, that dialect of the ancient Celtic language which is spoken in the highlands of Scotland. It is a commonly received opinion, that the Celtic, at the time of the Roman invasion, was universally spoken over the west of Europe; for all its numerous dialects show the clearest proofs of a common origin. The languages at present known to be certainly of the Celtic stock are the Welsh, the Bas-Breton or Armorican, the Irish, the Erse or Gaelic, the Manx, and the Cornish. The Scotch and Irish dialects are almost identical The Gaelic, which, from a variety of causes, has retained much of its original purity, is bold, expressive, and copious. It derives no assistance from the language either of Greece or Rome, from which it differs in its structure and formation. More than two-thirds of the names of places in Great Britain and Ireland are of Celtic origin, which, if other proofs were wanting, would establish the fact of its once having been the language of the country.

GAFF (*gaffe*, a harpoon: *Fr.*), in Nautical language, a sort of boom or pole, used to extend the upper edge of sails, as the mainsail of a sloop, &c.

GAGE or GAUGE (*jauger*, to measure: *Fr.*), an instrument for making measurements of different kinds.——GAGE, an apparatus for measurements of various kinds. Thus, a *sliding gage*, used by mathematical instrument makers for measuring and setting off distances; a *tide-gage*, for determining the heights of tides; a *wind-gage*, an instrument for measuring the force of the wind on any given surface, &c.

GAIL'LIARDE (*Ital.*), an ancient Italian dance, of a sportive character and lively movement. It was sometimes called a *Romanesque*, because it was said to have come originally from Rome.

GAL'AXY (*galaxias*, from *gala*, milk: *Gr.*), in Astronomy, the *Via lactea*, or *Milky Way*; a long, white, luminous track, which seems to encompass the heavens like a girdle, forming nearly a great circle of the celestial sphere. This, like most other phenomena of nature, has suggested some beautiful ideas to the poet. The invention of the telescope has confirmed the conjecture of the earlier astronomers that it consists of a multitude of stars, too remote to be separately distinguished by the naked eye, but scattered in millions on the dark ground of the general heavens. We are indebted to the labours and researches of the Herschels for most of the knowledge we possess regarding the milky way. It is thought that the vast collection of stars which surround us on every side, and of which our sun is one, is shaped like a flat circular zone, or thin slice of a sphere. This disc-like cluster is divided through one-third of its whole extent into two arms. When we look upon the milky way, we must be supposed to be looking towards the edge of the disc, that is, the thickest portion of our stellar universe, but in other directions the stars glitter distinct from each other, because then we are looking upon the thinnest portions of the cluster. In many parts of the milky way, the most powerful telescopes seem to perceive the farthest stars upon a black starless ground, but in others there are masses and clouds of stars which the best telescope cannot resolve.

GAL'BANUM (*Lat.*), in Medicine, a fœtid gum-resin, the produce of a Persian umbelliferous plant, the *Opoidia galbanifera*, and perhaps of other umbellifers.

GAL'BULUS (cypress fruit: *Lat.*), in Botany, the fleshy fruit of the Junipers, trees belonging to the coniferous order.

GALE'NA (*Lat.*), in Mineralogy, the native sulphuret of lead, obtained both in masses and crystallized. It occurs in primitive and transition mountains, but is more frequently found in secondary rocks, especially in compact limestone. It constitutes beds and veins, and is found more or less in every country. In England it is very abundant, and it is also widely diffused over the United States of America. Most of the lead of commerce is procured from galena, and usually contains a little silver. [See LEAD.]

GALEN'IC, in Medicine, that mode of treating disease which is founded upon the principles of Galen, or which that physician introduced.——*Galenical medicines*, those that are formed by simple means from vegetables, as by infusion or decoction, &c.; while the *chemical*, to which they are opposed, are those produced by extracting the more active principles by elaborate processes, as by calcination, digestion, fermentation, &c.

GALL (*galle: Sax.*). [See BILE.]

GALL'-BLADDER (same *deriv.*), a membrane situated in the concave side of the liver. Its use is to collect the bile, first secreted in the liver, and, mixing it with its own peculiar product, to elaborate it further; to retain it for a certain time, and then expel it as it is required.

GALL'-FLY. [See CYNIPS.]

GALL'-NUT, a protuberance or tumour produced by the puncture of gall-flies, species of the hymenopterous genus *Cynips*, on plants and trees of various kinds, but more particularly on the oak. The fly punctures the surface of a leaf, bud, or stalk, and deposits an egg in the interior, along with a drop of an irritating fluid: in the course of a few days, an excrescence is thrown out, affording nourishment to the young insect, and protecting it from external injury until it has attained its full size, when, after having undergone metamorphosis, it eats through the excrescence, and escapes into the open air.

GALL'-STONES, calculous concretions frequently formed in the gall-bladder, and sometimes occasioning great pain during their passage through the ducts into the *duodenum*, before they are evacuated.

GAL'LEON (*galeon: Fr.*), ships of war formerly used by the Spaniards and Portuguese. In more recent times, those vessels were called *galleons*, in which the Spaniards transported treasure from their American colonies.

GAL'LERY (*galerie: Fr.*), in Architecture, a long narrow room, the length of which is at least three times as great as its breadth, by which proportion it is distinguished from a *saloon*. Corridors also are sometimes called galleries. Since a gallery is generally decorated with paintings, in oil or fresco, a large collection of pictures, even if contained in several adjoining rooms, is called by that name.——GALLERY, in Fortification, a walk across a ditch in a besieged town, made of strong planks, and covered with earth. It was formerly used for carrying a mine to the foot of the ramparts.——GALLERY, in Mining, a narrow passage, or branch of a mine, carried under ground to a work intended to be blown up ——GALLERY, in Shipbuilding, a balcony, projecting from the stern of a ship of war, or of a large merchantman.

GAL'LEY (*galère: Fr*), a kind of low, flat-built vessel, furnished with one deck, and navigated with sails and oars, found chiefly in the Mediterranean.——An open boat used on the Thames by custom-house officers, &c.——The cook-room or kitchen of a ship.——The war galleys, or *naves longæ*, of the Romans, were variously named from their rows or banks of oars.——GALLEY-SLAVE, a person condemned to work at the oar on board a galley, being chained to the deck.——In France, the galleys, in which the convicts labour and are confined, resemble the *hulks* of Great Britain.

GAL'LIC A'CID, in Chemistry, an acid which forms one of the astringent principles of plants. It is obtained by the oxydation of tannic acid, or tannin, which abounds in nut-galls, oak bark, &c. It is slightly acidulous and styptic to the taste, but inodorous; and crystallizes in white silky needles, which are soluble in boiling water or alcohol. Its constituents are carbon, hydrogen, and oxygen. When an infusion of galls is dropped into a solution of sulphate of iron, it produces a deep purple precipitate, which becomes black by exposure to the air. It is a very long time in subsiding, and, in writing-ink, is retained in suspension by mucilage.

GAL'LICAN CHURCH, the distinctive title of the Roman Catholic church in France, which, in opposition to *ultramontanism*, long maintained a certain degree of independence with regard to the see of Rome. The *liberties* of the Gallican church were first asserted in the pragmatic sanction, in 1438, but were defined and confirmed in 1682. It was then decided that the pope has no temporal power in France, and only a spiritual power limited by canons and councils, and that the decisions of the holy see are subject to reversal by the body of the clergy.

GAL'LICISM (*Gallus*, a Frenchman: *Lat.*), an idiom or phrase, of the French language, introduced in speaking or writing another language.

GALLI'NÆ (*gallina*, a hen: *Lat.*), in Ornithology, the order of birds under which are comprehended the peacock, pheasant, turkey, partridge, grouse, domestic cock, &c.

GAL'LIOT (*galliotte: Fr.*), a small galley or Dutch vessel, used in former times. It carried a main and mizen mast, and a large gaff-mainsail; but was built very slightly, and was designed only for chase. It could both sail and row, and had sixteen or twenty oars: all the seamen on board were soldiers, and each had a musket by him as he sat at his oar

GAL'LON, a measure of capacity both for dry goods and liquids, holding four quarts The imperial gallon contains 10 lbs. avoirdupois of distilled water, equivalent to 277,274 cubic inches. The old English gallon, wine measure, contained 231 cubic inches; and the old gallon, beer measure, 282

GALLOO'N (*galon: Fr.*), a narrow thick kind of ferret, or lace, used to edge or border cloths

GALLOPA'DE (*galoper*, to gallop: *Fr.*), in the manège, a sidelong or curvetting kind of gallop. Also the term for a sprightly and active kind of dance.

GALLS, local diseases of plants, caused by the puncture of insects in depositing their eggs. They are produced by concentric layers of dried sap, and do not affect the general health of the tree.

GAL'VANISM, the development of electrical phenomena without the aid of friction, and by means of a chemical action which takes place between certain bodies. It derived its name from Galvani, a professor at Bologna, who, in a course of experiments on animal irritability, observed the first striking phenomena that led to its discovery, which occurred in the following manner. One of his assistants happened to bring the point of his scalpel to the crural nerves of a skinned frog lying near the electrical conductor, upon which the muscles of the limb were agitated with strong convulsions. After this, he continued his experiments in various ways, and ascertained that the mere agency of metallic substances, provided they were dissimilar metals, would produce such convulsions. This subject engaged the attention of experimentalists both before and after the death of Galvani, which happened in 1798; but none added anything of great importance to Galvani's discovery except Volta, who repeated his experiments, and found that whenever two pieces of metal of different kinds were placed in different parts of an animal, and were brought either into contact, or into connection by means of a metallic arc, convulsions ensued, and that this effect was strongest when the metals were zinc and silver, particularly when several pairs of the metals, having pieces of moist cloth between them, were employed. This led him to the construction of an apparatus for the purpose of accumulating electricity, which has since been called the *Galvanic battery* or *Voltaic pile*. Several improvements upon the voltaic pile were soon made by other philosophers; and the discoveries in galvanism multiplied with a rapidity, and to an extent, surpassing anything before known in the history of science. It has been ascertained that chemical action is indispensable to the production of galvanic electricity. The least complicated galvanic arrangement is termed *a simple galvanic circle*. It consists of three conductors, of which one at least must be solid, another fluid, and the third may be either solid or fluid. This is possessed but of feeble powers, yet they are often sufficiently striking. *Compound galvanic circles*, or *galvanic batteries*, are formed by multiplying those arrangements which compose simple circles. [See BATTERY, GALVANIC.]——*Chemical effects of Galvanism.* The most simple chemical effect of the galvanic battery is the ignition and fusion of metals; the facility with which the different metals are ignited, being inversely proportional to their power of conducting heat. Hence platina, which has the lowest conducting power, is most easily ignited; and silver, which conducts heat with greater facility than any other metal, is the most difficult to be ignited. The most striking effect of the voltaic battery, however, is the intense light which is produced by placing two pieces of charcoal, cut into the shape of pointed pencils, at the two ends of the wires of an interrupted circuit. When the battery is very powerful, and the charcoal points are brought within the thirtieth or fortieth of an inch of each other, a bright spark is produced. By withdrawing the points from each other, a constant discharge takes place, through the heated air, in a space of from one to four or more inches, according to the energy of the apparatus, producing a most brilliant arch of light, of considerable breadth, and in the form of a double cone. Platina, introduced into this arch, melts as wax does in the flame of a candle: and the light equals the brilliancy of the sun. But decomposition is the most important chemical effect of galvanism. The substance first decomposed by it was water. When two gold or platina wires are connected with the opposite poles of a battery, and their free extremities are plunged into the same cup of water, but without touching each other, hydrogen gas is disengaged at the negative wire, and oxygen at the positive. By collecting the gases in separate tubes, as they are liberated, they are found to be quite pure, and in the exact proportion of two measures of hydrogen to one of oxygen. In decomposing water or any other compound, the same element is always disengaged at the same side of the battery; so that the elements which collect around each pole have a certain analogy: inflammable bodies, alkalis, and earths, go to the negative pole, while oxygen and acids go more to the positive. Hence the terms *electro-positive* and *electro-negative*. It is also found that not only are the elements of a compound fluid conveyed, by galvanic energy, to the opposite poles situated in distant parts of the containing vessel, without the movement of these elements being perceptible; but that they may even be evolved in separate portions of the fluid placed in distinct vessels, and connected only by some slight link, as a few fibres of moist cotton or amianthus. Many phenomena, indeed still more extraordinary, present themselves in connection with these interesting experiments. The elements of compound bodies are actually conveyed, by the influence of the electric current, through solutions of substances on which, under other circumstances, they would have exerted an immediate and powerful chemical action, without any such action being produced. [See ELECTRICITY, MAGNETISM, and VOLTAIC ELECTRICITY.

GALVANI'ZED IRON, the commercial name of iron coated with zinc, to prevent rust.

GALVANOM'ETER (*galvanism;* and *metron*, a measure: *Gr.*), an instrument for measuring minute quantities of electricity, or the operations of galvanism. It consists of one, and sometimes more, delicate magnetized needles, suspended horizontally by some very slender fibre, and surrounded by a great number of coils of very thin insulated copper wire. When the electric current to be examined is transmitted through the wire, the needle is deflected in a direction, and to an extent, dependent on the direction and intensity of the current. [See ELECTRO-MAGNETISM.]

GA'MBIT, at Chess, a word derived from an Italian phrase used in wrestling, and signifying a tripping-up. The player who opens the game places a pawn in such a position that it can be taken by the adversary in order to give freedom of movement to his superior pieces. There are several gambits, known to chess players by different names.

GAMBO'GE (*Gambodia*, in India, whence it was first brought), a gum-resin, the inspissated juice of various species of *Garcinia* trees belonging to the nat. ord. *Guttiferæ*, and growing in the East Indies, Ceylon, &c. It is obtained in commerce in masses of a dull orange colour, possessing no smell, and a slightly acrid taste; and affords a beautiful yellow colour, much used by painters. Its medicinal properties are violently cathartic.

GAME LAWS (*gaman*, to sport: *Sax.*

Any person taking out a proper certificate may kill game on his own land, or that of another with his leave; and anyone having such a certificate may sell game to any person licensed to deal in it. Any person, in the actual possession of enclosed lands, or the owner of them, if he has the right of killing game on them, may by himself, or any one authorized by him in a certain form of writing, take, kill, and destroy hares, without paying duty or obtaining a certificate.

GAMES (same *deriv.*), in Antiquity, public diversions, or contests, exhibited on certain occasions as spectacles for the gratification of the people. Such, among the Greeks, were the Olympic, Pythian, Isthmian, and Nemæan games; and, among the Romans, the Apollinarian, Circensian, Capitoline, &c. The Romans had three sorts of games, viz. sacred, honorary, and ludicrous. The first were instituted in honour of some deity or hero. The second were those exhibited by private persons, to please the people; as, the combats of gladiators, the scenic games, and other amphitheatral sports. The ludicrous games (*ludus*, a sport: *Lat.*) were much of the same nature with the games of exercise and hazard among us: such were the *ludus Trojanus tesseræ*, &c. By a decree of the Roman senate, it was enacted that the public games should be consecrated, and united with the worship of the gods; whence it appears, that feasts, sacrifices, and games made up the greatest part, or rather the whole, of the external worship offered by the Romans to their deities.

GAMOPET'ALOUS (*gamos*, union; *petalon*, a leaf: *Gr.*), in Botany, an epithet given to a corolla with the petals united; monopetalous.

GAM'UT or GAM'MUT, in Music, the table or scale of notes laid down by Guido, and marked by the monosyllables *ut, re, mi, fa, sol, la*, &c., derived from syllables commencing the lines of one of the hymns of St. John the Baptist, in the Roman breviary, '*Ut* queant laxis *re*sonare fibris *mi*ra gestorum *fa*muli tuorum,' &c.; *ut* has been changed for *do*, as more convenient for singing.

GANG (*gangan*, to go: *Sax.*), in seamen's language, a select number of a ship's crew appointed on any particular service.

GANG'LION (*ganglion*, a knot: *Gr.*), an enlargement in the course of a nerve. Also, a tumour in the sheath of a tendon.

GAN'GRENE (*gangraina*, from *gnao*, I gnaw: *Gr.*), in Medicine, the first stage of mortification before the vitality of the part is completely extinct: when the part is altogether dead, it is termed *sphacelus*.

GAN'GUE, in Mining, the mineral substances which contain the ore of a metal, or are mingled with it without being chemically combined.

GANG'WAY, among seamen, the name of several ways or passages from one part of a ship to another; but it is especially applied to a range of planks laid horizontally along the upper part of a ship's side from the quarter-deck to the forecastle, and fenced on the outside by iron stanchions, and ropes, rails, or netting.—*To bring up to the gangway* is to punish a sailor by flogging him there.

GAN'NET, or *Solan Goose*, the *Sula alba* of ornithologists, a palmiped bird, about the size of a common goose, with a bill six inches long, jagged at the sides, and straight almost to the point, where it inclines downwards. The plumage in the young bird is dark with white spots; when mature it is white. Gannets are found in the north of Scotland, Norway, Newfoundland, and many other places; but they abound to an almost incredible extent in the Hebrides and other solitary islands of North Britain, where, in the months of May and June, it is difficult to walk without treading on their eggs, which are a source of considerable profit to the inhabitants.

GANOID (*ganos*, brilliancy: *Gr.*). In Ichthyology, those scales which are covered with a coat of enamel are termed ganoid. Many fossil fishes had scales of this nature.

GANT'LET or GAUNT'LET (*gantelet*: *Fr.*) a large kind of glove, made of iron, the fingers being covered with small plates: it was formerly worn by cavaliers, armed at all points.—*To throw down the gantlet* is a phrase signifying to challenge or defy. The expression derives its origin from the days of chivalry, when he who challenged an opponent in the lists threw down his glove, and he who accepted the challenge took it up.

GANT'LOPE (*gant*, all; and *loopen*, to run: *Dan.*), or GANT'LET, an old military punishment, in which the criminal, running between the ranks, received a lash from every man. A similar punishment is used on board ships: but it is seldom inflicted, except for such crimes as are calculated to excite general disgust among the seamen.

GAOL DELIVERY, a term in law for the clearing of a prison by a judicial trial of the prisoners; also a commission from the king to deliver or clear the gaols.

GAR'DENING (*garten*, a garden: *Ger.*), that branch of cultivation which teaches how to dispose fruit-trees, flowers, and herbs, to the best advantage, whether for profit or pleasure; and how to prepare the soil for sowing the different kinds of seed; as well as how to treat the plants during their various stages of vegetation, till they arrive at maturity. The subject is divided into *Horticulture*, which relates to the cultivation of culinary vegetables and fruits; *Floriculture*, which relates to the cultivation of ornamental and rare flowers, shrubs, and trees; *Arboriculture*, which relates to the cultivation of trees and shrubs used for various purposes in the arts and general economy; and *Landscape gardening*, or the general arrangement of the scenery or landscape about a country residence. We may perceive from ancient authors that the formation of beautiful gardens very early attracted the attention of the polished nations of antiquity; but the art seems to have been forgotten amid the desolation caused by the irruption of barbarous hordes into the provinces of the Roman empire. When the taste for ornamental gardening revived, it was corrupted; stiffness was mistaken for beauty, and regularity was carried to an extravagant excess. This was succeeded, among ourselves, by the opposite extreme. A gardener should study nature not less than the painter; but it is not necessary that he should avoid exhibiting any traces of art. Above all things, the style of the garden should be suited to that of the dwelling it is intended to adorn.

GAR'-FISH (*gar*. a lance: *Sax.*), in Ichthyology, the *Sea needle*, a long slender fish, with the jaws projecting into an elongated beak. It is the *Belone vulgaris* of naturalists. The head and back are a dark green, the sides paler, and the belly of a bright silvery colour. It makes its appearance on the English coast just previous to the arrival of the mackerel, which it resembles in flavour.

GAR'LIC (*gar*, a lance: *Sax.*; and *leek*), the *Allium sativum* of botanists, a plant with a bulbous root, consisting of many small tubercles included in its coats. It has a strong smell and an acrid taste, but is much used as a condiment.

GAR'NET (*granat*: *Ger.*), in Mineralogy, a precious stone of great beauty, usually occurring in crystals more or less regular, and having numerous sides. It is a silicate of alumina with oxide of iron: when extremely fine, it has been sold for ruby. Its prevailing colour is red of various shades, but it is often brown, and sometimes green, yellow, or black. *Precious garnet* is always red: fine specimens are found in Ceylon, Pegu, Brazil, &c.; and the term *oriental* sometimes applied to it indicates not a locality where it is found, but its excellence. Garnets are usually disseminated, and occur in all the primitive strata from gneiss to clay slate. In some parts of Germany, they are so abundant as to be used as fluxes for iron ores; in others, the garnet gravel is washed, pounded, and employed as a substitute for emery. Varieties have the names of the *precious* or *oriental*, the *pyrope*, the *topazolite*, the *melanite*, the *grossular*, the *pyreneite*, and the *colophonite*.

GAR'TER, ORDER OF THE, a military order of knighthood of ancient institution. Its origin and name have been often discussed. One tradition runs that it was instituted by Richard I. at the siege of Acre, where he caused twenty-six knights, who firmly stood by him, to wear thongs of blue leather about their legs. Another account attributes its origin to Edward III., when he picked up at a court entertainment the countess of Salisbury's garter, and rebuked the laughing bystanders by the words, 'Honi soit qui mal y pense,' words adopted as the motto of the order. Previous to the reign of Edward VI. it was generally called the order of St. George. The number of knights was originally twenty-six, and it has never much exceeded this number. Princes of the blood are added as supernumeraries, and special statutes are occasionally made for the admission of foreign potentates, and even of British subjects in excess of the ordinary number. The king or queen is sovereign of the order, of which about 60 foreign crowned heads have been members. This order is never conferred but upon persons of high rank. The habit and ensigns are, the garter, mantle, cap, and collar. The badge of the order is the image of St. George, called the George: and the motto is *Honi soit qui mal y pense*, or 'Evil be to him that thinks evil hereof.' The bishop of Winchester is the prelate of the order, and the bishop of Oxford the chancellor.

GAS (*gaz*, from *geist*, a spirit: *Ger.*), a general term employed in chemistry to express all permanently elastic aerial fluids, whether produced by chemical experiments or evolved in natural processes. Four of the elementary bodies are gases, viz. oxygen, hydrogen, nitrogen, and chlorine. Each species has its distinguishing characters and its own peculiar and uniform specific gravity, or weight, though, in all cases, several hundred times less than that of water. Gases possess many extraordinary properties, and play an important part in almost all chemical, and in many natural phenomena. [See the different gases under their respective names.] One of the properties of gases is, that if two or more are confined together, and the circumstances are such that they will not combine with each other, they will mix and interfuse although their specific gravities may be very different. Gases are highly elastic. According to Boyle's law (often attributed to Marriotte), the volume of a gas is inversely as the pressure, whilst the density and elastic force are directly as the pressure, and inversely as the volume. Thus a cubic foot of gas under a pressure of thirty inches of mercury will expand to two cubic feet if the pressure be reduced to one half. But if the pressure be doubled, the gas will only occupy half a cubic foot. The density of a cubic foot of gas will be doubled if the volume be reduced by pressure to one half, and halved if the diminished pressure allows the gas to expand to the volume of two cubic feet. The elastic force or tension follows the same rule. It is known that the elasticity of nearly all gases can be so far counteracted by great pressure that they will become liquid. The common process is to expose them to the pressure of their own atmospheres. Thus, carbonate of soda and sulphuric acid, mixed together in a perfectly close vessel, generate carbonic acid gas, which soon not only fills the vessels, but becomes condensed by the mutual pressure of its own particles. *Liquid* carbonic acid is highly volatile, and therefore, by the rapid expansion and evaporation consequent upon its issue from a receiver, is capable of producing a temperature so low as 189° below the freezing point of water. The solid carbonic acid which is produced, cold as it is, may be held in the hand with impunity, or retained in glass in the open air for a considerable time, because it immediately becomes surrounded with its own vapour, and is not in contact with the substance upon which it apparently rests. In order, therefore, to use the liquefied gas as a cooling agent, it must be brought into contact with another substance of a very different temperature, by means of a third, which should be a good conductor of heat. Ether is used for this purpose, because it will bear their contact and still retain its liquid state. Now, although the carbonic acid thus dissolved is not so cold as solid carbonic acid, if the finger is placed in it, the effect will be the same as if it were plunged in melted metal.

GAS FOR ILLUMINA'TION. When treating of carburetted hydrogen, we alluded to the constituents of gases for illumination. The substance most ordinarily used for the production of these is bituminous coal; and the gas obtained from it is a mixture of two or more gases or vapours, with small portions of other gaseous bodies, particularly hydrogen and carbonic oxide. Dr. Clayton, about the year 1735, examined the fitness of coal gas for the production of artificial light; but its application to economical purposes was unaccountably neglected for about sixty years after. At length, in 1798, Mr. W. Murdoch, in the employment of Messrs. Watt and Boulton, of the Soho foundry, erected a gas apparatus on a large scale at the foundry. In 1803, Mr. Winsor exhibited gas illuminations in the Lyceum, London; and proved the practicability of lighting the streets of cities by lighting Pall Mall. Since that time, gas has been more extensively employed every succeeding year, till at length almost all factories, and even the smaller towns, are lighted by it. So great, indeed, were the advantages which the public derived from this brilliant light, that, in less than twenty years from Mr. Winsor's experiments in Pall Mall, there were four large gas companies established in the metropolis. In 1852, there were eighteen public companies in London, each having gas works; which supplied gas for 134,300 private, and 30,400 street-burners. About 890 tons of coal were consumed daily; 7,120,000 cubic feet of gas were used in the longest night; 408,000 tons of coal were used during the year; and the product of gas was 4000 millions of cubic feet. When coal is subjected to destructive distillation, that is, raised to a red heat in closed vessels, it yields permanent gases, vapours condensible into the liquid or solid state by cooling, and solid matter as residuum. These must, in the manufacture of coal gas, be separated. For this purpose, the coal is placed in cast-iron retorts, which communicate by pipes with the *hydraulic main*, a large horizontal pipe, partially filled with tar and ammoniacal liquor, into which the pipes from the retorts dip. This hydraulic main condenses the more volatile vapours into a liquid, which runs off by an overflow-pipe. The gas passes into the purifiers, where the carbonic acid and sulphuretted hydrogen are removed by a mixture of lime and water; thence it is conducted into the gas-holders, or, as they are improperly called, gasometers where it is stored up for use. In order to obtain a good gas from coals, the distillation should commence with a retort previously heated to a cherry-red, which heat should be steadily continued during the whole process, that is, from five to eight hours; but the operation should be stopped some time before gas ceases to come over, lest compounds having feeble illuminating power should impoverish the contents of the gasometer.——OIL GAS contains no mixture of sulphuretted hydrogen, and requires no other purification than transmission through a refrigerator; and as less of it is required for any given quantity of light, the atmosphere of a room is less heated and contaminated by its combustion. It is, however, considerably more expensive than the gas from coal; although the first outlay of capital for a manufactory upon a large scale is less, on account of the smaller size of the necessary pipes and apparatus. Oil gas is obtained by dropping fish oil, and substances not fit for lamps, on iron, coke, or bricks, raised to a high temperature. One cubic foot of oil produces from 600 to 700 cubic feet of gas, or, on an average, 98 per cent. by weight. When resin is used for the production of gas, it must first be rendered fluid by solution in oil of tar, &c. One pound of resin yields from 14 to 23 cubic feet of gas.——WOOD GAS. Gas obtained by the destructive distillation of wood has been tried; but it totally failed on account of the feeble illuminating power which it possesses.

GAS-BURNERS, either simple beaks of metal perforated with a small round hole, or a circle with a series of holes which form an argand flame; or two holes drilled obliquely, to make the jets cross each other, so as to form a flame like a swallow's tail; or a slit which produces a sheet of flame, and is used with most of the street lamps. The burners are mounted with a stop-cock for regulating the supply of gas.

GAS-METER. Before the gas is consumed it is usually passed through an instrument called a *meter*, in order to ascertain the number of cubic feet which are used in a given time, or in a particular place. The instrument consists of a kind of revolving drum, having compartments which measure the gas, and deliver it, as they pass round in succession; water, which, before the next revolution, is replaced by gas, taking its place. It is filled with that fluid up to a certain height through an orifice in the side of the vessel, in which a plug is fitted. The gas enters by a pipe at one side, escapes from an orifice into a pipe at the other, and is thence conveyed to the burners. By means of a train of wheel-work in connection with the axis of the drum, an index is turned, which points out on the index-plate how many cubic feet have passed through the meter.

GASOM'ETER, or more correctly GASHOLDER, a hollow cylindrical vessel, usually made of metal plates, open at one end, and placed upon its open end in a cistern, or a cylindrical ring of water. It serves not merely as a magazine for receiving the gas when it is purified, and keeping it in store for use, but also for communicating to the gas, in the act of burning, such a uniform pressure as may secure a steady unflickering flame.

GAS'TRIC JUICE (*gastēr*, the stomach; *Gr.*), in the animal economy, a thin pellucid liquor, separated by the capillary exhaling arteries of the stomach. It is the principal agent in digestion; for it acts with a chemical energy in dissolving food, which is not merely reduced by it to very minute parts, but its taste and smell are quite changed, and it acquires new and very different properties. [See DIGESTION.]

GASTRI'TIS (same *deriv.*), in Medicine, inflammation of the stomach. It is attended by great irritability of that organ, hiccough, vomiting, and violent pain, with general uneasiness, and a small hard pulse. There is also fever, accompanied with prostration of strength. It is a very dangerous disease.

GASTROR'APHY (*gastēr*, the stomach; and *raphē*, a seam: *Gr.*), in Surgery, the operation of sewing up wounds of the abdomen.

GASTROT'OMY (*gastēr*, the stomach; and *tomē*, a cutting: *Gr.*), in Surgery, the operation of cutting into or opening the abdomen.

GA'UGING-ROD (*jauger*, to gauge: *Fr.*), an instrument used in measuring the contents of casks or vessels.

GAULT, a bed of fossiliferous clay, having an average thickness of 100 feet, which forms the lowest member of the upper cretaceous group in the south of England. It is interposed between the upper and lower green sand, and contains a great number of well preserved marine shells. It was originally fine mud deposited in a deep sea.

GAUZE (*gaze: Fr.*), a very thin, slight, transparent kind of woven stuff, sometimes of silk, and sometimes only of thread. It is frequently enriched with flowers of silver or gold.

GAV'EL-KIND (*gyfe*, give; *eal*, all; and *kyn*, kind: *Sax.*), a tenure or custom by which the lands of a father, dying intestate, are divided equally at his death among his sons; and the land of a brother, dying without issue, descends equally to his brothers. And though the ancestor be attainted and hanged, the heir succeeds without any escheat. This species of tenure prevailed in England, before the Norman conquest, in many parts of the kingdom, if not through the realm; but particularly in Kent, where it still exists, in consequence, as is affirmed, of the Kentish men having submitted upon the express condition of retaining their peculiar privileges.

GAVOT' (*gavotte: Fr.*), a kind of dance, the air of which has two brisk and lively strains in common time, each of which is played twice over.

GAZEL'LE or GAZ'EL, a member of the antelope tribe, the *Gazella Dorcas* of naturalists. It is a native of the north of Africa and Asia Minor. Like the goat, it has hollow permanent horns, and it feeds on shrubs; but in size and delicacy, and in the nature and colour of its hair, it resembles the roebuck. The beauty and brilliancy of its eye is its most remarkable feature.

GAZET'TE, a kind of official newspaper, containing an account of public or private transactions and events, which are deemed sufficiently important for insertion. *Gazetta* is said to have been the name of a Venetian coin, in value between a farthing and a halfpenny in England, which was the price of the first newspaper; and hence the name. The first gazette in England was published at Oxford in 1665. On the return of the court to London, the title was changed to the *London Gazette*. It is now the official newspaper, and is published on Tuesdays and Fridays.

GAZETTEE'R, a topographical work, containing brief descriptions, alphabetically arranged, of empires, kingdoms, cities, towns, and rivers. It may either include the whole world, or be limited to a particular country. The first work of this kind, with which we are acquainted, is that of Stephen of Byzantium, who lived in the beginning of the 6th century.

GA'ZONS (*Fr.*), in Fortification, masses of fresh earth, covered with grass, used to line the outsides of ramparts, parapets, &c.

GEH'LENITE, a mineral, found in the Tyrol, and named after Gehlen the chemist It is a ferrosilicate of alumina and lime.

GEL'ATIN or GEL'ATINE (*gelatio*, a freezing: *Lat.*, from its assuming the solid form on cooling), a concrete animal substance, or jelly, obtained by boiling the muscles, cartilages, bones, tendons, &c., in water; glue and isinglass are examples of this substance. About one-half of dry gelatine consists of carbon, one-quarter of oxygen, and the remainder of nitrogen and hydrogen. Alcohol and tannin precipitate gelatine from its solution; the former by abstracting the water, the latter by combining with the substance itself so as to form an insoluble compound. Gelatine forms a tremulous solid when cold, and again liquefies on the application of heat It may be kept in a dry state for a long time, but it soon putrefies in contact with water.

GEM'INI (*Lat.*), in Astronomy, the *Twins*, a constellation and sign of the zodiac, representing Castor and Pollux. It is easily recognized, by two conspicuous stars of the second magnitude very near each other; Castor being to the east, and Pollux to the west.

GEMMA' (*Lat.*), in Botany, a leaf-bud. Leaf-buds appear in the axils of leaves, i. e. in the angle between a leaf and the stem They are formed at first by prolongations from the medullary rays bursting through the bark. They are usually protected by scales until the leaves have expanded to a certain extent.——GEMMÆ, in the plural, is applied to certain structures which are thrown off by some cryptogamic plants (liverworts, for instance), and are capable of forming new individuals.

GEMMA'CEOUS (*gemma*, a bud: *Lat.*), a Botanical term applied to a flower-stalk which grows out of a leaf-bud.

GEMMA'TION (same *deriv.*), in Botany, the arrangement of leaves in the bud.

GEMMIP'AROUS (*gemma*, a bud; and *pario*, I bring forth: *Lat.*), an epithet applied to animals, which propagate by shoots, as most of the *polypi*.

GEM'MULE (*gemmula*, the dim. of *gemma* *Lat.*), in Botany, the ascending axis or plumule of an embryonic plant.

GEMS (*gemma*, a precious stone: *Lat.*), the name given to *precious stones* in general, but more especially to such as by their colour, brilliancy, polish, purity, and rarity, are sought after as objects of decoration. Gems of the most valuable kinds form the principal part of the crown jewels of sovereign princes, and are esteemed not merely for their beauty, but as comprising the greatest value in the smallest bulk. Gems are remarkable for their hardness and lustre. Those usually employed are diamonds, sapphires, emeralds, rubies, topazes, hyacinths, and chrysoberyls, which are the most valuable; crystalline quartz, pellucid, opalescent, or of different hues; amethyst, lapis lazuli, malachite, jasper, agate, chalcedony, onyx, carnelian, and blood-stone. They are of various classes, and proportional values.——GEM-ENGRAVING or *Gem-sculpture*, called also *lithoglyptics*, is the art of representing designs upon precious stones, either in raised work, as *cameos*, or by figures cut below the surface, as *intaglios*. This art is of great antiquity, and was probably practised by the Babylonians. Some think it originated in India; but wherever it began, we have ample evidence that it was in high esteem among the Greeks and Romans.

GENDAR'MES or GENS D'ARMES (*Fr.*: literally, armed persons), in the history of France, a select body of troops, destined to watch over the public safety, and consequently much employed by the police. They were so called on account of their succeeding the ancient gendarmes, who were completely clothed in armour. August 16th, 1830, a royal ordinance abolished the *gens d'armes*, and established a new body called the *municipal guard* of Paris, to consist of 1443 men, under the direction of the prefect of police.

GEN'DERS (*genus*: *Lat.*), in Grammar, are either masculine, for the male sex; feminine, for the female sex; or neuter, for nouns which are of neither sex. In Latin, the termination of a noun distinguishes the gender in many instances, *us* for the masculine, *a* the feminine, and *um* the neuter. Corresponding terminations are found in other languages. In these the idea of sex is carried out in nouns that represent things which are really sexless and would be called neuter by us. The English language has very few terminations by which the genders are distinguished, such as *count* and *countess*.

GENEAL'OGY (*genealogia*: from *genea*, descent; and *logos*, a description: *Gr.*), a history of the descent of a person or family from a series of ancestors. In various chapters and military orders, it is required that the candidates produce their genealogy, to show that they are noble by so many descents.

GEN'ERAL (*generalis*, relating to all: *Lat.*), the highest rank in the British army next to field-marshal. Lieutenant-generals rank next to the generals, and then come the major-generals. These officers have no duties unless specially entrusted with a command. The colonelships of regiments are distributed amongst them. The chief commander of an army is often called, by way of distinction, the *general-in-chief*.——A particular beat of drum which in the morning gives notice to the infantry to be in readiness to march, is also called the *general*.

GENERALIS'SIMO (*Ital.*), the supreme general or commander-in-chief of an army.

GEN'ERAL IS'SUE, in Law, that plea which denies at once the whole declaration or indictment, without offering any special matter by which to evade it. This is the ordinary plea upon which most causes are tried, and is now almost invariably used in criminal cases. *It puts everything in issue, that is, denies everything, and requires the party to prove all that he has stated. In many cases, for the protection* of justices, constables, excise officers, &c., they are, by act of parliament, enabled to plead the general issue, and give the special matter of their justification, in evidence.

GEN'ERALIZE, in Logic, to comprehend, under a common name, several objects, agreeing in some point, indicated by the common term.

GEN'ERATING LINE or FIGURE (*genero*, I produce: *Lat.*), in Geometry, that which, by its motion, produces any plane or solid figure, &c. Thus, a right line moved parallel to itself, generates a parallelogram; made to revolve in the same plane, round one of its extremities, it generates a circle. One entire revolution of a circle, along the same right line, generates the cycloid; and the revolution of a semicircle round its diameter generates a sphere, &c.

GEN'ERATOR (a producer: *Lat.*), in Music, the principal sound or sounds by which others are produced. Thus the lowest C for the treble of the pianoforte, besides its octave, will strike an attentive ear with its twelfth above, or G in alt, and with its seventeenth above, or E in alt. Hence C is called their *generator*, the G and E its products or *harmonics*.

GENER'IC (*genus*, a class: *Lat.*), pertaining to or connected with a *genus*, which see.

GEN'ESIS (an origin: *Gr.*), a canonical book of the Old Testament, and the first of the Pentateuch, or five books of Moses. The Greeks gave it the name of Genesis, from its beginning with an account of the creation of the world.

GEN'ET (*genette*: *Fr.*), the *Genetta vulgaris* of naturalists, a carnivorous animal, the size of a small cat, which is a native of Africa, Asia, and the south of Europe. Like its ally the civet cat, it produces an agreeable perfume, but less powerful and less permanent.—Also, a small-sized well-proportioned Spanish horse.

GENETH'LIACS (*genethliakos*, belonging to one's birthday: *Gr.*), the pretended art of calculating nativities.——Also, a short poem composed in honour of an individual.

GENIC'ULATED (*geniculatus*, with a bended knee: *Lat.*), in Botany, bending abruptly, like the knee.

GENIOGLOS'SI (*geneion*, the chin; and *glōssa*, the tongue: *Gr.*), in Anatomy, a pair of muscles with which the tongue is thrown out.

GENIS'TA (*Lat.*), in Botany, a genus of leguminous shrubs, including the *G. tinctoria*, or dyer's broom, and several other species of broom.

GEN'ITIVE CASE (*genitivus*, generative: *Lat.*), the second case in Latin and Greek nouns, which denotes possession or relation; it is usually marked in English by *s* with an apostrophe, thus (*'s*).

GE'NIUS (*Lat.*, from *gigno*, I produce), in the belief of the old Etruscans, a spiritual agency of a very indeterminate kind, appropriated not only to every human family and individual, but also to Gods, places, and things. Among the Romans, it became mingled with the Grecian doctrine of demons. According to them, every person had his own genius, that is a spiritual being, which introduced him into life, accompanied him during the course of it, and again conducted him out of it at the close of his career.——Genii, among the eastern nations, a race of beings created from fire, occupying an intermediate place between men and angels; endowed with a corporeal form, which they could change at pleasure. They are supposed to interest themselves greatly about the affairs of men, and to have considerable influence over them.

GE'NRE (*Fr.*). Pictures representing subjects of every-day life, whether real or fictitious, but not portraits or landscapes, are styled *genre* pictures. Wilkie's Blind Fiddler, Leslie's Sancho Panza and the Duchess, and Frith's Railway Station, may be cited as well-known examples.

GENTIA'NA (*Lat.*, from *Gentius*, king of Illyria), in Botany, a genus of plants, nat. ord. *Gentianaceæ*, containing many species, of which some are wild in Britain, and known for their bitter juice. The *Gentiana lutea* is a native of the mountainous parts of Germany, and the Swiss and Austrian Alps. Its root, the only part used, has a yellowish-brown colour, and very bitter taste; and its infusion or tincture is an excellent stomachic bitter.

GEN'TILES (belonging to the same race: *Lat.*), a name given in the sacred writings to all who were not of the twelve tribes of Israel.

GEN'TLEMAN (*gens*, a race: *Lat.* – the English word *gentle* originally meant belonging to a race or family), in Heraldry, any one entitled to coat armour; but the term is usually applied to those having no other title. Certain persons were born or made gentlemen, either expressly or by their office; but, as a rank, that of gentleman is now obsolete.

GEN'TLEMEN-AT-ARMS, a body of forty gentlemen, who attend in uniform in the sovereign's presence-chamber at levees and drawing-rooms, and on other state occasions. They receive pay, and have a captain at their head, usually a nobleman, who retires with the ministry.

GENTOO', a native of India who professes the religion of the Bramins. [See Hindoo.]

GE'NUS (*Lat.*), in Natural History, a group of species having some common characters which supply the definition of the genus. Thus the Asiatic and the African elephants are so far distinct that they are considered separate as species; but they have so much in common, that they are placed in the same generic group. In naming a species, naturalists give first the name of the genus, e.g. *Elephas*, and then the specific designation, e.g. *Elephas indicus*, or *Elephas africanus*. A genus is itself a subdivision of a family or an order. [See Species.]——In Logic, one of the predicables, which is considered the material part of the species of which it is affirmed.——In Music, the name for any scale of music: thus, the *diatonic genus*, which proceeds by the tones and semitones belonging to the key; and the *chromatic genus*, which proceeds entirely by semitones.

GEOCEN'TRIC (*gē*, the earth; and *kentron*, a centre: *Gr.*), in Astronomy, literally *having the earth for centre*. It is opposed to *heliocentric, having the sun for centre.* These terms are used only with regard to the solar system. The fixed stars are so distant that they are referred to the same place, whether supposed to be seen from the earth or the sun. The geocentric place of a planet is the place of the centre of the planet as it would appear from the centre of the earth; the heliocentric place such as it would appear from the centre of the sun. ——Geocentric Latitude of a planet, the angle made by a line drawn from the planet to the earth, with the plane of the ecliptic. ——Geocentric Longitude, the angle at the earth, made by two straight lines, one drawn from the planet to the first point of Aries, the other to the point of the ecliptic, intercepted by a perpendicular circle, the plane of which passes through the earth and planet.

GE'ODE (*geōdēs*, earthy: from *gē*, the earth; and *eidos*, form: *Gr.*), in Mineralogy, a roundish lump of agate or other mineral. Sometimes its interior is empty, and the sides of its cavity are lined with crystals; at others it contains a solid movable nucleus, or is filled with an earthy matter ——Geodiferous, producing geodes.

GEOD'ESY (*gē*, the earth; and *daio*, I divide: *Gr.*), literally a division of the earth, in which sense it is synonymous with *land surveying*; but it is applied in a more general sense to that part of practical geometry which relates to the determination of the magnitude and figure of the earth, or any portion of its surface. Hence it includes all the geometrical and trigonometrical operations necessary for the purpose; which are called *geodesical* or *geodetical*, in opposition to *astronomical*, or those required for determining azimuths and latitudes.

GEOG'NOSY (*gē*, the earth; and *gnōsis*, knowledge: *Gr.*). This word is nearly synonymous with *geology*, which see.

GEOG'RAPHY (*geōgraphia*: from *ge*, the earth; and *graphē*, a description: *Gr.*), the description of the earth as a whole, its surface, natural divisions, and local characteristics. The fundamental principles of geography are the spherical figure of the earth, its rotation on its axis, its revolution round the sun, and the position of the axis or line, round which it revolves, with regard to the celestial luminary; whence it follows that astronomy is the key of all geographical knowledge. The figure of the earth is that of an oblate spheroid, that is to say, it is a globe flattened at each pole. There is a difference of about 26½ miles between the polar and equatorial diameters. [See EARTH.] *General* geography comprehends the knowledge of the earth in general, and the phenomena common to the whole globe. *Particular* geography has relation to particular countries, showing their boundaries, figure, climate, seasons, inhabitants, arts, customs, language, history, &c. When it has reference to regions, districts, or parts or countries, it is called *chorography;* and when to particular cities, towns, or villages, &c., it is called *topography*. *Ancient* geography treats of the countries and places existing among the ancients; *modern* geography describes the various countries that now exist, and of which we are able to glean information from travellers. There are also other aspects under which geography may be considered; viz. as mathematical, physical, and political. *Mathematical* geography determines the form and dimensions of the earth; its relations with the celestial bodies; the relative positions and distances of places on its surface, and their representation by globes or maps. To ascertain the relative position of different places, geographers refer them to two *great circles*, that is, circles formed by the intersection of planes passing through the earth's centre. One of these, the *equator*, is equally distant from the poles; and the other is a meridian which passes through the poles and a given place from which the reckoning commences. The *latitude* of any place is its distance north or south of the equator, measured on its meridian. Latitude, therefore, is equal to the elevation of the pole above the horizon. *Longitude* is the distance of the meridian of any place, east or west, from what is called the first meridian, measured on the equator. For a *first meridian*, astronomers and geographers generally choose the meridian passing through the capital of their own country; though it is manifest that any other would do equally well. The first meridian of English geographers passes through Greenwich; that of the Parisians through the observatory at Paris. Latitude is found by astronomical observations; and longitude, by the interval which elapses between the times at which any celestial body passes over the respective meridians. *Distance* may be ascertained by changing degrees into miles. [See DEGREE.] *Physical* geography in its most extended sense comprises geology, hydrography, meteorology, and a description of the animal, vegetable, and mineral kingdoms; but it is usually limited to a description of the outward features of the globe, with an account of their bearings upon one another. Land occupies only one-third of the surface of the globe; and of this land, four-fifths are situated in the northern hemisphere; it is found chiefly in three great masses; viz. the *Old Continent*, comprising Europe, Asia, and Africa; the *new continent*, comprising North and South America, and *New Holland:* those are separated from each other by great oceans. In *political* geography, the earth is considered as the abode of rational beings, divided into larger or smaller societies, according to their diffusion over the globe, and their social relations. It considers the language, religion, government, degrees of civilization, population, resources, and local relations of the different countries; and therefore includes history and statistics. As a science the ancients knew but little of geography; yet we find that they did not overlook or neglect it. It was a constant custom among the Romans, after they had conquered and subdued any province, to have a map of it carried in triumph, and exposed to the view of the spectators. Historians inform us that the Roman senate, about a hundred years before Christ, sent geographers into various countries, that an accurate survey and mensuration of the globe might be obtained; but we now know that they saw scarcely the twentieth part of it. Before them, Necho, king of Egypt, commanded the Phœnicians to make a survey of the whole coast of Africa, which they accomplished in three years. Darius ordered the Ethiopic sea, and the mouth of the Indus, to be surveyed; and Pliny relates that Alexander, in his expedition into Asia, took two geographers to measure and describe the roads; and that from their itineraries the writers of the following ages gleaned the chief portions of their information. The honour of reducing geography to a system was, however, reserved for Ptolemy, who, by adding mathematical advantages to the historical method in which it had been treated of before, described the world in a much more intelligible manner; delineating it under more certain rules, and fixing the bounds of places from longitude and latitude. As a work of science, therefore, his system deservedly held the first rank among the ancients; and but little was added to what he achieved until the time of Copernicus, A D. 1520. From that period to the present, the science of geography has been steadily advancing; continual accessions to it having been made, by new discoveries, by accurate accounts of travels by land and water, by systematic topographies, and more precise measurements.

GEOL'OGY (*ge*, the earth: *logos*, a discourse: *Gr.*), the science which investigates the structure of the earth and the history of the successive changes it has undergone. The series of events to be unravelled is very complicated, and it requires a close, patient and skilful examination of the facts before they can be arranged in their true order. The rocks constituting the crust of the earth have not all had the same origin. Some have evidently solidified from a state of fusion: others appear to have been deposited in water; and a third series seems to have been originally deposited like the last in water, but to have been subsequently acted upon by heat. Hence arises the division of rocks into igneous, sedimentary, and METAMORPHIC. The igneous rocks include GRANITE and SYENITE (both of which are conjectured to have cooled slowly from a melted state under great pressure), and the series of TRAPS (BASALT, TRACHYTE) and LAVAS, which have issued from the mouths of VOLCANOES and flowed along the surface of the earth, or over the beds of shallow seas. The igneous rocks are confined to no one age; they are found interposed between or striking through sedimentary beds of all ages. It is only of late years that the key for unlocking the great difficulties of the road has been discovered, and this has been afforded by a study of the organic remains which most strata of the earth contain. For reliable conclusions as to these the geologist must look to the comparative anatomist, the conchologist, and the botanist. The remains are not scattered promiscuously throughout all strata; they are confined to those which have been deposited by water, and in these a given form has a limited range, being only found in one bed, or in a small series of beds. The older the bed the more distinct are the fossil forms from existing forms. Moreover, whenever a species present in the lower beds of a series is absent from the middle beds, it will not be found again in the higher beds; it has disappeared altogether. Reasoning on these facts, the geologist concludes that the rocks which contain remains of animals resembling existing marine animals were deposited by the sea, and that the age of any bed of a series is to be determined by its relative position, being older than those above and newer than those below it, unless there is evidence of local disturbance. Moreover, if a bed in a given locality is found to contain organic remains resembling those discovered in a bed situate in another locality, he will conclude that the two beds are of the same age, although their mineral constituents may be different, so that the date of the latter bed with reference to adjacent beds being known, the date of the former with reference to adjacent beds is known also. Again, a bed may be found whose organic contents agree in part with those of one bed of a known series and in part with those of a neighbouring bed, in which case it will be classed either as chronologically between the two, or as contemporaneous with both. On these principles the sedimentary rocks are arranged in periods and groups, distinguished by the peculiarities of the organic remains they contain. Each group consists of numerous beds which may differ widely from each other in most particulars, but which agree more or less in their organic contents. To say that a bed belongs to a given group implies only that it is of a certain age, and the age is chiefly determined by the foreign bodies embedded in the deposit and the order of superposition. It has been found that the whole series of sedimentary rocks may be naturally divided into three periods, viz.: Primary or palæozoic (the most ancient), secondary, and tertiary; and each of these is again divided with reference to differences in mineralogical characters and the embedded organic remains into systems, which are again subdivided into formations. For some account of the rocks of which the earth's crust is composed the reader may refer to CHALK, CLAY, LIMESTONE, and SANDSTONE. As to the state in which organic remains are found, see FOSSILS. The following is a list of the periods and systems into which the sedimentary strata of the earth have been divided. Some account of each group will be found in its alphabetical place:—

POST TERTIARY, or the Post Pliocene system.

TERTIARY, including the Pliocene, Miocene, and Eocene systems.

SECONDARY, including the Cretaceous, Oolitic, Liassic, and Triassic systems.

PRIMARY, including the Permian or Magnesian Limestone, Carboniferous, Devonian, Silurian, Cambrian and Laurentian systems.

A great light was thrown upon many difficult geological questions when it was ascertained that large portions of the earth's surface are slowly subsiding, and other portions are slowly rising. It is easy to conceive how, during a succession of ages, dry land may have been sunk below the ocean, and been elevated many times. Deposits would thus accumulate upon it under different circumstances, and denudation would occur, both in sinking and rising, by the action of the waves upon an ever-varying shore. The solid matter thus removed was of course deposited elsewhere, and hence we obtain some notion of the complicated series of events already alluded to, as having acted in forming the shell of the globe and sculpturing its surface. [See DENUDATION.]

GEOM'ETRY (*gē*, the earth; and *metron*, a measure: *Gr.*), that branch of mathematics which treats of the properties of figured space. The Greeks cultivated geometry more than any other people, but from the time of Euclid, who died 300 years B.C., to the 15th century, geometry was neglected. Since its revival, it has benefited by the illustrious labours of Napier, Descartes, Newton, and Leibnitz. The science of geometry is distinguished into the theoretical and the practical. *Theoretical or speculative* geometry treats of the various properties and relations in magnitudes, &c. *Practical* geometry comprehends the construction of figures, the drawing of lines in certain positions, as parallel or perpendicular to each other, &c. Speculative geometry is again distinguished into *elementary geometry*, which treats of the properties and proportions of right lines and right-lined figures, as also of the circle and its several parts; and the *transcendental geometry*, which treats of the higher order of curves, &c. *Elementary geometry* treats only of the right line and circle, of figures bounded by right lines and circles, and of solids bounded by these figures. The construction of algebraic equations of the second degree, and all problems that can be solved by right lines and circles, belong to elementary geometry. The following are definitions of great practical importance. A *point* is that which has neither length, breadth, nor thickness. A *line* has length without breadth or thickness. A *superficies*, or *surface*, has length and breadth only, the boundaries of which are lines. A *solid* is a figure which has length, breadth, and thickness. A *curve* continually changes its direction. A *straight* line lies evenly between its extreme points. *Parallel* lines keep at the same distance from each other if extended indefinitely. A *perpendicular* is a line standing upon another line, with which, or with its prolongation, it makes two equal angles, called *right angles*; an *obtuse angle* is greater, and an *acute angle* is less, than a right angle. A figure of three sides and angles is called a *triangle*. An *equilateral* triangle is that whose three sides are equal. An *isosceles* triangle is that which has two sides equal. A *scalene* triangle is that whose three sides are all unequal. A figure of four sides and angles is called a *quadrangle*, or *quadrilateral*. A *parallelogram* is a quadrilateral which has both its pairs of opposite sides parallel; and a *rectangle* is a parallelogram having four right angles. Four-sided figures are, moreover, distinguished, according to their sides and angles, into a *square*, having all its sides equal, and its angles right angles; a *rhombus*, having all the sides equal, but the angles not right angles; and a *rhomboid*, having the opposite sides equal two and two, and the angles not right angles. When a quadrilateral has none of its sides parallel, it is a *trapezium*; and when only two of its sides are parallel, a *trapezoid*. The *diagonal* is a right line which joins two opposite angles of a parallelogram, and divides it into two equal triangles The *base* of a figure is the side on which it is supposed to stand. The *vertex* is the extreme point opposite to the base; the *altitude* is the perpendicular distance from the vertex to the base.—A *circle* is a plane figure bounded by a curve line, called the *circumference*, which is everywhere equidistant from a certain point within, called its *centre*; the *radius* of a circle is a line drawn from the centre to the circumference; the *diameter* of a circle is a line drawn through the centre, and terminating at the circumference on both sides; an *arc* of a circle is any part of the circumference; a *chord* is a right line joining the extremities of an arc; a *segment* of a circle is any part of a circle bounded by an arc and its chord; a *semicircle* is half the circle, or a segment cut off by a diameter; a *sector* is any part of a circle which is bounded by an arc and two radii drawn to its extremities; and a *quadrant*, or quarter of a circle, is a sector having a quarter of the circumference for its arc. The circumference of every circle is supposed to be divided into 360 equal parts, called *degrees*, each degree into 60 *minutes*, and each minute into 60 *seconds*: hence a semicircle contains 180 degrees, and a quadrant 90 degrees. A *pyramid* is a solid having any rectilineal figure for its base, and for its lateral surfaces triangles whose vertexes meet in one point. A *prism* is a solid figure contained by plane figures, of which two that are opposite are equal, similar, and parallel to one another, and the others plane parallelograms. A *sphere* is a solid figure described by the revolution of a circle. A *cone* is a solid figure described by the revolution of a right-angled triangle about one of the sides containing the right angle. A *cylinder* is a solid figure described by the revolution of a right-angled parallelogram about one of its sides. And a *cube* is a solid figure contained by six equal squares. An *axiom* is a manifest truth not requiring a demonstration. The following are examples of axioms:—'Things equal to the same thing are equal to one another.' 'The whole is greater than any of its parts, and equal to the sum of all its parts.' 'If equal things be taken from equal things, the remainders will be equal.' 'Magnitudes which coincide with one another, or which exactly fill the same space, are equal to one another.' A *proposition* is something proposed either to be done or to be demonstrated, and is either a problem or a theorem. It is a *problem* when it proposes anything to be done, as to divide a given line into two equal parts, or to erect a perpendicular. It is a *theorem* when it proposes something to be proved, as that triangles having the same base and altitude are equal to each other, or that the angles in the same segment of a circle are equal. When something is premised, or demonstrated, in order to render what follows more easy, it is termed a *lemma* A *corollary* is a consequent truth, gained immediately from some preceding truth or observation. A *scholium* is a remark or observation made upon something going before it.——*Transcendental geometry* is, strictly speaking, that which has for its object all curves but the circle, and all equations above those of the second degree. Some, however, understand it as the application of the differential and integral calculus to the investigation of the properties of curved lines and surfaces.——GEOMETRICAL DEMONSTRATION. The method of *superposition* consists in showing that two figures being applied to each other will coincide or fill the same space; and, therefore, that they must be equal. A *reductio ad absurdum* consists in assuming the proposition not to be true, and reasoning from this assumption till consequences are deduced which are either contradictory of the hypothesis, which therefore it is absurd to suppose true, or are contradictory of some proposition previously demonstrated.——GEOMETRICAL INVESTIGATION is carried on by two methods; that of analysis, and that of synthesis. *Analysis*, *resolution*, or *inverted solution*, consists in setting out from the thing demanded, and arriving by certain established truths, termed *antecedents*, at something known or acknowledged to be true. *Synthesis*, on the contrary, begins with that proposition which ended the analysis just mentioned; and passes from one to another of the former antecedents, which now become *consequents*, taking them in an inverted order, until the conclusion sought, or that with which the analysis began, is established.——*Algebra applied to geometry*. This species of analysis was unknown to the ancients, but has produced the most important results in the hands of the moderns. Subjects which ancient geometry could reach only in some limited cases, and with difficulty, are demonstrated algebraically with great facility.——**GEOMETRICAL PROPORTION**, the equality of geometrical ratios. The *geometrical ratio* between two quantities is expressed by the quotient obtained by dividing one called the *antecedent* by the other called the *consequent*. It is the foundation of the rule of proportion, commonly called the *rule of three*.——**GEOMETRICAL PROGRESSION** is a series in which the terms increase or decrease by a common multiplier or ratio: thus 2, 4, 8, 16, 32; or 32, 16, 8, 4, 2.

GEOPON'ICS (*geōponikos*, belonging to agriculture, from *gē*, the earth; and *ponos*, labour: *Gr.*), the art or science of cultivating the earth.

GEORA'MA (*gē*, the earth; and *orao*, I see: *Gr.*), a hollow sphere, representing the surface of the earth, its mountains, seas, rivers, &c.

GEOR'GICS (*geōrgikos*, belonging to tillage, from *gē*, the earth; and *ergon*, work: *Gr.*), a poetical composition, treating of husbandry, after the manner of Virgil's poem on rural subjects, bearing this title. This poem, completed about 31 B.C., is in four books; the first of which treats of ploughing and preparing the ground; the second, of sowing and planting; the third, of the management of cattle, sheep, and goats; and the fourth is occupied with bees.

GEOR'GIUM SI'DŪS, the name given by Herschel, in honour of George III., to the planet which he discovered in 1781: now known as URANUS.

GERA'NIUM (*geranos*, a crane: *Gr.*, from the form of its fruit), a genus of plants, nat. ord. *Geraniaceæ*. There are numerous species, but most of the cultivated plants known as geraniums belong to the genus *Pelargonium*. The common wild herb Robert is *Geranium Robertianum*.

GERMAN'DER, in Botany, the name of several plants, as the *rock germander*, of the genus *Veronica*, and the *common* and *water* germander, of the genus *Teucrium*.

GER'MAN SIL'VER, an alloy of nickel, zinc, and copper. It is sometimes called *white copper*.

GER'MEN (a bud: *Lat.*), in Botany, the ovary, that part of the pistil which contains the ovules or young seeds.

GERMINA'TION (*germinatio*, from last), the act by which the embryo of a seed becomes developed into a plant. A temperature of between 60° and 80° is most favourable for germination; but some seeds require a tropical temperature. No seed will grow without moisture. Air also is necessary; hence seeds buried too deeply will not grow, but light is injurious. The root is developed first. The cotyledons, if not changed into leaves, rot away.

GERU'SALEMME LIBERA'TA, La, the title of Torquato Tasso's epic poem, published at Parma in 1581, when the author was in prison at Ferrara. The original manuscript, in Tasso's handwriting, is preserved in the Soane Museum, London. It is in OTTAVA RIMA, and divided into 20 cantos. Its subject is the first crusade, when Godfrey of Bouillon was one of the chief commanders, and it ends with the taking of Jerusalem in 1099. There are several English translations of this poem, and it has also been translated into most other languages of Europe. Everyone who reads the 'Jerusalem Delivered' remarks the melancholy feeling that pervades it, a melancholy that flowed naturally from the unhappiness of Tasso's mind and life. The diction has excited great admiration, from its grace and finish. In accordance with the taste of the time supernatural machinery is employed. The loves of the crusaders are freely introduced, and there are many descriptions of battles, as was to be expected from the subject. In the choice of this subject, Tasso has been thought to have had an advantage over Homer, but in vigour and originality the Italian is much below the Greek poet.

GES'NERA (from *Gesner*, a Botanist), in Botany, a genus of herbaceous or shrubby plants with showy flowers, nat. order *Gesneraceæ*.

GEY'SERS (from an Icelandic word signifying *raging* or *roaring*), the name of some fountains of hot water in Iceland, which spring at intervals 90 feet into the air, and then subside into their basins, which are lined with sinter, a siliceous deposit of the water. Various theories have been put forward to account for this curious phenomenon.

GHAUT, or **GHAT**, a word which originally meant a pass through a mountain; but in the East Indies, at present, it is used to denote any extensive chain of hills.

GHAZEL, an amatory ode amongst the Arabians and Persians, composed of not less than seven nor more than thirteen couplets. The second lines of the couplets rhyme together throughout the poem, the first lines have no rhymes.

GHEE, butter made in India from the milk of cows and buffalos, and clarified, after which it will continue sweet for some time. It is an article of considerable commerce, and is usually conveyed in bags of hide containing many gallons in each. Ghee is also made in Northern Africa.

GHIB'ELINES, a faction in Italy, in the 13th century, who were the opponents of another faction called the *Guelfs*, which see. They maintained the supremacy of the German emperors over the Italian states, which was disputed by the popes.

GHOST, HOLY. All Christians who subscribe to the doctrine of the Athanasian Creed believe the Holy Ghost to proceed from the Father and the Son. The Greek Church maintains that the Holy Ghost proceeds from the Father only; and this difference is one of the main points of distinction between that church and the Roman Catholic.

GI'ANT'S CAUSE'WAY, a vast assemblage of basaltic rocks, on the northern coast of Ireland, extending two miles in length along the coast of Antrim, and probably once continued to the coast of Scotland to the spot known by the name of Fingal's Cave. It consists of many hundred thousands of columns of a black kind of rock, hard as marble, about twenty feet in height, and nearly all of a pentagonal or five-sided figure. So compactly are the whole arranged that a knife can scarcely be introduced between them. Basalt displays more or less of this prismatic structure in all countries where it is found. It is the result of cooling from a state of fusion, and the prisms are always at right angles to the cooling surfaces, so that in dikes they are horizontal, whilst in a stream on the surface of the earth they are upright.

GIAOUR (dog: *Turk.*), a term commonly applied by the Turks to the adherents of all religions except the Mohammedan, whether Zoroastrians, Christians, or Jews. Some derive the word from Guebre, or Ghebr, a Persian word, meaning a worshipper of fire.

GIB'BON, a long-armed monkey. [See HYLOBATES.]

GIB'BOUS (*gibbus*, convex : *Lat.*), in Astronomy, a term applied to the bright portion of the moon, during her course from full to new, when the dark part appears falcated or horned, and the light part convex or gibbous.

GIE'SECKITE, a mineral discovered in Iceland, by Giesecke. It occurs in brownish hexagonal prisms, and is a hydrated silicate of alumina and potash.

GILD'ING (*gildan*, to overlay with gold : *Sax.*), the art of covering anything with gold, either in a foliated or liquid state. There are three distinct methods in general practice : namely, *wash* or *water gilding*, in which the gold is spread, whilst reduced to a fluid state, by solution in mercury; *leaf gilding*, either burnished or in oil, performed by cementing thin leaves of gold upon the work, either with size or by oil, and *japanner's gilding*, in which gold dust or powder is used instead of leaves. When gold is to be applied to anything that is of metal, the surface is previously covered with some gluey substance or size ; and when it is to be exposed to the effects of the weather, a composition of drying oil and ochre is used in place of the water-size. In the process of gilding metals, the surface is first cleansed, and then the leaves applied, which, by means of burnishing, and a certain degree of heat, are made to adhere in the manner desired. Gold is applied to glass, porcelain, and other vitrified substances, the surfaces of which, being very smooth, are capable of perfect contact with the gold leaves. Within the last few years, nearly all the gilt articles manufactured at Birmingham have been gilt by an electrotype process.

GILLS (*gula*, the neck : *Lat.*), the organs of respiration in fishes, consisting of some cartilaginous or bony arches attached to the bones of the head, and furnished on the exterior convex side with a multitude of vascular fibrils of a red colour. The water is admitted by the mouth, and escapes by the gill-openings, passing over the gills, and thus the air contained in the water acts upon the blood, as it circulates in the fibrils ——GILL, a measure of capacity, containing the fourth part of a pint; but among miners, a measure equal to a pint.

GILLY'FLOWER (corrupted from July flower, *girofleur : Fr.*), the name of certain plants. The *clove gillyflower* is of the genus *Dianthus*, or carnation pink; the *stock gilly flower* is a *Cheiranthus* ; and the *queen's gilly flower* a *Hesperis*.

GILT'HEAD, the *Chrysophrys auratus*, an acanthopterygious fish, so named from a golden spot between the eyes.

GIM'BALS (*gemellus*, paired : *Lat.*), a pair of brass hoops or rings, one of which moves within the other, about two axes placed at right angles. They are used for suspending a sea compass in its box, and keeping it in a horizontal position, notwithstanding the rolling of the ship.

GIN (*genièvre*, juniper: *Fr.*), a spirit formerly obtained, from oats, barley, or malt, redistilled with the addition of berries of the *genièvre* or juniper tree; but now made principally of malt spirits, flavoured by oil of turpentine. *Hollands* gin, manufactured chiefly at the village of Schiedam, is derived from wheat or rye, and flavoured with juniper berries.

GIN'GER (*zingiber : Lat.*), the dried root stock or rhizome of the *Zingiber officinalis*, an East Indian plant, which is also cultivated to a considerable extent in Jamaica and other West India islands. The root stock is of the thickness of a finger, knotty, irregular, and creeping. It possesses an aromatic, pungent flavour; makes an excellent preserve, and is used medicinally as a carminative.

GIN'GLYMUS (*gigglumos*, a hinge : *Gr.*), in Anatomy, a species of articulation resembling a hinge.

GIN'SENG, a Chinese word, applied to the root of the *Panax quinquefolia*, found in the northern parts of Asia and America. It has a fleshy, tapering root, about the thickness of the finger, which, when dry, is of a yellowish-white colour, with a mucilaginous sweetness in the taste, accompanied with a slight bitterness. The Chinese value the ginseng highly, and, as well as the Asiatics in general, think it almost a universal medicine. They have recourse to it in all diseases. The virtues generally ascribed to it are those of a restorative and a cordial. It is a monopoly of the government, and only a few persons have the privilege of purchasing the roots for their weight in gold. Our ivy belongs to the same nat. ord. *Araliaceæ*.

GIP'SIES, or GYP'SIES, a wandering tribe or race of vagrants, spread over the greater part of Europe, and some parts of Asia and Africa. The name is supposed to be corrupted from *Egyptian*, as they were formerly thought to have come from Egypt; but their origin is uncertain. They first appeared in western Europe, in the 15th century, under a leader who styled himself the Duke of Lower Egypt. The French call them Bohemians, the Italians *Zingari*. Their language is everywhere the same. Gipsies are remarkable for the yellow-brown, or rather olive colour of their skin; the jet-black of their hair and eyes; the extreme whiteness of their teeth ; and the symmetry of their limbs, which distinguishes even the men, whose general appearance, however, is repulsive. Though some occasionally follow a trade or honest occupation, they rarely settle permanently anywhere. Wherever the climate is mild enough, they are found in forests and deserts, in companies. They seldom use tents, but seek shelter from the cold of winter in grottoes and caves, or they construct huts, sunk some feet in the earth, and covered with sods laid on poles. They are fond of instrumental music, which they perform chiefly by ear, and their lively motions are remarkable in their own peculiar dances. The men obtain their living by gymnastic feats, tricks, &c., while the women invariably practise fortune-telling and chiromancy. They are not particular in their food, but eat all kinds of flesh, even that of animals which have died a natural death. Brandy is their favourite beverage, tobacco their greatest luxury; both men and women chew and smoke it with avidity, and are ready to make great sacrifices for the sake of satisfying this inclination. They have no settled religious notions: amongst the Turks they are Mohammedans; in Christian countries, if they make any religious profession at all, they follow the forms of Christianity, without, however, taking any interest in its spirit, or caring for instruction in it. They marry with none but their own race: their marriages are contracted in the rudest manner, and when a gipsy becomes tired of his wife, he turns her off without ceremony.

GIRA'FFE, the *Camelopard*, which see.

GIR'ASOL (*Ital.*), an opal of a white or bluish-white colour, but which, when turned towards the sun or any bright light, reflects a reddish tint; hence its name.

GIRD'ER (*gyrdan*, to enclose: *Sax.*), in Architecture, is the main beam, which either directly supports the flooring of a structure, or which supports the joists or cross beams whereon the flooring rests.

GIR'ONDISTS, a republican party in France at the period of the revolution. They obtained their appellation from several of their most distinguished members having come from the department of the Gironde. They opposed the sanguinary proceedings of the Mountain, the extreme republican party, by whom they were proscribed, and many of them guillotined in June 1793.

GIR'OUETTE (a weathercock: *Fr.*), a term applied to numerous public characters in France, who, during the revolutionary era, turned with every political breeze. To mark these, a *Dictionnaire des Girouettes* was published, containing their names, &c., with a number of weathercocks against each, corresponding to the number of changes in his political creed. [See the 'Biographical Treasury.']

GIV'EN, a term much used by mathematicians, to denote something supposed to be known. Thus, if a magnitude is known, it is said to be a *given* magnitude; if the ratio between two quantities is known, these quantities are said to have a *given* ratio, &c., &c.

GLA'BROUS (*glaber*, smooth: *Lat.*), in Natural History, hairless, smooth.

GLA'CIERS (*Fr.*), immense masses of ice, which accumulate on the peaks and slopes, and in the upper valleys of lofty mountains. In the Tyrol, Switzerland, Piedmont, and Savoy, the glaciers are so numerous that, taken together, they have been calculated to cover 1484 square miles of surface. The snow which lies above the line of perpetual congelation, being partially thawed during the summer months, is converted into ice in the winter, and, by the pressure of the higher portion of the mass, is forced downwards through ravines into the valleys, where they suffer waste from the higher temperature. This gives rise to a stream which rushes to join the nearest river. The snow-line of the Alps is at an elevation of 8000 feet, but the lower edge of some of the glaciers is not more than 3500 above the sea, and hence they lie, in some instances, in the midst of cultivation. The surface of every large glacier is strewed with stones and gravel, which have fallen from the surrounding precipices. This rubbish is partly carried to the sides of the glacier, and there deposited as lateral moraines, and partly to the lower end of the glacier, where it forms a terminal moraine. When the glacier advances into the valley, as it does in a cold season, the moraine is pushed before it; and when, in consequence of a warm season, it retreats, the moraine is left behind. Thus the lower limit of a glacier varies from year to year. In many mountainous countries there are phenomena which geologists explain by supposing that there were glaciers at a former period of time, where none now exist, or that existing glaciers were very much more extensive than at present. The precise mode by which glaciers move along their beds, and the cause of the zoned or ribboned structure of glacier ice have been the subjects of much inquiry, and given rise to some controversy. Professor James Forbes thought the phenomena were to be explained by attributing viscosity to the ice. Another theory is, that the downward journey of a glacier in its groove is not attended by a viscous movement of the particles, but is effected by continual fracture and regelation. This is rendered highly probable by some facts brought out by experiments on small pieces of ice, viz. that they can be made to assume any shape whatever by compression in moulds, and that two pieces of ice brought into contact will immediately freeze together, even when placed in hot water.

GLA'CIS (*Fr.*), in Fortification, a mass of earth serving as a parapet to the covered way, having an easy slope or declivity towards the country.

GLA'DIATE (*gladius*, a sword: *Lat.*), in Botany, an epithet for anything sword-shaped, but shorter and broader than ensiform.

GLA'DIATORS (*gladiatores*, from *gladius*, a sword: *Lat.*), in Antiquity, combatants who fought at the public games in Rome for the entertainment of the spectators. They were at first prisoners, slaves, or condemned criminals; but afterwards freemen fought in the arena, either for hire or from choice, and sometimes even persons of the first families, who had enjoyed the highest honours. The games were commenced by a *prælusio*, in which they fought with weapons of wood, till, upon a signal, they assumed their arms, and began in earnest to fight in pairs. When the vanquished was not killed in the combat, his fate was decided by the people; who, if they wished to save his life, signified it by pressing down their thumbs, but if they wished him to be killed, by turning them up. The first of these signals was called *pollicem premere*, the second *pollicem vertere*. If his life was given to him, he obtained a *missio*, or discharge for that day; and hence, in an exhibition *sine missione* (without any discharge), the gladiators were not spared. The victors were honoured with a palm branch, a sum of money, or other marks of the public favour; and they were not unfrequently released from further service, and received, as a badge of freedom, the *rudis*, or wooden sword. This profession was abolished by Constantine, revived under Constantius and his two successors, but finally put an end to by Honorius

GLADI'OLUS (*Lat*, literally a small sword, from the form of the leaves), in Botany, a genus of plants, nat. ord. *Iridaceæ*. They have beautiful flowers, and gardeners have produced many hybrid varieties.

GLAND (*glans*, literally the nut-like fruit of a forest tree · *Lat*), in Anatomy, an organ of the animal body concerned in the work of secretion. The form and composition of the glands are very various, but they exhibit in the arrangement of the cells a common structural plan. The cells which line their cavities and tubes form an epithelium, and at the same time act as secreting cells, and elaborate the matters which they discharge. The simple glands are without permanent orifices. They serve only a temporary purpose, and consist of nothing more than a vesicle or sacculus, which, after discharging the elaborated matter, disappears. Much more numerous are the permanent glands, which have been classed in three groups, viz. simple tubular glands, such as the sudorific glands of the skin; aggregated glands, such as the salivary glands, which are composed of a number of vesicles in groups or lobules; and the convoluted tubular glands, such as those found in the kidney, which consist of tubules of membrane lined with secreting cells. There is much obscurity as to the process of secretion by the glands. It is no doubt the result of the vital processes of the cells, but why one set of glands should elaborate and discharge the components of saliva, and another set the components of bile, from one common source of supply, viz. the blood, has never been elucidated.

GLAN'DERS (same *deriv.*), a virulent and fatal disease in horses, which shows itself by a discharge of mucus from the nostrils. It may be communicated to man.

GLANDIF'EROUS (*glans*, an acorn; and *fero*, I bear: *Lat*), in Botany, an epithet applied to trees which bear fruit, like acorns, chestnuts, and mast. This kind of fruit is called a nut or *glans* by botanists.

GLASS (*glas: Ger.*); Pliny ascribes its origin to accident. Certain merchants, he tells us, were driven into the mouth of the Belus, a river in Syria, by stress of weather; and being obliged to dress their victuals on the shore, they used kali for fuel, which, combining with the sand, produced glass: a phenomenon which suggested to the people of Sidon the manufacture of that substance for which they afterwards became so celebrated. It is not very likely, however, that the heat employed on such an occasion would have been sufficient to produce glass. Silica, which constitutes the basis of all commercial glass, is not fusible by itself in the strongest fire of our furnaces; but its vitreous fusion is easily effected by the addition of potash or soda, either alone or mixed with lime or litharge The window-glass manufacture was first begun in England in 1557, in Crutched Friars, London; and fine articles of flint glass were soon afterwards made in the Savoy House, Strand. In 1635, the art received a great improvement from Sir Robert Mansell, by the use of coal instead of wood for fuel. The first sheets of blown glass, for looking-glasses and coach windows, were made in 1673, at Lambeth, by Venetian artisans employed under the patronage of the Duke of Buckingham. The casting of mirror-plates was commenced in France about the year 1688, by Thevart, but in excellence and cheapness the French mirror-plate has been for some time rivalled by the English. There are several species of glass, which differ either in the materials, or mode of manufacture 'Ordinary window glass consists principally of fine sand, sulphate of soda and lime, generally introduced in the shape of ground chalk. *Plate glass* is composed of nearly the same materials, with the substitution of the carbonate for the sulphate of soda Ordinary bottle glass is composed of inferior qualities of the same constituents, with the substitution of soapers' waste for the alkaline element, white flint glass consists of the best sand, carbonate of potash, and red lead, or litharge. Besides these principal elements several others, such as nitre, arsenic, and manganese, are used in minute proportions for improving the colour, or other special purposes The pots in which the glass is fused are made of Stourbridge clay, kneaded and built up entirely by hand. In these pots the glass is thoroughly fused at a high temperature for a considerable time, and is then allowed to cool to a suitable consistency for working. *Sheet glass* is blown in long cylinders, which, after the ends are removed, are split down their length by a diamond, and afterwards flattened out in a kiln. *Coloured glass* is divisible into "pot metal," i. e. glass of the same colour throughout its whole thickness, or "flashed," the colour in this case being merely a thin film spread over a body of colourless glass. It is produced by the "gatherer" first dipping his pipe into a pot of coloured glass, and then into one of colourless glass, both being blown into cylinders together. Glass shades for ornaments are produced by the same process as the cylinders for sheet glass. *Crown glass*, an exclusively British manufacture, is first blown in a spheroid form, having a knob, the "bull's eye" opposite to the pipe of the blower. A piece of iron is attached to the bull's eye, and the pipe being detached, the glass is again heated; and being rotated by means of the iron in front of the furnace, gradually spreads out into a perfectly flat circular table, having the bull's eye in the centre—the process being one of the most beautiful in the whole range of glass manufacture. *Optical glass* is the most difficult on a large scale of any of the branches of the manufacture. Flint glass for optical purposes is made by stirring the metal, which contains a large proportion of lead in the crucible, and allowing it very gradually to cool. When cool the crucible is broken away, and the glass broken up into pieces, which are afterwards heated and pressed into a cake-like form. *Shaped glass* is either blown, moulded, or pressed. As to blown glass, in the great majority of cases the glass is blown into a shape somewhat approaching that which it is ultimately to assume, through an iron pipe, one end of which is dipped into a quantity of fluid glass. An iron "pontil" is attached opposite to the pipe, which is then broken off, and the glass adhering to the pontil is shaped with a few simple tools while being rotated. *Moulded glass*, including nearly all the ordinary varieties of bottles, is made by blowing the glass into a mould, the blowing rendering the article hollow, and the mould giving its shape to the exterior. In pressing glass the metal is dropped into a mould of the shape required for the exterior, and a plunger of the shape required for the interior is forced into it. In both moulded and pressed glass the article is generally finished off by being attached to a pontil, reheated and rotated. *Glass cutting* is executed by applying the glass to be cut, first to a cast iron wheel with sand and water, then to a stone wheel, and lastly to a wooden wheel for the polishing with pumice, rotten stone, and putty powder. For polishing chandelier drops, &c., a lead wheel, with a little fine rotten stone and water, is substituted. In *engraving* glass copper discs rotating in a lathe, and finely pulverized emery mixed with oil, are used to execute the outline and the ground; and for the polished work leaden discs, and very finely pulverized emery. Coarse engraving, however, is for the most part executed by means of the glass cutter's smoothing wheel.'—*Scientific Record of International Exhibition*, 1862.

GLASSES, OPTICAL. Glasses intended for optical purposes are ground to certain curved forms, and called lenses. They are either convex or concave, and are used for simple magnifiers and spectacles, or for telescopes and microscopes. The grinding of the lenses is performed in brass moulds, either concave or convex, formed to the same curvature as that desired in the lenses, and worked either by hand or by machinery. English artists, until recently, were unable to produce disks of glass for the formation of the object-glasses of large telescopes; but since the duty has been taken off glass, disks quite perfect, at least 25 inches in diameter, have been produced.

GLASS'WORT, a species of *Salicornia*, a shore plant containing much soda, and formerly collected for the purpose of obtaining that alkali from it.

GLAU'BERITE, a double sulphate of lime and soda, sometimes associated with rock-salt.

GLAU'BER'S SALT, in Chemistry, sulphate of soda, a well-known cathartic. It was first made by Glauber, in obtaining muriatic acid from common salt.

GLAUCO'MA (*Gr.*, from *glaukos*: grey), in Surgery, a disease in the eye, in which the crystalline humour has a greenish or bluish grey appearance, and its transparency is diminished.

GLAU'COUS (same *deriv.*), of a grey bluish colour; applied to leaves, &c., of plants which are covered with a fine mealiness, such as is seen on the underside of cabbage leaves.

GLA'ZING (*glasuren*, to glaze: *Ger.*), in the manufacture of pottery, the incrustation of vessels with a vitreous substance, the basis of which is lead. After the ingredients are ground together, they are calcined with a moderate heat, and, when cold, reduced to a powder, which is tempered with water, and laid on the ware by means of a brush. The violent heat of a furnace soon transforms this coating into a perfect glass.

GLEBE LAND (*gleba*, arable soil: *Lat.*), in Law, a portion of meadow or pasture land belonging to a parish church or ecclesiastical benefice.

GLEE (*gligge*, merriment: *Sax.*), in Music, a composition of three or more parts.

GLENE (*glēnē*, the ball of the eye: *Gr.*), in Anatomy, the cavity or socket of the eye and the pupil. Also any slight depression or cavity receiving a bone in articulation.

GLI'ADINE (*glia*, glue: *Gr.*), in Chemistry, a peculiar azotized substance, which with true vegetable fibrine constitutes gluten. The latter owes its adhesive property to gliadine, which, when dry, is a slightly transparent, brittle substance, of a straw colour.

GLI'RES (*glis*, a dormouse: *Lat.*), the rodent order of mammals, including the families of mice, porcupines, hares, jerboas, and mole rats. These animals have only two cutting teeth in each jaw, and there is a vacant space between these and the grinders. They have no canines. The jaws have the power of moving laterally. The toes are distinct and are furnished with small claws.

GLOBE (*globus*: *Lat.*), in practical Mathematics, an artificial spherical body, on the convex surface of which are represented the countries, seas, &c., of our earth, or the face of the heavens, with the several celestial circles. The former is called the *terrestrial*, and the latter the *celestial* globe. Their principal use, besides serving respectively to distinguish the earth's surface, and to mark the situation of the fixed stars, is to illustrate and explain the phenomena arising from the diurnal motion of the earth. They are, consequently, of the highest importance in acquiring a knowledge of geography and astronomy. [See EARTH, ASTRONOMY, &c.]

GLOBE FISHES. [See DIODON.]

GLOB'ULAR CHART (same *deriv.*), a name given to the representation of the surface or of some part of the surface of the terrestrial globe upon a plane, according to the principles of the *globular projection*. Its advantage is, that equal arcs of great circles are represented by straight lines, which are nearly equal. If the plane of projection is the equator, the different meridians will be represented by straight lines and the parallels of latitude by concentric circles. In general, however, the projection is made on the meridian, in which case the projections of the other meridians are ellipses.

GLOB'ULE (same *deriv.*), a small particle of matter of a spherical form; a word particularly applied to the red particles of blood, which swim in a transparent serum.

GLOM'ERATE (*glomero*, I form into a ball: *Lat.*), in Anatomy, an epithet for a gland, formed of a conglomeration of sanguineous vessels, having no cavity, but furnished with an excretory duct, as the lachrymal and mammary glands.

GLOSS (*glossa*, language: *Gr.*), at first, 'meant a word from a foreign language, or an obsolete or poetical word, or whatever required interpretation. It was afterwards used for the interpretation itself, and then it was extended to an entire expository sentence. The first glosses were interlinear: they were afterwards placed in the margin and extended finally, in some instances, to a sort of running commentary on an entire book. These were called apparatus.'— HALLAM.

GLOSSA'GRA (*glōssa*, the tongue; and *agra*, a catching: *Gr.*), in Medicine, a rheumatic pain in the tongue.

GLOSS'ARY (*glossarium*: *Lat.*; from *glōssa*, a tongue: *Gr.*), a dictionary or vocabulary, explaining obscure or antiquated words found in old authors.

GLOS'SOCELE (*glōssa*, the tongue: and *kēlē*, a tumour: *Gr.*), in Medicine, an extrusion of the tongue.

GLOT'TIS (*Gr.*, from *glōtta*, the tongue), in Anatomy, the narrow opening at the upper part of the larynx or windpipe, which, by its dilatation and contraction, contributes to the modulation of the voice.

GLOW'-WORM, the wingless female of a beetle, the *Lampyris noctiluca* of naturalists, remarkable for its luminous appearance in the dark. The glow-worm is seen about the months of June, July, and August. The light proceeds from the under side of the abdomen, and the insect can vary or suspend it at pleasure. The light-emitting segments preserve this power for some time after being separated from the rest of the body; and they manifest it *in vacuo*, and in atmospheres containing no oxygen. The male, which is winged and emits no light, has his head almost entirely occupied by his largely developed eyes.

GLUCI'NA (*glukus*, sweet: *Gr.*), a rare earth, discovered in 1797 by Vauquelin, and found, as yet, only in the emerald, beryl, and euclase. It derives its name from the sweetness of some of its salts.

GLUCI'NUM (same *deriv.*), or *Beryllium*, the metallic base of the earth glucina. It is of a dark grey colour, and is obtained by acting on the chloride of glucina with potassium.

GLUE (*gluten*: *Lat.*), a tenacious viscid matter, which serves as a cement. It is made from the parings of hides and other offals by boiling them in water, then straining off the impurities and boiling them again. The best glue is that which is oldest. Glue is impure *gelatine*.

GLUMES (*gluma*, chaff: *Lat.*), in Botany, the outer scales of the flowers of grasses. Each flower of the sedges has a solitary glume. These two families have been formed into a sub-class called *Glumaceæ*.

GLU'TEAL (*gloutos*, the buttocks; *Gr.*), in Anatomy, an epithet for what belongs to the buttock. Thus, the *gluteal muscles, arteries*, &c.

GLU'TEN (glue: *Lat.*), the viscid elastic substance which remains, when flour, wrapped in coarse cloth, is washed under a stream of water until all the soluble matters and starch are carried away. It exists in many kinds of grain and in some parts of other vegetables. The peculiar toughness and viscidity of wheat flour are due to it. There is more gluten in the wheat of warm than of cold climates. It contains nitrogen, and therefore, in some measure, approximates to animal matter: this causes it to give out a very disagreeable odour when putrefying. Dried in the air or in a stove, gluten diminishes considerably in size, becomes hard, brittle, glistening, and of a deep yellow colour. It is insoluble in ether, in fat, and essential oils, and nearly so in water.

GLU'TEUS (*gloutos*, the buttocks: *Gr.*), in Anatomy, the large and thick muscle upon which we sit. It serves to extend the thigh by pulling it directly backwards, and assists it in its rotary motion.

GLUT'TON (*glouton*: *Fr*; from *glutio*, I gulp down: *Lat.*), the *Gulo luscus*, of Zoologists, a carnivorous animal of the weasel tribe, found in the north of Europe, Asia, and America. It is sometimes called the wolverine. It grows to the length of three feet, but has short legs, and moves slowly. It is very cunning and voracious. In order to catch its prey it climbs a tree, and from that darts down upon its victim.

GLY'CERINE (*glukus*, sweet: *Gr.*), in Chemistry, a sweet liquid, one of the four proximate principles of oils and fats. It is set free in the process of saponification, and left behind, but in a very impure state, when the fat acid unites with the alkali in the formation of soap. It consists of carbon, hydrogen, and oxygen; and, when thrown on burning coals, takes fire like oil. Its spec. grav. when pure is 1·27. [See STEARIC ACID.] Water combines with it in almost all proportions; alcohol dissolves it easily; nitric acid changes it into oxalic acid.

GLYCO'NIAN, a verse in Greek and Latin poetry, consisting of three feet, a spondee, a choriamb, and a pyrrhic.

GLYPH (*glupho*, I hollow out: *Gr.*), in Architecture, any channel or cavity intended as an ornament.

GLYPHO'GRAPHY (*gluphē*, sculpture

and *graphē*, a writing: *Gr.*), an art by which the operations of drawing and engraving, which were formerly distinct, are combined in one. It consists in depositing upon a plate of metal a thin stratum of wax, or any other soft substance, on which a subject or design is engraved, the depth of the incisions being determined by the thickness of the soft coating The engraving thus made is subjected to the electrotype process, by which a sheet of copper or other suitable metal is deposited upon it. When this is detached it will exhibit in relief the engraving, and printed impressions may be produced from it in the same manner as from a woodcut to which it is analogous. ——Also, a description of the art of engraving on precious stones.

GLYP'TOTHEK (*gluptos*, carved; *theke*, a repository: *Gr.*), a name sometimes given to a gallery of sculpture, e g. the Glyptothek at Munich designed by Von Klenze.

GNAT (*gnæt*, from *gnagan*, to gnaw: *Sax.*), a name given to a number of dipterous insects the females of which are troublesome to man The common gnat is the *Culex ciliaris* of entomologists The gnat of this country is comparatively harmless; but those of warmer climates, known as mosquitoes, are peculiarly annoying, especially in marshy situations.

GNEISS (*Ger.*), in Geology, a rock composed of the same constituents as granite, viz. quartz, felspar, and mica, but arranged in layers and laminæ. Hence, it is often styled a foliated granite As to its origin, some geologists maintain that gneiss was at first a sedimentary rock—that is, was deposited by water—and that it was afterwards acted on by heat, which caused it to assume a crystalline structure. This is the metamorphic theory. Others think that it was derived from the disintegration of granitic rocks, and that the crystalline materials were then arranged in layers under water. Associated with gneiss are various other rocks of the same general nature, in which some of the mineral constituents are replaced by others; such as syenitic, gneiss, hornblende, schist, and mica schist. Gneissic rocks occur abundantly in Scotland, Norway, and Sweden, the Alps, the Andes, and the Himalayas. These rocks are utterly destitute of organic remains, but are often rich in metallic ores deposited in veins.

GNOMES (*Fr.*), spirits which were supposed to dwell in the interior parts of the earth, and to whose care mines, quarries, &c., are assigned.

GNO'MON (*gnōmōn*: *Gr.* The word literally signifies something that makes a thing known), in Astronomy, a style erected perpendicular to the horizon, in order to find the altitude of the sun.——In Dialling, the style or pin of a dial, which, by its shadow, shows the hour of the day. It represents the axis of the earth.——GNOMON, in Geometry, a figure formed by the two complements with either of the parallelograms about the diameter.

GNOMON'IC PROJECTION of a portion of a sphere, is that projection which supposes the eye to be in the centre of the sphere. Every great circle is thereby projected into a straight line, and this is peculiar to the gnomonic projection.

GNOMON'ICS (*gnomonikos*, relating to sun-dials; from last: *Gr.*), the art or science of dialling, or of constructing dials.

GNOS'TICS (*Gnōstikoi*, from *gnōsis*, knowledge: *Gr*), a sect of philosophers that arose in the first ages of Christianity, who pretended they alone had a true knowledge of the Christian religion. They formed for themselves a system of theology, agreeable to the philosophy of Pythagoras and Plato, and fancied they discovered deeper mysteries in the Scriptures than were perceived by those whom they considered as simple and ignorant They held that all natures, intellectual and material, are derived by successive emanations from the Deity. In process of time, the name designated sectarians of various descriptions, but who all agreed in certain opinions; and the tenet which seemed most particularly to distinguish them was the existence of two first principles, or deities, the one the author of good, and the other of evil.

GNU, a species of antelope, the *Connochetes gnu* of zoologists, having horns bent forward at the base and backward in the middle It is a native of Southern Africa, and its form partakes of that of the horse, the ox, and the deer. The gnu is a lively capricious animal; and when irritated, it expresses its resentment by plunging, curvetting, tearing the ground with its hoofs, and butting with its head These animals feed in large herds, and it is only when stragglers have been accidentally separated from the herd that any of them are found in a solitary state

GOAT (*gat*: *Sax.*), the name given to the members of a family of ruminant animals. The common goat is the *Hircus ægagrus* of naturalists The horns are hollow, erect, and scabrous. They delight in rocks and mountains, and subsist on scanty coarse food. The milk of goats is sweet and nourishing, and their flesh furnishes provisions to the inhabitants of countries where they abound. But the skin is the most valuable part of the animal. It is prepared for a variety of purposes, takes a dye better than any other, and is well known under the name of *morocco.* The *Cashmere goat*, from the hair of which are manufactured Cashmere shawls, is smaller than the common domestic goat. The Angora goat has a long, silky, fine hair, which is not curled; and it is also furnished with a soft, silky hair, of a silver-white colour, hanging down in long curling locks. The finest camlets are made from the wool of this goat.

GOAT'S-BEARD, a plant of the genus *Tragopogon*, nat ord. *Compositæ.*

GOAT'S THORN, the *Astragalus Tragacantha* of botanists, a plant of the nat. ord. *Leguminosæ*, growing in the south of Europe.

GOAT'-SUCKER, a passerine bird, the *Caprimulgus Europæus* of ornithologists. It is so called because it was supposed by the ancients to suck the teats of the goat but there is no foundation for this belief

It is also popularly known as the night-jar and fern owl. Like the owl, it is seldom seen in the daytime, unless disturbed, or unless the weather is dark and gloomy, when its eyes are not dazzled by the bright rays of the sun. Its mouth, which is of great size, fits it well for catching the night insects which are its prey.

GOBELINS, or HÔTEL-ROYAL DE GOBELINS, a celebrated academy for tapestry-drawing, and manufactory of tapestry, erected in the suburb of St. Marcel, at Paris, by Louis XIV. in the year 1667. The place was previously famous on account of the dyeing manufactory established there by Giles and John Gobelins in the reign of Francis I. They discovered a method of producing a beautiful scarlet, which has ever since been known by their name; and so extensive has been their fame, that not only the colour, but the house in which their business was carried on, and the river they made use of, are called *Gobelins*.

GO'BY (*gobius: Lat*; from *kōbios: Gr.*), the common name of some marine fishes belonging to the acanthopterygian genus *Gobius*, remarkable for having their ventral fins united.

GODS and GOD'DESSES of the ancient Romans. They were divided into *dii majorum gentium*, and *dii minorum gentium* (that is, into the superior and inferior gods); also, according to their place of residence, into celestial, terrestrial, infernal marine, and sylvan gods; and into animal and natural gods: the animal gods were mortals, who had been raised to divinity by ignorance and superstition; and the natural gods, parts of nature, such as the stars, the elements, mountains, rivers, &c. There were, besides, deities who were supposed to preside over particular persons: some had the care of women in childbirth; others, that of children and young persons; and others were the deities of marriage Each action, virtue, and profession had also its particular god: the shepherds had their Pan; the gardeners their *Flora*: the learned their Mercury and Minerva; and the poets their Apollo and the Muses.

GOD'WIT (*god*, good; and *wita* or *fita*, an animal: *Sax.*), the popular name of some grallatorial birds, allied to the snipes, and belonging to the genus *Limosa* of ornithologists. Two species are known in Britain, the black-tailed and the bar-tailed godwit; but both are migratory. They have long bills and legs; frequent marshes near the sea shore, and are esteemed great delicacies by epicures.

GOI'TRE (*Fr.*), in Medicine, a large tumour that forms gradually on the throat, between the trachea and the skin. It is an enlargement of the thyroid gland, and is known to medical men under the name of *bronchocele*. It is prevalent in several valleys of Switzerland, and in the mountainous parts of Brazil. Iodine is the most efficacious remedy. As to the cause of this complaint medical men are not agreed.

GOLD is the most ductile and malleable of all the metals. It is the heaviest metal except platina, its specific gravity being 19·3; and not being liable to be oxidised by air, it is well fitted to be used as coin. It is not sonorous when struck. The common acids do not act upon it; but it is dissolved by a mixture of nitric and hydrochloric acids, the *aqua regia* of the old chemists. Its equivalent is 197. Its lustre does not equal that of steel, platina, or silver, but it surpasses the other metals in this respect. It requires a strong fire to fuse it, remaining unaltered in the degree of heat that melts tin or lead, but a less powerful heat than is necessary to the fusing of iron or copper. It becomes ignited and white before it runs, and when in fusion, appears of a pale bluish-green colour on the surface. It amalgamates the most readily of all the metals with quicksilver. When in a state of fusion, it very easily and very intimately combines with silver, and, when mixed with that metal, will also run into a mass with iron. The malleability of gold is such that it may be reduced to a film having only the thickness of the 200,000th part of an inch, and one grain of it may be made to cover upwards of fifty square inches. As to ductility an ounce is capable of being extended in the form of wire to the length of many hundred miles. No metal destroys the malleability of gold so completely as lead: one two-thousandth part renders it too brittle for rolling, and its very fumes produce a serious effect upon it. Gold is found in beds of quartz, sandstone, &c., and also in many rivers, particularly in Peru, in minute and irregular grains, which are known by the name of *gold-dust*. The principal use of gold, as is well known, is in coinage It has been with mankind, from time immemorial, the representative of every species of property. Even before the art of coining was invented, it passed for money in the condition in which it was found in the earth; and in this form it is still current in many parts of Africa. It is rarely used in a state of perfect purity, but is almost universally alloyed with copper, or with silver, in order to increase its hardness. In expressing the fineness of an alloy of gold, the mass is supposed to be divided into twenty-four equal parts; and the number of these consisting of pure gold is expressed. Thus, our gold coin is twenty-two carats fine: that is twenty-two parts of it are gold, and two parts another metal—copper. Gold would be too soft if unalloyed. When silver is used, instead of copper, as an alloy, the coin is whiter. In Australia, the rocks containing gold are of Silurian age. The precious metal is found disseminated in veins of hard quartz [see REEF], or in the rocks adjacent to these veins. Upon these rocks lie deposits of tertiary age, consisting of clays, sands, and gravel. These deposits are frequently some hundreds of feet thick, and are evidently the remains of older strata, which have been denuded and re-deposited by the action of water. The miners term this series of beds drift or alluvial, and they excavate them to a great depth in their search for the disseminated gold, which is usually found most abundantly in the lowest bed, lying on the Silurian rocks. On their way to this bottom' bed, sheets of basalt are frequently passed through, sometimes fifty feet thick. In some places four or five sheets of basalt are met with in a depth of 300 or 400 feet, adding of course very greatly to the labours of the miners. Nuggets are only found in the alluvial beds. The reader will now understand the miner's distinction between 'Quartz mining' and 'Alluvial mining.'

GOLD'BEATERS' SKIN, the membrane of the intestine or blind gut of the ox, carefully prepared for the use of the gold-beater, who places the gold leaf between pieces of it when he is beating out the metal.

GOL'DEN FLEECE, in the mythological fables of the ancients, the fleece of the ram upon which Phryxus and Helle are supposed to have been carried over the sea to Colchis. When this ram was sacrificed to Jupiter, its fleece was hung upon a tree in the grove of Mars, guarded by two brazen-hoofed bulls, and a monstrous dragon that never slept; but was at last carried off by Jason and the Argonauts. [See ARGONAUTS.]

GOL'DEN NUM'BER, in Chronology, that number which indicates the year of the lunar cycle for any given time. It was called the Golden Number because in the ancient calendar it was written in letters of gold, on account of its great utility in ecclesiastical computations, especially in fixing the time of Easter. It was likewise called the Prime, because it pointed out the first day of the new moon, *primum lunæ*. To find the Golden Number, add 1 to the year of our Lord, divide the sum by 19, and the remainder, if any (or 19, if there is none), is the Golden Number; the quotient at the same time expressing the number of cycles which have revolved from the beginning of the year preceding the birth of Christ.

GOL'DEN-ROD, the *Solidago Virgaurea* of botanists, a plant belonging to the natural order *Compositæ*.

GOLD'FINCH, the *Fringilla Carduelis* of Ornithologists, a bird remarkable for its docility and pleasing song. The common goldfinch is very elegantly coloured, and is somewhat smaller than the sparrow. There are several other species of the genus, all remarkable for their plumage, sagacity, and melody.

GOLD-FISH', the *Cyprinus auratus*, a fish of a gold colour, and of the size of a pilchard. It was originally brought from China, and is now kept in small ponds, glass globes, or other vessels, by way of ornament. It is very prolific, and is easily bred, requiring scarcely any further attention than that of frequently changing the water.

GOLD-LEAF' or LEAF-GOLD', gold that is formed into a leaf, the thickness of which varies, according to the purpose for which it is designed. The gold is first reduced from the ingot to such a thickness that a square inch will weigh 6¼ grains; it is then cut into pieces about an inch square, which are placed between pieces of GOLD-BEATERS' SKIN [which see], and these again are placed between pieces of vellum and parchment. The hammers employed weigh from 8lb. to 16lb., and the beating takes place on a smooth block of marble. As the beating proceeds the leaf is divided into squares, and again beaten, until it has acquired the necessary degree of thinness. The finished leaves of gold are put up in small books made of soft paper, rubbed over with red chalk to prevent adhesion of the gold. An ounce of the metal may in this manner be made so thin as to cover 160 square feet; but it is more profitable to make it into only 100 square feet: there is less waste by broken leaves, and it is more useful to the gilder. The light transmitted through gold leaf is of a green colour.

GOLD-WI'RE, a cylindrical ingot of silver, superficially gilt, and afterwards drawn through a vast number of holes of different diameters to bring it to the requisite fineness, which is sometimes equal to that of a hair. Before each time of drawing, it is covered with wax, to preserve it from being worn away.——GOLD-WIRE FLATTED, the wire already described, flatted between rollers of polished steel, and used in spinning, weaving, lace-making, and embroidery.——GOLD THREAD, or *spun gold*, flatted silver-gilt wire, wrapped or laid over a thread of yellow silk, by twisting with a wheel and iron bobbins.

GO'LDYLOCKS, a name given to certain plants of the genus *Chrysocoma*. They belong to the natural order *Compositæ*, and are so called from their colour and appearance.

GOLF, a game with bat and ball, much practised in the north of England.

GOMPHO'SIS (*Gr.*, from *gomphos*, a wooden bolt for shipbuilding: *Gr.*), in Anatomy, a species of articulation, in which one bone is set in the other like a peg in a board: as the teeth within the jaws.

GOMU'TI, the *Borassus Gomutus*, a species of palm growing in the Indian islands.

GON'DOLA (*Ital.*), a boat used very much on the canals of Venice, being the conveyance employed in passing from one part of the city to another. It is about thirty feet long, and in the centre, where there is a small cabin for passengers, five wide. Gondolas are sharp pointed at both prow and stern, and are rowed with great velocity and skill by two men termed gondoliers. An ancient sumptuary law requires them to be furnished with black curtains, which give them a gloomy appearance.

GONG, or TAMTAM, a kind of cymbal used by the Chinese. It is made of a very brittle compound of copper and tin; which, however, the Chinese render malleable during manufacture, as the instrument always exhibits marks of the hammer.

GONIOM'ETER (*gōnia*, an angle; and *metron*, a measure: *Gr.*), an instrument for measuring solid angles, or the inclination of planes, but particularly those of crystals. Such an instrument is necessary to the mineralogist. Various forms have been contrived, but that best known in this country was invented by Dr. Wollaston.

GOOSE, an aquatic web-footed bird, belonging to the genus *Anser* of ornithologists. The *Anser ferus*, or grey goose, our common wild goose, is easily tamed; and from it has sprung the domestic breed of goose. There are several other species of wild goose that frequent the British islands.

GOOSE'BERRY, the fruit of the *Ribes grossularia*, of which many varieties have been produced by the gardener's art. Currant bushes belong to the same genus.

GOOSE'-FOOT, a wild plant, of the genus *Chenopodium*. [See CHENOPODIACEÆ.]

GOOSE'-NECK, in a ship, a piece of iron fixed on the end of the tiller, to which is fastened the lanyard of the whip-staff, or the wheel-rope for steering the ship.

GOOSE'WING, in seamen's language, a sail set on a boom on the lee side of a ship; also the clews or lower corners of a ship's mainsail or foresail when the middle part is furled.

GOR'DIAN KNOT, in Antiquity, a knot made by Gordius, king of Phrygia, so very intricate that there was no finding where it began or ended. An oracle had declared that he who should untie this knot would be master of Asia. Alexander having undertaken it, and fearing that his inability to untie it might prove an ill omen, cut it asunder with his sword, and thus either accomplished or eluded the oracle. Hence, in modern language, *to cut the Gordian knot* is to remove a difficulty by bold or unusual means.

GOR'DIUS AQUATICUS, the common *Hair Worm*, which derives its generic name from a habit of coiling itself into a knot. It is of the thickness of a hog's bristle, from six to ten inches long, and lives in stagnant water.

GORGE (*Fr.*), in Architecture, the same as *cavetto* [which see].——In Fortification, the entrance of a bastion, ravelin, or other outwork.

GOR'GED (*gorge*, a throat: *Fr.*), in Heraldry, bearing a crown, coronet, or the like, about the neck.

GOR'GET (same *deriv.*), armour attached to the helmet and covering the neck.

GOR'GONIA, a genus of flexible corals, usually much ramified, and more or less resembling a tree branch, or small bush. The horny axis of the stems and branches is coated with carbonate of lime, differently coloured in the different species, and this coating or bark is composed of SPICULA, cemented together by animal matter, and forming, when separated, pretty objects for the microscope. The whole is the work of zoophytes which reside in cells, the orifices of which are scattered over the bark.

GOR'GONS (*Gorgōn*, from *gorgos*, terrible: *Gr.*), in Mythology, three sister deities named Stheno, Euryale, and Medusa, who had hair entwined with serpents, hands of brass, winged bodies covered with scales, tusk-like teeth, and eyes so terrible that they turned everyone on whom they looked to stone. Perseus is said to have killed them with the aid of weapons lent him by Pluto and other deities. [See MEDUSA.]

GOS'HAWK (*gos*, goose; and *hafoc*, a hawk: *Sax.*), the *Falco* (or *Astur*) *palumbarius* of ornithologists, a voracious bird, very destructive to game. It is now very rare in the British islands, being almost confined to the highlands of Scotland. It was formerly employed in falconry.

GOS'PEL (*god*, good; and *spel*, a message: *Sax.*), a translation of the Greek *Euangelion*. The four books of the New Testament attributed to Matthew, Mark, Luke, and John, are called Gospels. In the first three centuries after Christ, many other gospels were in circulation; but, although the fathers of the church quoted passages from them, they did not assign a divine authority to them. Some of these apocryphal gospels are still extant. Several eminent critics have maintained that the three first gospels were derived from one original gospel afterwards lost.

GOS'SAMER, fine filmy threads that float in the air in calm clear weather, especially in autumn. They are most usually seen in stubble fields and on furze or low bushes. They are formed by spiders.

GOSSYP'IUM (*Lat.*), a genus of plants belonging to the nat. ord. *Malvaceæ*, including the species of cotton plants, most of which are Asiatic, but some are of American growth and culture. [See COTTON.]

GOTH'IC STYLE, in Architecture, characterized by the use of the pointed arch, and termed by the French the *Style ogival* (*ogive*, a pointed arch: *Fr.*). It was derived, through the *Romanesque*, from the corrupt Italian used in the latter period of the Roman empire. The Romanesque, which included some of the characteristics of the Gothic, and was a debased style that sprang from unskilful attempts to imitate the Roman, may be said to have been in use from about the year 800 until the latter end of the 12th century. Its leading features were, horizontal lines, massive walls pierced by comparatively small openings, semicircular arches over doors, &c., and semicircular vaultings, rows of small pillars placed as ornaments in the upper part of the walls, &c. The churches consisted of a nave and side aisles, which, with transepts, formed a cross; and the head of the cross was generally terminated by a semicircular and additional building called the *apsis*, which formed that part of the choir specially devoted to ecclesiastical ceremonies. Some have divided the Romanesque into the *Saxon*, *Norman*, *Lombard*, *Byzantine*, and other styles. Towards the end of the 12th century, however, great changes were introduced. The pointed arch, which distinguishes the true Gothic style, was then adopted, though at first there was an anomalous mixture of circular and pointed arches; a tendency to perpendicular lines became predominant: the towers were made light and lofty. The powers of mechanical construction were at length exhibited in the utmost perfection, the proportion between strength and burden being calculated with extraordinary precision, and the thrusts of the vaultings counteracted in the most ingenious and efficient manner—lightness and boldness being attained in the highest degree. Many believe the pointed arch to have been suggested by the interlacing of arches in the ornamentation of walls during the period of the Romanesque; and others, that it was derived from the East: but something closely resembling it is found in the ruins and monuments of Egypt and Assyria. [See ARCHITECTURE.]

GOUGE (*Fr.*), an instrument or tool, used by various artificers, being a sort of round chisel for cutting or hollowing out wood, &c.

GOURD (*gourde: Fr.*), the fruit of climbing herbaceous plants belonging to the nat. ord. *Cucurbitaceæ*, natives of hot countries. These fruits assume various strange shapes, and many are edible. The skin of the bottle gourd (*Lagenaria vulgaris*), and some other species, is so strong that it is employed to hold liquids.

GOUT (*goutte: Fr.*), or ARTHRITIS (*Gr.*, from *arthron*, a joint), in Medicine, a very painful disease, the principal seat of which is in the joints and ligaments of the feet. It is often periodical or intermitting. It is a disease which seldom attacks young people, and is attended with the secretion of the superfluous earthy matter, which is no longer necessary for the formation of the bones, but which, instead of being carried off by the proper channels, is deposited beneath the skin, or accumulates internally, thus producing chalk-stones and various internal concretions. It is very common among those who indulge in the pleasures of the table, and is sometimes hereditary; but females seldom have this disease.

GOV'ERNMENT (*gouvernement: Fr.*). If the governing power is vested in the hands of one, it is a *monarchy;* if in the hands of the nobility, an *aristocracy;* and if in the hands of the people, or those chosen by them a *democracy*. The *executive government* is the function of administering public affairs; the *legislative government*, that of making the laws. In England, the executive government is in the sovereign and his ministers; but the legislative government is in the parliament, that is, the king, lords, and commons, whence the constitution of England is denominated a *mixed government.*——GOVERNMENT, in Grammar, the influence of a word with regard to construction: as when established usage requires that one word should cause another to be in a particular case or mood.

GOV'ERNOR (*gouverneur: Fr.*), a contrivance used for regulating the action of the steam-engine. It usually consists of two heavy balls, fixed respectively on the lower extremities of two rods, having at their upper extremities hinges of some form that attach them to a vertical spindle, which is made to revolve by the steam-engine, water-wheel, &c., which is to be regulated. When the machinery is moving with the proper velocity, the rods and balls are carried round by the spindle at a regulated distance from it; but when the velocity becomes too high, the balls and rods are thrown out by centrifugal force; and this, to a greater or less extent diminishes the supply of steam to the steam cylinder by means of the throttle-valve, or of water to the water-wheel by lowering the sluice-gate, until the right speed is attained. If the motion becomes too slow, the balls descend below the proper position, which opens the throttle-valve of the steam-engine, or increases the supply of water to the water-wheel.

GRACE (*gratia*, favour: *Lat.*), DAYS OF, in Commercial Law, three days allowed for payment after a bill has become due.

GRACES, The, in Heathen Mythology, were three beautiful goddesses, Aglaia, Thalia, and Euphrosyne, who were the constant attendants of Venus, whose daughters they were by Jupiter or Bacchus.——GRACES, in Music, turns, trills, and shakes, introduced for the purpose of embellishment.

GRADA'TION (*gradatio*, a going step by step: *Lat*), in Logic, an argumentation, consisting of propositions so disposed that the attribute of the first is the subject of the second; the attribute of the second the subject of the third; and so on, till the last attribute comes to be predicated of the subject of the first proposition.——In Music, a diatonic ascending or descending succession of cords——In Painting, the blending one tint into another.

GRA'DIENT (*gradiens*, going step by step: *Lat.*), a technical term connected with railways, and indicating an inclined plane.

GRAD'UATE (*gradus*, a step: *Lat.*), one who has obtained a degree at a college or university.

GRADUA'TION (same *deriv.*), in practical Astronomy, the division of circular arcs into degrees, minutes, &c. It requires the greatest accuracy, and its proper execution supposes great mechanical skill.

GRAFT'ING, in Horticulture, the process of inserting a branch of one tree into the stock of another, so that it may receive nourishment from it, while at the same time it produces a new tree like the old one whence the graft was taken. The use of grafting is to propagate any rare kinds of fruits. All good fruits have been obtained accidentally from seeds. It is quite uncertain whether or not the seeds of these will produce fruit worthy of cultivation; but when shoots are taken from such trees as bear good fruit, no degeneration is to be apprehended. Generally speaking, all the species of one genus may be grafted on one another; but there are exceptions; thus, the apple cannot be usefully grafted on the pear. Species belonging to different natural orders can scarcely ever be grafted on each other. Hence, the nearer in affinity the scion and the stock, the better.

GRAIN (*Fr.; from granum: Lat.*), the generic name of the seeds of wheat, barley, oats, rice, &c. All kinds of grain contain nutritious particles of a similar character, although they vary, both in their quantity and in their mixture, in various grains: but their most valuable elements are—*gluten*, which affords the strongest nourishment for the animal body: *fecula* or *starch*, which, though not so nutritious as gluten, seems to render it more digestible; and a *sweet mucilage*, which is more nutritious than starch, but is small in quantity, and renders the grain liable to the vinous and acetous fermentation.——GRAIN, the integer of our system of weights. The troy pound contains 5760 grs., the avoirdupois 7000; the troy ounce 480 grs., and the avoirdupois ounce 437½.

GRAINS OF PAR'ADISE, the acrid seeds of various species of *Amomum*, plants allied to ginger. Their properties are intoxicating, but of a very deleterious character, and they are said to be frequently employed to give a false strength to spirits and beer.

GRAL'LÆ (stilts: *Lat.*, from their long legs), in Ornithology, an order of birds, divided into seven families, viz.: *Otitidæ*, bustards; *Charadriidæ*, plovers; *Gruidæ*, cranes; *Ardeidæ*, herons; *Scolopacidæ*, snipes; *Palamedeidæ*, screamers; and *Rallidæ*, rails.

GRAM'INA (*Lat.*), or GRASSES, the most numerous family of plants, common to all countries. They have neither calyx nor corolla, but in place of them imbricated scales called *paleæ* and *glumes*. An English meadow of natural grass often exhibits a hundred different species. But the most productive kinds have been specially cultivated, and fields are now sown, not only with true grasses, but with clover, trefoil, sainfoin, and lucerne, which the farmer calls grasses, but which belong to a very different order, that of *Leguminosæ*. The *true grasses* include wheat, rye, barley, oats, rice, Indian corn, and the sugar-cane; their chief characteristic being that their stems or culms are cylindrical and provided at intervals with knots, from each of which arises a long linear or lanceolate leaf, sheathing the stem for some distance.

GRAM'MAR (*gramma*, a writing: *Gr.*), the art which analyzes and classes the words in a language, which details its peculiarities, and furnishes rules, recognized by the best authorities, for its construction. General grammar teaches the principles which are common to all languages; and the grammar of any particular language teaches the principles peculiar to that language. Grammar treats of sentences, and of the several parts of which they are composed. Sentences consist of words, words of one or more syllables, and syllables of one or more letters; so that, in fact, letters, syllables, words, and sentences make up the whole subject of grammar. By means of inarticulate sounds beasts can give expression to certain feelings; but man is distinguished from the brute creation by the power of producing a much greater variety of sounds, and of attaching to each modification a particular meaning.——GRAMMAR also signifies a book containing the rules of this art, methodically digested.

GRAMME (*gramma*, a weight equal to two oboli: *Gr.*), the French integer of weight, equal to 15·438 English troy grains.

GRANDEE', a designation given to the highest nobility of Spain or Portugal.

GRAND JU'RY, a jury convened by the sheriff to examine the grounds of accusation against offenders, and the validity of indictments. Those against whom true bills are found by the grand jury are afterwards tried before a petty jury.

GRAN'ITE (*granit*: *Ger.*; from *granum*, a grain: *Lat.*), a rock of igneous origin composed of crystals of quartz, felspar, and mica, confusedly mixed together. The felspar is sometimes white, sometimes red. When it occurs in large crystals it is called porphyritic granite. There is a variety composed only of felspar and quartz, which on certain sections presents broken lines resembling Eastern characters, and hence it is called Graphic Granite. When hornblende takes the place of mica the rock is called *Syenite*. Granite is believed to have once been in a state of fusion in the interior of the earth and to have cooled slowly, under great pressure. Although granite is often found at the surface of the earth, some vast mountain ranges chiefly consisting of it, it is never found lying upon sedimentary rocks. It has evidently been found at widely distant epochs; for whilst it lies beneath the oldest fossiliferous rocks, it is found penetrating in the form of veins into rocks of the tertiary period. Granite is much used for building purposes. Some kinds however readily decay. From its disintegration in situ has been found the clay called *Kaolin* which is employed in the manufacture of porcelain. [See GNEISS.]

GRAN'ITEL (same *deriv.*), in Mineralogy, a granitic compound containing two constituents only; as quartz and felspar, or quartz and hornblende.

GRAN'ITIN (from *granite*), in Mineralogy, a granitic aggregate of three species of minerals, some of which differ from those species which compose granite; as quartz, felspar, and jade or shorl.

GRANT, in Law, a mode of conveyance by mere deed, and without livery of seisin, appropriate to estates in lands and tenements not in possession, and also to incorporeal hereditaments.

GRANULA'TION (*granum*, a grain: *Lat.*), the act of forming metal into grains. This is generally effected by pouring the metal in a fluid state into water. Should it require to be finely divided, it must be made to pass through a perforated ladle or sieve. If the particles are to be spherical, it must be poured from such a height that they will be cold before reaching the water; hence the great height of *shot towers*.——GRANULATIONS, in Medicine, the minute grain-like, fleshy bodies, which form on the surfaces of ulcers and suppurating wounds, and serve both for filling up the cavities and bringing nearer together and uniting their sides. The colour of healthy granulations is a deep florid red, and they always have a tendency to unite. When livid, they are unhealthy, and have only a languid circulation.

GRAPE (*grappe*, a bunch: *Fr.*), the fruit of the vine, growing in clusters, from which wine is expressed. The climate of England is not very favourable to their proper ripening, but the grapes we produce in hot-houses are generally superior to those which we import green from Malaga and other ports of Spain. When grapes are dried and preserved, they are called *raisins*; or, if they are the very small kind cultivated in Zante, Cephalonia, and Ithaca, and in the Morea near Patras, *currants*.

GRA'PE-SHOT, in Artillery, a combination of small shot put into a thick canvas bag, and corded so as to form a kind of cylinder. It is now superseded by *canister shot*.

GRAPH'ITE (*grapho*, I write: *Gr.*), in Mineralogy, Plumbago, or BLACK LEAD, which see.

GRAPHOM'ETER (*grapho*, I write; and *metron*, a measure: *Gr.*), a mathematical instrument, called also a *semicircle*, the use of which is to find the number of degrees in any angle, the vertex of which is at the centre of the instrument.

GRAP'NEL (*grapin: Fr.*), a small anchor fitted with four or five flukes or claws: it is used in boats or small vessels.

GRASS'HOPPER, a genus of orthopterous insects, distinguished from the crickets by the roof-like position of the wing-covers, and from the locusts by less robustness of body and greater length and slenderness of the legs, and antennæ. The grasshopper of our fields is harmless The stridulating sounds of the male insects is produced by rubbing the ridges of the inner surface of the thigh against the veins of the wing-cases

GRAU'WACKE (grey rock: *Ger*), an obsolete geological term, originating in Germany, for argillo arenaceous palæozoic strata.

GRAV'EL (*gravier Fr*), small stones or pebbles intermixed with sand. It is supposed to be derived from fragments of rocks and flints, worn by the action of water and by their mutual attrition, into rounded and other forms ——GRAVEL, in Medicine, a painful disorder, arising from a gritty matter concreting into small stones in the kidneys and bladder

GRA'VER (*graveur: Fr.*), the same as burin, which see

GRAVIM'ETER (*gravitas*, weight; and *metior*, I measure *Lat*), an instrument for determining the specific gravities of bodies

GRAVITA'TION (*gravitas*, weight *Lat*) The tendency of all the molecules of our system to move towards each other in proportion to their masses, and inversely to the square of their distances, is styled gravitation. It is this tendency which forms the bond by which the countless particles composing the universe are held together in their present arrangement and shape, and it equally regulates the descent of the minutest grain of dust to the ground, and the motion of the planets in their orbits Indeed, it reaches far beyond the bounds of our system, for there is reason to suppose that the binary stars are subjected to its laws. The force of gravitation varies directly as the masses of the gravitating bodies; for example, if one of two such bodies has a mass twice that of the other, then the attracting force of the former is twice that of the latter. It varies also inversely as the square of their distances; for example, if a given distance be made twice greater, the attracting force will be four times less. That manifestation of the force which takes place on or near the earth is styled terrestrial gravitation; and since it is the combined operation of every part of the globe that produces it, we may consider the attracting force to act only from the centre. Gravitation has the same intensity at all parts of the earth's surface, which are at equal distances from the centre The farther away a body is from that point the less is the gravitating force. Consequently that force is less intense on the top of a mountain than at the surface of the ocean, less at the poles than at the equator. That which we call weight is the effect of the gravitating force It is the pressure which the attraction of the earth causes a body to exert upon some other body interposed between it and the earth's centre *Weight* is proportional to mass *Absolute weight* is the relation which the pressure of a body bears to that of some other body, whose pressure is taken as unity. The absolute weight of bodies of similar constitution is proportional to their volumes Bodies which, with equal volumes, have different weights, have also different densities · that body which has the greater weight being more dense than another of the same volume but less weight The attracting force of the earth is strongly shown in the fall towards it of bodies left without support The direction of motion is towards the earth's centre Gravitation acts with equal intensity on all bodies, each particle of matter being equally attracted by the earth The cause of some bodies falling more rapidly than others is the resistance of the air, for a piece of gold and a feather are seen to fall with the same speed under an exhausted receiver. The motion of a falling body is uniformly accelerated, for the force which gave the motion a beginning is constantly acting upon it, and always with the same intensity; consequently at every instant it adds a new degree of speed to that which it has already communicated, and the velocity at the termination of its fall is composed of all the small increments of velocity added together Hence the greater the height of the fall, the greater the velocity at its termination It has been found that the final velocities increase as the times, that is, they follow the order of the numbers 1, 2, 3, 4, &c. A body in the latitude of London falls during the first second of its descent through 16 095 feet; during the second second through 48 285 feet, during the third second through 80 475 feet; during the fourth second through 112 665 feet, and so on The *total* space fallen through at the end of the second second is therefore 64 380 feet, at the end of the third second 144 855 feet, and at the end of the fourth second 257 520. Whence it appears that the spaces passed through in equal successive portions of time increase as the odd numbers 1, 3, 5, 7, &c.; whilst the total spaces fallen through increase as the square of the times 1^2, 2^2, 3^2, 4^2, &c. = 1, 4, 9, 16, &c.

GRAV'ITY (*gravitas*, weight: *Lat.*), CENTRE OF [See CENTRE *of gravity*.]

GRAV'ITY, SPECIFIC, is the weight of any kind of matter, considered with reference to that of an equal bulk of some other, which is assumed as a standard of comparison; and this standard, by universal consent, is distilled water at a certain temperature—in England, generally at 62° Fahr. Comparison may be made with distilled water at any temperature, if the allowance required by its altered density is taken into account. It happens that a cubic foot of distilled water weighs 1000 ounces avoirdupois. Consequently, assuming this as the specific gravity of rain-water, and comparing all other bodies with it, the numbers that express the specific gravity of bodies will at the same time denote the weight of a cubic foot of each in avoirdupois ounces; which is a great convenience in numerical computations. From the preceding definition we readily deduce the following laws:—1. In bodies of equal magnitude, the specific gravities are directly as the weights, or as their densities 2 In bodies of the same specific gravity, the weights will be as the magnitudes 3. In bodies of equal weights, the specific gravities are inversely as the magnitudes. 4. The weights of different bodies are to each other in the compound ratio of their magnitudes and specific gravities. Hence it is obvious that, of the magnitude, weight, and specific gravity of a body, any two being given, the third may be found; and we may thus ascertain the magnitude of bodies which are too irregular to admit of the application of the common rules of mensuration; or we may, by knowing the specific gravity and magnitude, find the weight of bodies which are too ponderous to be submitted to the action of the balance or steelyard; or lastly, the magnitude and weight being given, we may ascertain the specific gravities The specific gravity of a solid is found by weighing it first in air, and then while immersed in distilled water, or some fluid of known density which will not dissolve it. The weight lost by immersion is the weight of a quantity of fluid equal in bulk to the body. The weight of the body in air, divided by the weight lost, will be its specific gravity with reference to the fluid employed. If the body will not sink in the fluid, some substance that will make it sink must be attached to it. The effective part of the weight, added to the weight of the body, will be the weight of an equal bulk of the fluid; and dividing the weight of the body in air by this, will give its specific gravity with respect to the fluid. The most accurate and concise mode of ascertaining the density of liquids is to employ a small glass measure with a very short narrow neck, called a *specific gravity bottle*, and adjusted to hold exactly 1000 grains of distilled water. The vessel being counterpoised, and then filled with any other liquid, its weight is observed, and the density of its contents, compared with that of water, may be found by merely cutting off three decimal places. After each operation, the glass must be carefully rinsed with pure water, and again dried, by heating it, and then sucking out the humid air by means of a slender tube. The specific gravity bottle enables us to take the specific gravity of a body which is in powder—of a soil for instance. For this purpose, half the quantity of water the bottle would hold is to be placed in it; then just enough of the clay, &c., to cause it to be filled with the mixture; and it is then to be weighed. The weight of the water being deducted, the remainder will be the weight of the clay, &c.; and this, divided by half the weight of the water, which the bottle would hold, will be the specific gravity of the clay, &c. The specific gravity of fluids may also be ascertained by the *hydrometer*, which see.

GRAY'LING, a fresh-water fish belonging to the *Salmonidæ*, the *Thymallus vulgaris* of Ichthyologists. It is of a brownish colour, with several dusky stripes along the sides. When fresh from the water it is slightly varied with blue, green, and gold, and a few dark spots. It is found in some parts of England; but abundantly in clear rapid streams in the north of Europe; and it is much esteemed as food.

GRAY'WACKE. [See GRAUWACKE]

GREAVE (*grève: Fr;* in *Burgund. Fr.*, a shin), a piece of armour, fitted to the front of the leg. It was used both by the Greeks and Romans, but on one leg only, as the other was protected by the shield

GREBE, the common name of some birds belonging to the genus *Podiceps*, of ornithologists. They are divers, and placed in the family *Colymbidæ*. The toes are not completely webbed, but have a scalloped membrane at each side like the coots. The little grebe or dabchick is the commonest in these islands

GREEK CHURCH, that section of Christians who conform, in their creed, usages, and church government, to the form of Christianity introduced into the Greek empire about the fifth century, and brought to its present state under the patriarchs of Constantinople, Alexandria, Antioch, and Jerusalem. The bishops of Constantinople and Rome were long rivals, each attempting to obtain universal supremacy: the former being impeded in their efforts by their proximity to the emperors, the latter ultimately attained their object. The first dispute on matters of doctrine between the rival churches occurred in the 9th century. The Greeks denied the procession of the Holy Ghost from the Father *and the Son;* the Latins asserted and defined it as an article of faith. The latter, however, continued powerful in the East until A D. 1054, when a final separation took place. Like the Roman Catholic, this church recognizes two sources of doctrine, the Bible and tradition, under which last it comprehends not only those dogmas which were orally delivered by the apostles, but also those which have been approved by the fathers of the Greek church. It is the only church which holds that the Holy Ghost proceeds from the Father only, thus differing from the Roman Catholic and Protestant churches, which agree in believing the Holy Ghost to proceed from the Father and the Son. Like the Catholic church, it has seven sacraments: baptism, confirmation, the eucharist — preceded by confession — penance, ordination, marriage, and extreme unction; but it is peculiar in holding that full purification from original sin in baptism requires an immersion three times of the whole body in water, whether infants or adults are to be baptised, and in joining confirmation with baptism as its completion. It scarcely can be said to admit the doctrine of purgatory, has nothing to do with pre destination, works of supererogation, indulgences, and dispensations; it allows pictures, but forbids images; permits the marriage of its secular priests; adopts auricular confession, and holds that doctrine of Christ's presence in the eucharist called consubstantiation, which see; and it recognizes neither the pope nor anyone else as the visible vicar of Christ on earth, giving to the patriarchs of Constantinople, however, a spiritual supremacy. In the invocation of the saints, in their fasts, relics, &c., the Greeks are as zealous as the Roman Catholics; it may be said, indeed, that the services of the Greek church consist almost entirely of outward forms. This form of Christianity is the religion of Russia, Greece, Moldavia, and Wallachia, and of congregations scattered throughout the provinces of the Turkish and Austrian empires.

GREEK FIRE, a combustible composition, invented by the Greeks in the middle ages, during their wars with the Arabs and Turks. It is supposed to have consisted of bitumen, or asphaltum, nitre, and sulphur. Many extraordinary accounts are given of its destructive effects. Bomb-shells are now-a-days sometimes filled with a combustible matter termed Greek fire, composed of naphtha and phosphorus, or with the bisulphide of carbon and phosphorus. This forms a very destructive missile: for when the shell explodes, the composition ignites spontaneously and cannot be extinguished with water.

GREEK LAN'GUAGE. The language of the primitive inhabitants of Greece, the Pelasgic, was already extinct in the time of Herodotus, if we may believe his assertion that it was different from the Hellenic. From the great number of Hellenic tribes of the same race, it was to be expected that there would be different dialects; and it is customary to distinguish three principal ones, according to the three leading branches of the Greeks, the Æolic, the Doric, and the Ionic, to which is added the Attic. At what time this language first began to be expressed in writing has long been a subject of doubt. According to the general opinion, Cadmus, the Phœnician, introduced the alphabet into Greece. His alphabet consisted of but sixteen letters; four more are said to have been invented by Palamedes in the Trojan war, and four by Simonides, of Ceos. As the Ionians first adopted these letters, the alphabet with twenty-four is called the *Ionic*. In Homer's time all knowledge, religion, and laws, were preserved by memory alone, and for that reason were clothed in verse, till prose was introduced with the art of writing. In Poetry the chief writers were Homer (long the reputed author of the Iliad and the Odyssey, but his individuality has been doubted); Hesiod, who wrote the 'Works and Days,' more than 800 years B.C.; Sappho, Alcæus, and Anacreon, writers of lyrics in the sixth century B.C.; Simonides, another writer of lyrical pieces; Pindar, who composed odes; Æschylus, Sophocles, and Euripides, who wrote tragedies; and Aristophanes, a writer of comedies; these flourished in the fifth century B.C.; Bion, Moschus, and Theocritus, who wrote idyls; Callimachus, hymns and epigrams, in the third century B.C. In other departments of literature, the following were the leading men whose writings have survived: Herodotus and Thucydides, both historians in the fifth century B.C.; Xenophon, the historian; Isocrates, Demosthenes, and Æchines, orators; Plato and Aristotle, philosophers, in the fourth century B.C.; Euclid and Apollonius, mathematicians, in the third century B.C.; Polybius, the historian, in the second century B.C.; Diodorus Siculus, the historian, in the first century B.C.; Strabo and Pausanius, geographers; Plutarch, the biographer; and Epictetus, the philosopher, in the first century after Christ; Lucian, a writer of dialogues; Ptolemy, the geographer; Arrian, the historian; Galen, the physician; and M. Aurelius Antoninus, the philosopher, in the second century after Christ. In this and the following centuries flourished the Fathers of the Church (see **FATHERS**), and a number of minor writers on Greek, whom want of space obliges us to pass by, except Heliodorus, who, in the fourth century of our era, wrote 'Theagenes and Chariclea,' the first of extant novels.——MODERN GREEK or ROMAIC. The Greek language seems to have preserved its purity longer than any other known to us. But this majestic dialect ceased to exist as a living language when Constantinople was taken by the Turks in A.D. 1453, and in the lower classes only did the common Greek survive the dialect of the polished classes. But the liberation of Greece has done much to revive the knowledge of its noble tongue in the regions in which it was originally spoken. The downfall of the Eastern empire, by scattering learned exiles through all parts of Europe, spread the knowledge of it in every land. The Romaic or modern Greek, like the Italian or modern Latin, differs from the ancient chiefly in having exchanged the terminations of the different cases, &c., for prepositions. In it, also, accents are confounded, and, though marked, are not noticed in pronunciation; diphthongs, anciently distinct, have the same pronunciation, *ει*, *οι*, *ί*, and *υ*, being pronounced *ί*; the form and signification of ancient words are changed in various ways, the dual number and oblique cases are lost; auxiliaries *have* and *will* are employed to indicate the past and future; personal pronouns are used with verbs; and orthography is without fixed rules. But it differs less from the original Greek than the Italian from the Latin. The use of the ancient Greek liturgy tended to preserve the language, and kept it from becoming different in different districts. The dialect of the common people is the least corrupt; that of Attica is the worst. The ancient letters are still used.

GREEN-CLOTH, BOARD OF, a court of justice belonging to the royal household, and held in the queen's palace, under the lord-steward. To this court are committed the accounts of expenses and payments to the queen's servants; and its jurisdiction extends to all offences committed in the royal palaces, and within the verge of the court, which reaches 200 yards from the palace gate every way. None of the royal household can be arrested for debt without a warrant from this board.

GREENFINCH, a British bird belonging to the finch family, the *Coccothraustes chloris* of ornithologists. The feathers are of a greenish hue, and the wings and tail variegated with yellow.

GREENHOUSE, in Horticulture, a glazed building, erected for sheltering and preserving the tender exotic plants, which will not bear to be exposed to the open air during the winter season. [See CONSERVATORY.]

GREENSAND, in Geology, fossiliferous beds belonging to the cretaceous formation. The Upper Greensand lies upon the gault, and belongs to the upper division of the cretaceous series. The Lower Greensand is under the gault, and belongs to the Neocomian or lower division of that series. The Upper Greensand chiefly consists of the fragments of some chloritic mineral. In some places there are bands of siliceous limestone and calcareous sandstone. The whole is about 100 feet in thickness in the Isle of Wight. The Lower Greensand varies greatly in its mineral composition, but it appears to have been principally derived from the wearing down of plutonic rocks. In the Isle of Wight it attains a thickness of 843 feet.

GREEN'STONE, in Geology a volcanic rock composed of a granular mixture of hornblende and felspar, or of augite and felspar. It is intermediate in composition between basalt and trachyte.

GREGO'RIAN CAL'ENDAR, in Chronology, a correction of the Julian. In the latter, every secular or hundredth year is bissextile: in the former, every one in four. This reformation of the calendar, which was made by pope Gregory XIII. A.D. 1582, is also called the *New Style*. [See STYLE.]

GRENA'DE (*Fr.*), a hollow shell or globe of iron, filled with combustibles, discharged from a howitzer. There is also a smaller kind, thrown by hand, which are called *hand-grenades*. These were originally used by soldiers who, from long service and distinguished bravery, were selected for the service; and hence the name of the *grenadiers*, who now form the first company of a battalion.

GREN'ATITE, a mineral of a dark reddish brown colour, sometimes called *prismatic garnet*, and *staurotide*. It is composed of silica, alumina, and oxide of iron. It occurs imbedded in mica slate, and in talc, and is not fusible by the blowpipe. It sometimes occurs crystallised in the form of a cross, and it is then made a religious amulet.

GRIF'FIN (*griffon*: *Fr.*), an imaginary animal, with four legs, wings, and a beak; being in the upper part an eagle, and in the lower a lion. The ancients intended by this combination to give an idea of strength and swiftness, united with an extraordinary vigilance in guarding whatever was intrusted to its care. It was supposed to watch over mines of gold and hidden treasures, and was consecrated to the sun.

GRIS'AILLE (*Fr.*). A picture is said to be *en grisaille* when it is executed only in white and grey.

GRISET'TE (*Fr.*), originally a dress of coarse grey cloth, worn by females of the lower classes in Paris; hence it is used for the females themselves.

GROAT, an ancient silver coin, worth about fourpence of our money. At the time of the Conquest, the French *solidus* began to be called a shilling, and the Saxon *shilling* a groat.

GROS'BEAK, a name given to several British birds in the family of finches, on account of their short thick bills. They are nearly related to the common bullfinch.

GROSS (*gros*: *Fr.*), in Commerce, twelve dozen.——GROSS WEIGHT, the weight of merchandise or goods, with the dross, the bag, cask, &c., in which they are contained, for which an allowance is to be made of tare and tret. These being deducted, the remainder is denominated *neat* or *net* weight.——ADVOWSON IN GROSS, in Law, an advowson separated from the property of a manor, and annexed to the person of its owner.

GROS'SULAR (*grossulus*, a small unripe fig: *Lat.*), in Mineralogy, a rare kind of garnet, so named from its green colour. It is found in Siberia.

GROTES'QUE (*Fr.*), in the Fine Arts, a term applied to a combination of capricious ornaments, consisting of figures, animals, leaves, &c., which, as a whole, have no existence in nature. 'The true grotesque (says Mr. Ruskin), being the expression of the *repose* or *play* of a *serious* mind, there is a false grotesque opposed to it, which is the *full exertion* of a frivolous one.'——In Architecture, artificial grotto work, decorated with shells, rock, &c.

GROUND (*grund*: *Sax.*), in Etching, a composition spread over the surface of the metal to be etched, to prevent the nitric acid from eating except where the drawing has been made.——In Music, the name given to a composition in which the bass, consisting of a few bars of independent notes, is continually repeated to an ever-varying melody.——In Painting, the surface on which figures or other objects are represented.——GROUND-ICE, ice formed under peculiar circumstances, at the bottom of running water, in consequence of the ground being cooled by radiation, below the freezing point of water.——GROUND-IVY, the *Glechoma hederacea*, a British labiate plant.——GROUND-PLATES, in Architecture, the lower portions of a timber, which receives the principal and other posts.——GROUND-PLOT, the ground on which a building is placed.——GROUND-RENT, rent paid for the privilege of building on another man's ground, and generally on a long lease.——GROUND-SWELL, an undulation of the ocean, caused by a distant gale of wind.——GROUND-TACKLE, in ships, the ropes, &c., belonging to anchors.

GROUND'SEL, a name given to several wild plants belonging to the genus *Senecio*, nat. ord. *Compositæ*.

GROUP (*groupe*: *Fr.*), in Painting and Sculpture, an assemblage of figures or other objects.——GROUPING is the art of so combining and balancing the parts as to produce an harmonious effect.

GROUSE, the name of several species of game birds, belonging to the family of Tetraonidæ. In Britain there are the wood-grouse, or capercaillie, the black-grouse, the red or common grouse, and the white-grouse, or ptarmigan. They are shy, and wild birds living in forests or on moors.

GRUB (*graban*, to dig: *Sax.*), the worm or maggot produced from a beetle, which afterwards becomes a winged insect.

GRYL'LUS (*Lat.;* from *grullos*, literally a small pig; *grulizo*, I grunt: *Gr.*), in Entomology, a genus of saltatorial orthoptera, including our great green grasshopper *Gryllus viridissimus*.

GUAI'ACUM (*guayacan: Span.;* from *hoaxacan: Ind.*), in Botany, a genus of West Indian trees, nat. ord. *Zygophyllaceæ*, which yield a resinous matter used in medicine, called *Guaiacine*.

GUAN'ACO (*Peruv.*), the local name of the wild llama, the *Llama guanacus* of naturalists. It is the characteristic quadruped of the plains of Patagonia. [See LLAMA.]

GUA'NO (the corrupted Spanish form of a native Peruvian word), a substance which is found in large quantities on islands near the east coast of South America, and other parts of the world. It is the accumulated excrement of sea birds with the decayed bodies of seals, fish, birds &c.; and is such an excellent manure, that it forms an extensive and profitable branch of commerce. The value of different guanos depends upon the quantities of ammonia and phosphoric acid they respectively contain. Upwards of 240,000 tons are annually imported and used in this country.

GUARANTEE' (*garantie: Fr.*), an undertaking or engagement by a third party, that the stipulations of a treaty, or the engagement or promise of another, shall be performed. A person is not liable on a special promise in the nature of a guarantee, unless a written agreement or memorandum of such promise shall be signed by the party making the promise, or some person authorized by him. It is not necessary that the *consideration* for such promise should appear in writing, or be capable of inference from a written document.

GUARD, NA'TIONAL, of France, an institution devised in 1789, and fully organized in 1791. It was raised by voluntary enlistment, and consisted of one man out of every twenty citizens. Its staff was dissolved in 1795, and it was placed under the control of the military authorities. Under the restoration, it was deprived of the privilege of choosing its own officers, and in consequence of its demanding the dismissal of the ministry, it was dissolved in 1827.——IMPERIAL GUARD. When Napoleon became emperor, in 1805, he augmented the consular guard, which then consisted of 3300 infantry and 2100 cavalry, besides artillery and marines. It was an institution of great efficiency, consisting exclusively of soldiers who had served four years in the line, or of those who had belonged to what was called the *Young Guard*. In 1812, both guards consisted of 56,000 men. At the restoration, the soldiers of the young guard were transferred to the line, and the old guard was formed into regiments.

GUARD'ANT (*gardant*, guarding: *Fr.*), in Heraldry, having the face turned towards the spectator, as it were in a posture of defence.

GUARD'IAN (*gardien: Fr.*), in Law, a person charged by will or by the Court of Chancery with the custody of such persons as are incapable of self-guidance, and especially of minors.——GUARDIAN *ad litem*, a person appointed by the court to prosecute or defend a suit on behalf of infants.

GUARD'SHIP, a vessel of war, intended to superintend the marine affairs of a harbour or river; to take care that the ships not in commission have their proper watchword duly kept, by sending her guard-boats round them every night; and to receive seamen who are impressed in time of war.

GUARDS (*gardes: Fr.*), in a particular sense, the troops that are designed to guard the royal person and palace, and which consist both of horse and foot. In Britain the household troops or guards consist of two regiments of life-guards, the royal regiment of horse-guards, and three regiments of foot-guards, viz. the Grenadier, Coldstream and Scots Fusilier Guards. The actual body-guard of the sovereign on ordinary occasions consists of the *Yeomen of the Guard*, a corps originally established by Henry VII. in 1485. There are at present 140 yeomen, officered by a captain, a lieutenant, an ensign, and four exons. The captain is a nobleman, who is appointed by the ministry, and retires from office along with them.——From the earliest times, sovereigns have had a body of soldiers, designed especially to defend their persons. Alexander the Great had a corps of *Argyraspides* or silver shields; the Roman emperors had their *Prætorian* guards; the kings of France had their *Scotch* and afterwards their *Swiss* guards. The pope had, and continues to have, Swiss guards.

GUA'VA, American trees of the genus *Psidium*, nat. ord. *Myrtaceæ*. The fruit is round like an apple, with a pulpy interior containing many seeds. The flavour is agreeable, and from it is prepared a much esteemed jelly.

GUDG'EON (*goujon: Fr.*), a well-known fresh-water fish, the *Gobio fluviatilis* of naturalists. It belongs to the *Cyprinidæ*, and is distinguished from the barbel by having only two filaments or barbules at the mouth, and by having no strong bony ray at the commencement of the dorsal fin.

GUE'BRES (infidels: *Pers.*), a Persian sect, who still worship fire as an emanation or emblem of the Deity. A colony of them has been long established at Bombay and other parts of India, and has attained to riches and distinction: these are termed *Parsees*, on account of having sprung from the Persians. The sacred books of the Guebres are termed the *Zend Avesta*.

GUELDER ROSE, a wild British shrub with white flowers and deciduous leaves, the *Viburnum opulus* of botanists, nat. ord. *Caprifoliaceæ*.

GUELFS or **GUELPHS**, the name of a family, composing a faction formerly in Italy, whose contests with a rival faction, called the *Ghibelines*, were the cause of much misery and bloodshed. The wars of the Guelfs and Ghibelines became a struggle between the spiritual and secular power. The popes, who endeavoured to compel the German emperors to acknowledge their supremacy, and the cities of Italy, struggling for independence and deliverance from the oppressive yoke of these same emperors, formed the party of the Guelfs. Those who favoured the emperors were called Ghibelines. The contests of the Guelfs and Ghibelines originated in a German feud in the 12th century. The dukes of Bavaria, of the great house of Guelph, carried on a war against the house of Hohenstauffen, one of whose castles, *Weiblingen*, gave the name of Ghibelines to their party. When the Emperor Frederic I., the head of the latter, invaded Italy, to reassert the rights of the empire, these names were transplanted into that country. In the 14th century, the papal see was removed to Avignon, and, from that time, the original principles of these factions were lost; but they disturbed Italy until near the end of the 15th century.

GUILD (*gildan*, to pay: *Sax.*), a company, fraternity, or corporation, associated for some commercial purpose; of which every member was to pay something towards the common expenses. The guilds of the Anglo-Saxons, unlike those of more modern times, were not confined to mercantile purposes. They became ultimately so powerful, in London and other places, that admission into them was necessary as a qualification for the exercise of municipal rights.

GUILD'HALL (*gilde*, a corporation: *Ger.*), the chief hall of the city of London, for holding courts, and for the meeting of the lord-mayor and commonalty, in order to make laws and ordinances for the welfare and regulation of the city.——**GUILD-RENTS**, rents paid to the crown by any guild or fraternity: or those that formerly belonged to religious houses, and came to the crown at the general dissolution of monasteries.

GUIL'LOTINE, an instrument of public execution, for beheading persons at one stroke; adopted in France during the period of the revolution, and still employed in France when capital punishment is inflicted. It consists of a heavy knife, guided in its descent by grooves. The invention of this decapitating machine has been erroneously ascribed to Guillotin, a French physician. It was used long before in other places; thus, in Italy, for beheading persons of noble birth, under the name of *Manuaja*; and even in Scotland, under the name of *Maiden*. It was merely proposed by Guillotin, and adopted by the Convention, as being less cruel to the sufferer, and less ignominious for the family of the person executed; and the first criminal suffered by it at the *Place de Grève*, May 27th, 1792. It is also a vulgar error, that Guillotin was the first who perished by it: he survived until 1814.

GUIN'EA, an English denomination of money, and formerly a gold coin weighing 118·7 grains, first coined in the reign of Charles II. Its value is 21*s*. It was so called because it was made from gold that was brought from Guinea, on the coast of Africa.

GUIN'EA-FOWL, the *Numida Meleagris* of ornithologists, an African bird, now common in Europe, belonging to the order of *Gallinæ*. It is similar in its habits to our domestic poultry. Its colour is a dark grey, beautifully variegated with small white spots. Its head is bare of feathers, and covered with a naked bluish skin; on the top is a callous conical protuberance, and on each side of the upper mandible, at the base, hangs a loose wattle, which, in the female, is red, and in the male bluish. It makes a harsh unpleasant cry.

GUIN'EA-PIG, the *Cavia Cobaya* of Zoologists, a beautiful little rodent quadruped, a native of South America, but now domesticated in Europe. It is seven or eight inches long, and of a white colour, variegated with black and orange spots.

GUIN'EA-WORM. [See FILARIA.]

GUITAR' (*guitare*: *Fr.*; from *cithara*, a lute: *Lat.*), a musical stringed instrument, rather larger than a violin, and played with the fingers. It is much used in Spain and Italy, particularly in the former country, where there are few, even of the labouring class, who do not amuse themselves with it.

GULES (*gueule*, the mouth: *Fr.*), in Heraldry, the red colour equivalent to ruby, among the precious stones, and Mars among planets. It is represented by vertical lines in engraving.

GULF (*golfe*: *Fr.*), in Geography, a broad capacious bay, which, when very extensive, takes the name of a sea; as, the gulf of Venice, which is also called the Adriatic sea. A *gulf* and a *bay* differ only in extent; we apply *bay* to a large or small recess of the sea, but *gulf* is applied only to a large extent of water.——It also means a deep cavity in the earth, and a whirlpool.

GULF-STREAM, a current of warm water, which issues from the basin of the Mexican gulf and Caribbean sea, doubles the southern cape of Florida, and takes a north-eastern direction, in a line nearly parallel with the American coast. It touches the southern borders of the great banks of Newfoundland, and gradually diffuses itself until it is lost in the North Atlantic. At first the waters are intensely blue, with a temperature of 85° F., and have a velocity of four miles an hour. The dampness of our climate, and its winter mildness compared with North America in a corresponding latitude, are owing to the Gulf-stream. Much has been written as to the theory of this flow of water, but no suggestion of a cause has yet commanded universal assent.

GUN'-COTTON, the pyroxilin or trinitrocellulose of chemists, is a highly inflammable and explosive substance, discovered by Schönbein. It is a compound of carbon, hydrogen, and oxygen. It is obtained by steeping clean cotton wool in a mixture of the strongest sulphuric and nitric acids in equal proportions; and then thoroughly washing and cautiously drying it at a temperature of 212°. The original appearance of the cotton is little changed, saving that it has increased about 70 per cent. in weight. But it has now become explosively inflammable; and, when ignited by a spark, it flashes off with greater rapidity and energy than gunpowder. When properly prepared it does not become ignited until raised to a temperature of 277° F. Its value in gunnery as a substitute for gunpowder has been much debated, but a recent report, embodying the result of experiments, is highly favourable. The following is the substance of the report:—One pound of gun-cotton produces an effect exceeding three pounds of gunpowder in artillery. It may be placed in store, and preserved with great safety. The danger from explosion does not arise until it is confined. It may become damp, and even perfectly wet, without injury, and may be dried by mere exposure to the air. This is of great value in ships of war; and in case of fire the magazine may be submerged without injury. Gun-cotton keeps the gun clean, and requires less windage, and, therefore, performs much better in continuous firing. In gunpowder there is 68 per cent. of refuse, while in gun-cotton there is no residuum, and, therefore, no fouling. From the low temperature produced by gun-cotton the gun does not heat. The absence of fouling allows all the mechanism of a gun to have much more exactness than where allowance is made for fouling. The absence of smoke promotes rapid firing and exact aim. There are no poisonous gases, and the men suffer less inconvenience from firing. The fact of smaller recoil from a gun charged with gun-cotton is established by direct experiment. Its value is two-thirds of the recoil from gunpowder, the projectile effect being equal. The comparative advantage of gun-cotton and gunpowder for producing high velocities is shown in the following experiment with a Krupp's cast-steel gun, 6-pounder:—Ordinary charge, 30 ounces powder, produced 1338 feet per second: charge of 13½ oz. gun-cotton produced 1563 feet. The fact of the recoil being less in the ratio of two or three enables a less weight of gun to be employed, as well as a shorter gun. Bronze and cast-iron guns have been fired 1000 rounds without in the least affecting the endurance of the gun. From a difference in the law of expansion there is an extraordinary difference of result in the explosion of shells—namely, that the same shell is exploded by the same volume of gas into more than double the number of pieces. This is to be accounted for by the greater velocity of explosion when the gun-cotton is confined very closely in small spaces. It is also a peculiarity that the stronger and thicker the shell the smaller and more numerous the fragments into which it is broken. The fact that the action of gun-cotton is violent and rapid in exact proportion to the resistance it encounters, tells us the secret of the far higher efficiency of gun-cotton in mining than gunpowder. The stronger the rock the less gun-cotton comparatively with gunpowder is found necessary for the effect—so much so, that while gun-cotton is stronger than gunpowder, weight for weight, as three to one in artillery, it is stronger in the proportion of 6·274 to one in strong and solid rock, weight for weight. Its power in splitting up the material can be exactly regulated. It is a well-known fact that a bag of gunpowder nailed on the gates of a city will blow them open. A bag of gun-cotton exploded in the same way produces no effect. To blow up the gates of a city with gun-cotton it must be confined before explosion; 20 lbs. of gun-cotton, carried in the hand of a single man, would be sufficient, only he must know its nature. In a bag it is harmless; exploded in a box it will shatter the gates to atoms. A strong bridge of oak, of 24 feet span, was shattered to atoms by a small box containing 25 lbs. of gun-cotton laid on its centre. The bridge was not broken—it was shivered.

GULL, the name of some web-footed sea birds belonging to the genus *Larus*. They are found in every part of the world, and often met with many leagues from land. Gulls are voracious, and devour almost everything that comes in their way, whether fresh or putrid; yet they can endure hunger for a long time. There are thirteen species frequenting our shores.

GUM (*gomme: Fr.*), a vegetable product, which forms a viscid solution with water, but is insoluble in alcohol, ether, and oils. Strong sulphuric acid changes it into oxalic and mucic acids. It is exemplified by gum-arabic.

GUM-AR'ABIC, a gum which flows from the *Acacia Arabica*, and *Acacia vera*, which grow on the banks of the Nile, and in Arabia. It is transparent, without smell, and white, or with a yellow or brownish tint. It is used in medicine and the arts.

GUM'-LAC, a resinous substance, produced by the puncture of a female insect, a *Coccus*, upon the branches of several plants, among others the *Croton laccіferum*, or Bihar tree, growing in Siam, Assam, &c. The twig becomes incrusted with a reddish mammillated resin, which has a fracture of a crystalline appearance, and constitutes the *stick-lac* of commerce. The incrustation is often a quarter of an inch thick. The resinous concretion taken off the twigs, coarsely pounded, and triturated with water in a mortar, to remove most of the colouring matter, and dried in the sun, is *seed-lac*. The seed-lac is put into oblong bags of cotton cloth, which are held over a charcoal fire, and twisted so as to strain the liquefied resin through, and make it drop and form thin plates, which constitute *shell-lac*.

GUM'-RESIN, an exudation from many trees, such as olibanum or frankincense, galbanum, scammony, gamboge, euphorbium, asafœtida, aloes, myrrh, and gum-ammoniac. Almost all the gum-resins are medicinal substances, and little employed in the arts and manufactures.

GUM-TRAG'ACANTH, the gum of the *Astragalus Tragacantha*, a thorny shrub found in Crete, Asia, and Greece. It has the appearance of twisted ribands, is white or reddish, nearly opaque, and a little ductile; it swells considerably in water, partially dissolving, and forming a very thick mucilage.

GUN, a fire-arm, or weapon of offence, invented in the 14th century. The term includes everything that forcibly discharges a ball, shot, &c., through a cylindrical barrel, by means of gunpowder, except the pistol and mortar. The larger species of guns are called cannon, and the smaller muskets, carbines, fowling-pieces, &c. Cannon were used at the battle of Cressy in 1346, and perhaps three years earlier at the battle of Algesiras. But there is a piece of ordnance at Amberg in Germany, inscribed with the year 1303. Guns were originally made of iron bars united together, and strengthened with iron hoops; an example of which is still preserved in the Tower of London. They were at first fired with a match, or sparks produced by the revolution of a steel wheel, and were so heavy that the soldiers were provided with rests to support them. Muskets with rests were used so lately as the civil wars in the time of Charles I. About the middle of the last century the troops throughout Europe were armed with firelocks, which until lately were furnished with flints. Every gun is required by act of parliament to be tested before being sold. Cannon were originally very long in the bore, and large charges were used with them; but the experiments of Robins and others showed that neither is necessary. The best length has been found to be 17 calibres, but in the English service the regulation length is 14. In battery guns, whatever the total length of the gun, a certain length is necessary in front of the trunnions; for the embrasures of earth from which they are generally fired would be shattered if the muzzles did not project beyond them. For a similar reason navy guns must project to a certain distance beyond the side of the vessel. The art of constructing guns is in a state of transition, new forms of artillery being likely to supplant the old. Of these new forms the *Armstrong gun* is at present in the highest favour. This gun is strengthened by, or built up of, superimposed rings or hollow cylinders, each grasping those within. In America the *Dahlgren gun* (named from its inventor), has been much employed. It is constructed like an ordinary cannon except that it is made very thick at the breech, whence it tapers down sharply to less than the usual size.

GUN-METAL, a hard alloy composed of 90 per cent. of copper, nearly 10 per cent. of zinc, and a minute quantity of tin, employed for parts of apparatus where there is much friction.

GUN'NERY, the science of using artillery judiciously, and with the greatest effect. Besides an accurate acquaintance with the management of ordnance of all kinds, the charge and angle of elevation necessary for different distances, &c., the artillerist must be practically skilled in throwing up batteries and other field-works; he must understand mathematics (particularly the doctrine of curves, to calculate the path of the balls) and mechanics. [See PROJECTILES.]

GUN'NY BAGS, employed for bringing rice to this country from the east, are made from the inner bark of a tree called by botanists *Corchorus capsularis*, nat. ord *Tiliaceæ*.

GUN'POWDER, a compound of about 78 parts saltpetre, 12 charcoal, and 10 sulphur. The ingredients must be quite pure, separately reduced to powder, thoroughly mixed, moistened, and formed into a cake, which is afterwards broken up, granulated or corned, dried, and polished by attrition. The violence of the explosion of gunpowder is due to the sudden and abundant production of gases which are expanded by the intense heat. It is supposed that at the moment of explosion the heated gases occupy at least 2000 times the space of the powder. The gases produced are carbonic acid and nitrogen, along with sulphuret of potassium, which gives rise to the white smoke that follows the explosion. 28 grs of gunpowder, confined in a cylindrical space which it just filled, was found to exert a force of more than 400,000 lbs. Gunpowder was known in Europe in the 13th century, and to the Chinese long before.

GUN'TER'S CHAIN, in Mensuration, the chain commonly used in measuring or surveying land, so called from the inventor It is 66 feet in length, and is divided into 100 links of 7·92 inches each; consequently an acre of land is equal to 10 square chains And as there are 100,000 square links in an acre, the contents of a field made up in square links is changed into acres merely by moving the decimal point five places to the left.——GUNTER'S LINE, a logarithmic line, usually graduated upon scales, sectors, &c. The numbers are generally drawn on two separate rulers, sliding against each other, and it enables us to perform multiplication and division instrumentally, as a table of logarithms does arithmetically. It is very useful in rough calculations.——GUNTER'S QUADRANT, the simplest form of a quadrant. It is provided with two sight-holes, and a string with a bob of lead; and is used for roughly measuring vertical angles: also, for finding the hour of the day, the sun's azimuth, and solving other common problems of the sphere. The face of this quadrant is also provided with useful scales and tables.

GUN'TER'S SCALE, generally called by seamen *Gunter*, is a large plain scale having various lines of numbers engraved on it, by means of which questions in navigation are solved with a pair of compasses. The natural lines are on one side of the scale, and the corresponding logarithms on the other.

GUN'WALE, the uppermost wale of a ship, or that piece of timber which reaches on either side from the quarter deck to the forecastle, being the uppermost bend, which finishes the upper works of the hull The *bulwark* is above this.

GUR'NARD (*gournal: Fr.*), the name of several acanthopterygious fishes, belonging to the genus *Trigla*. The head has a peculiar aspect, being four-sided and encased in bone. Several species have been taken on our coasts.

GUS'TO (taste: *Ital.*). This word is used figuratively for *intellectual taste*.

GUT (*kutteln: Germ.*), the intestinal canal of an animal. It extends with many circumvolutions from the pylorus to the vent, is composed of three coats, and is attached to the body by a membrane called the mesentery. The thin and small portions are called by anatomists the *duodenum*, the *ilium*, and the *jejunum*: the large and thick, the *cæcum*, the *colon*, and the *rectum*. By means of this canal, the undigested and unabsorbed parts of food are conveyed from the stomach and discharged. *Silkworm Gut*, used by anglers, is obtained by placing the silkworm in vinegar after it has left off feeding and is preparing to spin its cocoon. After macerating about three weeks, the worm is broken across over the silk bag, which is then gently extended until it is of the proper thickness. When this is dried it forms the gut.

GUT'TA PER'CHA, a substance contained in the sap of a tree 60 or 70 feet high, belonging to the natural order *Sapotaceæ* (*Isonandra Gutta*), abounding in the island of Singapore and in the Malayan peninsula, especially in Borneo It appears to separate from the juice or sap of the tree in the same way as India-rubber, and its general properties with regard to solvents and to the products of destructive distillation resemble those of caoutchouc. The first sample of gutta percha was brought to England in 1843. Since that period the gum of this obscure plant has been manufactured by European ingenuity into an incredible variety of useful articles. In fact, it takes upon itself all shapes, in obedience to the skill of man; and its adaptability to all climates, its impenetrable and enduring qualities, will cause it to be employed in almost every department of arts and manufactures. When immersed for a few minutes in water above 150 Fahr., it becomes soft and plastic, so as to be capable of being moulded to any shape, which it retains on cooling. It resists water, damp, and all the causes which produce fermentation. It is not acted upon by caustic and concentrated alkaline solutions, nor those of the vegetable and mineral acids. Weak alcoholic liquors do not affect it: even brandy dissolves but a trace of it. Olive oil dissolves none of it while cold, and very little when hot. Sulphuric, muriatic, and nitric acids attack it when they are concentrated, particularly the last. About 20,000 cwts. of gutta percha are annually imported.

GUT'TA SERE'NA (the *drop serene* of Milton: *Lat.*), or AMAUROSIS, which see, a disease in the retina of the eye, which deprives the patient of his sight. The sensibility of the retina, or optic nerve, is either wholly or partially lost. Sometimes it effects only one half the eye; sometimes it is intermittent.

GUY (from *guide*), in Marine language, a large slack rope, extending from the head of the mainmast to that of the foremast, to sustain a tackle for loading or unloading. Also, a rope used to keep a heavy body steady while hoisting or lowering.

GYMNA'SIUM (*gumnasion*, from *gumnos*, naked: *Gr.*), in Grecian Antiquity, the name given by the Spartans to the public building where the young men, naked, exercised themselves in leaping, running, throwing the discus and spear, wrestling, &c. Gymnasia were afterwards very common in all parts of Greece; and were imitated, augmented and improved, at Rome. They were not single edifices, but a collection of buildings united; being so capacious as to hold many thousands of people at once, and having room enough for philosophers, rhetoricians, and the professors of all other sciences, to read their lectures, and for wrestlers, dancers, &c, to exercise at the same time without the least mutual disturbance or interruption. Two of those at Athens, the Lyceum and Academy, were respectively rendered famous by the lectures of Aristotle and Plato.

GYMNAS'TICS (*gumnastikos*, relating to bodily exercises: *Gr.*), the art of practising the several bodily exercises, as wrestling, running, fencing, dancing, &c. These were considered of the highest importance in Greece, but at Rome they were exercised only by mercenary athletes. Modern gymnastics are intended chiefly for the preservation and promotion of health.

GYMNOS'OPHISTS (*gumnosophistai*: fr. *gumnos*, naked; and *sophistēs*, a philosopher: *Gr*), a sect of Indian philosophers who went barefooted, and almost in a state of nudity, living in the woods and on mountains, and subsisting on the productions of the earth. They never drank wine; maintained a life of celibacy; and believed in the transmigration of the soul. There was a sect, of the same name, in Africa, who differed from the others in living as anchorites.

GYMNOSPER'MOUS (*gumnos*, naked; and *sperma*, seed: *Gr*), in Botany, having naked seeds, or seeds not enclosed in a capsule or other vessel Amongst the *Coniferæ* and *Cycadaceæ*, the seeds are fertilized by the direct application of the pollen to them, and hence these orders have been placed in an alliance called *Gymospermæ* or *Gymnogens*.

GYMNO'TUS (*gumnotus*, bare-backed: from *gumnos*, naked: and *nōtos*, the back: *Gr.*). [See ELECTRICAL EEL.]

GYNÆCE'UM (*gunaikeion*, belonging to women: *Gr.*, or *Gynæconites*), amongst the ancient Greeks the apartment of the women, a separate portion of the house, where they employed themselves in spinning, weaving, and needlework. The men's part of the house was termed *Adronitis* (*andros*, of a man: *Gr.*).

GYNÆCOC'RACY (*gunaikos*, of a woman; and *kratos*, power: *Gr.*), a state in which women are allowed to govern. The term is used in contradistinction from the *Salic law*, by which females are excluded from the throne in some European states.

GYNÆCON'OMI (*gunaikonomoi*: from *gunē*, a woman; and *oikonomos*, a manager: *Gr.*), certain magistrates amongst the Athenians, who had charge of the interests of the women, and punished such as forsook the line of propriety and modesty. A list of such as had been fined was put up by them upon a palm-tree in the *Ceramicus*. The *gynæconomi* were ten in number, and differed from the *gynæcocosmi*; for the former were inspectors of manners, the latter of dress.

GYNAN'DRIA (*gunē*, a female; and *anēr*, a male: *Gr.*), the 20th class of the Linnæan system of plants. Its characteristic is, having the stamens, style, and stigma, consolidated into a body called a column. It consists chiefly of plants termed *orchidaceous*.

GYP'SUM (*gupsos*: *Gr*.), a mineral known as *sulphate of lime*, *alabaster*, *selenite*, *satin spar*, *gyps*, and *plaster of Paris*. When it is carefully burned, it loses its water of composition, and forms the well-known *plaster of Paris*. The transparent varieties of gypsum are termed *selenite*; the massive *alabaster*; and the fibrous, *satin spar*. A species found in small pearly scales is termed *schaumkalk*. In the manufacture of stucco ornaments, plaster of Paris, mixed with water to the consistence of cream, is used, and during consolidation expands into the finest lines of the mould, so as to give a sharp and faithful impression.

GY'RFALCON (*gyr*, a vulture: *Ger.*; and *falcon*), the common name of the *Falco Islandicus*, the largest of the falcons breeding in these islands. It was formerly much prized by persons devoted to falconry, and large sums were paid for specimens procured in Iceland, which were thought superior to others.

GYRI'NUS (*gurinos*, from *guros*, round: *Gr.*), a genus of aquatic beetles, the type of which is the whirligig or water-beetle. They usually employ themselves in running round and round in company, on the surface of a piece of water. When disturbed they dart under water, carrying with them a small bubble of air.

GY'ROSCOPE (*guros*, round; and *scopeo*, I see: *Gr.*), an instrument invented by M. Foucault for proving the rotation of the earth about its axis. Its principle depends upon the powerful resistance which a rapidly revolving heavy body opposes to a change of position in its axis of rotation. A disc of metal, with a heavy circumference suspended in a particular way, is set in rapid rotation in a given plane. If the instrument be carefully constructed the motion may be kept up long enough to show phenomena which can only be explained by assuming the rotation of the earth.

H

H, the eighth letter and sixth consonant of the English alphabet. Until about the 5th century before Christ the letter H was used by the Greeks to signify the aspirate; it was afterwards their capital e long, the aspirate being indicated by (ʽ): but it was retained by the Latins, who, however, wrote several words with and without it indifferently: thus, *aruspex* and *haruspex*, *onustus* and *honustus*, &c.; and, in borrowing words from the Greek, they often changed the *h* into *s*: thus, *sex*, from *hex*, six; *serpo*, from *herpo*, I creep, &c. In English words, *h* is sometimes mute, as in *honour*, *honest*; also when united with *g*, as in *right*, *flight*, *brought*. In *which*, *what*, and some other words where it follows *w*, it is sounded before it, *hwich*, *hwat*, &c. H, among the Greeks, as a numeral, signified *eight*. As an abbreviation, among the Romans, it signified *homo*, *hæres*, *hora*, &c.; and for L.L. in H.S., a *sestertius*. This being *libra libra semis* (two pounds and a half, or, as they were termed two asses and a half), would be represented in full by L.L.S.; but it was shortened into H.S. This use of the letter *h* is universal among ancient Latin writers, when speaking of Roman money [see SESTERTIUS]. As a numeral, they used it for 200, and with a dash over it, for 200,000. With us it is an abbreviation for *Hanover*:—G.C.H. *Grand Cross of Hanover*. For *Hegiræ*:—A.H. *Anno Hegiræ* (the year of the Hegira.) For *his* or *her*:—H.M.S. *His or Her Majesty's Ship*. For *holy*:—H.R.E. *Holy Roman Empire*, &c.——In Music, H is the seventh degree in the diatonic scale, and the twelfth in the chromatic.

HA'BEAS COR'PUS (you are to have the body: *Lat.*), in Law, the title of a writ, of which there are several kinds:—*Habeas corpus ad respondendum*, you are to bring up the person to answer: *Lat.*), to remove a prisoner confined by the process of an inferior court, in order to charge him with a new action in a higher. *Habeas corpus ad faciendum, subjiciendum, et recipiendum* (you are to produce the body, to do, submit, and receive whatever the court shall direct), a writ directed to a person detaining another, and a great safeguard against unjust imprisonment or delay of trial. Blackstone considers it the grand Palladium of the liberty of the subject. The writ of habeas corpus is the glory of the British constitution: it not only protects the citizen from unlawful imprisonment at the suggestion of the civil officers of the government, but also against groundless arrests at the suit or instigation of individuals. The right, however, has been suspended by the legislature in times when it seemed desirable to clothe the executive with an extraordinary power, as the Romans were in the habit of choosing a dictator in emergencies in which the commonwealth was in danger.

HABEN'DUM (to have: *Lat.*), in Law, that clause in a deed of conveyance which sets forth the estate intended to be granted in the lands, &c. conveyed. It begins 'to have and to hold.'

HAB'ERGEON (*Fr.*). [See HAUBERK]

HAB'IT (*habitus: Lat.*), in Philosophy, an aptitude or disposition either of mind or body, acquired by a frequent repetition of the same act: thus, virtue is called a habit of the mind; strength, a habit of the body.——HABIT, in Medicine, denotes the settled constitution of the body; also a particular state formed by nature, or induced by extraneous circumstances.——HABIT, in Natural History, signifies the general form and appearance of an animal or plant.

HAB'ITAT (it inhabits: *Lat.*), in Botany, the nature of the places where a plant is found, on a mountain, in a marsh, by the sea-shore, and so on.

HAC'KLE (*hechel: Ger*), a tool with which flax and hemp are dressed. It consists of long iron teeth, regularly set in a piece of board; being, in fact, a large kind of card.

HAD'DOCK (*hadot: Fr.*), a malacopterygious fish, nearly allied to the cod; the *Gadus æglefinus* of ichthyologists. It has a long body, the upper part of a dusky brown colour, and the belly of a silvery hue It is found in vast shoals in the northern seas, on the coasts of Britain and Ireland, &c.; and is a most valuable article of food.

HA'DES (*a*, not; and *eido*, I see: *Gr.*), in Mythology, the abode of the dead

HA'DING, in Mining, the direction of a slip or fault. The deviation of a mineral vein from the vertical is called its *hade*.

HADJEE, amongst the Mahometans a pilgrim who has visited the prophet's tomb at Mecca.

HAD'LEY'S QUAD'RANT, an instrument founded on the laws of reflection, and which enables the mariner, however unsteady the ship may be, to take the altitude of the sun, &c. Though termed a quadrant because it can measure arcs of 90°, its arch is only the eighth part of a circle.

HÆMATI'TE (*aima*, blood: *Gr*), in an extremely rich and fine iron ore, the native oxide. It is very ponderous, and is either of a pale red, a deeper red, or a bluish colour; is usually of a very glossy surface, and, when broken, of a fine and regularly striated texture, the striæ converging towards the centre of the body, and the masses naturally breaking into fragments of a broad base and pointed end, appearing somewhat pyramidal.

HÆMAT'OCELE (*aima*, blood; and *kēlē*, a hernia: *Gr.*), in Medicine, a hernia from extravasation of blood.

HÆM'ORRHAGE (*aimorrhagia*: from *aima*, blood; and *rhēgnumi*, I break: *Gr.*), a flux of blood from any part of the body. It may arise from a full state of the vessels, or *plethora*, in which case it is termed *active hæmorrhage*; or from a debilitated state of the vessels or system generally, when it is termed *passive hæmorrhage*.

HÆM'ORRHOIDS (*aimorrhois*: from *aima*, blood; and *rheo*, I flow: *Gr.*), in Medicine, tumours of the hæmorrhoidal veins, or veins of the rectum, constituting the disease called *piles*, and very often accompanied with a flow of blood.

HAGIOG'RAPHY (*hagios*, holy; and *graphē*, a description: *Gr.*), the Holy Scripture. The term has been applied also to the histories or legends termed the lives of the saints. The Jews divide the books of the Scriptures into three parts:—the Law, which is contained in the first five books of the Old Testament; the Prophets, or Nevim, and the Cetuvim, or *writings*, by way of eminence The latter class, called by the Greeks *Hagiographai*, comprehends the books of Psalms, Proverbs, Job, Daniel, Ezra, Nehemiah, Ruth, Esther, Chronicles, Canticles, Lamentations, and Ecclesiastes.

HAIL (*hagel: Ger.*), a meteor which occurs chiefly in spring and summer, is often accompanied by thunder and lightning, and always by electrical phenomena. Hailstones generally consist of a porous mass like frozen snow, surrounded by layers of ice Their form is exceedingly varied, but is generally roundish: they are usually about a quarter of an inch in diameter; but they occasionally weigh nine or ten ounces They sometimes fall with great velocity, and not unfrequently do considerable mischief to the glass of windows, and even to the growing crops. Many explanations have been given of the formation of hail, it is most probably an aggregation of small particles of moisture frozen in the upper regions of the air, and increased during descent by freezing rain. Hail occasionally falls with such violence as to kill large numbers of animals. Deer, cattle, and ostriches have been killed in numbers by hail storms in South America.

HAIR (*haar: Ger.*), the characteristic covering of the mammiferous class of animals. Hairs originate in a follicle, formed in the substance of the true skin. They are allied in structure to the epidermis. At the base of each there is a bulbous enlargement; the interior of which consists of a soft substance, called pulp. The hair is increased by the continual supply of pulp in the follicle, and its conversion into the substance of hair as it issues through the neck of the follicle Hairs consist of a cortical material of a horny texture and a pith-like interior. In the human hair the cortical part is transversely striated. The hairs of the bat tribe bear rings of small spines, and hence are frequently mounted as microscopic objects. Bristles, fur, and wool, are all modifications of hair. Some kinds of hair, as the human, &c., are perennial and grow continuously; others are shed at particular seasons. Many kinds of animals have two species of hair, a fine and a coarse: it is one of the processes of the arts to remove the latter, and leave the former, as in seal skin. Hair consists chiefly of indurated albumen, and yields some gelatine when boiled with water.——HAIR, in Botany, the down or hair-like threads on the surface of plants.

HAIR'-PENCILS, in Painting, are composed of very fine hairs, obtained from the minever, the marten, the badger, the polecat, &c., which are mounted in a quill when they are small or of moderate size, but when larger than a quill in tin tubes. The most essential quality of a good pencil is to form a fine point, so that all the hairs may be united when they are moistened by drawing them through the lips

HAIR'S-BREADTH, a measure of length, equal to the forty-eighth part of an inch

HAL'BERD (*halebarde: Fr.*), an offensive weapon somewhat like a spear, formerly carried by a body of men called *halberdiers*, and more recently by the sergeants of foot and artillery.

HAL'CYON (*Lat.*; from *halkuōn*: *hals*, the sea; and *kuo*, I conceive: *Gr.*), or *Kingfisher*, the *alcedo ispida* of ornithologists, a British bird with beautiful plumage. It frequents the neighbourhood of streams, and subsists on small fish, water-beetles, and leeches. The name halcyon was given to this bird by the ancients, as the female was supposed to lay her eggs in nests, on rocks near the sea, during the calm weather, about the winter solstice. It was formerly a common notion (and this is often alluded to by our old poets) that a dead bird, suspended by a thread, would point its bill to the quarter whence the wind blew.——HALCYON DAYS, in Antiquity, seven days before, and as many after, the winter solstice; so called from the halcyon being supposed to select that period for incubation. The weather was then generally remarkable for calmness, and hence *halcyon days* was a term used to express days of 'peace and tranquillity.'

HALF'-BLOOD, in Law, relationship by the father's or mother's side only.

HALF'-MOON, in Fortification, an outwork composed of two faces, forming a salient angle, whose gorge is in the form of a crescent or half-moon.

HAL'IBUT (*heilbutte: Ger.*), the *Hippoglossus vulgaris* of ichthyologists, a flat fish allied to the turbot. Both eyes are on the right side of the head It grows to a great size, being the largest of the *Pleuronectidæ* or flat-fish family. It is sometimes seven feet in length, and occasionally weighs 400 lbs. It forms an article of food, but is coarse and dry.

HALIO'TIS (*halios*, marine; *ous*, the ear: *Gr.*), a genus of gasteropodous molluscs, with ear-shaped shells, perforated with a series of holes. One species of ear shell is the *Ormer* of the Channel Islands. Other species from warm seas have shells that are remarkable for the pearly iridescence of their inner surface.

HALLELU'IAH (praise ye the Lord: *Heb.*), a doxology derived from the Old Testament, and, from its harmonious softness, retained by us without translation.

HAL'LIARD (*haulyard*), a rope or tackle for hoisting or lowering a sail, signal, &c.

HALLUCIN'ATION (*hallucinatio*, a wandering of the mind: *Lat.*), in Medicine, *dysæsthesia*, erroneous imagination. *Hallucinations of the senses* arise from some defect in the organs of sense, or from some unusual circumstances attending the object; and they are sometimes symptomatic of general disease, as in fevers. *Maniacal hallucinations* arise from some imaginary or mistaken idea.

HA'LO (*Lat.*), in Natural Philosophy, a luminous ring or circle, sometimes white and sometimes coloured, appearing round the body of the sun, moon, or stars, when seen through a thin cloud or a misty atmosphere. It is of two kinds. The first is of small dimensions, and generally consists of three or more concentric rings, differently coloured, and presenting appearances similar to the phenomena produced with very thin plates of transparent substances. These are usually termed *coronæ* (crowns). The second kind, or *halos* properly so called, are very much larger. The lunar halo is a white luminous circle, sometimes having its inner edge tinged with red. But the solar halo exhibits colours like those of the rainbow, though not so vivid; their interior is red, their exterior a violet, which gradually blends with the sky; sometimes there is also another much larger and concentric halo, the colours of which are fainter. *Coronæ* are supposed to be formed by the *deflection* of light in passing small watery globules suspended in the atmosphere; and *halos* by the *refraction* of light in passing through small transparent and prismatic crystals of ice floating in the upper regions of the atmosphere.

HAL'OGENE (*hals*, the sea, and *gennao*, I produce: *Gr.*), in Chemistry, those substances which form compounds of a saline nature, by their union with metals; as *chlorine, iodine, &c.*

HAM'ADRYAD (*hamadruas*: from *hama*, together with; and *drus*, an oak: *Gr.*), in the Heathen Mythology, a *wood nymph*, supposed to live and die with the tree to which it was attached.
